P103.1 Overcrowding. The number of occupants in a *short-term rental property* shall not exceed the limits established by Section 404 of the International Property Maintenance Code.

P103.2 Prohibited sleeping spaces. Kitchens and non-habitable spaces shall not be used as *sleeping spaces*.

SECTION P104
MEANS OF EGRESS AND ESCAPE

P104.1 Minimum access. Where more than one *sleeping space* is located in a *dwelling unit* or *sleeping unit*, a *sleeping space* shall not constitute the only means of access to other *sleeping spaces* or *habitable spaces* and shall not serve as the only means of egress from other *habitable spaces*.

P104.2 Exit identification. Where the egress path to an exit is not readily apparent, photoluminescent exit signs shall be installed to clearly mark the egress path.

P104.3 Emergency escape and rescue opening. Each *sleeping space* shall have an *emergency escape and rescue opening* that complies with the code that was in effect at the time of construction, and openings shall be maintained such that they are operational from the inside without the use of keys or tools. Where bars, grilles, grates or similar devices are placed over an *emergency escape and rescue opening*, the minimum net clear opening size that complies with the code that was in effect at the time of construction shall be maintained.

P104.4 Escape ladders. Where a *sleeping space* is located more than one *story* above *grade plane*, an emergency escape ladder complying with ASTM F2175 shall be provided at not less than one *emergency escape and rescue opening* on each such story.

SECTION P105
SAFETY PLAN

P105.1 General. The *responsible party* shall prepare, implement, and maintain a written safety plan for each *short-term rental property*.

P105.2 Approval. The safety plan shall be submitted to the *Fire Code Official* and *approved* before a permit is issued.

P105.3 Safety plan elements. *Short-term rental property* safety plans shall include the following:

1. Name and contact information of *responsible party*.
2. The procedure for a transient occupant to report an emergency and the means of communicating that procedure to transient occupants.
3. A graphic illustration of the full floor plan of the *dwelling unit* or *sleeping unit* with a *short-term rental property* that includes the following:
   - 3.1. The location of each *sleeping space*.
   - 3.2. Two escape paths for each *sleeping space*, including the path to the nearest outside exit door and to a designated *emergency escape and rescue opening* for the *sleeping space*.
   - 3.3. The location of *portable fire extinguishers*, *smoke alarms*, *carbon monoxide alarms*, and emergency escape ladders if provided.
4. Safety equipment records, including the following:
   - 4.1. Location and manufacturing date of each *smoke alarm*, as marked on the back of the alarm.
   - 4.2. Location and manufacturing date of each *carbon monoxide alarm*, as marked on the back of the alarm.
5. Location of fuel-fired equipment and *appliances*.

SECTION P106
FIRE SAFETY INSPECTIONS

P106.1 Responsible party inspections. The *responsible party* shall complete a monthly fire safety inspection of the *short-term rental property* to verify compliance with this appendix. All indoor and outdoor areas associated with the *short-term rental property* shall be

inspected.

P106.1.1 Inspection of automatic sprinkler systems. Inspection of automatic sprinkler systems, where provided, shall include the following on a monthly basis unless otherwise indicated:

1. Control valves shall be verified as being in the open position.
2. Leaking, damaged, corroded, or painted sprinklers shall be replaced.
3. Decorations or other materials obstructing sprinkler discharge or attached to sprinklers shall be removed.
4. Water tanks or other stored water sources, if present, shall be verified as full.
5. Instruction signs and tags shall be installed near the main valve.
6. The owner's manual for the system shall be onsite.
7. Water pumps, if present, shall be tested annually to confirm proper operation.
8. Waterflow devices that initiate alarms, if present, shall be tested annually to confirm proper operation.

P106.2 Official inspections. Where required by the *fire code official*, an annual inspection by the *fire code official* or an approved third-party inspector shall be conducted at the *responsible party's* expense to verify compliance with this appendix. The results of each inspection shall be documented and maintained at the *short-term rental property* in a conspicuous location for transient occupants to review.

SECTION P107
VIOLATIONS

P107.1 General. Failure to comply with this appendix shall constitute an unlawful act in accordance with Section 113.1 and shall result in the issuance of a notice of violation to the short-term rental owner in accordance with Section 113.3.

SECTION P108
REFERENCED STANDARDS

E108.1 General. See Table P108.1 for standards that are referenced in various sections of this appendix. Standards are listed by the standard identification with the effective date, standard title, and the section or sections of this appendix that reference the standard.

TABLE P108.1 REFERENCED STANDARDS

STANDARD ACRONYM	STANDARD NAME	SECTIONS HEREIN REFERENCED
ASTM F2175-2015	Standard Specification for Portable and Permanent Emergency Escape Ladders for Residential Use	P104.4

Reason: Regulation of short-term rental (STR) properties is largely done by a patchwork of jurisdiction-by-jurisdiction requirements with little consistency from what I've found. My focus in submitting this proposal is gaining a level of consistency and education of STR owners and operators via a understandable consolidation of the "most important" safety requirements in ICC codes. Although the ICC codes, such as the IFC and IEBC, include a large number of safety-related provisions that are applicable to STRs (and served as the basis for much of the appendix content), they are currently dispersed in a way that does not promote understanding or compliance by people who don't live in the code world. "Most important" reflects my personal opinion of code requirements that I felt were appropriate to include/duplicate/reference in the new appendix to have the greatest impact on improving safety (primarily fire safety) if understood and followed by responsible parties. Certainly, others may have different perspectives, and hopefully the framework provided by the proposed appendix can be further populated as needed to address considerations raised by others during the code development

process.

Some additional requirements, that are not otherwise provided for by current codes and seem appropriate for regulation of STRs, are also included in the proposal. These include, among others, as escape ladders for second story sleeping areas, declaration of sleeping spaces, and requiring that sleeping spaces are treated as bedrooms even though such spaces in a STR might be repurposed common areas that wouldn't have previously been considered or regulated as a bedroom.

It's important to note that while fires are not known to be frequent in STRs, they have resulted in significant life loss. Also note that the content of this appendix deliberately sidesteps some of the most controversial issues surrounding regulation of STRs by a jurisdiction, particularly nuisance complaints related to noise, parking and trash; neighborhood STR density limits; licensing; and collection of fees/lodging taxes.

Although I serve as a consultant to the National Fire Sprinkler Association, and while this proposal includes regulations that affect sprinklers, this proposal was not reviewed or endorsed by NFSA. And, I am not representing NFSA on this issue.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Actually, the proposal is not entirely editorial, but it should have no impact on the cost of construction because, for the most part, it simply consolidates/duplicates a selection of existing ICC code requirements into a single location. That's not to say that there wouldn't be costs associated with upgrading an otherwise non-compliant STR property or the required administrative oversight or safety feature additions, but these are not construction costs.

F280-24

Public Hearing Results (CAH1)

Committee Action: **As Modified by Committee**

Committee Modification: SLEEPING SPACE.A bedroom or other location in a short-term rental designated in the permit application as a space that will be offered for overnight occupancy ~~intended to provide sleeping accommodations~~.

P102.5 Portable Fire extinguishers. A minimum of one portable fire extinguisher with a minimum rating of 1~~2~~ A:10-B:C shall be provided on each story of a *short-term rental unit* and as required by Section P102.9, secured on a mounting bracket in a conspicuous and unobstructed location along a normal path of travel.

P102.9 Outdoor cooking.
A 1A:10BC fire extinguisher and appliance operating instructions shall be located within 10 feet of outdoor cooking appliances.
~~Outdoor cooking shall not be conducted on combustible balconies or decks or within 10 feet (3048 mm) of combustible construction.~~

P103.2 Prohibited sleeping spaces. Kitchens,
and rooms or areas not designated on the permit application and *approved* for use as a *sleeping space*, ~~non-habitable spaces~~ shall not be used as *sleeping spaces*.

P104.4 Escape ladders. Where a *sleeping space* is located more than one *story* above *grade plane*, an emergency escape ladder ~~complying with ASTM F2175~~ shall be provided at not less than one *emergency escape and rescue opening* on each such story.

Exception: An emergency escape ladder is not required for stories that have two or more means of egress.

P106.2 Official inspections. Where required by the *fire code official*, an annual inspection
~~by the *fire code official* or an approved third-party inspector~~ shall be conducted ~~at the *responsible party's* expense~~ to verify compliance

with this appendix. The results of each inspection shall be documented and maintained at the *short-term rental property* in a conspicuous location for transient occupants to review.

~~**SECTION P108**~~
~~**REFERENCED STANDARDS**~~

~~**P108.1 General.** See Table P108.1 for standards that are referenced in various sections of this appendix. Standards are listed by the standard identification with the effective date, standard title, and the section or sections of this appendix that reference the standard.~~
~~**TABLE P108.1 REFERENCED STANDARDS**~~

~~STANDARD ACRONYM~~	~~STANDARD NAME~~	~~SECTIONS HEREIN REFERENCED~~
~~ASTM F2175-2015~~	~~Standard Specification for Portable and Permanent Emergency Escape Ladders for Residential Use~~	~~P104.4~~

Committee Reason: This proposal provides a concise set of requirements appropriately located within an Appendix. This will provide for more consistency for fire safety and enforcement. This will also avoid state legislatures taking on the issue and instead will leave control in the hands of the regulators.
The modifications are associated with providing clarification on intent.

- **Sleeping Space and locations.** The definition of sleeping space is revised to more specifically address the areas where overnight occupancy sleeping will be permitted. This may include a living or family room in addition to the traditional bedrooms, for example. Likewise, Section P103.2 it is clarified as to what areas are prohibited from allowing sleeping within the short-term rental unit.
- **Fire extinguishers.** The fire extinguisher requirements have been changed to require a smaller extinguisher. Additionally extinguishers are now required within 10 feet of outdoor cooking appliances. Many short term rental units have grills or similar appliance where the occupant may not be familiar with operation which increases the risk of fire.
- **Emergency escape ladder.** Section P104.4 simply requires that the escape ladder be provided without a specific reference to the standard. In addition, if there are at least 2 means of egress from a story such ladders are unnecessary. With the deletion of the reference to the ASTM F2175 standard Section P108 is no longer necessary and is deleted.
- **Inspections.** Section P106.2 is revised to remove the requirement for a third party inspection. An annual inspection would still be required.

(Vote 13/0)

F280-24

Individual Consideration Agenda

Comment 1:

IFC: SECTION 202, P101.3, P102.2, P102.3, P102.3.1 (New), P102.3.2 (New), P102.3.1, P102.3.2, P102.5, P104.1, P104.2, P104.3, P104.4, P105.1, P105.4 (New), P106.1, P106.1.1, P106.2

Proponents: Jeffrey Shapiro, Lake Travis Fire Rescue, Lake Travis Fire Rescue (jshapiro@ltfr.org) requests As Modified by Committee (AMC2)

Further modify as follows:

2024 International Fire Code

Revise as follows:

SHORT-TERM RENTAL PROPERTY.
A *dwelling unit, sleeping unit*, or portion thereof providing one or more *sleeping spaces*, made available for ~~temporary~~ transient overnight occupancy, whether rented or swapped, for a period of 30 or fewer days ~~or less~~.

P101.3 Permit. A permit shall be required for each short-term rental property. Where two or more *sleeping spaces* ~~rooms~~ are available for separate rental or exchange in a single *dwelling unit* or *sleeping unit*, only one permit for the *dwelling unit* or *sleeping unit* shall be required. A permit application shall be accompanied by a floor plan that identifies every *sleeping space* and a copy of the safety plan required by this appendix.

Revise as follows:

P102.2 Permissible locations. *Short-term rental properties* shall only be located in dwelling units or sleeping units in buildings that are legally in existence for residential use ~~were constructed with an *approved* building code~~ and are maintained in accordance with the

International Property Maintenance Code.

Exception: The *fire code official* is authorized to accept other *short-term rental properties* ~~of a different type~~ where justified in accordance with Section 104.2.3 or 104.2.4.

P102.3 Smoke alarms. *Smoke alarms* shall be installed and maintained in accordance with Section 907.2.11~~.~~ except as provided by Sections P102.3.1 through 102.3.4.

Add new text as follows:

P102.3.1 Interconnection. Where more than one smoke alarm is required to be installed within an individual *dwelling* or *sleeping unit*, the smoke alarms shall be interconnected in such a manner that the activation of one alarm will activate all of the alarms in the individual unit. Physical interconnection of smoke alarms shall not be required where *listed* wireless alarms are installed and all alarms sound upon activation of one alarm. The alarm shall be clearly audible in all *sleeping spaces* over background noise levels with all intervening doors closed.

P102.3.2 Power Source. Smoke alarms shall be powered in accordance with Section 1103.8.2.

Revise as follows:

P102.3.3~~1~~ Additional smoke alarms. Where a *sleeping space* would otherwise not require a *smoke alarm* based on the requirements of 907.2.11, a *smoke alarm* shall be installed in such space.

P102.3.4~~2~~ Replacement. If a smoke alarm stops functioning or is more than 10-years old, based on the date marked on the back of the device, or if there is no marked date, such smoke alarm shall be replaced.

P102.5 Portable Fire extinguishers. A minimum of one portable fire extinguisher with a minimum rating of 1-A:10-B:C shall be provided on each story of a *dwelling unit* or *sleeping unit* being used as a *short-term rental property* ~~*unit*~~ and as required by Section P102.9, secured on a mounting bracket in a conspicuous and unobstructed location along a normal path of travel.

P104.1 Minimum access. *Sleeping spaces* shall have unrestricted access to both a *means of egress* and where required by Section 104.3, at least one *approved emergency escape and rescue opening.* Escape paths within a *dwelling unit* or *sleeping unit* used as a *short-term rental property* shall not include any intervening lockable doors or other obstructions that are not controlled by occupants of the *short-term rental property.*

~~Where more than one *sleeping space* is located in a *dwelling unit* or *sleeping unit*, a *sleeping space* shall not constitute the only means of access to other *sleeping spaces* or *habitable spaces* and shall not serve as the only means of egress from other *habitable spaces*.~~

P104.2 Exit identification. Where the egress path to an exit in a *dwelling unit* or *sleeping unit* used as a *short-term rental property* is not readily apparent, photoluminescent exit signs shall be installed to clearly mark the egress path in the *dwelling unit* or *sleeping unit*.

P104.3 Emergency escape and rescue opening. Each *sleeping space* shall have an *emergency escape and rescue opening* that complies with the requirements of the code that was in effect at the time of construction applicable to bedrooms, and such openings, where required, shall be maintained ~~such that they are~~ operational from the inside without the use of keys or tools. Where bars, grilles, grates or similar devices are placed over an *emergency escape and rescue opening*, the minimum net clear opening size that complies with the code that was in effect at the time of construction shall be maintained.

Revise as follows:

P104.4 Escape ladders. Where a *sleeping space* in a *dwelling unit* or *sleeping unit* used as a *short-term rental property* is located more than one *story* above *grade plane*, an emergency escape ladder shall be provided at not less than one *emergency escape and rescue opening* on each such story.

Exception: An emergency escape ladder is not required for stories that have two or more means of egress.

P105.1 General. The *responsible party* shall prepare, implement, and maintain a written safety plan for each *dwelling unit* or *sleeping unit* used as a *short-term rental property*.

Add new text as follows:

P105.4 Emergency card. An emergency card shall be permanently or semi-permanently mounted in a conspicuous and central location within *dwelling units* and *sleeping units* used as *short-term rental properties*. The information included on the card shall include all of the following:

1. Phone number to call in the event of an emergency
2. Property address
3. Floor plan designating beds in *sleeping spaces* consistent with those shown on the permit application; location of exits; location of emergency escape and rescue openings, where provided; and location of portable fire extinguishers

Revise as follows:

P106.1 Responsible party inspections. The *responsible party* shall complete a monthly fire safety inspection of ~~the~~*dwelling units or sleeping units* used as *short-term rental property* to verify compliance with this appendix. All indoor and outdoor areas associated with the *dwelling unit or sleeping unit* used as a *short-term rental property* shall be inspected.

P106.1.1 Inspection of automatic sprinkler systems. Inspection of automatic sprinkler systems in a *dwelling unit* or *sleeping unit,* where provided, shall include the following on a monthly basis unless otherwise indicated:

1. Control valves in the *dwelling unit* or *sleeping unit* shall be verified as being in the open position.
2. Leaking, damaged, corroded, or painted sprinklers in a *dwelling unit* or *sleeping unit* shall be replaced.
3. Decorations or other materials obstructing sprinkler discharge or attached to sprinklers in a *dwelling unit* or *sleeping unit* shall be removed.
4. Water tanks or other stored water sources, if present in a *dwelling unit* or *sleeping unit* , shall be verified as full.
5. Instruction signs and tags in a *dwelling unit* or *sleeping unit* shall be installed near the main valve.
6. The owner's manual for the system in a *dwelling unit* or *sleeping unit* shall be onsite.
7. Water pumps, if present in a *dwelling unit* or *sleeping unit*, shall be tested annually to confirm proper operation.
8. Waterflow devices that initiate alarms, if present in a *dwelling unit* or *sleeping unit*, shall be tested annually to confirm proper operation.

P106.2 Official inspections. Where required by the *fire code official*, an annual inspection shall be conducted to verify compliance with this appendix. The results of each inspection shall be documented and maintained at the *dwelling unit or sleeping unit* used as a *short-term rental property* in a conspicuous location for transient occupants to review.

Reason:

1. The revisions to the definition of Short-term Rental Property clarify that the term, and thereby the appendix, does not apply to daytime only rentals, such as those properties that might rent a pool/cabana or other space for partial days. The intent is assuring that the appendix isn't applied to rental properties that are rented for monthly or longer periods, given that occupants will certainly become familiar with these properties similar to a primary residence. It is noted that the IBC definition of Transient is correlated to short-term rental, with both specifying 30-days or less as the qualifier. It was previously suggested that the definition be modified to specify that the 30-day trigger should be consecutive days, but this was determined to be unnecessary since any property available for less than 30-days, consecutive or otherwise, is encompassed within the intended application of the appendix.
2. Revisions to P101.3 are a clarification of intent, by using the defined term.

3. Revisions to P102.2 clarify that buildings built prior to the existence of a building code can contain a STR if they are legally in existence for residential use. Buildings built after a building code has been adopted would have to comply with the code governing construction/updates to be legally in existence. The addition of dwelling units or sleeping units clarifies that the entire building doesn't need to be viewed as a STR, vs. only the dwelling unit or sleeping unit being rented.
4. Revisions to P102.3 relax requirements for smoke alarm interconnection. Interconnection text is sourced from 1103.8.2 but does not recognize the Chapter 11 exceptions, recognizing the existence of wireless interconnect devices that are no readily available and relatively inexpensive as an alternative to hard-wiring interconnection in existing structures.
5. Revisions to P102.5 clarify that the portable fire extinguisher only applies to dwelling units and sleeping units, not potentially areas of much larger buildings such as condominiums or apartments that might contain STR units.
6. Revisions to P104.1 improve on the original proposal by better ensuring availability of emergency escape routes. This does not negate separate applicability of IPMC Section 404.4.2, where adopted, which was the basis of the original text. Instead, the revised text better suits short-term rental situations.
7. Revisions to P104.2 clarify that the exit identification requirements only apply to dwelling units and sleeping units, not potentially areas of much larger buildings such as condominiums or apartments that might contain STR units.
8. Revisions to P104.3 clarify that the referenced EERO requirements are those that relate to bedrooms. Although this is pretty clear in the I-codes that require(d) EEROs, the clarification was requested here. In addition, "where required" has been included since there are some cases where EEROs are not required, particularly in some buildings equipped with automatic sprinkler systems.
9. Revisions to P104.4 clarify that the escape ladder requirements only apply to dwelling units and sleeping units, not potentially areas of much larger buildings such as condominiums or apartments that might contain STR units.
10. Revisions to P105.1 clarify that the safety plan requirements only apply to dwelling units and sleeping units, not potentially areas of much larger buildings such as condominiums or apartments that might contain STR units.
11. The new P105.4 adds the additional safety feature of a posted emergency information card that is readily seen by occupants who might not read any of the other information provided by the host in a binder or otherwise. This includes the minimum information that any STR occupant should be familiar with before spending the night.
12. Revisions to P106 clarify that the inspection requirements only apply to dwelling units and sleeping units, not potentially areas of much larger buildings such as condominiums or apartments that might contain STR units.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

Reduced requirements will technically reduce cost, but the financial consequences are expected to be negligible. Changes generally clarify the original intent of the proposal but are not purely editorial.

Estimated Immediate Cost Impact Justification (methodology and variables):

Common sense.

Comment (CAH2)# 709

Comment 2:

Proponents: Ricky Cortez, Poconos VRO, Self requests Disapproved

Reason: I urge you to vote against the adoption of Proposal F280-24.Lack of Data

Proposal F280-24 lacks sufficient data to support stricter restrictions on short-term rentals compared to other occupancy groups, such as hotels. The current proposal is based on anecdotal evidence, which does not provide a solid foundation for implementing widespread adoption.

Conflicting Data

Data from the National Fire Protection Association indicates a decrease in overall house fires, including the years when STRs have

occupied a significant number of houses. This raises the question of whether additional restrictions are necessary when fire safety incidents are on the decline.

Burdensome Requirements

Communities are already struggling with burdensome requirements imposed by local authorities, and this proposal may further exacerbate those challenges. It gives the impression that the motive behind the proposed code change is financial gain rather than addressing a specific problem.

Impact on Our Community

The Pocono Mountains are a major draw for visitors, and our thriving vacation rental industry plays a vital role in supporting the local economy. PVRO members are committed to being good neighbors and providing well-maintained, quality homes that enhance the value and vitality of our communities. The additional requirements proposed by F280-24 could discourage hosts from operating STRs, thereby reducing the availability of vacation rentals and adversely affecting tourism and local businesses.

2024 Economic Impact Study: Economic Impact -

https://poconosvro.wildapricot.org/Economic-Impact

- Over 35,000 jobs are derived from our tourism industry
- $4.5 billion in visitor spending come from our tourists
- 38% of STR owners rely on the income from their rentals

As a Host

The health and safety of our guests is paramount. Our success as a business depends on providing a safe place to stay and offering our guests the advice, warnings, and equipment necessary to ensure a pleasant and favorable experience. Efforts to define a standard of care that would improve upon what we, as experienced hosts with designations like SuperHost or top-tier star ratings, already strive for will not be as effective as our current practices.

I operate in a municipality with a defined Short-Term Rental Ordinance that outlines legal standards. There are existing building codes and municipal ordinances relating to health and safety. I have insurance that bases rates on the risks of my operation, and I list my property on booking sites that compile guest experiences and present them to future guests. When my guests state publicly that my vacation rental has "everything," I believe they are correct. When my guests request additional amenities, I provide them. No regulation is better than the free market, and no universal standards can provide better coverage than what I offer and what our local regulators and political processes have put in place. One size does not fit all; imposing a base-level of health and safety is an unnecessary burden for my business and those I compete with.

Additionally, the use of the home is not changing and will continue to be a single-family residence. It is not a commercial space. It is unnecessary for a residential home to need escape ladders in bedrooms and photoluminescent exit signage. The same land usage applies with capacity and occupancy limits. If these changes apply to our vacation homes, they would also have to apply to residential homes used as vacation homes and full-time residences without any capacity or occupancy restrictions.

Host's Personal Story

To help committee members understand the real-world implications of the proposed code modifications, I'd like to share my personal story and experiences as a Host. Hosting has positively impacted my life, my community, and the guests I've welcomed.

I have been a host on Airbnb for 7 years, and have welcomed over 700 families into our community. I take immense pride in prioritizing the safety and well-being of my guests. Throughout my hosting journey, I have diligently maintained my space to create a safe and accessible environment. I'm proud to share that in all my years of hosting, I have not had a single incident related to a fire or any safety concern.

I have taken proactive steps to ensure safety, including the use of interconnected smoke/CO detectors, fire extinguishers, and other life-safety and monitoring devices. I regularly maintain these devices to ensure they are always up to date.As a host, I am not alone in relying on my short-term rental to make ends meet. In fact, 65% of Hosts say they plan to use money they've earned on Airbnb to cover the

heightened costs of living over the next 12 months. Thanks to the income from Airbnb, I have been able to cover basic needs like food and utilities, pay my mortgage, pay my medical bills, and save for retirement.

Our Request

We urge the International Code Council to reconsider Proposal F280-24 and instead work with local governments and industry stakeholders to develop more balanced and practical safety measures. By doing so, we can ensure the safety of guests without imposing unnecessary hardships on hosts who are already meeting existing local standards.

Conclusion

In conclusion, while we recognize the importance of safety in short-term rentals, Proposal F280-24 is an overreach that could harm both hosts and the communities they serve.

Thank you for your time and consideration.

All the best,

Ricky Cortez
Executive Director
Poconos Association of Vacation Rental Owners (PVRO)

Comment (CAH2)# 371

Comment 3:

Proponents: Elizabeth Deterra, STR Owner (edeterra129@gmail.com) requests Disapproved

Reason: I urge you to vote against the adoption of Proposal F280-24. Proposal F280-24 lacks sufficient data to support stricter restrictions on short-term rentals compared to other occupancy groups, such as hotels. The current proposal is based on anecdotal evidence, which does not provide a solid foundation for implementing widespread adoption.

Data from the National Fire Protection Association indicates a decrease in overall houses, including the years when STRs have occupied a significant number of houses. This raises the question of whether additional restrictions are necessary when safety incidents are on the decline.

Communities are already struggling with burdensome requirements imposed by local authorities, and this proposal may further exacerbate those challenges. It gives the impression that the motive behind the proposed code change is financial gain rather than addressing a specific problem.

My sister and I have been a host on Airbnb for 3 years, and welcomed 60+ guests into our home. We take immense pride in prioritizing the safety and well-being of our guests. Throughout our hosting journey, we have diligently maintained our space to create a safe and accessible environment. We are

proud to share that in all our years of hosting, we have not had a single incident related to any safety concern.

Steps we have taken, include the use of smoke/CO detectors, extinguishers, and other life-safety devices, and the methods used to ensure maintenance is up to date.

As hosts, we are not alone in relying on my short-term rental to make ends meet. In fact, 65% of Hosts say they plan to use money they've earned on Airbnb to cover the heightened costs of living over the next 12 months. Thanks to the income from Airbnb we have been able to cover basic needs like food and utilities, pay our property taxes, pay medical bills, and save for retirement.

Our airbnb has worked to maintain safety and a superhost status that includes a clean environment and safe place to stay. We are responsible for maintaining a safe property for ourselves as well as our neighbors. Again, I urge you to vote against the adoption of Proposal F280-24.

Cost Impact: No change to code.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Comment (CAH2)# 271

Comment 4:

Proponents: Michael Gnade, myself (mike.gnade@gmail.com) requests Disapproved

Reason: As a small business owner and student of Economics, I urge you to vote against the adoption of Proposal F280-24. Proposal F280-24 lacks sufficient data to support stricter restrictions on short-term rentals compared to other occupancy groups, such as hotels. The current proposal is based on anecdotal evidence, which does not provide a solid foundation for implementing widespread adoption. It additionally targets small business owners in an economic landscape that favors big businesses and hotel chains.

Furthermore, the data we do have conflicts with the anecdotal evidence presented. Data from the National Fire Protection Association indicates a decrease in overall house fires, including the years when STRs have occupied a significant number of houses. This raises the question of whether additional restrictions are necessary when fire safety incidents are on the decline.

I can tell you that my local township and HOA have imposed additional restrictions in my community and all it has done is led to litigation against the township and HOA, decreased home values, and increased HOA dues. Please don't make the same mistake and vote against this proposal.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Comment (CAH2)# 353

Comment 5:

Proponents: Tom Jaleski, Jensen Hughes, AirBnB requests Disapproved

Reason: The code change proposal for an appendix to the International Fire Code seems to have a purpose in trying to provide code wide guidance on an issue that many jurisdictions are working through, but the proposal as modified seems to not be quite ready for the code. A couple of items that need clarification:

- Short Term Rentals (STRs) can occur in a wide variety of buildings; homes, in apartments, condos; which are not treated the same by the code. This appendix for anything other than single-family residences, does not consider the sprinklers in multi-family buildings, or the other aspects of the buildings required by code.
- NFPA reports on home fires show that the vast majority of fires start in the kitchens. Placing any restriction on grill devices seems to

address a concern that has not been documented as a hazard. Since most homes are of wood construction, a setback restriction would likely not allow grilling at all, since building setbacks, except possibly in the front, would not allow outdoor cooking. Not allowing an activity without documentation of being a hazard is not a basis for code.

- Permitting can place an overburden on some jurisdictions. The house has already been permitted. Most of the time a business permit application already alerts the jurisdiction of the house being used as an STR, that can be enough. Emergency response do not know when a call comes in if the house is being rented of used by the owner, so does it possibly being known as an STR change their procedures?
- Escape ladders can be more hazardous than they may provide safety. These are not required in homes and the escape ladders can provide a means for a hazard when used not in an emergency situation, do not change the firefighter response to bedroom windows, and would likely be deemed to scary to be used even in an emergency. Inclined, fixed ladders are scary enough and are the source of many falls. The installation of an escape ladder seems to create more hazard that it may alleviate.
- In some localities, inspections by AHJs do not have a right to enter the house. Even some local laws on STRs do not override this restriction. The modification making it the homeowner responsibility to verify smoke detectors, CO detectors, and fire extinguishers are all operational is the best procedure.

I understand the need for guidance of requirements for STRs, I also see that placing too many restrictions on homeowners would not be followed, could result in more unknown STRs, and could adversely impact localities who appreciate and respect the financial and cultural impacts of STRs. The industry already has many safety protocols in place to be a part of their network, because it is in their best interest to have safe locations for people to rent. Any restrictions beyond having homeowners understand their responsibility to keep their smoke and CO detectors operational, and their fire extinguishers charged and placed on each floor; is simply based on fear and hearsay rather than documentation.

I support the CAH#1 modified proposal as guidance in an appendix, with the exception of the escape ladders.

Thank you

Comment 6:

Proponents: Kathryn Levassiur, Airbnb (levassiurk@gmail.com) requests Disapproved

Reason: Dear ICC Committee,
I am pleased to have the opportunity to provide comments against agenda item F280-24. The proposed regulations seem too burdensome and onerous. Data from the National Fire Protection Association has not increased in fire events on properties rented as short term rentals, even though the number of STR properties has increased significantly in the past 9 years.

I use 9 years, because I have been renting my home short term since 2015. Even before I hosted my very first guests, I instinctively made sure my home in Huntington Beach, CA was safe for guests with CO2 and smoke alarms and routinely checking them, lighted walkways, maintaining everything in top working order.

My city has STR regulations, including onsite inspections, fire extinguisher in marked closets, escape route, insurance with specific STR coverage. My home is single level, but if I had a multi level home, I would insure safe exit of my guests on upper floors. I know a lot of hosts, as a volunteer Airbnb Community Leader, as an Airbnb Superhost Ambassador, as founder and head of Huntington Beach STR Alliance, I've encountered thousands of STR stakeholders and not one did not have guest safety at the top of mind. Our homes are our biggest investments and we don't want to lose them because of overlooked safety issues.

My husband and I depend on out STR income to pay property taxes, homeowners insurance, medical insurance, food. We can't afford to go out and adding additional regulations will surely increase our permit fees to operate our short term rentals in CA and FL, which a

scary proposition for us.

We started out as private room hosts in Huntington Beach, then added a private entrance for our space and rent out the rest of the "entire" home on Airbnb. We're seniors and we downsized in our own home. We're thrilled about it! We also spend part of our time in FL to be with family and have another home there with an attached "apartment" that we list on Airbnb. Our homes are never empty, always utilized with listing them on Airbnb. In closing, thank you for your consideration to my opposition of F280-24.

Comment (CAH2)# 287

Comment 7:

Proponents: Julie Marks, VERMONT SHORT TERM RENTAL ALLIANCE, Self (director@vtstra.org) requests Disapproved

Reason: The short-term rental of one's vacation home is no different than the long-term rental of any residential property. The safety requirements for rental units must be treated in parody regardless of the rental period being 1 night, 1 month, or 1 year. Mandating safety features that protect short-term renters and not long-term renters is unjust and unreasonable. Residential rentals are not commercial properties. They offer no public areas, have no on-site staff, and do not accommodate parties unknown to one another. Vacation rental homes are residential and ought to be regulated as such. Excessive and cost-prohibitive requirements, such as fixed egress ladders and sprinkler systems, encourage noncompliance. Safety features should be accessible to all operators, regardless of wealth, and should be given allowable variances when other, nonprescribed solutions that reasonably meet the same purpose can be applied.

Comment (CAH2)# 346

Comment 8:

Proponents: Amy Monett, Self requests Disapproved

Reason: My name is Amy Monett, I live in Baton Rouge, LA, I have been an Airbnb host for 1 year and 3 months, I have 80 5 star ratings, my small apartment is in the top 1% of listings on the Airbnb app, and I urge you to vote against the adoption of Proposal F280-24. My property, which is attached to my home, has smoke and CO2 detectors installed, has fire extinguishers readily available and has never had any saftey incidents. Along with many other hosts, I treat my guests' space as part of my home and in doing so, make it as safe as my own home.

In addition to being a host, I am also a Co-Leader of the East Baton Rouge Area Airbnb Host Community Group. We are over 200 members strong and discuss safety and liability issues regularly. I've not yet met a host in our area that does not want the utmost safety in their rentals for both their guests and protection of their property. It is in all of our best interests for our families and guests that we provide safe spaces and we strive to do so, without the oversight of local or national entities.

Being involved with Airbnb and having a short term rental has made my life, and the lives of many others, better in SO many ways. Personally, my rental helps keep us in our home by offsetting our mortgage and insurance costs. It also affords me the opportunity to meet so many people from around the world and in my community. As a community group, we also volunteer in our area. Just last week we spent a Saturday morning working at the Baton Rouge Food Bank. In addition, we have had guests from as far away as Venice, Italy, and others who live nearby but need a place to stay while visiting family. Airbnb has opened opportunities for so many by helping people

share their homes with others for a fee. Isn't this how boarding houses used to be? Family run, warm and friendly, and at resonable cost?

So many communities are already struggling with burdensome requirements imposed by local authorities and this proposal may further exacerbate those challenges. It gives the impression that the motive behind the proposed code change is financial gain. I know that if I had to pursue additional inspections and related fees, it would likely not make sense financially for us to rent out our small space any longer.

Please vote against the adoption of proposal F280-24 - for me and for all of the other short term hosts out there who are truly shairng their safe homes with others.

Comment (CAH2)# 507

Comment 9:

Proponents: Heidy Seoenz, Self (heidy@seoenz.com) requests Disapproved

Reason: As a dedicated advocate for the El Paso short term rental community, I urge you to oppose the adoption of Proposal F280-24. This proposal seeks to impose restrictive regulations on short term rentals, which would have detrimental effects on both property owners and the local economy.

Having worked tirelessly to promote the benefits of short term rentals in El Paso through my advocacy work with El Paso Short Term Rental Advocates (elpasostra.org), I have witnessed firsthand the positive impact that these rentals have on our community. They provide valuable income opportunities for property owners, support local businesses, and contribute to the vibrant tourism industry in our city.

Proposal F280-24, however, threatens to stifle this growth and innovation by imposing onerous restrictions that would limit the ability of property owners to operate their rentals effectively. By imposing arbitrary limits on occupancy, parking, safety measures and other aspects of short term rental operations, this proposal would unfairly penalize responsible property owners and hinder the economic potential of our community.

Through the education programs we have in our alliance we have implemented courses and checklist that all hosts must use of smoke/CO detectors (interconnected, if applicable), fire extinguishers, and other life-safety devices, and the methods used to ensure maintenance is up to date. We follow all this guidelines through our insurance policies as well.

As a passionate advocate and throughout my hosting journey, I have diligently maintained my space to create a safe and accessible environment, which includes an outdoor grill/sofa bed in my living room. I'm proud to share that in all my years of hosting, I have not had a single incident related to a fire or any safety concern. We follow our occupancy regulations from the city to not allow more than the allowed amount of guests.

I have been hosting on Airbnb for 7 years and I have welcomed 5,000 guests since I started. I take immense pride in prioritizing the safety and wellbeing of my guests. Through out the years I have also decided to teach others how to host on airbnb and following the best practices as a good neighbor (seoenz.com).

As an advocate for my city, I'm not alone in relying on my short-term rental to make ends meet. In fact, 65% of Hosts say they plan to use money they've earned on Airbnb to cover the heightened costs of living over the next 12 months. Thanks to the income from Airbnb I have been able to cover basic needs like food and utilities, pay my mortgage, pay my daughter's tuition, and save for retirement. Specifically to El Paso Tx, 90% of the hosts are mom and pop that only have one airbnb and use this money to pay for our high property taxes (we have the 2nd highest property tax in the nation). They rely immensely on the income to be able to not depend on their children.

Many of our hosts are military, retirees, and empty nesters that take safety seriously.

Communities are already struggling with burdensome requirements imposed by local authorities, and this proposal may further exacerbate those challenges. It gives the impression that the motive behind the proposed code change is financial gain rather than addressing a specific problem. Let us not hinder progress and innovation, but rather embrace the opportunities that short term rentals bring to our community.

Comment (CAH2)# 521

Comment 11:

Proponents: Kara Shure, Airbnb, Inc. requests Disapproved

Reason: Airbnb Comment re: F280-24 As Modified by Committee (CAH2)

July 3, 2024

Airbnb appreciates the opportunity to provide our comment and express our support for common sense regulations that protect the safety of short-term rental guests and the homes of short-term rental Hosts. As a trusted and reliable partner for local authorities and the communities in which we operate, Airbnb has made significant investments in strengthening our policies and technology to prioritize the safety of our community.

These include:

- Our Trust and Safety Advisory Coalition, comprised of global experts, including the International Association of Fire Chiefs, which advises us on our platform policies, employee training and education for our community.
- A program to send free smoke/CO detectors to Airbnb Hosts around the world.
- Our Neighborhood Support Line, which enables neighbors to speak directly to us with urgent concerns about a nearby listing.
- Our 24-hour Safety Line allows Hosts and guests to directly reach our specialized Safety team for help during an active stay.
- Home safety workshops in collaboration with hosts and local fire services.
- The creation of a first-of-its-kind law enforcement portal, which helps us support law enforcement investigations globally.

In addition to these ongoing efforts to enhance safety, Airbnb recognizes the importance of engaging with organizations like the International Code Council to continually improve safety standards. We value the opportunity to contribute to the discussions and collaborate on best practices that promote the safety and well-being of our community.

Support of CAH1 Modifications from Orlando

We appreciate several modifications proposed and approved at the Committee Action Hearing in Orlando this April. These modifications demonstrate careful thought and provide helpful guidance on fire extinguishers and smoke and carbon monoxide detectors.

- **Outdoor cooking**
  We endorse the proposed modification (MP6) stipulating the placement of fire extinguishers near outdoor cooking appliances. We urge the Committee to avoid placing further restrictions that could prohibit outdoor cooking on decks or balconies. Barbecues and grills are commonly enjoyed amenities in vacation rentals, and imposing limitations in the absence of data suggesting a specific problem (compared to other homes) would be inappropriate.

Opposition to Certain Provisions

- **Escape ladders**
  We believe that, as applied in this Appendix, emergency escape ladders would provide minimal safety improvement. Moreover, we are unaware of any data supporting the need for these devices – which are not required in other residential rentals – in short-term rentals (see footnote below). In fact, indiscriminate use of escape ladders can introduce additional hazards if not employed correctly and may be more dangerous than remaining in place and awaiting proper rescue.

Conclusion

In conclusion, Airbnb supports common sense fire safety regulations, including many of the components of Proposal F280-24 as modified by the committee (CAH2). As the Council continues its deliberations, we urge it to consider whether there is sufficient evidentiary reasoning to justify code changes at this time.

Through collaboration with industry experts, local authorities, and our community, Airbnb continually evaluates and enhances our safety protocols to maintain the highest standards and to foster a culture of safety and responsibility. To that end, we appreciate the opportunity to provide our perspective to the members of the ICC.

Sincerely,

Andrew Kalloch

Director, Policy Development

Airbnb

(1) Recent reports from the National Fire Protection Association have found that the population-based fire rates continued to decline after Airbnb's founding (2008). Comment 12:

Proponents: Lisa Sievers, Lewis Sievers Properties LLC, Lewis Sievers Properties LLC (lisa@lisasievers.com) requests Disapproved

Reason: Hello - I respectfully ask you to vote against the adoption of Proposal F280-24 regarding short-term rentals. The requirements will only only pile on yet more ordinance-based requirements for cities that have short-term rentals. We already are subjected to far more safety, code and other burdensome and costly requirements than standard long term rental property and homes and this proposal would only add more red tape and expense.

As an owner of two short-term rentals, I can assure you that we have had zero safety issues. We have a smoke detector and fire extinguisher in both of our short-term rentals. I would like to know if there is data showing that short-term rentals have a greater risk of fire than a long term rental property or a home. It is my understanding that this has never been an issue and in fact fire incidents are on the decline.

Additionally, as a leading member of the Dallas Short-term Rental Alliance, I would again ask you to vote against this proposal. To repeat, it is difficult enough to jump through the extensive amount of hoops that the city requires of us to register and operate. Adding another layer of bureaucracy on top of will cause additional time delays and expense for cities and frustration for short-term rental owner/operators.

Thank you for your consideration. Happy to discuss further. Lisa Sievers 214 597 4030

Comment 13:

Proponents: Shane Simenstad, Safe Kids Worldwide, Safe Kids Worldwide, Public Policy Manager requests Disapproved

Reason: Thank you for this opportunity to provide comment on Proposal F280-24, which would modify the International Fire Code (IFC) by adding a new Appendix P covering short-term residential dwellings. As a non-profit organization dedicated to preventing unintentional child injuries, including those resulting from fire and burns, we support the development of safety standards addressing this emerging and growing space. However, we have questions as to whether certain elements of F280-24, as proposed, may create burdensome requirements for short-term rental hosts without providing a significant safety benefit.

Sleeping Space Definition
The Section P101 definition of a “sleeping space” is broad enough to potentially include floors, sofas, and couches. Should a living room sofa or floor be classified in such a way, this would appear to create a conflict with the minimum access requirements described in P104.1.

Outdoor Cooking
Section P102.9, covering outdoor cooking on balconies or decks, would include, under its restriction, one or two-family dwelling units which, we understand, are exempted for outdoor fireplaces and gas grills under 2024 IFC 307.4.3 and 308.1.6 respectively. Including these exceptions here, along with requirements that grills be CSA certified and fire extinguishers be kept nearby, would seem to balance fire protection with code consistency.

Fire Safety Inspections
P106.2 would require annual compliance inspections for this code by a fire code official or approved third-party inspector, a burden not required for other similar residential occupancies in this code. We are curious as to what data demonstrates the safety benefit provided by such a requirement, as opposed to requiring that such properties be made immediately available for inspection by a fire code official without notice.

Safe Kids Worldwide is a grassroots organization dedicated to preventing unintentional child injuries, the leading cause of death for kids in the United States. Our network acts through education & awareness, community programming and policy advocacy to address these injuries at their root causes and build an equitable, sustainable culture of safety. As part of our strategic plan, we are focused on including equity in all we do. This shift is in response to systemic, persistent disparities in child safety. We envision a world where children grow up healthy and safe from unintentional injuries regardless of their background.

We thank you again for the opportunity to comment on this proposal and for your commitment to safety.

Sincerely,

Safe Kids Worldwide

Comment 14:

Proponents: Carl Vidal, Self requests Disapproved

Reason: Carl Vidal
4224 Vista De Paseo RD NW
Albuquerque, NM 87120
7/1/24
International Code Council

Dear Members of the ICC Committee,

I urge you to vote against the adoption of Proposal F280-24. This proposal lacks sufficient data to support stricter restrictions on short-term rentals compared to other occupancy groups, such as hotels. The current proposal is based on anecdotal evidence, which does not provide a solid foundation for implementing widespread adoption.

Data from the National Fire Protection Association indicates a decrease in overall house fires, including the years when short-term rentals (STRs) have occupied a significant number of houses. This raises the question of whether additional restrictions are necessary when fire safety incidents are on the decline.

Furthermore, communities are already struggling with burdensome requirements imposed by local authorities, and this proposal may further exacerbate those challenges. It gives the impression that the motive behind the proposed code change is financial gain rather than addressing a specific problem.

I have been a host for short-term rentals that I both own and operate as a licensed realtor property manager for eight years, welcoming over 5,000 guests into our homes. I take immense pride in prioritizing the safety and well-being of my guests. I'm proud to share that in all my years of hosting, I have not had a single incident related to a fire or any safety concern.

As a host, I am not alone in relying on my short-term rentals to make ends meet. In fact, 65% of hosts say they plan to use the money they've earned on Airbnb to cover the heightened costs of living over the next 12 months. Thanks to the income from Airbnb, I have been

able to cover basic needs like food and utilities, pay my mortgage, pay my medical bills, and save for retirement.

Additionally, I am the author of the New Mexico short-term rental economic impact study, where 14,000 rentals in NM produced over $1 billion in economic impact, 14,555 jobs, and $82 million in taxes (https://irviehomes.com/economic-impact-studies). Short-term rentals are vital to our community and need to operate without burdensome regulations that will put many owners and property managers out of work.

Short-term rentals provide an invaluable service by offering flexible, affordable, and diverse accommodation options. They cater to families, business travelers, and tourists, contributing significantly to local economies. The proposed restrictions could undermine this crucial sector, leading to a loss of income for thousands of hosts and reduced tourism revenue for cities and towns.

I appreciate your time and consideration in this matter. Please prioritize fair and reasonable regulations for short-term rentals that support both hosts and guests while ensuring community safety.

Sincerely,

Carl Vidal

Comment (CAH2)# 355

Comment 15:

Proponents: Eugenie "Jean" Young, Long Beach Airbnb Hosting Club (visitbeautifullongbeach@gmail.com) requests Disapproved

Reason: July 2, 2024
International Code Council
200 Massachusetts Ave, NW
Suite 250, Washington, DC 20001

Dear ICC Members,

I am writing this letter to encourage you to vote against the adoption of Proposal F280-24. This proposal lacks the evidence needed to support the recommendations put forth here.

In November 2014, I wrote my first letter to Long Beach city staff encouraging study, community input, and recognition in the city code that short-term rentals exist and are workable. After much time and input from hosts, community groups and neighbors alike, by May 2020, we had a strong ordinance. It ensures that short term rentals in Long Beach are regulated, sets a cap on the number of unhosted units, requires exit signage, a fire extinguisher, smoke detectors, and a 24-hour point of contact.

A bit about my personal story. I've been a resident of Long Beach for 30 years. As a divorcee and freelancer, I evened out income ups and downs by taking in Airbnb guests to supplement my income.

Since discovering Airbnb in 2013, I have hosted guests from five continents. Overwhelmingly, the experience has been positive. I encourage my guests to explore and shop locally -- and they always do! Many of my guests meet locals during their stay to obtain a deeper, richer experience of Long Beach. I highlight the best restaurants, beaches, shopping experiences, and sports and entertainment venues Long Beach has to offer.

The money I generate from home sharing allows me to maintain my home and pay property taxes and cover expenses with the ever-increasing cost of living in Southern California. Culturally and economically, the exchange has been vibrant and healthy -- for my guests, for me, and for the city. Short term rentals circulate roughly $15 million a year in trickle down spending to the local Long Beach economy. This does not include direct spending by guests, or the collection of a hotel bed tax, which generates about $3M a year for the city. I also employ two cleaners, who live in Long Beach, and have enabled them to boost their standard of living thanks to income from short-term rental cleaning fees.
I pride myself on keeping a beautiful, tranquil -- and safe – environment. I have an outdoor grill and a sofa bed in my living room. I have a fire extinguisher in the kitchen, and smoke/CO2 detectors in each room of my home. I am happy to say that in my 13 years hosting, I have not had an incident related to fire or safety.

If effectively managed, short-term rentals of residences help homeowners hold on to their residences and invest in upkeep, which can support neighborhood stability and vitality.
The reality in Long Beach is that 80% of hosts earn modest extra income and have just one listing. Hosts want to be responsible and operate in accordance with the law.

The 2028 Olympics will be here before we know it, bringing athletes and tourism to Long Beach. We are all looking forward to future tourism, which is such an important revenue generator for our city. We are vigilant in ensuring the health and safety of our short-term renters because we want to protect them and our property, but we do not feel that additional, burdensome requirements, are needed to address problems we do not have.
Sincerely,

Jean Young

Cost Impact: No change to code.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Comment (CAH2)# 423

FS2-24

IBC: 703.2.1.3

Proposed Change as Submitted

Proponents: Stephen Szoke, American Concrete Institute, American Concrete Institute (steve.szoke@concrete.org); Steve Skalko, Stephen V. Skalko, P.E. & Associates LLC, Precast/Prestressed Concrete Institute (svskalko@svskalko-pe.com); Shamim Rashid-Sumar, National Ready Mixed Concrete Association, National Ready Mixed Concrete Association (ssumar@nrmca.org)

2024 International Building Code

Revise as follows:

703.2.1.3 Restrained classification. Fire-resistance-rated assemblies tested under ASTM E119 or UL 263 shall not be considered to be restrained unless evidence satisfactory to the *building official* is furnished by the *registered design professional* showing that the construction qualifies for a restrained classification in accordance with ASTM E119 or UL 263. Restrained construction shall be identified on the *construction documents*. **Exception:** Unless otherwise determined by the *registered design professional*, concrete girders, beams, and slabs connected to structural concrete framing or structural concrete walls in accordance with ACI 318 shall be considered restrained. Restrained concrete construction shall be identified on the *construction documents*.

Reason: This code change proposal does not alter the technical requirements of the code. The exception is simply to avoid sending the Registered Design Professional (RDP) to ASTM E119 to discover that all concrete connections designed in accordance with ACI 318 restrain movement relative to the supporting structural members. This is consistent with the classification described in ASM E119 Standard Test Methods for Fire Tests of Building Construction and Materials. Appendix X3 Guide for Determining Condition of Restrain for Floor and Roof Assemblies and for Individual Beams of ASTM E119 advises that concrete framing is to be considered restrained for:

(1) Beams fastened to the framing members,

(2) All types of concrete cast-in-place floor or roof construction (such as beam-and-slabs, flat slabs, pan joists, and waffle slabs) where the floor or roof construction is cast with the framing members

(3) Interior and exterior spans of precast construction with cast-in-place joints resulting in restraint equivalent to that which would exist in condition (1).

(4) All types of prefabricated floor or roof construction where the structural members are secured to such construction.

The minimum structural integrity requirements of ACI 318 are such that horizontal structural concrete elements are required to have connections restraining movement relative to the supporting structural member. ACI 318 Table 4.10.2.1 – Minimum requirements for structural integrity based on member type directs the RDP to the appropriate structural integrity sections of ACI 318:

Nonprestressed one-way cast-in-place slabs – 7.7.7

Nonprestressed two-way slabs – 8.7.4.2

Prestressed two-way slabs – 8.7.5.6

Nonprestresssed two-way joint systems – 8.8.1.6

Cast-in-place beam – 9.7.7

Nonprestressed one-way joint system – 9.8.1.6

Precast joint and connection – 16.2.1.8

For those interested in the minimum structural integrity requirements of ACI 318, they are as follows:

Nonprestressed one-way cast-in-place slabs

7.7.7 *Structural integrity reinforcement in cast-in-place one-way slabs*

7.7.7.1 Longitudinal structural integrity reinforcement consisting of at least one-quarter of the maximum positive moment reinforcement shall be continuous.

7.7.7.2 Longitudinal structural integrity reinforcement at noncontinuous supports shall be anchored to develop f_y at the face of the support.

7.7.7.3 If splices are necessary in continuous structural integrity reinforcement, the reinforcement shall be spliced near supports. Splices shall be mechanical or welded in accordance with 25.5.7 or Class B tension lap splices in accordance with 25.5.2.

Nonprestressed two-way slabs

8.7.4.2 *Structural integrity*

8.7.4.2.1 All bottom deformed bars or deformed wires within the column strip, in each direction, shall be continuous or spliced using mechanical or welded splices in accordance with 25.5.7 or Class B tension lap splices in accordance with 25.5.2. Splices shall be located in accordance with Fig. 8.7.4.1.3.

8.7.4.2.2 At least two of the column strip bottom bars or wires in each direction shall pass within the region bounded by the longitudinal reinforcement of the column and shall be anchored at exterior supports.

Prestressed two-way slabs

8.7.5.6 *Structural integrity*

8.7.5.6.1 Except as permitted in 8.7.5.6.3, at least two tendons with 1/2 in. diameter or larger strand shall be placed in each direction at columns in accordance with (a) or (b):

(a) Tendons shall pass through the region bounded by the longitudinal reinforcement of the column.

(b) Tendons shall be anchored within the region bounded by the longitudinal reinforcement of the column, and the anchorage shall be located beyond the column centroid and away from the anchored span.

8.7.5.6.2 Outside of the column and shear cap faces, the two structural integrity tendons required by **8.7.5.6.1** shall pass under any orthogonal tendons in adjacent spans.

8.7.5.6.3 Slabs with tendons not satisfying 8.7.5.6.1 shall be permitted if bonded bottom deformed reinforcement is provided in each direction in accordance with 8.7.5.6.3.1 through 8.7.5.6.3.3.

8.7.5.6.3.1 Minimum bottom deformed reinforcement A_s in each direction shall be the larger of (a) and (b). The value of *fy* shall be limited to a maximum of 80,000 psi:

(a) $A_s = [4.5 (f_c')^{0.5} c_2 d]/f_y$ (8.7.5.6.3.1a)

(b) $A_s = [300 c_2 d/f_y]$ (8.7.5.6.3.1b)

where c_2 is measured at the column faces through which the reinforcement passes.

8.7.5.6.3.2 Bottom deformed reinforcement calculated in 8.7.5.6.3.1 shall pass within the region bounded by the longitudinal reinforcement of the column and shall be anchored at exterior supports.

8.7.5.6.3.3 Bottom deformed reinforcement shall be anchored to develop f_y beyond the column or shear cap face.

Nonprestresssed two-way joint systems

8.8.1.6 For structural integrity, at least one bottom bar in each joist shall be continuous and shall be anchored to develop fy at the face of supports.

Cast-in-place beam

9.7.7 Structural integrity reinforcement in cast-in-place beams

9.7.7.1 For beams along the perimeter of the structure, structural integrity reinforcement shall be in accordance with (a) through (c):

(a) At least one-quarter of the maximum positive moment reinforcement, but not less than two bars or strands, shall be continuous

(b) At least one-sixth of the negative moment reinforcement at the support, but not less than two bars or strands, shall be continuous

(c) Longitudinal structural integrity reinforcement shall be enclosed by closed stirrups in accordance with 25.7.1.6 or hoops along the clear span of the beam

9.7.7.2 For other than perimeter beams, structural integrity reinforcement shall be in accordance with (a) or (b):

(a) At least one-quarter of the maximum positive moment reinforcement, but not less than two bars or strands, shall be continuous.

(b) Longitudinal reinforcement shall be enclosed by closed stirrups in accordance with 25.7.1.6 or hoops along the clear span of the beam.

9.7.7.3 Longitudinal structural integrity reinforcement shall pass through the region bounded by the longitudinal reinforcement of the column.

9.7.7.4 Longitudinal structural integrity reinforcement at noncontinuous supports shall be anchored to develop f_y at the face of the support.

9.7.7.5 If splices are necessary in continuous structural integrity reinforcement, the reinforcement shall be spliced in accordance with (a) and (b):

(a) Positive moment reinforcement shall be spliced at or near the support

(b) Negative moment reinforcement shall be spliced at or near midspan

9.7.7.6 Splices shall be mechanical or welded in accordance with 25.5.7 or Class B tension lap splices in accordance with 25.5.2.

Nonprestressed one-way joint system

9.8.1.6 For structural integrity, at least one bottom bar in each joist shall be continuous and shall be anchored to develop fy at the face of supports

Precast joint and connection

16.2.1.8 Integrity ties shall be provided in the vertical, longitudinal, and transverse directions and around the perimeter of a structure in accordance with 16.2.4 or 16.2.5

16.2.4 *Minimum connection strength and integrity tie requirements*

16.2.4.1 Except where the provisions of 16.2.5 govern, longitudinal and transverse integrity ties shall connect precast members to a lateral-force-resisting system, and vertical integrity ties shall be provided in accordance with 16.2.4.3 to connect adjacent floor and roof levels.

16.2.4.2 Where precast members form floor or roof diaphragms, the connections between the diaphragm and those members being

laterally supported by the diaphragm shall have a nominal tensile strength of not less than 300 lb per linear ft.

16.2.4.3 Vertical integrity ties shall be provided at horizontal joints between all vertical precast structural members, except cladding, and shall satisfy (a) or (b):

(a) Connections between precast columns shall have vertical integrity ties, with a nominal tensile strength of at least $200A_g$lb, where A_g is the gross area of the column. For columns with a larger cross section than required by consideration of loading, a reduced effective area based on the cross section required shall be permitted. The reduced effective area shall be at least one-half the gross area of

the column.

(b) Connections between precast wall panels shall have at least two vertical integrity ties, with a nominal tensile strength of at least 10,000 lb per tie.

16.2.5 Integrity tie requirements for precast concrete bearing wall structures three stories or more in height.

16.2.5.1 Integrity ties in floor and roof systems shall satisfy (a) through (f):

(a) Longitudinal and transverse integrity ties shall be provided in floor and roof systems to provide a

nominal tensile strength of at least 1500 lb per foot of width or length.

(b) Longitudinal and transverse integrity ties shall be provided over interior wall supports and between the floor or roof system and exterior walls.

(c) Longitudinal and transverse integrity ties shall be positioned in or within 2 ft of the plane of the floor or roof system.

(d) Longitudinal integrity ties shall be oriented parallel to floor or roof slab spans and shall be spaced not greater than 10 ft on center. Provisions shall be made to transfer forces around openings.

(e) Transverse integrity ties shall be oriented perpendicular to floor or roof slab spans and shall be spaced not greater than the bearing wall spacing.

(f) Integrity ties at the perimeter of each floor and roof, within 4 ft of the edge, shall provide a nominal tensile strength of at least 16,000 lb.

16.2.5.2 Vertical integrity ties shall satisfy (a) through (c):

(a) Integrity ties shall be provided in all wall panels and shall be continuous over the height of the building.

(b) Integrity ties shall provide a nominal tensile strength of at least 3000 lb per horizontal foot of wall.

(c) At least two integrity ties shall be provided in each wall panel.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

No technical change to the provisions of the code. Proposal simply adds language to IBC that reflects the nature of the provisions in ASTM E119

FS2-24

Public Hearing Results (CAH1)

Committee Action: **As Submitted**

Committee Reason: The committee determined that the proposed exception language clarifies the requirements of "Restrained

classification" in the code. The exception is added to avoid sending the RDP to ASTM E119 to determine all concrete connections designed in accordance with ACI 318 for restrained movement relative to the supporting structural members (Vote: 11-0).

FS2-24

Individual Consideration Agenda

Comment 1:

IBC: 703.2.1.3

Proponents: Bonnie Manley, AISC, AISC (manley@aisc.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

Revise as follows:

703.2.1.3 Restrained classification. Fire-resistance-rated assemblies tested under ASTM E119 or UL 263 shall not be considered to be restrained unless evidence satisfactory to the *building official* is furnished by the *registered design professional* showing that the construction qualifies for a restrained classification in accordance with ASTM E119 or UL 263. Restrained construction shall be identified on the *construction documents*. ~~**Exception**~~ **Exceptions:**

1. Unless otherwise determined by the *registered design professional*, concrete girders, beams, and slabs connected to structural concrete framing or structural concrete walls in accordance with ACI 318 shall be considered restrained. Restrained concrete construction shall be identified on the *construction documents*.
2. Unless otherwise determined by the *registered design professional*, cast-in-place or prefabricated concrete floor or roof construction secured to structural steel framing members and individual structural steel beams and girders that are welded or bolted to integral framing members shall be considered restrained construction in accordance with AISC 360, Appendix 4, Section 4.3.3. Restrained structural steel construction shall be identified on the *construction documents*.

Reason: The purpose of this modification is to add comparable information on restrained construction for structural steel elements. From AISC 360-22, Appendix 4, Section 4.3.3 states the following:

> **4.3.3. Restrained Construction**
>
> For floor and roof assemblies and individual beams in buildings, a restrained condition exists when the surrounding or supporting structure is capable of resisting forces and accommodating deformations caused by thermal expansion throughout the range of anticipated elevated temperatures. Cast-in-place or prefabricated concrete floor or roof construction secured to steel framing members, and individual steel beams and girders that are welded or bolted to integral framing members, shall be considered restrained construction.

Additionally, from AISC 360-22, Commentary Appendix Section 4.3.3:

> Gewain and Troup (2001) provide a detailed review of the background research and practices in the qualification fire-resistance testing and rating of structural steel and composite steel/concrete girders, beams, and steel-framed floors and roofs. The restrained assembly fire-resistance ratings, developed from tests on loaded restrained floor or roof specimens, and the restrained beam fire-resistance ratings, developed from tests on loaded restrained beam specimens, are commonly applicable to all types of steel-framed floors, roofs, girders, and beams, with minor exceptions, as recommended in Table X3.1 of ASTM E119, especially where they incorporate or support cast-in-place or prefabricated concrete slabs. AISC Design Guide 19, Fire Resistance of Structural Steel Framing (Ruddy et al., 2003), provides several detailed examples of steel-framed floor and roof designs by qualification testing.

Please refer to the full AISC 360-22 commentary for additional technical background and guidance on applying the provisions. AISC makes its standards available to all free of charge. AISC 360-22 can be downloaded for free from https://www.aisc.org/publications/steel-standards/.

Bibliography: AISC (2022), *Specification for Structural Steel Buildings*, ANSI/AISC 360-22, American Institute of Steel Construction, Chicago, Ill., August 1, 2022.
Available at: https://www.aisc.org/publications/steel-standards/.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal references a standard already adopted in the 2024 IBC.

Comment (CAH2)# 478

Comment 2:

Proponents: Stephen Szoke, American Concrete Institute, American Concrete Institute (steve.szoke@concrete.org) requests As Submitted

Reason: Support committee action for approval as submitted.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Comment (CAH2)# 375

FS6-24

IBC: 703.3.1, 703.3.2 (New)

Proposed Change as Submitted

Proponents: Shamim Rashid-Sumar, National Ready Mixed Concrete Association, National Ready Mixed Concrete Association (ssumar@nrmca.org); Darryl Dixon, National Ready Mixed Concrete Association, National Ready Mixed Concrete Association (ddixon@nrmca.org)

2024 International Building Code

703.3.1 Noncombustible materials. Materials required to be noncombustible shall be tested in accordance with ASTM E136. Alternately, materials required to be noncombustible shall be tested in accordance with ASTM E2652 using the acceptance criteria prescribed by ASTM E136. **Exception:** Materials having a structural base of noncombustible material as determined in accordance with ASTM E136, or with ASTM E2652 using the acceptance criteria prescribed by ASTM E136, with a surfacing of not more than 0.125 inch (3.18 mm) in thickness having a *flame spread index* not greater than 50 when tested in accordance with ASTM E84 or UL 723 shall be acceptable as noncombustible.

Add new text as follows:

703.3.2 Inherently noncombustible materials. Inherently noncombustible materials, such as concrete and steel, shall not be required to be tested to be acceptable as noncombustible materials.

Reason: This code change provides a clarification to IBC Section 703.3.1, which requires that materials required to be noncombustible be tested in accordance with ASTM E136 or ASTM E2652. However, the testing requirements should not apply to clearly noncombustible materials such as concrete, masonry or steel.

The proposed text provides necessary clarification indicating that such materials are not required to be tested.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This code change provides an editorial clarification to the previous code section and will not increase or decrease the cost of construction.

FS6-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee disapproved the proposal based on the fact that the proposed text is confusing. The committee encouraged the proponent to work on modifying the proposal for the CAH2. Specifically, clarify the aspect ratio of some materials, organic materials, and add more specific language to clarify what needs to be tested. The committee suggested that the proposed modifications during the CAH1 be incorporated (Vote: 8-3).

FS6-24

Individual Consideration Agenda

Comment 1:

IBC: 703.3.1, 703.3.2

Proponents: Marcelo Hirschler, GBH International, GBH International (mmh@gbhint.com); Robert Marshall, FCAC, FCAC (fcac@iccsafe.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

703.3.1 Noncombustible materials. Materials required to be noncombustible shall be tested in accordance with ASTM E136. Alternately, materials required to be noncombustible shall be tested in accordance with ASTM E2652 using the acceptance criteria prescribed by ASTM E136. **Exception:** Materials having a structural base of noncombustible material as determined in accordance with ASTM E136, or with ASTM E2652 using the acceptance criteria prescribed by ASTM E136, with a surfacing of not more than 0.125 inch (3.18 mm) in thickness having a *flame spread index* not greater than 50 when tested in accordance with ASTM E84 or UL 723 shall be acceptable as noncombustible.

Revise as follows:

703.3.2 ~~Inherently noncombustible materials~~ Testing not required. ~~Inherently noncombustible materials, such as concrete and steel,~~ The following building materials shall not be required to be tested to be acceptable as noncombustible building materials.

1. Steel.
2. Concrete, containing no combustible aggregates or fibers,
3. Masonry, containing no combustible aggregates or fibers,
4. Glass (excluding plastic glazing),
5. 5xxx and 6xxx series aluminum alloys.

Reason: Several materials can claim to be inherently noncombustible, in many cases without it being truly valid. For example, any plastic or wood materials are always combustible. This issue is an important consideration for building materials (as required in multiple areas of the IBC, such as chapters 6, 8 and 14, where requirements are different depending on whether the materials are or are not noncombustible.

Some materials exist (often insulation materials) where it is not possible to determine without testing (normally to ASTM E136, as required in section 703.3.1 of this code) whether they are truly noncombustible. For example, fiberglass insulation materials will always contain some combustible binder to be useful. The material can pass the ASTM E136 test (and be noncombustible) if it contains a small amount of binder but fail the test with larger amount of binder. That can only be determined by testing and is impossible to note visually.

It makes no sense to test steel, concrete or masonry (if they contain no combustible aggregates or fibers; this would have to be certified by the proponent). Therefore, as it has been shown by testing (and common sense) that testing steel, concrete or masonry to ASTM E136 is unnecessary, as they will pass the test they can be excluded from being required to be tested.

However, some new building materials are made with organic (such as foam plastics) components to lower the weight and make them easier to manipulate. In that case, it is unclear whether they are truly noncombustible materials, and they would need to be tested to know the answer for sure. That is why the requirement has been added that they contain no combustible aggregates or fibers.

Test results from at least two testing labs have been able to show that glass (whether ordinary glass or quartz) truly meets the requirements of ASTM E136 and is a noncombustible material. The same is not true for other glazing materials, which are typically plastic and are combustible; they must be excluded.

That brings up the question of aluminum. Typical building materials are, more often than not, alloys of aluminum and other metals. The

Aluminum Association has published a report in Building Safety Journal (August 17th, 2020) where they discuss the “noncombustibility” of aluminum. It is of great interest that the 4 aluminum alloys that they tested “were selected for their widespread use in construction”. Those alloys tested all passed the ASTM E136 test. However, the same report also states that “Aluminum, just like many comparable metals, is not combustible in any general application other than when it is specifically made to be.” That suggests that there may be some aluminum alloys that may or may not be noncombustible. After considerable debate and investigation of test reports, consensus was reached that most of the aluminum alloys used as building materials belong to the 6xxx series of alloys, with less than 1.2% magnesium, and the main ones (such as 6063, 6061, 6005) have all been tested for noncombustibility. In terms of sheet aluminum products, the series 5xxx alloys (such as 5052, 5083, 5005) are often used in construction, with higher levels if magnesium (the highest being 5083, which contains 4.9% magnesium). This product has also been tested and shown to be noncombustible. Therefore, consensus was reached that it is safe to include “5xxx and 6xxx series aluminum alloys” to the list of building materials that do not require testing to be considered noncombustible materials.

The task group that developed this comment included representatives from a variety of industries, including: steel, aluminum, concrete, masonry, glass, wood, and plastics.

FCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and early 2024 the FCAC has held several virtual meetings and one in-person meeting open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the FCAC Website.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This will clarify that a number of materials are clearly noncombustible and will not require additional fire testing. If anything, this comment will decrease costs because less testing for non combustibility will be needed.

Comment (CAH2)# 106

FS7-24

IBC: 703.7

Proposed Change as Submitted

Proponents: Edward Lisinski, American Wood Council (elisinski@awc.org)

2024 International Building Code

Revise as follows:

703.7 Sealing of adjacent mass timber elements. In *buildings* of Types IV-A, IV-B and IV-C construction, where a *fire-resistant joint system* is not required at abutting *joints* or intersections in accordance with Section 715, ~~sealant or adhesive~~ sealants meeting the requirements of ASTM C920 or adhesives meeting the requirements of ASTM D3498 shall be provided to resist the passage of air ~~in~~ at the following locations:

1. ~~At abutting~~ Abutting edges and intersections of *mass timber building elements* required to be fire-resistance rated.
2. ~~At abutting~~ Abutting intersections of *mass timber building elements* and *building elements* of other materials where both are required to be fire-resistance rated.

~~Sealants shall meet the requirements of ASTM C920. Adhesives shall meet the requirements of ASTM D3498.~~

~~**Exception**~~ **Exceptions:** Sealants or adhesives need not be provided ~~where they are not a required component of a tested fire-resistance-rated assembly~~ where any of the following apply:

1. The abutting edges or intersections were tested without sealants or adhesives as part of a *fire-resistance-rated* assembly.
2. The abutting edges or intersections occur entirely within a single *dwelling unit* or *fire area* in the same *story*.
3. Draftstopping material in accordance with Section 718.3.1 is installed on the unexposed side of the abutting edges or intersections.

Reason: With the addition of Types IV-A, IV-B, and IV-C construction to the code, a prescriptive requirement for sealing the abutting edges and intersections of fire-resistance-rated mass timber elements was adopted to reduce the likelihood of flames and hot gasses passing between mass timber elements to adjacent fire areas. The requirement for use of adhesives or sealants was prescribed based on details from compartment fire testing, where adhesives or sealants were used at the intersections of mass timber panels. However, the existing code language has been misapplied to require sealants or adhesives between mass timber assemblies that already require a fire-resistant joint system and between mass timber elements that aren't required to perform a fire separation function, such as the bearing of a beam on a column or a mass timber panel on a beam. In addition, other alternatives exist to resist air movement between mass timber elements where fire separation is required. This change addresses these issues.

- The first sentence of Section 703.7 is modified to clarify that Section 703.7 only applies where a fire-resistant joint system is not required, since a fire-resistant joint system would serve the intended purpose of the sealant or adhesive required by Section 703.7, and the inclusion of additional sealants or adhesives might compromise the fire-resistant joint system.
- Exception #1 is modified to clarify that it only applies to abutting edges or intersections that were tested without sealants or adhesives as part of the fire-resistance-rated assembly.
- Exception #2 acknowledges that it is not necessary to prevent passage of air from one side of a building element to the other if both sides of the building element are within the same dwelling unit or fire area.
- Exception #3 is added to recognize that in lieu of using sealant or adhesive, draftstopping material can be installed on the unexposed side to prevent passage of air through the abutting edges or intersections.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

This code change proposal will decrease the cost of construction by approximately $50 per tube of sealant or adhesive for each tube not used due to Exception 2 or 3.

Estimated Immediate Cost Impact Justification (methodology and variables):

The proposal incorporates exceptions to the use of prescribed sealants or adhesives for conditions where such requirements are unnecessary. There will be both material (approximately $15 per tube of sealant or adhesive) and labor (approximately $35 of labor costs to install each tube) cost savings by reducing the locations where sealants or adhesives are installed.

FS7-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee disapproved the proposal based on the fact that the proposed text is confusing. The committee also wanted to see more data. The committee indicated that the proposal calls for testing that is nonexistent, stating "We do not do those tests in this fashion". The proposed requirement could be located in different section as suggested during the hearing (Vote: 7-4).

FS7-24

Individual Consideration Agenda

Comment 1:

IBC: 703.7, 703.7.1 (New), 703.7.2 (New)

Proponents: Edward Lisinski, American Wood Council (elisinski@awc.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

703.7 Sealing of adjacent mass timber elements. In *buildings* of Types IV-A, IV-B and IV-C construction,joints or intersections of abutting mass timber building elements shall meet the requirements of 703.7.1 or 703.7.2.~~where a *fire-resistant joint system* is not required at abutting *joints* or intersections in accordance with Section 715, sealants meeting the requirements of ASTM C920 or adhesives meeting the requirements of ASTM D3498 shall be provided to resist the passage of air at the following locations:~~

1. ~~Abutting edges and intersections of *mass timber building elements* required to be fire-resistance rated.~~
2. ~~Abutting intersections of *mass timber building elements* and *building elements* of other materials where both are required to be fire-resistance rated.~~

~~**Exceptions:** Sealants or adhesives need not be provided where any of the following apply:~~

1. ~~The abutting edges or intersections were tested without sealants or adhesives as part of a *fire-resistance-rated* assembly.~~
2. ~~The Abutting edges or intersections occur entirely within a single *dwelling unit* or *fire area* in the same *story*.~~

3. ~~Draftstopping material in accordance with Section 718.3.1 is installed on the unexposed side of the abutting edges or intersections.~~

Add new text as follows:

703.7.1 Joints or intersections with a fire-resistant joint system. *Fire-resistant joint systems* used at joints or intersections shall be installed in accordance with Section 715.2.

703.7.2 Joints or intersections without a fire-resistant joint system. Where a *fire-resistant joint system* is not used, sealants meeting the requirements of ASTM C920 or adhesives meeting the requirements of ASTM D3498 shall be provided to resist the passage of air at the following locations:

1. At abutting edges and intersections of *mass timber building elements* required to be fire-resistance rated.
2. At abutting intersections of *mass timber building elements* and *building elements* of other materials where both are required to be fire-resistance rated.

Exceptions: Sealants or adhesives need not be provided at locations where any of the following apply:

1. The sealant or adhesive is not a required component of a tested *fire-resistance-rated* assembly.
2. The abutting edges or intersections occur entirely within a single *dwelling unit* within a *story* or *fire area* within a *story*.
3. Draftstop material in accordance with Section 718.3.1 is installed on the unexposed side of the abutting edges or intersections.

Reason: The provisions for the sealing of adjacent mass timber elements outlined in Section 703.7 enhance fire safety in buildings of Types IV-A, IV-B, and IV-C construction by restricting the passage of air to prevent the spread of fire and smoke, ultimately contributing to the overall fire protection strategy of the structure. Three changes were made based on comments from the committee in Committee Action Hearing #1 and to make the section easier to understand.

1. The charging language in Section 703.7 was changed to clarify that joints or intersections between mass timber building elements have different requirements when a fire-resistant joint system is used or not.

2. Section 703.7.1 is added to clarify that, when a fire-resistant joint system is used, it shall be installed in accordance with 715.2. This new section will avoid the potential misinterpretation that additional sealants or adhesives are also required, the use of which might compromise the fire-resistant joint system.

3. Section 703.7.2 is added to clarify requirements when a fire-resistant joint system is not used. The existing code language is relocated to this section and modified. Exceptions to 703.7.2 are provided in the code for specific scenarios where sealants or adhesives are not necessary.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

This code change proposal will decrease the cost of construction by approximately $50 per tube of sealant or adhesive for each tube not used due to new section 703.7.1 or new section 703.7.2, Exceptions 2 and 3.

Estimated Immediate Cost Impact Justification (methodology and variables):

See original code proposal for justification of cost decrease.

FS9-24

IBC: 704.5 (New), 704.5, 704.5.1, 704.5.2 (New), AWC Chapter 35 (New)

Proposed Change as Submitted

Proponents: Edward Lisinski, American Wood Council (elisinski@awc.org)

2024 International Building Code

Add new text as follows:

704.5 Protection of Connections and Attachments. Connections and attachments to structural members that are required to have a fire-resistance rating shall be protected in accordance with 704.5.1 and 704.5.2.

Revise as follows:

~~**704.5**~~ **704.5.1 Attachments to structural steel members.** The edges of lugs, brackets, rivets and bolt heads attached to structural steel members shall be permitted to extend to within 1 inch (25 mm) of the surface of the fire protection.

~~**704.5.1**~~ **704.5.1.1 Secondary attachments to structural steel members.** Where primary and secondary structural steel members require fire protection, any additional structural steel members having direct connection to the *primary structural frame* or *secondary structural members* shall be protected with the same fire-resistive material and thickness as required for the structural member. The protection shall extend away from the structural member a distance of not less than 12 inches (305 mm), or shall be applied to the entire length where the attachment is less than 12 inches (305 mm) long. Where an attachment is hollow and the ends are open, the fire-resistive material and thickness shall be applied to both exterior and interior of the hollow steel attachment.

Add new text as follows:

704.5.2 Connections to structural wood members. Where a structural wood member is required to have a *fire-resistance rating*, structural connections to that member shall be protected from fire exposure for the time corresponding to the required *fire-resistance rating* of the member. Protection time shall be determined by one of the following:

1. Testing in accordance with Section 703.2.1 where the connection is part of the fire-resistance test.
2. Engineering analysis that demonstrates that the temperature rise at any portion of the connection is limited to an average temperature rise of 250°F (139°C), and a maximum temperature rise of 325°F (181°C), for a time corresponding to the required *fire-resistance rating* of the structural element being connected. For the purposes of this analysis, the connection includes connectors, fasteners and portions of wood members included in the structural design of the connection.
3. Engineering analysis in accordance with ANSI/AWC FDS.

Add new standard(s) as follows:

AWC

American Wood Council
222 Catoctin Circle SE, Suite 201
Leesburg, VA 20175

ANSI/AWC FDS-2024: Fire Design Specification (FDS) for Wood Construction

Reason: The intent of this proposal is to:

1. Relocate criteria for the protection of connections between structural wood members from Chapter 23 to Chapter 7, alongside related criteria for structural steel connections and attachments.
2. Extend the requirements that currently apply specifically to connections in Types IV-A, IV-B, and IV-C construction to connections

between fire-resistance-rated structural wood members in general.

3. Add a reference to ANSI/AWC *2024 Fire Design Specification (FDS) for Wood Construction*, which provides a design methodology for protecting connections with wood and/or gypsum, where protection times are assigned based on the temperature rise limitations established in ASTM E119 testing and Item #2 of existing Section 2304.10.1. The FDS was developed as an American National Standard through the AWC ANSI-approved consensus standards development process, and is available on the AWC website at the following location: https://awc.org/wp-content/uploads/2023/11/AWC_FDS2024_20231103_AWCWEBSITE.pdf

4. Clarify in the charging paragraph that connections must be protected for the time associated with the members being connected.

If this proposal is successful, the intention is to remove Section 2304.10.1 in the Group B code development process so there are not duplicative requirements in the code.

Bibliography: ANSI/AWC 2024 Fire Design Specification (FDS) for Wood Construction. View this document online: https://awc.org/wp-content/uploads/2023/11/AWC_FDS2024_20231103_AWCWEBSITE.pdf.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

$0

Estimated Immediate Cost Impact Justification (methodology and variables):

This proposal relocates a code section from Chapter 23 into a more proper location in Chapter 7. However, it does allow for this section to be available for design of wood members in other types of construction besides Type IV. It provides additional options for compliance with existing connection protection requirements specified in IBC 704.2 and IBC 704.3 without removing any of the existing options for demonstrating compliance. The inclusion of these additional options does not in and of itself increase or decrease the overall cost impact of the code, because these options may not be chosen. The existing options are still relevant, and if chosen, have no cost impact on the actual code requirements.

FS9-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee determined that the proposed language needs more clarification. The committee mentioned that the proposed text is a good starting point and the standard is needed. The proponent needs to look into the issue of adding "steel" in sections 704.5.1 and 704.5.1.1. Also, the proposed text does not address the structural aspect. Although the proponent mentioned that the proposal relocated criteria for the protection of connections between structural wood members from Chapter 23, the committee could not find the text in Chapter 23. The committee has an issue with proposing engineering analysis vs testing (Vote: 9-2).

FS9-24

Individual Consideration Agenda

Comment 1:

IBC: 704.5, 704.5.1, 704.5.1.1, 704.5.2

Proponents: Edward Lisinski, American Wood Council (elisinski@awc.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

704.5 Protection of Connections and Attachments. Connections and attachments to structural members that are required to have a fire-resistance rating shall be protected in accordance with 704.5.1 and 704.5.2.

704.5.1 Attachments to structural ~~steel~~ members. The edges of lugs, brackets, rivets and bolt heads attached to structural ~~steel~~ members shall be permitted to extend to within 1 inch (25 mm) of the surface of the fire protection.

704.5.1.1 Secondary attachments to structural ~~steel~~ members. Where primary and secondary structural steel members require fire protection, any additional structural steel members having direct connection to the *primary structural frame* or *secondary structural members* shall be protected with the same fire-resistive material and thickness as required for the structural member. The protection shall extend away from the structural member a distance of not less than 12 inches (305 mm), or shall be applied to the entire length where the attachment is less than 12 inches (305 mm) long. Where an attachment is hollow and the ends are open, the fire-resistive material and thickness shall be applied to both exterior and interior of the hollow steel attachment.

704.5.2 Connections to structural wood members. Where a structural wood member is required to have a *fire-resistance rating*, structural connections to that member shall be protected from fire exposure for the time corresponding to the required *fire-resistance rating* of the member. Protection time shall be determined by one of the following:

1. Testing in accordance with Section 703.2.1 where the connection is part of the fire-resistance test.
2. Engineering analysis that demonstrates that the temperature rise at any portion of the connection is limited to an average temperature rise of 250°F (139°C), and a maximum temperature rise of 325°F (181°C), for a time corresponding to the required *fire-resistance rating* of the structural element being connected. For the purposes of this analysis, the connection includes connectors, fasteners and portions of wood members included in the structural design of the connection.
3. ~~Engineering analysis~~ Design of protection for structural connections in accordance with ANSI/AWC FDS.

Reason: This comment addresses two concerns that were brought up in the testimony at Committee Action Hearing #1.

1. This comment removes the word "steel" that was originally proposed to the titles and text of Sections 704.5.1 and 704.5.1.1 to address concerns that these sections should apply to all types of construction.

2. Option #3 in the proposed Section 704.5.2 removes the term "engineering analysis" and uses language more consistent with language used in the FDS.

One comment from the Committee regarded some confusion as to where the requirements for Option #2 can be found in the existing code. The requirements in Options #1 and #2 are currently found in Section 2304.10.1. It would be our intention to come back with a proposal in Group B to remove that section if this proposal is approved, so there are not duplicative code requirements in different sections. Chapter 23 is not permitted to be modified in Group A, so it could not be done as one code change at this time.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

$0. This proposal relocates an existing section of code to a more appropriate location and adds an additional option for compliance.

Estimated Immediate Cost Impact Justification (methodology and variables):

This proposal relocates requirements for protecting connections from Section 2304.10.1 to Section 704.5.2, which is mostly editorial. In addition, a third option is provided to protection connections through methods developed in the FDS. Both existing options are maintained in the code. If a designer or builder wants to protect a connection through the existign code methods they can, however this will give them an additional third option which may be beneficial to them.

FS10-24

IBC: 704.5.1

Proposed Change as Submitted

Proponents: Richard Walke, Creative Technology Inc. and CM Services, National Fireproofing Contractors Association (richwalke61@gmail.com)

2024 International Building Code

Revise as follows:

704.5.1 Secondary attachments to structural members. Where primary and secondary structural steel members require fire protection, any additional ~~structural~~ steel members having direct connection to the *primary structural frame* or *secondary structural member*, *and* having a cumulative unprotected footprint greater than 4.65 square inches (3,000 mm^2) per 3 linear feet or per linear meter of primary or secondary steel, shall be protected with the same fire-resistive material and thickness as required for the structural member. The protection shall extend away from the structural member a distance of not less than ~~12~~18 inches (~~305~~457 mm), or shall be applied to the entire length where the attachment is less than ~~12~~18 inches (~~305~~457 mm) long. Where an attachment is hollow and the ends are open, the fire-resistive material and thickness shall be applied to both exterior and interior of the hollow steel attachment.

Reason: Section 704.6.1 of the 2021 IBC was establish based on a Proposal FS8-18 submitted by the California State Fire Marshal's Office. We supported the original intent of the proposal which was to protect secondary non-structural tubular steel attachments. However, during the code development process, the scope of the proposal changed significantly. In the end this section required protection of all "secondary steel attachments" to primary and second structural steel members.

But what is a "secondary steel attachment"? Members of the National Fireproofing Contactors Association (NFCA) have reported code officials are asking for anything and everything attached to the primary and second structural steel members be protected, including sometimes, the tie wires which support acoustical ceilings. That clearly was not the intent of the original proposal.

Section 704.6.1 was updated in the 2024 IBC as a result of Proposal FS11-21 submitted by National Fireproofing Contractors Association (NFCA) with help from the American Iron and Steel Institute. The focus of the changes was to limited the application of the section to structural members having direct connection to the primary structural frame or secondary structural members. Without having hard data to support a more surgical approach to what attachments truly impact the fire performance of the primary and second structural steel members, we believe this was a reasonable compromise.

After further research, we found guidance on the protection of attachments in a UL Solutions United Kingdom document. The 4.65 square inches (3,000 mm^2) per 3 linear feet or per linear meter of structural element length limitation included in this proposal is based on recommendation from *UL Solutions' guide to steelwork fire protection*. The same limitation is also stated in several other international documents relating to fireproofing, including:

1. The Fire and Blast Information Group (FABIG) Technical Note 11, entitled, *Fire Loading and Structural Response*.
2. International Coating's *Intertherm 750 Application Manual*.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

Based on industry and manufacturer input, the average cost of protecting an intermediate size attachment for a distance of 18 in. from the primary or secondary steel is approximately $1 to $2.

Estimated Immediate Cost Impact Justification (methodology and variables):

This includes materials and labor costs for protecting a typical attachment for a distance of 18 in. The total cost in any given building will depend upon the number of attachments which will ultimately require protection.

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee disapproved the proposal based on the fact that the proposal created unintended consequences. The proposal lacks supporting data on the issue addressed in the proposed code text (Vote: 11-0).

FS10-24

Individual Consideration Agenda

Comment 1:

Proponents: Richard Walke, Creative Technology Inc. and CM Services, National Fireproofing Contractors Association (richwalke61@gmail.com) requests As Submitted

Reason: At Committee Action Hearing #1, the proponents requested disapproval along with feedback from the Committee on the merits of this proposal. The Committee's feedback suggested they would like to see cases where unprotected attachments are a problem in order to support this proposal.

Since Committee Action Hearing #1, the National Fireproofing Contractors Association has initiated discussions with other industry stakeholders to develop data on the impact of attachments on the fire-resistance rating of building elements. At this time, our work is not far enough along to know what, if any, changes will be needed in this proposal. By requesting As Submitted, our goal is to keep the proposal active so as to be able to develop a comprehensive data backed proposal for the Public Comment Hearing in April, 2026.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Comment (CAH2)# 471

FS13-24

IBC: 705.2.2, 705.2.3.1

Proposed Change as Submitted

Proponents: Julius Carreon, City of Bellevue, Washington Association of Building Officials Technical Code Development Committee (jcarreon@bellevuewa.gov); Quyen Thai, City of Tacoma, Washington Association of Building Officials Technical Code Development Committee (qthai@cityoftacoma.org); Micah Chappell, Seattle Department of Construction and Inspections, Washington Association of Building Officials Technical Code Development Committee (micah.chappell@seattle.gov)

2024 International Building Code

Revise as follows:

705.2.2 Type III, IV or V construction. Projections from walls of Type III, IV or V construction shall be of any *approved* material. Balconies and similar projections of combustible construction shall comply with Section 705.2.3.1.

705.2.3.1 Balconies and similar projections. Balconies and similar projections of combustible construction other than *fire-retardant-treated wood* shall be *fire-resistance* rated where required by Table 601 for floor construction or shall be of heavy timber construction in accordance with Section 2304.11. *Fire-retardant-treated wood* shall not be permitted for balconies and similar projections on buildings of Type IV-A, IV-B, or IV-C construction. The aggregate length of the projections shall not exceed 50 percent of the *building*'s perimeter on each floor. **Exceptions:**

1. On *buildings* of Types I and II construction, three *stories* or less above *grade plane*, *fire-retardant-treated wood* shall be permitted for balconies, porches, decks and exterior *stairways* not used as required exits.
2. Untreated *wood and plastic composites* that comply with ASTM D7032 and Section 2612 are permitted for pickets, rails and similar *guard* components that are limited to 42 inches (1067 mm) in height.
3. Balconies and similar projections on *buildings* of Types III, IV-HT and V construction shall be permitted to be of Type V construction and shall not be required to have a *fire-resistance rating* where sprinkler protection is extended to these areas.
4. Where sprinkler protection is extended to the balcony areas, the aggregate length of the balcony on each floor shall not be limited.
5. On buildings of Types IV-A or IV-B construction three stories or less above grade plane, and Type IV-C construction not classified as *high-rise*, non-fire-resistance rated heavy timber building elements shall be permitted for balconies, porches, decks and exterior stairways not used as required exits.

Reason: This code change proposal is intended to clarify the requirements for combustible projections of Type III, IV or V construction in Section 705.2.2 and provides a new/separate exception for combustible projections of Types IV-A, IV-B and IV-C construction, three new construction types added in 2021 code cycle.

For projections of Type III, IV or V construction, the current construction requirements are not clear since Section 705.2.2 simply indicates the construction shall be of any "approved" material. What does an “approved” material mean, particularly when the construction material is combustible, and the type of construction requires fire protection such as for type III-A, IV-A, IV-B, IV-C and V-A? Section 705.2.3.1 provides the requirements when combustible materials are used but there is no direct code path to the section, since it is located as a subsection of 705.2.3 that applies only if the balcony/projection has fire separation distance (FSD) of less than 5-ft.

In addition, the 2021 IBC added three new construction types—IV-A, IV-B and IV-C—that allow the use of mass timber in buildings up to 18, 12 and nine stories. These new types are based on the previous Heavy Timber construction type (renamed Type IV-HT) but with additional fire-resistance ratings and levels of required noncombustible protection, to match the level of performance of Types I and II construction. It is not clear whether the additional fire-resistance ratings and levels of required noncombustible protection will also need to be applied for balconies and similar projections on these new mass timber construction types. It is our understanding that the current construction requirements in IBC Section 705.2 (projections) is intended for the traditional IV construction type (now classified as

Type IV-HT) and therefore not intended for high-rise buildings. The 2024 IBC has clarified exception #3 in 705.2.3.1, which permits the use of type V construction where sprinkler protection is provided, is limited to IV-HT but silent on IV-A, IV-B and IV-C. Hence, depending how the designer and code official interpret what is considered "approved" material in 705.2.2, the projection construction for these new types of construction could be conservative (i.e., all projections need the additional fire resistance rating and non-combustible protection per Table 601) or non-conservative (i.e., use type V, FRT, or exposed/non-rated heavy timber on 18 story high rise).

To address the ambiguity of the code language in Section 705.2.2 and the requirements for combustible projections on the new types of mass timber construction, we are proposing the following:

- Add a pointer on Section 705.2.2 to address combustible projection requirements on fire resistance rated construction types such as Types III-A, IV-A, V-A and new mass timber construction types IV-A/B/C. WABO TCD has also submitted a separate code change proposal that renumbers Section 705.2.3.1 to Section 705.2.4, to clarify and undo the inadvertent substantive change when the section of the code was moved from Section 1406.3 to Section 705.2.3.1 between 2015 and 2018 code (See FS15-15: http://media.iccsafe.org/codes/2015-2017/GroupA/PCH/IBC-Fire-Safety.pdf). Based on the reason statement for FS15-15 and its previous location in 2015 code, Section 705.2.3.1 should be applied independently from Section 705.2.3, which means it should not be constrained by fire separation distance requirements. By adding a pointer on Section 705.2.2, it makes it clear that where fire resistance rating is required by Table 601 for floor construction (i.e., Types III-A, IV-A, V-A and IV-A/B/C), any combustible projection construction will need to comply with 705.2.3.1 regardless if the projection is beyond the 5 feet separation distance trigger in Section 705.2.3. If both proposals are approved, our intent is that the other proposal (renumbering the section) would govern for both Section 705.2.3.1 and the pointer in Section 705.2.2.
- Add a clarifying prohibition and an exception in 705.2.3.1, to deal with combustible projections on Type IV-A, IV-B and IV-C construction.
    - Consistent with the intent of the original proponents of the proposal to introduce Types IV-A, IV-B, and IV-C into the code, fire-retardant treated wood is prohibited in those types of construction. This only affects stick-framed FRT wood, since FRT mass timber does not exist.
    - However, the exception will permit the use of (exposed) non-rated heavy timber construction on buildings of Types IV-A or IV-B construction three stories or less above grade plane, and Type IV-C construction not classified as high rise. This implies that combustible balconies and similar projections on Type IV-A and Type IV-B buildings more than 3-stories and Type IV-C buildings classified as high rise shall meet the type of construction in accordance with Table 601. We understand the fire performance requirements on Types IV-A and IV-B construction were developed based on Type I and Type II construction, hence, the proposed 3-stories cut-off for the exception on Type IV-A and Type IV-B is intended to align with the exception for Type I and Type II (705.2.3.1 exception 1). For Type IV-C, we are proposing a non-high rise cut-off to align with traditional Type IV-HT construction, which does not require fire rated construction (and both Type IV-C and Type IV-HT have 85 feet maximum building height limit).
    - WABO TCD sent a draft of the proposal to AWC and one comment that we received from them is that their preferred terminology was "heavy timber building elements," as opposed to "heavy timber construction" currently use in the IBC. The "heavy timber construction" terminology occurs in (9) other locations in the IBC but we have not proposed to change those in this proposal. If the committee agrees on replacing the terminology with "heavy timber building elements", we can submit an editorial change in the second CAH.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

As noted in the reason statement of the proposal, the construction requirements for combustible balconies and similar projections on the three construction Types IV-A, IV-B and IV-C is currently very ambiguous. Depending how the designer and code official interpret what is considered "approved" material in the current code will determine if this code change proposal will increase or decrease the cost of construction. In general, construction for Types IV-A/B buildings 3-stories or less and Type IV-C buildings that aren't high rises may see a small decrease in cost as this code proposal makes it clear that exposed/non-rated heavy timber is permitted, as opposed to fire-resistance rated mass timber.

Recognizing that the choice of materials used in construction is an option, in jurisdictions where designers and code officials have allowed non-fire-resistance rated heavy timber for these balconies/projections, construction cost for Types IV-A/B buildings that are more than 3-stories and Type IV-C high rise buildings may see a small increase in cost as this code proposal implies the balconies/projection construction for these buildings will need additional fire resistance rating protection per Table 601. Data on the increase in cost is not readily available to people who aren't professional

estimators, but a 2022 online article (https://www.checkatrade.com/blog/cost-guides/cross-laminated-timber-cost/) estimates adding fire protection and soundproofing to cross-laminated timber costs approximately $3 to $7 per square foot. We assume the cost increase will be in this ballpark.

We do not consider the prohibition on FRT wood to be a cost increase since no amount of stick framing should have been allowed in these types of construction.

FS13-24

Public Hearing Results (CAH1)

Errata: This proposal includes unpublished errata "HT" is existing text in 2024 IBC
705.2.3.1 Balconies and similar projections

3. Balconies and similar projections on buildings of Types III, IV-HT and V construction shall be permitted to be of Type V construction and shall not be required to have a fire-resistance rating where sprinkler protection is extended to these areas.

Committee Action: **As Modified by Committee (AMC1)**

Committee Modification: 705.2.3.1 Balconies and similar projections. Balconies and similar projections of combustible construction other than fire-retardant treated wood shall be fire-resistance rated where required by Table 601 for floor construction or shall be of heavy timber construction in accordance with Section 2304.11. ~~Fire-retardant treated wood~~ Wood structural elements not complying with Table 2304.11 shall not be permitted for balconies and similar projections on buildings of Type IV-A, IV-B, or IV-C construction. The aggregate length of the projections shall not exceed 50 percent of the building's perimeter on each floor.
Exceptions:

1. On *buildings* of Types I and II construction, three *stories* or less above *grade plane*, *fire-retardant-treated wood* shall be permitted for balconies, porches, decks and exterior *stairways* not used as required exits.

2. Untreated *wood and plastic composites* that comply with ASTM D7032 and Section 2612 are permitted for pickets, rails and similar *guard* components that are limited to 42 inches (1067 mm) in height.

3. Balconies and similar projections on *buildings* of Types III, IV-HT and V construction shall be permitted to be of Type V construction and shall not be required to have a *fire-resistance rating* where sprinkler protection is extended to these areas.

4. Where sprinkler protection is extended to the balcony areas, the aggregate length of the balcony on each floor shall not be limited.

5. On buildings of Types IV-A or IV-B construction three stories or less above grade plane, and Type IV-C construction not classified as *high-rise*, non-fire-resistance rated heavy timber building elements shall be permitted for balconies, porches, decks and exterior stairways not used as required exits.

Committee Reason: The committee agreed that the modification clarifies the intent of the proposal. The proposed text is a needed clarification to the code users (Vote: 11-0).

FS13-24

Individual Consideration Agenda

Comment 1:

IBC: 705.2.3.1

Proponents: Edward Lisinski, American Wood Council (elisinski@awc.org) requests As Modified by Committee (AMC2)

Further modify as follows:

2024 International Building Code

705.2.3.1 Balconies and similar projections. Balconies and similar projections of combustible construction other than *fire-retardant-treated wood* shall be *fire-resistance* rated where required by Table 601 for floor construction or shall be of heavy timber construction in accordance with Section 2304.11. Wood structural elements ~~not complying with Table 2304.11 shall not be permitted~~ for balconies and similar projections on buildings of Type IV-A, IV-B, or IV-C construction shall comply with Section 2304.11. The aggregate length of the projections shall not exceed 50 percent of the *building*'s perimeter on each floor.

Exceptions:

1. On *buildings* of Types I and II construction, three *stories* or less above *grade plane*, *fire-retardant-treated wood* shall be permitted for balconies, porches, decks and exterior *stairways* not used as required exits.
2. Untreated *wood and plastic composites* that comply with ASTM D7032 and Section 2612 are permitted for pickets, rails and similar *guard* components that are limited to 42 inches (1067 mm) in height.
3. Balconies and similar projections on *buildings* of Types III, IV-HT and V construction shall be permitted to be of Type V construction and shall not be required to have a *fire-resistance rating* where sprinkler protection is extended to these areas.
4. Where sprinkler protection is extended to the balcony areas, the aggregate length of the balcony on each floor shall not be limited.
5. On buildings of Types IV-A or IV-B construction three stories or less above grade plane, and Type IV-C construction not classified as *high-rise*, ~~non-fire-resistance rated~~ heavy timber *building elements* shall ~~be permitted~~ not be required to be *fire-resistance rated* for balconies, porches, decks and exterior stairways not used as required exits.

Reason: This is an editorial clean up of some of the language that was approved in Committee Action Hearing #1. In the charging statement, a floor modification made a reference to heavy timber complying with Table 2304.11. However, this should be a reference to heavy timber in compliance with Section 2304.11 (not Table 2304.11). By referencing Section 2304.11, the section will also apply to cross laminated timber (CLT) or other mechanically laminated floor deck which are permitted in heavy timber construction, but are not referenced in Table 2304.11. This sentence was also rearranged to remove a double negative. In Exception #5, language was copied from Exception #3 to make this exception clearer.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is an editorial clean up of the code language based on a floor modification in CAH1.

Comment (CAH2)# 32

FS14-24

IBC: 705.6, 705.6.1 (New)

Proposed Change as Submitted

Proponents: Edward Lisinski, American Wood Council (elisinski@awc.org)

2024 International Building Code

Delete and substitute as follows:

~~**705.6 Continuity.** The *fire-resistance rating* of *exterior walls* shall extend from the top of the foundation or floor/ceiling assembly below to one of the following:~~

1. ~~The underside of the floor sheathing, roof sheathing, deck or slab above.~~
2. ~~The underside of a floor/ceiling or roof/ceiling assembly having a *fire-resistance rating* equal to or greater than the *exterior wall* and the *fire separation distance* is greater than 10 feet.~~

~~Parapets shall be provided as required by Section 705.12.~~

705.6 Continuity. The continuity of the *fire-resistance rating* shall extend from the top of the foundation to the top of the parapet. If a parapet is not required by Section 705.12, the *fire-resistance rating* shall extend to the underside of the roof sheathing, deck or slab.

Add new text as follows:

705.6.1 Supporting Construction. Where a floor or roof assembly supports an *exterior wall* or parapet above, the portion of the floor or roof assembly that supports the *exterior wall* or parapet shall have a *fire-resistance rating* of not less than the *fire-resistance rating* required for the *exterior wall* or parapet.

Reason: The proposed revision coordinates with existing requirements for fire-resistance rating (FRR) continuity for all types of supporting construction. Existing language, added in 2024 code development cycle (FS18-21), has caused confusion in application to platform construction because walls in platform construction are not continuous from foundation to roof. In platform construction, FRR continuity must be maintained through portions of floor or roof elements supporting the wall or parapet above, however, the wall itself is not continuous. The proposed revisions clarify that FRR continuity is to be maintained to the top of the parapet or to the underside of the roof deck where a parapet is not required. By clarifying the concept of FRR continuity versus continuity of the exterior wall, the intent of Item 2 in existing language is addressed more broadly and no longer necessary in the code.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal clarifies that the important aspect of fire protection is the continuity of the fire-resistance as required in IBC 705.7.1, and not the continuity of the exterior wall itself.

FS14-24

Public Hearing Results (CAH1)

Committee Action: **As Submitted**

Committee Reason: The committee approved the proposal based on the fact that the proposal coordinates with existing requirements for fire-resistance rating (FRR) continuity for all types of supporting construction (Vote: 8-3).

FS14-24

Individual Consideration Agenda

Comment 1:

IBC: 705.6, 705.6.1

Proponents: David Renn, PE, SE, City and County of Denver, Code Change Committee of ICC Colorado Chapter (david.renn@denvergov.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

705.6 Continuity. The continuity of the *fire-resistance rating* of *exterior walls* shall extend from the top of the foundation to the top of the parapet. If a parapet is not required by Section 705.12, the *fire-resistance rating* of *exterior walls* shall extend to the underside of the roof sheathing, deck or slab.

~~**705.6.1 Supporting Construction.** Where a floor or roof assembly supports an *exterior wall* or parapet above, the portion of the floor or roof assembly that supports the *exterior wall* or parapet shall have a *fire-resistance rating* of not less than the *fire-resistance rating* required for the *exterior wall* or parapet.~~

Reason: 705.6 Continuity: This section is proposed to be revised to add wording to clarify that fire-resistance rating in this section is for exterior walls. The wording added matches the current wording in 705.6.

705.6.1 Supporting Construction: This section is proposed to be deleted since FS16-24 was approved with a new section 705.8 for supporting construction. Since supporting construction is not a continuity requirement it should not be a subsection of the continuity section and it is preferred to have this in its own section as approved in FS16-24. Also, 705.6.1 is narrowly focused on supporting construction for platform framing, while 705.8 is general and covers all supporting construction for exterior walls (e.g., platform framing, curtain wall supported by slab edge or beam, or floor framing supporting a set back exterior wall).

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

As with original proposals FS14-24 and FS16-24, the proposed changes are clarifications since the code already includes continuity requirements (in Section 705.6) and includes supporting construction requirements (in Section 704.1.1 that is referenced in FS16-24).

Comment (CAH2)# 186

FS15-24

IBC: 705.7.1

Proposed Change as Submitted

Proponents: Edward Lisinski, American Wood Council (elisinski@awc.org)

2024 International Building Code

Revise as follows:

705.7.1 Floor assemblies supporting exterior walls in Type III, IV and V construction. In Type III, IV and V construction where a floor assembly supports gravity loads from an *exterior wall*, the *fire-resistance rating* of the portion of the floor assembly that supports the *exterior wall* shall be not less than the *fire-resistance rating* required for the *exterior wall* in Table 601. The *fire-resistance rating* provided by the portion of the floor assembly supporting and within the plane of the *exterior wall* shall be permitted to include the contribution of the ceiling membrane when considering exposure to fire from the inside. Where a floor assembly supports gravity loads from an *exterior wall*, the *building elements* of the floor construction within the plane of the *exterior wall*, including but not limited to rim joists, rim boards and blocking, shall be in accordance with the requirements for interior *building elements* of ~~Type III~~ the applicable type of construction.

Reason: Existing Section 705.7.1 was added by change proposal FS19-21 to address continuity of fire-resistance rating for exterior walls of Type III platform construction. These same structural stability requirements that are appliable to Type III construction are equally applicable to Type IV and V construction where platform construction is used.

The AWC *Design for Code Acceptance No. 3 (DCA 3)* document has design details to maintain the required fire resistance of the wall for fire exposure from the interior of the building, and, when required by IBC Section 705.5, for exposure from the exterior as well. Examples of these details can be found in the AWC DCA 3 document (a link has been provided in the bibliography section below). A ceiling membrane may or may not be present, but as shown in the existing language of Section 705.7.1 and the AWC DCA 3, it is an appropriate design assumption to consider its contribution when the fire rating of the floor assembly supporting the exterior wall is to be based on fire exposure from the interior of the building. This situation could occur in Type IV and V construction as well and the building elements will respond the same way in a fire, so those construction types should be included in this code section.

AWC has a separate change proposal to Section 705.6 to provide general language that supports the concept of continuity of fire-resistance rating applicable when exterior walls are continuous, and when floors intersect the exterior wall in typical platform construction.

Bibliography: American Wood Council *Design for Code Acceptance No. 3.* View this document online: https://awc.org/wp-content/uploads/2021/12/awc-dca3_20210209_awcwebsite.pdf

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal provides clarification of the applicability of existing code requirements for platform construction.

Public Hearing Results (CAH1)

Committee Action: **As Submitted**

Committee Reason: The committee concluded that the proposal is expanding on what was approved during the last cycle and it is the right step forward (Vote: 9-2).

Individual Consideration Agenda

Comment 1:

IBC: 705.7.1

Proponents: David Renn, PE, SE, City and County of Denver, Code Change Committee of ICC Colorado Chapter (david.renn@denvergov.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

705.7.1 Floor assemblies supporting exterior walls ~~in Type III, IV and V construction~~. ~~In Type III, IV and V construction where~~ Where a floor assembly supports gravity loads from an *exterior wall*, the *fire-resistance rating* of the portion of the floor assembly that supports the *exterior wall* shall be not less than the *fire-resistance rating* required for the *exterior wall* in Table 601. The *fire-resistance rating* provided by the portion of the floor assembly supporting and within the plane of the *exterior wall* shall be permitted to include the contribution of the ceiling membrane when considering exposure to fire from the inside. Where a floor assembly supports gravity loads from an *exterior wall*, the *building elements* of the floor construction within the plane of the *exterior wall*, including but not limited to rim joists, rim boards and blocking, shall be in accordance with the requirements for interior *building elements* of the applicable type of construction.

Reason: This section is intended to clarify requirements for platform framed floor/ceiling assemblies that support exterior walls, and the original proposal expanded the scoping of this section to include Type III, IV and V construction, instead of just Type III. This comment proposes to further expand this to Type I and II construction by deleting the type of construction scoping. Types I and II construction can include platform framing with cold-formed steel joists just as Types III, IV and V construction have platform framing with wood joists, so this section should apply to all construction types.This is needed since this section allows the ceiling of a floor/ceiling assembly to contribute to the fire-resistance rating provided by the portion of the floor assembly supporting and within the plane of the exterior wall. Approved proposal FS14-24 changed continuity requirements for the exterior wall to require continuity of the fire-resistance rating through the platform framed floor, while the current code language allows the exterior wall rating to stop at the underside of a floor/ceiling assembly that has the same rating as the wall. If this section isn't expanded to include Types I and II the ceiling contribution would not be allowed and it would be very difficult to continue the wall rating through the platform framed floor since the interior gypsum board would have to be continued around C-shaped joists, which is difficult, if not impossible, to achieve.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This comment expands the scoping to include Type I and II construction to allow the ceiling membrane to count towards the exterior wall rating. This is essentially the same as the current continuity requirements in 705.6 that allow the fire-resistance rating of an exterior wall to stop at the underside of a floor/ceiling assembly that has an equal or greater rating. Therefore, there is no cost impact relative to current code language.

FS16-24

IBC: 705.7.1, 705.8 (New)

Proposed Change as Submitted

Proponents: David Renn, PE, SE, City and County of Denver, Colorado Chapter Code Development Committee (david.renn@denvergov.org)

2024 International Building Code

Revise as follows:

~~705.7.1~~ 705.8.1 **Floor assemblies in Type III construction.** In Type III construction where a floor assembly supports gravity loads from an *exterior wall*, the~~*fire-resistance rating* of the portion of the floor assembly that supports the *exterior wall* shall be not less than the *fire-resistance rating* required for the *exterior wall* in Table 601. The~~*fire-resistance rating* provided by the portion of the floor assembly supporting and within the plane of the *exterior wall* shall be permitted to include the contribution of the ceiling membrane when considering exposure to fire from the inside. Where a floor assembly supports gravity loads from an *exterior wall*, the *building elements* of the floor construction within the plane of the *exterior wall*, including but not limited to rim joists, rim boards and blocking, shall be in accordance with the requirements for interior *building elements* of Type III construction.

Add new text as follows:

705.8 Supporting construction. The supporting construction for an exterior wall shall have a fire-resistance rating as required by Section 704.1.1.

Reason: Currently, there is no specific requirement in Section 705 for supporting construction of exterior walls. However, such supporting construction must still meet the requirement of 704.1.1 that "The fire-resistance ratings of supporting structural members and assemblies shall be not less than the ratings required for the fire-resistance-rated assemblies supported by the structural members." The fire-resistance rating continuity requirements in 705.6 and the structural stability requirements of 705.7 essentially require supporting construction within the plane of an exterior wall to have the same fire-resistance rating as the wall supported. However, there are often cases where a fire-resistance rated exterior curtain wall is supported by a floor or beam that is inside the exterior wall, which is not covered by these sections. Also, where exterior walls step back at an upper floor, the exterior wall is supported on a floor or beam below the wall. For these cases, 704.1.1 currently requires the supporting construction to have a fire-resistance rating not less than the wall supported, but this is often missed by designers.

As an example, a 5-story Type III building could have a set-back exterior wall at the 5th story that is a bearing wall for the roof, and this wall requires a 2-hour fire-resistance rating per Table 601. Designers often miss that the floor or beam supporting this wall at Level 5 also needs to have a 2-hour fire-resistance rating, as well as all supporting construction below this floor or beam down to the foundation. When this is discovered in plan review, there are significant changes needed to the drawings to meet the requirements. This proposal is intended to avoid this by providing a direct reference to 704.1.1 in a new supporting construction section, 705.8, which will located after 705.7 that includes structural stability requirements for lateral bracing of the wall.

Current Section 705.7.1 for floor assemblies in Type III construction is relocated to be a subsection to the new supporting construction section since it addresses supporting construction requirements directly. Some wording in this section is proposed to be deleted since it is redundant with the new 705.8 section.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal is a clarification with a pointer to an existing requirement, so there is no cost impact.

Public Hearing Results (CAH1)

Committee Action: **As Modified by Committee (AMC1)**

Committee Modification:

705.8.1 Floor assemblies in Type III construction.
In Type III construction where a portion of a floor assembly within the plane of the *exterior wall* supports gravity loads from an *exterior wall*, the *fire-resistance rating* provided by the portion of the floor assembly ~~supporting and within the plane of the *exterior wall*~~ shall be permitted to include the contribution of the ceiling membrane when considering exposure to fire from the inside. Where a floor assembly supports gravity loads from an *exterior wall*, the *building elements* of the floor construction within the plane of the *exterior wall*, including but not limited to rim joists, rim boards and blocking, shall be in accordance with the requirements for interior *building elements* of Type III construction.

Committee Reason: The committee determined that the proposed modifications fix the issue in the original proposal by adding a "portion of a floor". The committee agreed that the added text for supporting the construction of exterior walls is needed (Vote: 11-0).

FS16-24

Individual Consideration Agenda

Comment 1:

IBC: 705.8, 705.8.1

Proponents: David Renn, PE, SE, City and County of Denver, Code Change Committee of ICC Colorado Chapter (david.renn@denvergov.org); Edward Lisinski, American Wood Council, American Wood Council (elisinski@awc.org) requests As Modified by Committee (AMC2)

Further modify as follows:

2024 International Building Code

705.8 Supporting construction. The supporting construction for ~~an exterior wall~~ *exterior walls* and parapets shall have a ~~fire-resistance rating~~ *fire-resistance rating* as required by Section 704.1.1.

705.8.1 Floor assemblies in Type III construction. In Type III construction where a portion of a floor assembly within the plane of the *exterior wall* supports gravity loads from an *exterior wall*, the *fire-resistance rating* provided by the portion of the floor assembly shall be permitted to include the contribution of the ceiling membrane when considering exposure to fire from the inside. Where a floor assembly supports gravity loads from an *exterior wall*, the *building elements* of the floor construction within the plane of the *exterior wall*, including but not limited to rim joists, rim boards and blocking, shall be in accordance with the requirements for interior *building elements* of Type III construction.

Reason: RENN: The original proposal includes supporting construction requirements for exterior walls. This comment expands this to include supporting construction for parapets. This is needed to correlate with approved FS17-24 that includes requirements for platform framed roofs that support fire-resistance rated parapets. (Note that the new section in FS17-24 is proposed to be a subsection of 705.8 in a separate comment for FS17-24.)

This comment also makes editorial changes to put defined terms in italics.

LISINSKI: This public comment is to coordinate the approved FS16-24, which created a new section 705.8, with action taken on FS17-24. The approval

for FS17-24 added requirements for supporting of parapets, and therefore parapets need to be added to the charging language of this section. This is intended to just be editorial to coordinate with action taken in Committee Action Heating #1.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

RENN: This proposal adds supporting construction requirements for parapets in new section 705.8, but these requirements are already in the code in 704.1.1 that this new section references. Therefore, there is no change to the cost of construction.

LISINSKI: This is an editorial proposal to coordinate with action taken on FS17-24.

Comment (CAH2)# 189

FS17-24

IBC: 705.7.2 (New)

Proposed Change as Submitted

Proponents: Edward Lisinski, American Wood Council (elisinski@awc.org)

2024 International Building Code

Add new text as follows:

705.7.2 Roof assemblies supporting parapets in Type III, IV and V construction. In Type III, IV and V construction where a roof assembly supports gravity loads from a parapet, the *fire-resistance rating* of the portion of the roof assembly that supports the parapet shall be not less than the *fire-resistance rating* required for the parapet in Section 705.12. The *fire-resistance rating* provided by the portion of the roof assembly supporting the parapet shall be permitted to include the contribution of the ceiling membrane when considering exposure to fire from the inside. Where a roof assembly supports gravity loads from a parapet, the *building elements* of the roof construction within the plane of the *exterior wall*, including but not limited to, rim joists, rim boards, and blocking, shall be in accordance with the requirements for roof assemblies of the applicable type of construction.

Reason: The proposed new section adds criteria that parallels Section 705.7.1, except that Section 705.7.1 is specific to floor assemblies supporting an exterior wall above. This change is necessary to clarify that the same criteria would also apply to a roof assembly supporting a parapet above. This is further necessary because parapet construction is addressed by the requirements of Section 705.12 and does not fall under the definition of exterior wall. The change clarifies that fire resistance is permitted to include the contribution of the ceiling membrane when considering exposure from the inside, just as it is for floor assemblies in platform construction.

AWC has a separate change proposal to Section 705.6 that provides general language in support of the concept of continuity of fire-resistance rating for roof assemblies supporting a parapet as it occurs in typical platform construction.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This code change proposal provides clarification that roof assemblies supporting a parapet above shall have the same criteria as floor assemblies supporting an exterior wall above.

FS17-24

Public Hearing Results (CAH1)

Committee Action: **As Submitted**

Committee Reason: The committee indicated that the proposal clarifies the code requirements for roof assemblies supporting parapets in Type III, IV and V construction. One of the committee members had an issue with what requirements are intended in the proposed text "Where a roof assembly supports gravity loads from a parapet, the building elements of the roof construction within the plane of the exterior wall, including but not limited to, rim joists, rim boards, and blocking, shall be in accordance with the requirements for roof assemblies of the applicable type of construction." (Vote: 10-1).

FS17-24

Individual Consideration Agenda

Comment 1:

IBC: 705.7.2

Proponents: Edward Lisinski, American Wood Council, American Wood Council (elisinski@awc.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

705.7.2 Roof assemblies supporting parapets in Type III, IV and V construction. In Type III, IV and V construction where a portion of a roof assembly within the plane of the *exterior wall* supports gravity loads from a parapet, the *fire-resistance rating* ~~of the portion of the roof assembly that supports the parapet shall be not less than the *fire-resistance rating* required for the parapet in Section 705.12. The *fire-resistance rating*~~ provided by the portion of the roof assembly supporting and within the plane of the parapet shall be permitted to include the contribution of the ceiling membrane when considering exposure to fire from the inside. Where a roof assembly supports gravity loads from a parapet, the *building elements* of the roof construction within the plane of the *exterior wall*, including but not limited to, rim joists, rim boards, and blocking, shall be in accordance with the requirements for roof assemblies of the applicable type of construction.

Reason: This change is editorial to coordinate this proposal with action taken on FS16-24 in CAH1. This edits the code language to match 705.8.1.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal is editorial to coordinate with action taken on FS16-24.

Comment (CAH2)# 151

Comment 2:

IBC: 705.7.2

Proponents: David Renn, PE, SE, City and County of Denver, Code Change Committee of ICC Colorado Chapter (david.renn@denvergov.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

705.7.2 Roof assemblies supporting parapets ~~in Type III, IV and V construction.~~ ~~In Type III, IV and V construction where~~ Where a portion of a roof assembly within the plane of the *exterior wall* supports gravity loads from a parapet, the ~~*fire-resistance rating* of the portion of the roof assembly that supports the parapet shall be not less than the *fire-resistance rating* required for the parapet in Section 705.12. The~~ *fire-resistance rating* provided by the portion of the roof assembly ~~supporting the parapet~~ shall be permitted to include the contribution of the ceiling membrane when considering exposure to fire from the inside. Where a roof assembly supports gravity loads from a parapet, the *building elements* of the roof construction within the plane of the *exterior wall*, including but not limited to, rim joists, rim boards, and blocking, shall be in accordance with the requirements for roof assemblies of the applicable type of construction.

Reason: This section is intended to clarify requirements for platform framed roof/ceiling assemblies that support parapets, and the original proposal includes Type III, IV and V construction. This comment proposes to expand this to Type I and II construction by deleting

the type of construction scoping. Types I and II construction can include platform framing with cold-formed steel joists just as Types III, IV and V construction have platform framing with wood joists, so this section should apply to all construction types.
This is needed since this section allows the ceiling of a roof/ceiling assembly to contribute to the fire-resistance rating provided by the portion of the roof assembly supporting and within the plane of the exterior wall. Approved proposal FS14-24 changed continuity requirements for the exterior wall to require continuity of the fire-resistance rating through the platform framed roof, while the current code language allows the exterior wall rating to stop at the underside of a roof/ceiling assembly that has the same rating as the wall. If this section isn't expanded to include Types I and II the ceiling contribution would not be allowed and it would be very difficult to continue the wall rating through the platformed framed roof since the interior gypsum board would have to be continued around C-shaped joists, which is difficult, if not impossible, to achieve.This comment also includes wording changes to match wording in FS16-24 that includes a related floor assembly section, which was approved as modified by committee. The wording regarding required fire-resistance rating of the portion of the roof assembly supporting the parapet is removed since this is already covered by new section 705.8 that is in FS16-24.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This comment expands the scoping to include Type I and II construction to allow the ceiling membrane to count towards the exterior wall rating. This is essentially the same as the current continuity requirements in 705.6 that allow the fire-resistance rating of an exterior wall to stop at the underside of a roof/ceiling assembly that has an equal or greater rating. Therefore, there is no cost impact relative to current code language. Other changes in this comment are editorial to match approved FS16-24.

Comment (CAH2)# 188

Proposed Change as Submitted

Proponents: Kevin Scott, KH Scott & Associates LLC, self (khscottassoc@gmail.com)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE FIRE SAFETY CODE COMMITTEE. PART II WILL BE HEARD BY THE FIRE CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Building Code

Revise as follows:

706.1 General. *Fire walls* required by this code or the *International Fire Code* shall be constructed in accordance with Sections 706.2 through 706.11. The extent and location of such *fire walls* shall provide a complete separation. Where a *fire wall* separates occupancies that are required to be separated by a *fire barrier* wall, the most restrictive requirements of each separation shall apply.

707.1 General. *Fire barriers* ~~installed as~~ required ~~elsewhere in~~by this code or the *International Fire Code* shall comply with this section.

708.1 General. The following wall assemblies shall comply with this section:

1. Separation walls as required by Section 420.2 for Group I-1 and Group R occupancies.
2. Walls separating tenant spaces in *covered and open mall buildings* as required by Section 402.4.2.1.
3. *Corridor* walls as required by Section 1020.3.
4. Enclosed elevator lobby separation as required by Section 3006.3.
5. Egress balconies as required by Section 1021.2
6. Walls separating *ambulatory care facilities* from adjacent spaces, *corridors* or tenants as required by Section 422.2.
7. Walls separating *dwelling and sleeping units* in Groups R-1 and R-2 in accordance with Sections 907.2.8.1 and 907.2.9.1.
8. Vestibules in accordance with Section 1028.2.

Revise as follows:

709.1 General. Vertical and horizontal *smoke barriers* required by this code or the *International Fire Code* shall comply with this section.

710.1 General. *Smoke partitions* ~~installed as~~ required ~~elsewhere in the~~by this code or the *International Fire Code* shall comply with this section.

711.1 General. *Horizontal assemblies* required by this code or the *International Fire Code* shall comply with Section 711.2. Nonfire-resistance-rated floor and *roof assemblies* shall comply with Section 711.3.

TABLE 307.1.1 HAZARDOUS MATERIALS EXEMPTIONS[a]

MATERIAL CLASSIFICATION	OCCUPANCY OR APPLICATION	EXEMPTION

Combustible fiber	Baled cotton	Densely packed baled cotton shall not be classified as combustible fiber, provided that the bales comply with the packing requirements of ISO 8115.
Corrosive	Building materials	The quantity of commonly used building materials that are classified as corrosive materials is not limited.
	Personal and household products	The quantity of personal and household products that are classified as corrosive materials is not limited in retail displays, provided that the products are in original packaging.
	Retail and wholesale sales occupancies	The quantity of medicines, foodstuffs or consumer products, and cosmetics containing not more than 50 percent by volume of water-miscible liquids, with the remainder of the solutions not being flammable, is not limited. To qualify for this allowance, such materials shall be packaged in individual containers not exceeding 1.3 gallons.
Explosives	Groups B, F, M and S	Storage of special industrial explosive devices is not limited.
	Groups M and R-3	Storage of black powder, smokeless propellant and small arms primers is not limited.
Flammable and combustible liquids and gases	Aerosols	Buildings and structures occupied for the storage of aerosol products, aerosol cooking spray products, or plastic aerosol 3 products shall be classified as Group S-1.
	Alcoholic beverages	The quantity of alcoholic beverages in liquor stores and distributors without bulk storage is not limited.
		The quantity of alcoholic beverages in distilling or brewing of beverages is not limited.
		The storage quantity of beer, distilled spirits and wines in barrels and casks is not limited.
		The quantity of alcoholic beverages in retail and wholesale sales occupancies is not limited. To qualify for this allowance, beverages shall be packaged in individual containers not exceeding 1.3 gallons.
	Cleaning establishments with combustible liquid solvents	The quantity of combustible liquid solvents used in closed systems and having a flash point at or above 140ºF is not limited. To qualify for this allowance, equipment shall be listed by an approved testing agency and the occupancy shall be separated from all other areas of the building by not less than 1-hour fire barriers ~~constructed in accordance with Section 707~~ or ~~1-hour~~ horizontal assemblies ~~constructed in accordance with Section 711~~, or both
		The quantity of combustible liquid solvents having a flash point at or above 200ºF is not limited.
	Closed piping systems	The quantity of flammable and combustible liquids and gases utilized for the operation of machinery or equipment is not limited.
	Fuel	The quantity of liquid or gaseous fuel in fuel tanks on vehicles or motorized equipment is not limited.
		The quantity of gaseous fuels in piping systems and fixed appliances regulated by the International Fuel Gas Code is not limited.
		The quantity of liquid fuels in piping systems and fixed appliances regulated by the International Mechanical Code is not limited.
	Flammable finishing operations using flammable and combustible liquids	Buildings and structures occupied for the application of flammable finishes shall comply with Section 416.
	Fuel oil	The quantity of fuel oil storage complying with Section 605.4.2 of the *International Fire Code* is not limited. .
	Hand sanitizer	The quantity of alcohol-based hand rubs (ABHR) classified as Class I or II liquids in dispensers installed in accordance with Sections 5705.5 and 5705.5.1 of the *International Fire Code* is not limited. The location of the ABHR dispensers shall be provided in the construction documents.
	Retail and wholesale sales occupancies with flammable and combustible liquids	The quantity of medicines, foodstuffs or consumer products, and cosmetics containing not more than 50 percent by volume of water-miscible liquids, with the remainder of the solutions not being flammable, is not limited. To qualify for this allowance, such materials shall be packaged in individual containers not exceeding 1.3 gallons.
Highly toxic and toxic materials	Retail and wholesale sales occupancies	The quantity of medicines, foodstuffs or consumer products, and cosmetics containing not more than 50 percent by volume of water-miscible liquids, with the remainder of the solutions not being flammable, is not limited. To qualify for this allowance, such materials shall be packaged in individual containers not exceeding 1.3 gallons.
Any	Agricultural materials	The quantity of agricultural materials stored or utilized for agricultural purposes on the premises is not limited.
	Energy storage	The quantity of hazardous materials in stationary storage battery systems is not limited.
		The quantity of hazardous materials in stationary fuel cell power systems is not limited.
		The quantity of hazardous materials in capacitor energy storage systems is not limited.
	Refrigeration Systems	The quantity of refrigerants in refrigeration systems is not limited.

For SI: 1 gallon = 3.785L, °C = (°F - 32)/1.8.

a. Exempted materials and conditions listed in this table are required to comply with applicable provisions of the International Fire Code.

402.4.2.2 Anchor building separation. An *anchor building* shall be separated from the *covered* or *open mall building* by *fire walls* ~~complying with Section 706~~. **Exceptions:**

1. *Anchor buildings* of not more than three *stories above grade plane* that have an occupancy classification the same as that permitted for tenants of the *mall building* shall be separated by not less than 2-hour fire-resistance-rated *fire barriers* ~~complying with Section 707~~.
2. The *exterior walls* of *anchor buildings* separated from an *open mall building* by an *open mall* shall comply with Table 705.5.

402.4.2.3 Parking garages. An attached garage for the storage of passenger vehicles having a capacity of not more than nine *persons* and *open parking garages* shall be considered as a separate *building* where it is separated from the *covered or open mall building* or *anchor building* by not less than 2-hour *fire barriers* ~~constructed in accordance with Section 707~~ or *horizontal assemblies* ~~constructed in accordance with Section 711~~, or both.
Parking garages, which are separated from *covered mall buildings*, *open mall buildings* or *anchor buildings*, shall comply with the provisions of Table 705.5.

Pedestrian walkways and tunnels that connect garages to mall *buildings* or *anchor buildings* shall be constructed in accordance with Section 3104.

[BE] 402.8.7 Service areas fronting on exit passageways. Mechanical rooms, electrical rooms, building service areas and service elevators are permitted to open directly into *exit passageways*, provided that the *exit passageway* is separated from such rooms with not less than 1-hour *fire barriers* ~~constructed in accordance with Section 707~~ or *horizontal assemblies* ~~constructed in accordance with Section 711~~, or both. The *fire protection rating* of openings in the *fire barriers* shall be not less than 1 hour.

402.4.2.1 Tenant separations. Each tenant space shall be separated from other tenant spaces by ~~a~~ *fire partitions* ~~*partition* complying with Section 708~~. A tenant separation wall is not required between any tenant space and the *mall*.

404.6 Enclosure of atriums. *Atrium* spaces shall be separated from adjacent spaces by a 1-hour *fire barrier* ~~constructed in accordance with Section 707~~ or a *horizontal assembly* ~~constructed in accordance with Section 711~~, or both. **Exceptions:**

1. A *fire barrier* is not required where a glass wall forming a *smoke partition* is provided. The glass wall shall comply with all of the following:
   1.1. *Automatic* sprinklers are provided along both sides of the separation wall and doors, or on the room side only if there is not a walkway on the *atrium* side. The sprinklers shall be located between 4 inches and 12 inches (102 mm and 305 mm) away from the glass and at intervals along the glass not greater than 6 feet (1829 mm). The sprinkler system shall be designed so that the entire surface of the glass is wet upon activation of the sprinkler system without obstruction.
   1.2. The glass wall shall be installed in a gasketed frame in a manner that the framing system deflects without breaking (loading) the glass before the sprinkler system operates.
   1.3. Where glass doors are provided in the glass wall, they shall be either *self-closing* or automatic-closing.
2. A *fire barrier* is not required where a glass-block wall assembly complying with Section 2110 and having a $^{3}/_{4}$-hour *fire protection rating* is provided.
3. A *fire barrier* is not required between the *atrium* and the adjoining spaces of up to three floors of the *atrium* provided that such spaces are accounted for in the design of the smoke control system.
4. In other than Group I-2 and Group I-1, Condition 2, a *fire barrier* is not required between the *atrium* and the adjoining spaces where the *atrium* is not required to be provided with a smoke control system.

5. In Group I-2 and Group I-1, Condition 2, a *fire barrier* is not required between the *atrium* and the adjoining spaces, other than care recipient sleeping or treatment rooms, for up to three *stories* of the *atrium* provided that such spaces are accounted for in the design of the smoke control system and do not provide access to care recipient sleeping or treatment rooms.
6. A *horizontal assembly* is not required between the *atrium* and openings for escalators complying with Section 712.1.3.
7. A *horizontal assembly* is not required between the *atrium* and openings for *exit access stairways* and *ramps* complying with Item 4 of Section 1019.3.

405.4.2 Smoke barrier penetration. The compartments shall be separated from each other by ~~a~~ *smoke* barriers ~~*barrier* in accordance with Section 709~~. Penetrations between the two compartments shall be limited to plumbing and electrical piping and conduit that are firestopped in accordance with Section 714. Doorways shall be protected by *fire door assemblies* that comply with Section 716, automatic-closing by smoke detection in accordance with Section 716.2.6.6 and installed in accordance with NFPA 105 and Section 716.2.2.1. Where provided, each compartment shall have an air supply and an exhaust system independent of the other compartments.

405.4.3 Elevators. Where elevators are provided, each compartment shall have *direct access* to an elevator. Where an elevator serves more than one compartment, an enclosed elevator lobby shall be provided and shall be separated from each compartment by a *smoke barrier* ~~in accordance with Section 709~~. Doorways in the *smoke barrier* shall be protected by *fire door assemblies* that comply with Section 716, shall comply with the smoke and draft control assembly requirements of Section 716.2.2.1 with the UL 1784 test conducted without an artificial bottom seal, and shall be automatic-closing by smoke detection in accordance with Section 716.2.6.6.

406.3.1 Classification. *Private garages* and carports shall be classified as Group U occupancies. Each *private garage* shall be not greater than 1,000 square feet (93 m^2) in area. Multiple *private garages* are permitted in a *building* where each *private garage* is separated from the other *private garages* by not less than 1-hour *fire barriers* ~~in accordance with Section 707,~~ or ~~1-hour~~ *horizontal assemblies* ~~in accordance with Section 711~~, or both.

406.6.4.1 Separation. *Mechanical-access enclosed parking garages* shall be separated from other occupancies and accessory uses by not less than 2-hour *fire barriers* ~~constructed in accordance with Section 707~~ or ~~by not less than 2-hour~~ *horizontal assemblies* ~~constructed in accordance with Section 711~~, or both.

407.3 Corridor wall construction. Corridor walls shall be constructed as *smoke partitions* ~~in accordance with Section 710~~.

[BE] 407.4.4.2 Separation. *Care suites* shall be separated from other portions of the *building*, including other *care suites*, by ~~a~~ *smoke partitions* ~~*partition* complying with Section 710~~.

[BE] 407.5 Smoke barriers. *Smoke barriers* shall be provided to subdivide every *story* used by *persons* receiving care, treatment or sleeping into not fewer than two *smoke compartments. Smoke barriers* shall be provided to subdivide other *stories* with an *occupant load* of 50 or more *persons*, into not fewer than two *smoke compartments.* ~~The *smoke barrier* shall be in accordance with Section 709.~~

408.7 Security glazing. In occupancies in Group I-3, windows and doors in 1-hour *fire barriers* ~~constructed in accordance with Section 707~~, *fire partitions* ~~constructed in accordance with Section 708~~ and *smoke barriers* ~~constructed in accordance with Section 709~~ shall be permitted to have security glazing installed provided that the following conditions are met.

1. Individual panels of glazing shall not exceed 1,296 square inches (0.84 m^2).
2. The glazing shall be protected on both sides by an *automatic sprinkler system*. The sprinkler system shall be designed to, when actuated, wet completely the entire surface of any glazing affected by fire.
3. The glazing shall be in a gasketed frame and installed in such a manner that the framing system will deflect without breaking (loading) the glass before the sprinkler system operates.
4. Obstructions, such as curtain rods, drapery traverse rods, curtains, drapes or similar materials shall not be installed between the automatic sprinklers and the glazing.

410.4.1 Separation from stage. The *stage* shall be separated from dressing rooms, scene docks, property rooms, workshops,

storerooms and compartments contiguous to the *stage* and other parts of the *building* by *fire barriers* ~~constructed in accordance with Section 707~~ or *horizontal assemblies* ~~constructed in accordance with Section 711~~, or both. The *fire-resistance rating* shall be not less than 2 hours for stage heights greater than 50 feet (15 240 mm) and not less than 1 hour for *stage* heights of 50 feet (15 240 mm) or less.

410.4.2 Separation from each other. Dressing rooms, scene docks, property rooms, workshops, storerooms and compartments contiguous to the *stage* shall be separated from each other by not less than 1-hour *fire barriers* ~~constructed in accordance with Section 707~~ or *horizontal assemblies* ~~constructed in accordance with Section 711~~, or both.

412.4.1 Fire separation. A hangar shall not be attached to a *dwelling* unless separated by ~~a~~ not less than 1-hour *fire barriers* ~~*barrier* having a *fire-resistance rating* of not less than 1 hour~~. Such separation shall be continuous from the foundation to the underside of the roof and unpierced except for doors leading to the *dwelling unit*. Doors into the *dwelling unit* shall be equipped with *self-closing* devices and conform to the requirements of Section 716 with a noncombustible raised sill not less than 4 inches (102 mm) in height. Openings from a hangar directly into a room used for sleeping purposes shall not be permitted.

412.3.4 Heating equipment. Heating equipment shall be placed in another room separated by not less than 2-hour *fire barriers* ~~constructed in accordance with Section 707~~ or *horizontal assemblies* ~~constructed in accordance with Section 711~~, or both. Entrance shall be from the outside or by means of a vestibule providing a two-doorway separation. **Exceptions:**

1. Unit heaters and vented infrared radiant heating equipment suspended not less than 10 feet (3048 mm) above the upper surface of wings or engine enclosures of the highest aircraft that are permitted to be housed in the hangar need not be located in a separate room provided that they are mounted not less than 8 feet (2438 mm) above the floor in shops, offices and other sections of the hangar communicating with storage or service areas.
2. Entrance to the separated room shall be permitted by a single interior door provided that the sources of ignition in the appliances are not less than 18 inches (457 mm) above the floor.

420.2 Separation walls. Walls separating *dwelling units* in the same building, walls separating *sleeping units* in the same *building* , walls separating *dwelling units* from *sleeping units* in the same *building* and walls separating *dwelling* or *sleeping units* from other occupancies contiguous to them in the same building shall be constructed as *fire partitions* ~~in accordance with Section 708~~.

420.3 Horizontal separation. Floor assemblies separating *dwelling units* in the same *buildings*, floor assemblies separating *sleeping units* in the same *building* , floor assemblies separating *dwelling units* from *sleeping units* in the same *building* and floor assemblies separating dwelling or *sleeping units* from other occupancies contiguous to them in the same *building* shall be constructed as *horizontal assemblies* ~~in accordance with Section 711~~.

420.6 Smoke barriers in Group I-1, Condition 2. *Smoke barriers* shall be provided in Group I-1, Condition 2 to subdivide every *story* used by *persons* receiving care, treatment or sleeping and to provide other *stories* with an *occupant load* of 50 or more *persons*, into not fewer than two *smoke compartments*. Such *stories* shall be divided into *smoke compartments* with an area of not more than 22,500 square feet (2092 m^2) and the distance of travel from any point in a *smoke compartment* to a *smoke barrier* door shall not exceed 200 feet (60 960 mm). ~~The *smoke barrier* shall be in accordance with Section 709.~~

422.2 Separation. *Ambulatory care facilities* where the potential for four or more care recipients are to be *incapable of self-preservation* at any time shall be separated from adjacent spaces, *corridors* or tenants with a *fire partition* ~~installed in accordance with Section 708~~.

503.1 General. Unless otherwise specifically modified in Chapter 4 and this chapter, *building height*, number of *stories* and *building area* shall not exceed the limits specified in Sections 504 and 506 based on the type of construction as determined by Section 602 and the occupancies as determined by Section 302 except as modified hereafter. *Building height*, number of *stories* and *building area* provisions shall be applied independently. For the purposes of determining area limitations, height limitations and type of construction, each portion of a building separated by one or more *fire walls* ~~complying with Section 706~~ shall be considered to be a separate building.

508.4.4.1 Construction. Required separations shall be *fire barriers* ~~constructed in accordance with Section 707~~ or *horizontal assemblies* ~~constructed in accordance with Section 711~~, or both, so as to completely separate adjacent occupancies. *Mass timber* elements serving as *fire barriers* or *horizontal assemblies* to separate occupancies in Type IV-B or IV-C construction shall be separated from the interior of

the *building* with an *approved* thermal barrier consisting of *gypsum board* that is not less than $^{1}/_{2}$ inch (12.7 mm) in thickness or a material that is tested in accordance with and meets the acceptance criteria of both the Temperature Transmission Fire Test and the Integrity Fire Test of NFPA 275. **Exception:** A thermal barrier shall not be required on the top of horizontal assemblies serving as occupancy separations.

509.4.1 Separation. Where Table 509.1 specifies a fire-resistance-rated separation, the incidental uses shall be separated from the remainder of the *building* by ~~a *fire* barrier constructed in accordance with Section 707~~ or ~~a *horizontal* assembly constructed in accordance with Section 711~~, or both. Construction supporting 1-hour *fire barriers* or *horizontal assemblies* used for incidental use separations in *buildings* of Type IIB, IIIB and VB construction is not required to be fire-resistance rated unless required by other sections of this code.

510.7.1 Fire separation. *Fire barriers* ~~constructed in accordance with Section 707~~ or *horizontal assemblies* ~~constructed in accordance with Section 711~~ between the parking occupancy and the upper occupancy shall correspond to the required *fire-resistance rating* prescribed in Table 508.4 for the uses involved. The type of construction shall apply to each occupancy individually, except that structural members, including main bracing within the open parking *structure*, which is necessary to support the upper occupancy, shall be protected with the more restrictive fire-resistance-rated assemblies of the groups involved as shown in Table 601. *Means of egress* for the upper occupancy shall conform to Chapter 10 and shall be separated from the parking occupancy by not less than 2-hour *fire barriers* ~~having not less than a 2-hour *fire-resistance rating* as required by Section 707 with *self-closing* doors complying with Section 716~~ or *horizontal assemblies* ~~having not less than a 2-hour *fire-resistance rating* as required by Section 711~~, or both with *self-closing* doors complying with Section 716. *Means of egress* from the *open parking garage* shall comply with Section 406.5.

510.8 Group B or M buildings with Group S-2 open parking garage above. Group B or M occupancies located below a Group S-2 *open parking garage* of a lesser type of construction shall be considered as a separate and distinct *building* from the Group S-2 *open parking garage* for the purpose of determining the type of construction where the following conditions are met:

1. The *buildings* are separated with a *horizontal assembly* having a *fire-resistance rating* of not less than 2 hours.
2. The occupancies in the *building* below the *horizontal assembly* are limited to Groups B and M.
3. The occupancy above the *horizontal assembly* is limited to a Group S-2 *open parking garage*.
4. The *building* below the *horizontal assembly* is of Type IA construction. **Exception:** The *building* below the *horizontal assembly* shall be permitted to be of Type IB or II construction, but not less than the type of construction required for the Group S-2 *open parking garage* above, where the *building* below is not greater than *one story* in height above *grade plane.*
5. The height and area of the *building* below the *horizontal assembly* does not exceed the limits set forth in Section 503.
6. The height and area of the Group S-2 *open parking garage* does not exceed the limits set forth in Section 406.5. The height, in both feet and *stories*, of the Group S-2 *open parking garage* shall be measured from *grade plane* and shall include the *building* below the *horizontal assembly*.
7. *Exits* serving the Group S-2 *open parking garage* ~~shall~~ discharge at grade with direct and unobstructed access to a street or *public way* and are separated from the *building* below the *horizontal assembly* by not less than 2-hour *fire barriers* ~~constructed in accordance with Section 707~~ or ~~2-hour *horizontal assemblies* constructed in accordance with Section 711~~, or both.

706.1.1 Party walls. Any wall located on a *lot line* between adjacent *buildings*, which is used or adapted for *joint* service between the two *buildings*, shall be constructed as a *fire wall* ~~in accordance with Section 706~~. Party walls shall be constructed without openings and shall create separate *buildings*. **Exceptions:**

1. Openings in a party wall separating an *anchor building* and a *mall* shall be in accordance with Section 402.4.2.2.1.
2. Party walls and *fire walls* are not required on *lot lines* dividing a *building* for ownership purposes where the aggregate height and area of the portions of the *building* located on both sides of the *lot line* do not exceed the maximum height and area requirements of this code. For the *building official's* review and approval, the official shall be provided with copies of dedicated access easements and contractual agreements that permit the *owners* of portions of the building located on either side of the *lot line* access to the other side for purposes of maintaining fire and *life safety systems* necessary for the operation of the building.

713.2 Construction. *Shaft enclosures* shall be constructed as *fire barriers* ~~in accordance with Section 707~~ or *horizontal assemblies* ~~in accordance with Section 711~~, or both.

713.5 Continuity. *Shaft enclosures* shall be constructed as *fire barriers* ~~in accordance with Section 707~~ or *horizontal assemblies* ~~constructed in accordance with Section 711~~, or both, and shall have continuity in accordance with Section 707.5 for *fire barriers* or Section 711.2.2 for *horizontal assemblies*, as applicable.

713.11 Enclosure at the bottom. *Shafts* that do not extend to the bottom of the *building* or *structure* shall comply with one of the following:

1. Be enclosed at the lowest level with construction of the same *fire-resistance rating* as the *lowest floor* through which the *shaft* passes, but not less than the rating required for the *shaft enclosure.*
2. Terminate in a room having a use related to the purpose of the *shaft*. The room shall be separated from the remainder of the *building* by *fire barriers* ~~constructed in accordance with Section 707~~ or *horizontal assemblies* ~~constructed in accordance with Section 711~~, or both. The *fire-resistance rating* and opening protectives shall be not less than the protection required for the *shaft enclosure*.
3. Be protected by *approved fire dampers* installed in accordance with their listing at the *lowest floor* level within the *shaft enclosure*.

Exceptions:

1. The fire-resistance-rated room separation is not required, provided that the only openings in or penetrations of the *shaft enclosure* to the interior of the *building* occur at the bottom. The bottom of the *shaft* shall be closed off around the penetrating items with materials permitted by Section 718.3.1 for *draftstops* , or the room shall be provided with an *approved automatic sprinkler system*.
2. A *shaft enclosure* containing a waste or linen chute shall not be used for any other purpose and shall discharge in a room protected in accordance with Section 713.13.4.
3. The fire-resistance-rated room separation and the protection at the bottom of the *shaft* are not required provided that there are no combustibles in the *shaft* and there are no openings or other penetrations through the *shaft enclosure* to the interior of the *building*.

713.13.3 Chute access rooms. Access openings for waste, recycling or linen chutes shall be located in rooms or compartments enclosed by not less than 1-hour *fire barriers* ~~constructed in accordance with Section 707~~ or *horizontal assemblies* ~~constructed in accordance with Section 711~~, or both. Openings into the access rooms shall be protected by opening protectives having a *fire protection rating* of not less than $^3/_4$ hour. Doors shall be self- or automatic-closing upon the detection of smoke in accordance with Section 716.2.6.6. The room or compartment shall be configured to allow the access door to the room or compartment to close and latch with the access panel to the chute in any position.

713.13.4 Chute discharge room. Waste, recycling or linen chutes shall discharge into an enclosed room separated by *fire barriers* with a *fire-resistance rating* not less than the required fire rating of the *shaft enclosure* ~~and constructed in accordance with Section 707~~ or *horizontal assemblies* ~~constructed in accordance with Section 711~~, or both. Openings into the discharge room from the remainder of the *building* shall be protected by opening protectives having a *fire protection rating* based on the fire rating of the *shaft enclosure* in accordance with Tables 716.1(2) and 716.1(3) . Doors shall be self- or automatic-closing upon the detection of smoke in accordance with Section 716.2.6.6. Waste chutes shall not terminate in an incinerator room. Waste and linen rooms that are not provided with chutes need only comply with Table 509.1.

901.7 Fire areas. Where *buildings*, or portions thereof, are divided into *fire areas* so as not to exceed the limits established for requiring a *fire protection system* in accordance with this chapter, such *fire areas* shall be separated by *fire walls* ~~constructed in accordance with Section 706~~, *fire barriers* ~~constructed in accordance with Section 707~~, or *horizontal assemblies* ~~constructed in accordance with Section 711~~, or a combination thereof having a *fire-resistance rating* of not less than that determined in accordance with Section 707.3.10.

909.20.2 Construction. The *smokeproof enclosure* shall be separated from the remainder of the *building* by not less than 2-hour *fire barriers* ~~constructed in accordance with Section 707~~ or *horizontal assemblies* ~~constructed in accordance with Section 711~~, or both. Openings are not permitted other than the required *means of egress* doors. The vestibule shall be separated from the *stairway* or *ramp* by not less than 2-hour *fire barriers* ~~constructed in accordance with Section 707~~ or *horizontal assemblies* ~~constructed in accordance with Section 711~~, or both. The open exterior balcony shall be constructed in accordance with the *fire-resistance rating* requirements for floor assemblies.

909.20.6.1 Ventilation systems. *Smokeproof enclosure* ventilation systems shall be independent of other *building* ventilation systems. The equipment, control wiring, power wiring and ductwork shall comply with one of the following:

1. Equipment, control wiring, power wiring and ductwork shall be located exterior to the *building* and directly connected to the *smokeproof enclosure* or connected to the *smokeproof enclosure* by ductwork enclosed by not less than 2-hour *fire barriers* ~~constructed in accordance with Section 707~~ or *horizontal assemblies* ~~constructed in accordance with Section 711~~, or both.
2. Equipment, control wiring, power wiring and ductwork shall be located within the *smokeproof enclosure* with intake or exhaust directly from and to the outside or through ductwork enclosed by not less than 2-hour *fire barriers* ~~constructed in accordance with Section 707~~ or *horizontal assemblies* ~~constructed in accordance with Section 711~~, or both.
3. Equipment, control wiring, power wiring and ductwork shall be located within the *building* if separated from the remainder of the *building*, including other mechanical equipment, by not less than 2-hour *fire barriers* ~~constructed in accordance with Section 707~~ or *horizontal assemblies* ~~constructed in accordance with Section 711~~, or both.

Exception:

1. Control wiring and power wiring located outside of a 2-hour *fire barrier* construction shall be protected using any one of the following methods:
   1.1. Cables used for survivability of required critical circuits shall be *listed* in accordance with UL 2196 and shall have a *fire-resistance rating* of not less than 2 hours.
   1.2. Where encased with not less than 2 inches (51 mm) of concrete.
   1.3. *Electrical circuit protective systems* shall have a *fire-resistance rating* of not less than 2 hours. *Electrical circuit protective systems* shall be installed in accordance with their listing requirements.

913.2.1 Protection of fire pump rooms. Fire pumps shall be located in rooms that are separated from all other areas of the *building* by 2-hour *fire barriers* ~~constructed in accordance with Section 707~~ or ~~2-hour~~ *horizontal assemblies* ~~constructed in accordance with Section 711~~, or both. **Exceptions:**

1. In other than *high-rise buildings*, separation by not less than 1-hour *fire barriers* ~~constructed in accordance with Section 707~~ or ~~1-hour~~ *horizontal assemblies* ~~constructed in accordance with Section 711~~, or both, shall be permitted in *buildings* equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or 903.3.1.2.
2. Separation is not required for fire pumps physically separated in accordance with NFPA 20.

1009.6.4 Separation. Each *area of refuge* shall be separated from the remainder of the *story* by a *smoke barrier* ~~complying with Section 709~~ or a *horizontal exit* complying with Section 1026. Each *area of refuge* shall be designed to minimize the intrusion of smoke. **Exceptions:**

1. *Areas of refuge* located within an enclosure for *interior exit stairways* complying with Section 1023.
2. *Areas of refuge* in outdoor *facilities* where *exit access* is essentially open to the outside.

1023.2 Construction. Enclosures for interior exit *stairways* and *ramps* shall be constructed as *fire barriers* ~~in accordance with Section 707~~ or *horizontal assemblies* ~~constructed in accordance with Section 711~~, or both. *Interior exit stairway* and *ramp* enclosures shall have a *fire-resistance rating* of not less than 2 hours where connecting four stories or more and not less than 1 hour where connecting less than four stories. The number of *stories* connected by the interior exit *stairways* or *ramps* shall include any *basements*, but not any *mezzanines*. Enclosures for interior *exit stairways* and *ramps* shall have a *fire-resistance rating* not less than the floor assembly penetrated, but need not exceed 2 hours. **Exceptions:**

1. *Interior exit stairways* and *ramps* in Group I-3 occupancies in accordance with the provisions of Section 408.3.8.
2. *Interior exit stairways* within an *atrium* enclosed in accordance with Section 404.6.
3. *Interior exit stairways* in accordance with Section 510.2.

1023.3.1 Extension. Where *interior exit stairways* and *ramps* are extended to an *exit discharge* or a *public way* by an *exit passageway*, the *interior exit stairway* and *ramp* shall be separated from the *exit passageway* by ~~a~~ *fire* barriers ~~*barrier* constructed in accordance with Section 707~~ or ~~a~~ *horizontal* assemblies ~~*assembly* constructed in accordance with Section 711~~, or both. The *fire-resistance rating* shall be not less than that required for the *interior exit stairway* and *ramp*. A *fire door assembly* complying with Section 716 shall be installed in the *fire barrier* to provide a *means of egress* from the *interior exit stairway* and *ramp* to the *exit passageway*. Openings in the *fire barrier* other than the *fire door assembly* are prohibited. Penetrations of the *fire barrier* are prohibited. **Exceptions:**

1. Penetrations of the *fire barrier* in accordance with Section 1023.5 shall be permitted.
2. Separation between an *interior exit stairway* or *ramp* and the *exit passageway* extension shall not be required where there are no openings into the *exit passageway* extension.
3. Separation between an *interior exit stairway* or *ramp* and the *exit passageway* extension shall not be required where the *interior exit stairway* and the *exit passageway* extension are pressurized in accordance with Section 909.20.4.

1023.12.1 Termination and extension. A *smokeproof enclosure* shall terminate at an *exit discharge* or a *public way*. The *smokeproof enclosure* shall be permitted to be extended by an *exit passageway* in accordance with Section 1023.3. The *exit passageway* shall be without openings other than the *fire door assembly* required by Section 1023.3.1 and those necessary for egress from the *exit passageway*. The *exit passageway* shall be separated from the remainder of the *building* by not less than 2-hour *fire barriers* ~~constructed in accordance with Section 707~~ or *horizontal assemblies* ~~constructed in accordance with Section 711~~, or both. **Exceptions:**

1. Openings in the *exit passageway* serving a *smokeproof enclosure* are permitted where the *exit passageway* is protected and pressurized in the same manner as the *smokeproof enclosure*, and openings are protected as required for access from other floors.
2. The *fire barrier* separating the *smokeproof enclosure* from the *exit passageway* is not required, provided that the *exit passageway* is protected and pressurized in the same manner as the *smokeproof enclosure*.
3. A *smokeproof enclosure* shall be permitted to egress through areas on the *level of exit discharge* or vestibules as permitted by Section 1028.

1024.3 Construction. *Exit passageway* enclosures shall have walls, floors and ceilings of not less than a 1-hour *fire-resistance rating*, and not less than that required for any connecting *interior exit stairway* or *ramp*. Exit passageways shall be constructed as *fire barriers* ~~in accordance with Section 707~~ or *horizontal assemblies* ~~constructed in accordance with Section 711~~, or both.

1026.2 Separation. The separation between buildings or refuge areas connected by a *horizontal exit* shall be provided by ~~a *fire wall,* complying with Section 706; or by a *fire barrier* complying with Section 707 or a *horizontal assembly* complying with Section 711, or both~~ not less than 2-hour fire walls, fire barriers or horizontal assemblies, or a combination thereof. ~~The minimum *fire-resistance rating* of the separation shall be 2 hours.~~ Opening protectives in horizontal *exits* shall also comply with Section 716. Duct and air transfer openings in a *fire wall* or *fire barrier* that serves as a *horizontal exit* shall also comply with Section 717. The *horizontal exit* separation shall extend vertically through all levels of the building unless floor assemblies have a *fire-resistance rating* of not less than 2 hours and do not have unprotected openings.

Exception: A *fire-resistance rating* is not required at horizontal *exits* between a *building* area and an above-grade *pedestrian*

walkway constructed in accordance with Section 3104, provided that the distance between connected buildings is more than 20 feet (6096 mm).

Horizontal exits constructed as *fire barriers* shall be continuous from *exterior wall* to *exterior wall* so as to divide completely the floor served by the *horizontal exit*.

1028.2 Exit discharge. *Exits* shall discharge directly to the exterior of the *building*. The *exit discharge* shall be at grade or shall provide a direct path of egress travel to grade. The *exit discharge* shall not reenter a *building*. The combined use of Exceptions 1 and 2 shall not exceed 50 percent of the number and minimum width or required capacity of the required *exits*. **Exceptions:**

1. Not more than 50 percent of the number and minimum width or required capacity of *interior exit stairways* and *ramps* is permitted to egress through areas, including *atriums*, on the level of discharge provided that all of the following conditions are met:
   1.1. Discharge of *interior exit stairways* and *ramps* shall be provided with a free and unobstructed path of travel to an exterior *exit* door and such *exit* is readily visible and identifiable from the point of termination of the enclosure.
   1.2. The entire area of the *level of exit discharge* is separated from areas below by construction conforming to the *fire-resistance rating* for the enclosure.
   1.3. The egress path from the *interior exit stairway* and *ramp* on the *level of exit discharge* is protected throughout by an *approved automatic sprinkler system*. Portions of the *level of exit discharge* with access to the egress path shall be either equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1 or 903.3.1.2, or separated from the egress path in accordance with the requirements for the enclosure of *interior exit stairways* or *ramps*.
   1.4. Where a required *interior exit stairway* or *ramp* and an *exit access stairway* or *ramp* serve the same floor level and terminate at the same *level of exit discharge*, the termination of the *exit access stairway* or *ramp* and the *exit discharge* door of the *interior exit stairway* or *ramp* shall be separated by a distance of not less than 30 feet (9144 mm) or not less than one-fourth the length of the maximum overall diagonal dimension of the *building*, whichever is less. The distance shall be measured in a straight line between the *exit discharge* door from the *interior exit stairway* or *ramp* and the last tread of the *exit access stairway* or termination of slope of the *exit access ramp*.
2. Not more than 50 percent of the number and minimum width or required capacity of the *interior exit stairways* and *ramps* is permitted to egress through a vestibule provided that all of the following conditions are met:
   2.1. The entire area of the vestibule is separated from areas below by construction conforming to the *fire-resistance rating* of the *interior exit stairway* or *ramp enclosure*.
   2.2. The depth from the exterior of the *building* is not greater than 10 feet (3048 mm) and the length is not greater than 30 feet (9144 mm).
   2.3. The area is separated from the remainder of the *level of exit discharge* by a *fire partition* ~~constructed in accordance with Section 708~~. **Exception:** The maximum transmitted temperature rise is not required.
   2.4. The area is used only for *means of egress* and *exits* directly to the outside.
3. *Horizontal exits* complying with Section 1026 shall not be required to discharge directly to the exterior of the *building*.

1030.1.1.1 Spaces under grandstands and bleachers. Spaces under *grandstands* or *bleachers* shall be separated by not less than 1-hour *fire barriers* ~~complying with Section 707 and~~ or *horizontal assemblies* ~~complying with Section 711 with not less than 1-hour *fire-resistance-rated* construction~~, or both. **Exceptions:**

1. Ticket booths less than 100 square feet (9.29 m^2) in area.
2. Toilet rooms.
3. Other accessory use areas 1,000 square feet (92.9 m^2) or less in area and equipped with an *automatic sprinkler system* in accordance with Section 903.3.1.1.

3005.4 Machine rooms, control rooms, machinery spaces, and control spaces. The following rooms and spaces shall be enclosed with *fire barriers* ~~constructed in accordance with Section 707~~ or *horizontal assemblies* ~~constructed in accordance with Section 711~~, or both:

1. Machine rooms.
2. Control rooms.
3. Control spaces.
4. Machinery spaces outside of the hoistway enclosure.

The *fire-resistance rating* shall be not less than the required rating of the hoistway enclosure served by the machinery. Openings in the *fire barriers* shall be protected with assemblies having a *fire protection rating* not less than that required for the hoistway enclosure doors.

Exceptions:

1. For other than fire service access elevators and occupant evacuation elevators, where machine rooms, machinery spaces, control rooms and control spaces do not abut and do not have openings to the hoistway enclosure they serve, the *fire barriers* ~~constructed in accordance with Section 707~~ or *horizontal assemblies* ~~constructed in accordance with Section 711~~, or both, shall be permitted to be reduced to a 1-hour *fire-resistance rating*.
2. For other than fire service access elevators and occupant evacuation elevators, in *buildings* four *stories* or less above *grade plane* where machine room, machinery spaces, control rooms and control spaces do not abut and do not have openings to the hoistway enclosure they serve, the machine room, machinery spaces, control rooms and control spaces are not required to be fire-resistance rated.

3006.3 Elevator hoistway door protection. Where Section 3006.2 requires protection of the elevator hoistway doors, the protection shall be provided by one of the following:

1. An enclosed elevator lobby shall be provided at each floor to separate the elevator hoistway doors from each floor with *fire partitions* ~~in accordance with Section 708~~. In addition, doors protecting openings in the fire partitions shall comply with Section 716.2.2.1. Penetrations of the fire partitions by ducts and air transfer openings shall be protected as required for *corridors* in accordance with Section 717.5.4.1.
2. An enclosed elevator lobby shall be provided at each floor to separate the elevator hoistway doors from each floor by *smoke partitions* ~~in accordance with Section 710~~. In addition, doors protecting openings in the *smoke partitions* shall comply with Sections 710.5.2.2, 710.5.2.3 and 716.2.6.1. Penetrations of the *smoke partitions* by ducts and air transfer openings shall be protected as required for *corridors* in accordance with Section 717.5.4.1.
3. Additional doors or other devices shall be provided at each elevator hoistway door in accordance with Section 3002.6. Such doors or other devices shall comply with the smoke and draft control door assembly requirements in Section 716.2.2.1.1 when tested in accordance with UL 1784 without an artificial bottom seal.
4. The elevator hoistway shall be pressurized in accordance with Section 909.21.
5. A *smoke-protective curtain assembly for hoistways* shall be provided at each elevator hoistway door opening in accordance with Section 3002.6. Such curtain assemblies shall comply with the smoke and draft control requirements in Section 716.2.2.1.1 when tested in accordance with UL 1784 without an artificial bottom seal. Such curtain assemblies shall be equipped with a control unit *listed* to UL 864. Such curtain assemblies shall comply with Section 2.11.6.3 of ASME A17.1/CSA B44. Installation and maintenance shall be in accordance with NFPA 105.

3104.5.1 Fire barriers. *Pedestrian walkways* shall be separated from the interior of the *building* by not less than 2-hour *fire barriers* constructed in accordance with ~~Section~~ Sections 707 and ~~Sections~~ 3104.5.1.1 through 3104.5.1.3.

2024 International Fire Code

Revise as follows:

[BF] 909.20.2 Construction. The *smokeproof enclosure* shall be separated from the remainder of the building by not less than 2-hour *fire barriers* ~~constructed in accordance with Section 707 of the *International Building Code*~~ or *horizontal assemblies* ~~constructed in accordance with Section 711 of the *International Building Code*~~, or both. Openings are not permitted other than the required *means of egress* doors. The vestibule shall be separated from the *stairway* or *ramp* by not less than 2-hour *fire barriers* ~~constructed in accordance with Section 707 of the *International Building Code*~~ or *horizontal assemblies* ~~constructed in accordance with Section 711 of the *International Building Code*,~~ or both. The open exterior balcony shall be constructed in accordance with the *fire-resistance-rating* requirements for floor assemblies.

[BF] 909.20.5.1 Ventilation systems. *Smokeproof enclosure* ventilation systems shall be independent of other building ventilation systems. The equipment, control wiring, power wiring and ductwork shall comply with one of the following:

1. Equipment, control wiring, power wiring and ductwork shall be located exterior to the building and directly connected to the *smokeproof enclosure* or connected to the *smokeproof enclosure* by ductwork enclosed by not less than 2-hour *fire barriers* ~~constructed in accordance with Section 707 of the *International Building Code*~~ or *horizontal assemblies* ~~constructed in accordance with Section 711 of the *International Building Code*,~~ or both.
2. Equipment, control wiring, power wiring and ductwork shall be located within the *smokeproof enclosure* with intake or exhaust directly from and to the outside or through ductwork enclosed by not less than 2-hour *fire barriers* ~~constructed in accordance with Section 707 of the *International Building Code*~~ or *horizontal assemblies* ~~constructed in accordance with Section 711 of the *International Building Code*~~, or both.
3. Equipment, control wiring, power wiring and ductwork shall be located within the building if separated from the remainder of the building, including other mechanical equipment, by not less than 2-hour *fire barriers* ~~constructed in accordance with Section 707 of the *International Building Code*~~ or *horizontal assemblies* ~~constructed in accordance with Section 711 of the *International Building Code*,~~ or both.

Exception: Control wiring and power wiring located outside of a 2-hour *fire barrier* construction shall be protected using any one of the following methods:

1. Cables used for survivability of required *critical circuits* shall be *listed* in accordance with UL 2196 and shall have a *fire-resistance rating* of not less than 2 hours.
2. Where encased with not less than 2 inches (51 mm) of concrete.
3. Electrical circuit protective systems shall have a *fire-resistance rating* of not less than 2 hours. Electrical circuit protective systems shall be installed in accordance with their listing requirements.

[BE] 1023.2 Construction. Enclosures for *interior exit stairways* and *ramps* shall be constructed as *fire barriers* ~~in accordance with Section 707 of the International Building Code~~ or *horizontal assemblies* ~~constructed in accordance with Section 711 of the International Building Code,~~ or both. *Interior exit stairway* and *ramp* enclosures shall have a *fire-resistance rating* of not less than 2 hours where connecting four stories or more and not less than 1 hour where connecting less than four stories. The number of stories connected by the *interior exit stairways* or *ramps* shall include any *basements*, but not any *mezzanines*. Enclosure for *interior exit stairways* and *ramps* shall have a *fire-resistance rating* not less than the floor assembly penetrated, but need not exceed 2 hours. **Exceptions:**

1. *Interior exit stairways* and *ramps* in Group I-3 occupancies in accordance with the provisions of Section 408.3.8 of the International Building Code.
2. *Interior exit stairways* within an atrium enclosed in accordance with Section 404.6 of the International Building Code.
3. *Interior exit stairways* in accordance with Section 510.2 of the *International Building Code*.

[BE] 1023.3.1 Extension. Where *interior exit stairways* and *ramps* are extended to an *exit discharge* or a *public way* by an *exit passageway*, the *interior exit stairway* and *ramp* shall be separated from the *exit passageway* by ~~a~~ *fire barriers* ~~constructed in accordance with Section 707 of the International Building Code~~ or ~~a~~ *horizontal assemblies* ~~*assembly* constructed in accordance with Section 711 of the International Building Code,~~ or both. The *fire-resistance rating* shall be not less than that required for the *interior exit stairway* and *ramp*. A *fire door* assembly complying with Section 716 of the International Building Code shall be installed in the *fire barrier* to provide a *means of egress* from the *interior exit stairway* and *ramp* to the *exit passageway*. Openings in the *fire barrier* other than the *fire door*

assembly are prohibited. Penetrations of the *fire barrier* are prohibited.

Exceptions:

1. Penetrations of the *fire barrier* in accordance with Section 1023.5 shall be permitted.
2. Separation between an *interior exit stairway* or *ramp* and the *exit passageway* extension shall not be required where there are no openings into the *exit passageway* extension.
3. Separation between an *interior exit stairway* or *ramp* and the *exit passageway* extension shall not be required where the *interior exit stairway* and the *exit passageway* extension are pressurized in accordance with Section 909.20.4 of the International Building Code.

[BE] 1023.12.1 Termination and extension. A *smokeproof enclosure* shall terminate at an *exit discharge* or a *public way*. The *smokeproof enclosure* shall be permitted to be extended by an *exit passageway* in accordance with Section 1023.3. The *exit passageway* shall be without openings other than the *fire door assembly* required by Section 1023.3.1 and those necessary for egress from the *exit passageway*. The *exit passageway* shall be separated from the remainder of the building by not less than 2-hour *fire barriers* ~~constructed in accordance with Section 707 of the International Building Code~~ or *horizontal assemblies* ~~constructed in accordance with Section 711 of the International Building Code,~~ or both.

Exceptions:

1. Openings in the *exit passageway* serving a *smokeproof enclosure* are permitted where the *exit passageway* is protected and pressurized in the same manner as the *smokeproof enclosure*, and openings are protected as required for access from other floors.
2. The *fire barrier* separating the *smokeproof enclosure* from the *exit passageway* is not required, provided that the *exit passageway* is protected and pressurized in the same manner as the *smokeproof enclosure*.
3. A *smokeproof enclosure* shall be permitted to egress through areas on the *level of exit discharge* or vestibules as permitted by Section 1028.

[BE] 1026.2 Separation. The separation between buildings or refuge areas connected by a *horizontal exit* shall be provided by ~~a *fire wall* complying with Section 706 of the International Building Code; or by a *fire barrier* complying with Section 707 of the International Building Code or a *horizontal assembly* complying with Section 711 of the International Building Code, or both.~~ not less than 2-hour fire walls, fire barriers or horizontal assemblies, or a combination thereof. ~~The minimum *fire-resistance rating* of the separation shall be 2 hours.~~ Opening protectives in *horizontal exits* shall also comply with Section 716 of the International Building Code. Duct and air transfer openings in a *fire wall* or *fire barrier* that serves as a *horizontal exit* shall also comply with Section 717 of the International Building Code. The *horizontal exit* separation shall extend vertically through all levels of the building unless floor assemblies have a *fire-resistance rating* of not less than 2 hours and do not have unprotected openings.

Exception: A *fire-resistance rating* is not required at *horizontal exits* between a building area and an above-grade pedestrian walkway constructed in accordance with Section 3104 of the International Building Code, provided that the distance between connected buildings is more than 20 feet (6096 mm).

Horizontal exits constructed as *fire barriers* shall be continuous from *exterior wall* to *exterior wall* so as to divide completely the floor served by the *horizontal exit*.

[BE] 1028.2 Exit discharge. *Exits* shall discharge directly to the exterior of the building. The *exit discharge* shall be at grade or shall provide a direct path of egress travel to grade. The *exit discharge* shall not reenter a building. The combined use of Exceptions 1 and 2 shall not exceed 50 percent of the number and minimum width or required capacity of the required *exits*. **Exceptions:**

1. Not more than 50 percent of the number and minimum width or required capacity of *interior exit stairways* and *ramps* is permitted to egress through areas, including atriums, on the *level of discharge* provided that all of the following conditions are met:

   1.1. Discharge of *interior exit stairways* and *ramps* shall be provided with a free and unobstructed path of travel to an exterior exit door and such *exit* is readily visible and identifiable from the point of termination of the enclosure.

   1.2. The entire area of the *level of exit discharge* is separated from areas below by construction conforming to the *fire-resistance rating* for the enclosure.

   1.3. The egress path from the *interior exit stairway* and *ramp* on the *level of exit discharge* is protected throughout by an *approved automatic sprinkler system*. Portions of the *level of exit discharge* with access to the egress path shall either be equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1 or 903.3.1.2, or separated from the egress path in accordance with the requirements for the enclosure of *interior exit stairways* or *ramps*.

   1.4. Where a required *interior exit stairway* or *ramp* and an *exit access stairway* or *ramp* serve the same floor level and terminate at the same *level of exit discharge*, the termination of the *exit access stairway* or *ramp* and the exit discharge door of the *interior exit stairway* or *ramp* shall be separated by a distance of not less than 30 feet (9144 mm) or not less than one-fourth the length of the maximum overall diagonal dimension of the building, whichever is less. The distance shall be measured in a straight line between the exit discharge door from the *interior exit stairway* or *ramp* and the last tread of the *exit access stairway* or termination of slope of the *exit access ramp*.

2. Not more than 50 percent of the number and minimum width or required capacity of the *interior exit stairways* and *ramps* is permitted to egress through a vestibule provided that all of the following conditions are met:

   2.1. The entire area of the vestibule is separated from areas below by construction conforming to the *fire-resistance rating* of the *interior exit stairway* or *ramp* enclosure.

   2.2. The depth from the exterior of the building is not greater than 10 feet (3048 mm) and the length is not greater than 30 feet (9144 mm).

   2.3. The area is separated from the remainder of the *level of exit discharge* by a *fire partition* ~~constructed in accordance with Section 708 of the International Building Code~~. **Exception:** The maximum transmitted temperature rise is not required.

   2.4. The area is used only for *means of egress* and *exits* directly to the outside.

3. *Horizontal exits* complying with Section 1026 shall not be required to discharge directly to the exterior of the building.

[BE] 1030.1.1.1 Spaces under grandstands and bleachers. Spaces under *grandstands* or *bleachers* shall be separated by <u>not less than 1-hour</u> *fire barriers* ~~complying with Section 707 of the International Building Code~~ and *horizontal assemblies* ~~complying with Section 711 of the International Building Code with not less than 1-hour *fire-resistance-rated* construction~~ <u>, or both .</u>

Exceptions:

1. Ticket booths less than 100 square feet (9 m^2) in area.
2. Toilet rooms.
3. Other accessory use areas 1,000 square feet (93 m^2) or less in area and equipped with an *automatic sprinkler system* in accordance with Section 903.3.1.1.

Reason: This proposal is designed to provide consistency with references to fire-resistance-rated construction requirements. The 2024 IBC makes multiple requirements for fire walls, fire barriers, fire partitions, smoke barriers, and smoke partitions. The format of the requirements is not consistent, but more importantly, there is really no need to reference the section regulating these components every time a requirement is made. These terms are all defined terms and each component has a specific section that it must comply with. Where Section 426.1.7 requires a tire buffing room to be separated from the remainder of the building by 1-hour fire barriers, it is understood that the fire barrier must comply with the code. If the fire barrier does not comply with the code, it is not a fire barrier.

For example, the IBC does not state provide “exit doors in accordance with Section 1010” every time an exit door is required. Such language is not necessary and the code does not need to state it, because if the door does not comply then it is not considered an exit door.

Currently, the IBC does not reference the specific sections in the following locations:
404.6, 407.5.4, 408.6.1, 412.4.1, 415.9.1.2, 415.11.1.6, 415.11.7.4, 420.6, 426.1.7, 507.9, 510.2, 510.5, 510.6, 707.3.10, 714.4, 714.5.4, 717.5.1.1, 909.6, 909.6.2, 909.18.6, 910.3.2, 911.1.6, 1026.2, 3007.6.2, 3008.6.2
None of these sections refer back to Chapter 7, but they all seem to work effectively without that reference.

This proposal intends to eliminate the multiple phrases “constructed in accordance with Section 70X” because they are not needed, and are basically redundant. The code proves that they are not needed by the number of references where the section for construction is not included.

Even where a section in Chapter 7 is referenced, a number of references are worded differently. Some of those sections include:

- **402.4.2.2** Anchor building separation. …fire walls complying with Section 706.
- **420.2** Separation walls. …fire partitions in accordance with Section 708
- **422.2** Separation walls. …fire partitions installed in accordance with Section 708
- **716.3.2.1.1** Where 3/4-hour-fire-protection window assemblies permitted. …fire partitions designed in accordance with Section 708
- **1026.2** Separation. …fire wall complying with Section 706; or by a fire barrier complying with Section 707 or a horizontal assembly complying with Section 711, or both.

This code change is editorial and makes no change in code application. This proposal simplifies the code language and provides consistency in the requirements for fire walls, fire barriers, smoke barriers, etc.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal is long, but it is entirely editorial. There is no change in code application or code requirements.

FS21-24 Part I

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee has concerns with "where required by this code". The committee indicated that the proposal needs to maintain the authority between codes. The committee agreed with some of the proposed text for example, the IBC does not state provide “exit doors in accordance with Section 1010” every time an exit door is required. Such language is not necessary and the code does not need to state it, because if the door does not comply then it is not considered an exit door (Vote: 10-1).

FS21-24 Part I

Individual Consideration Agenda

Comment 1:

IBC: 706.1, 707.1, 709.1, 710.1, 711.1

Proponents: Kevin Scott, KH Scott & Associates LLC, self (khscottassoc@gmail.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

Revise as follows:

706.1 General. *Fire walls* ~~required by this code or the *International Fire Code*~~ shall be constructed in accordance with Sections 706.2 through 706.11. The extent and location of such *fire walls* shall provide a complete separation. Where a *fire wall* separates occupancies that are required to be separated by a *fire barrier* wall, the most restrictive requirements of each separation shall apply.

707.1 General. *Fire barriers* ~~required by this code or the *International Fire Code*~~ shall comply with this section.

Revise as follows:

709.1 General. Vertical and horizontal *smoke barriers* ~~required by this code or the *International Fire Code*~~ shall comply with this section.

710.1 General. *Smoke partitions* ~~required by this code or the *International Fire Code*~~ shall comply with this section.

711.1 General. *Horizontal assemblies* ~~required by this code or the *International Fire Code*~~ shall comply with Section 711.2. Nonfire-resistance-rated floor and *roof assemblies* shall comply with Section 711.3.

Reason: This item was Disapproved at CAH 1. FS21-24 Part II was Approved as Modified at CAH 1.

The only negative comment about the proposal was with regard to whether the IFC could require fire barriers, fire walls, etc. Without entering into that argument, this comment has been revised to correlate all of 5 charging sections dealing with each type of fire-rated or smoke-rated assembly so that they do not reference which code the requirement comes from. The issue is if it is a fire barrier, how is it constructed...Section 707 provides those provisions; and Section 706 for fire walls, etc.

The language used in each section matches the original language in Section 709.1 for smoke barriers, "vertical and horizontal smoke barriers shall comply with this section." Very simple; and each section conveys the same message.

Then throughout the code, where the code refers to a fire wall, for example in IBC Section 402.4.2.2, the code user refers back IBC Section 406 which provides the criteria on construction.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

There is no change in code application or code requirements.

Comment (CAH2)# 794

FS23-24

IBC: 706.3

Proposed Change as Submitted

Proponents: David Bueche, Hoover Treated Wood Products, Hoover Treated Wood Products (dbueche@frtw.com)

2024 International Building Code

Revise as follows:

706.3 Materials. *Fire walls* shall be of any *approved* noncombustible materials. **Exception:** *Buildings* of Type III or V construction.

Reason: Type III construction allows use of untreated combustible materials in all locations except in a fire wall or an exterior wall. The code already allows 2 hour exterior wall to be constructed of fire-retardant-treated wood in lieu of noncombustible materials in Type III construction. It makes sense to extend that to a fire wall as the performance would be no different. This code change eliminates any potential conflict with Section 602.3.

Furthermore, building a fire wall using a completely different construction method such as concrete or masonry not employed in the remainder of the building requires a specialty contractor. This may result in scheduling and coordination conflicts and delays that necessarily result in higher costs.

Note that the fire resistances listed in Table 706.4 remain unchanged.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

$0.00

The addition of fire-retardant-treated wood as an option to this section of the code may decrease the cost of construction.

Estimated Immediate Cost Impact Justification (methodology and variables):

Fire-retardant-treated wood is generally less expensive than noncombustible materials. Because FRTW may be used as an alternate to these materials, the cost may be less.

FS23-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The proposal was disapproved as requested by the proponent to work on the proposal for the CAH2 (Vote: 11-0).

FS23-24

Individual Consideration Agenda

Comment 1:

IBC: 706.3

Proponents: David Bueche, Hoover Treated Wood Products, Hoover Treated Wood Products (dbueche@frtw.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

706.3 Materials. *Fire walls* shall be of any *approved* noncombustible materials. ~~**Exception**~~ **Exceptions:**

1. *Buildings* of ~~Type III or~~ V construction.
2. *Fire-retardant-treated wood* complying with section 2303.2 shall be permitted in buildings of Type III construction.

Reason: This clarifies that the intent is to allow fire-retardant-treated wood to be used in fire walls of Type III construction. This type of construction allows use of untreated combustible materials in all locations except in a fire wall or an exterior wall. The code already allows 2 hour exterior walls to be built of fire-retardant-treated wood in lieu of noncombustible materials in Type III construction. It makes sense to extend that to a fire wall as the performance would be no different. This code change eliminates any potential conflict with Section 602.3.

Furthermore, building a fire wall using a completely different construction method such as concrete or masonry not employed in the remainder of the building requires a specialty contractor. This may result in scheduling and coordination conflicts and delays that necessarily result in higher costs.

Note that the fire resistances listed in Table 706.4 remain unchanged.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

$0.00

The addition of fire-retardant-treated wood as an option to this section of the code may decrease the cost of construction.

Estimated Immediate Cost Impact Justification (methodology and variables):

Fire-retardant-treated wood is generally less expensive than noncombustible materials. Because FRTW may be used as an alternate to these materials, the cost may be less.

Comment (CAH2)# 618

FS24-24

IBC: 706.5

Proposed Change as Submitted

Proponents: Tim Pate, City and County of Broomfield, Colorado Chapter Code Development Committee (tpate@broomfield.org)

2024 International Building Code

Revise as follows:

706.5 Horizontal continuity. *Fire walls* shall be continuous from *exterior wall* to *exterior wall* and shall extend not less than 18 inches (457 mm) beyond the exterior surface of *exterior walls*. **Exceptions:**

1. *Fire walls* shall be permitted to terminate at the interior surface of combustible exterior sheathing or siding provided that the *exterior wall* has a *fire-resistance rating* of not less than 1 hour for a horizontal distance of not less than 4 feet (1220 mm) on both sides of the *fire wall*. Openings within such *exterior walls* shall be protected by opening protectives having a *fire protection rating* of not less than $^{3}/_{4}$ hour.
2. *Fire walls* shall be permitted to terminate at the interior surface of *fire-retardant-treated-wood* or noncombustible exterior sheathing, exterior siding or other noncombustible exterior finishes provided that the sheathing, siding or other exterior noncombustible finish extends a horizontal distance of not less than 4 feet (1220 mm) on both sides of the *fire wall*.
3. *Fire walls* shall be permitted to terminate at the interior surface of *fire-retardant-treated-wood* or noncombustible exterior sheathing where the *building* on each side of the *fire wall* is protected by an *automatic sprinkler system* installed in accordance with Section 903.3.1.1 or 903.3.1.2.

Reason: This proposal is to add fire retardant treated wood in addition to the noncombustible sheathing in 706.5 exception 2 and 3. This would be equivalent to 706.6 #4 for vertical continuity which requires fire-retardant-treated wood roof sheathing for roof sheathing or installing the ⅝" type X drywall to underside of regular roof sheathing.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal will not increase or decrease cost of construction since it is adding another type of product to meet the code

FS24-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee disagreed with the proposed text to exceptions 2 and 3 in Section 706.5 for horizontal continuity. The committee has an issue with adding "fire-retardant-treated-wood" before the noncombustible exterior sheathing (Vote: 10-1).

FS24-24

Individual Consideration Agenda

Comment 1:

IBC: 706.5

Proponents: Edward Lisinski, American Wood Council (elisinski@awc.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

706.5 Horizontal continuity. *Fire walls* shall be continuous from *exterior wall* to *exterior wall* and shall extend not less than 18 inches (457 mm) beyond the exterior surface of *exterior walls*. **Exceptions:**

1. *Fire walls* shall be permitted to terminate at the interior surface of combustible exterior sheathing or siding provided that the *exterior wall* has a *fire-resistance rating* of not less than 1 hour for a horizontal distance of not less than 4 feet (1220 mm) on both sides of the *fire wall*. Openings within such *exterior walls* shall be protected by opening protectives having a *fire protection rating* of not less than $^{3}/_{4}$ hour.
2. *Fire walls* shall be permitted to terminate at the interior surface of ~~*fire-retardant-treated wood* or~~ noncombustible exterior sheathing, exterior siding or other noncombustible exterior finishes provided that the sheathing, siding or other exterior noncombustible finish extends a horizontal distance of not less than 4 feet (1220 mm) on both sides of the *fire wall*.
3. *Fire walls* shall be permitted to terminate at the interior surface of ~~*fire-retardant-treated wood* or~~ noncombustible exterior sheathing where the *building* on each side of the *fire wall* is protected by an *automatic sprinkler system* installed in accordance with Section 903.3.1.1 or 903.3.1.2.
4. In buildings of Type III, IV-HT or V construction, *fire walls* shall be permitted to terminate at the interior surface of *fire-retardant-treated-wood* exterior sheathing provided that *fire-retardant-treated wood* exterior sheathing extends a horizontal distance of not less than 4 feet (1220 mm) on both sides of the *fire wall*.
5. In buildings of Type III, IV-HT or V construction, *fire walls* shall be permitted to terminate at the interior surface of *fire-retardant-treated-wood* exterior sheathing where the *building* on each side of the *fire wall* is protected by an *automatic sprinkler system* installed in accordance with Section 903.3.1.1 or 903.3.1.2.

Reason: The testimony at Committee Action Hearing #1 raised concerns with fire-retardant-treated wood (FRTW) exterior sheathing being used in any type of construction as a replacement for noncombustible exterior sheathing. Direction was offered to model this code change after language used in Section 706.6, Exception #4, which limited the use of FRTW roof sheathing to buildings of Type III, IV and V construction when terminating a fire wall vertically. This proposed comment on FS24-24 mirrors that option to provide termination of a fire wall horizontally at FRTW sheathing only in Types III, IV-HT and V construction. Additional testimony mentioned that we would be weakening a building by permitting FRTW exterior sheathing on many buildings, but by limiting the types of construction, only buildings which permit FRTW exterior sheathing are included, so there would be no weakening of building elements in these instances.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The original proposal was also considered editorial because it is just adding an additional method for code compliance.

Comment (CAH2)# 38

FS26-24

IBC: 707.3, 707.3.12 (New)

Proposed Change as Submitted

Proponents: Micah Chappell, Seattle Department of Construction and Inspections, Seattle Department of Construction and Inspections (micah.chappell@seattle.gov); Ardel Jala, Seattle Dept of Construction & Inspections, Seattle Dept of Construction & Inspections (ardel.jala@seattle.gov)

2024 International Building Code

707.3 Fire-resistance rating. The *fire-resistance rating* of *fire barriers* shall comply with this section.

Add new text as follows:

707.3.12 Energy Storage Systems. The *fire barrier* separating *energy storage systems* from other spaces in the building shall have a minimum 2-hour *fire-resistance rating.*

Reason: The 2024 International Fire Code (IFC) requires fire barriers provide a 2-hour fire resistance rating when separating areas containing energy storage systems (ESS), from other areas of the building, and has a pointer to Section 707 of the International Building Code (IBC). This proposed additional language to Section 707.3 of the IBC provides the minimum fire resistance rating required for those fire barriers aligning the IBC with IFC.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The IFC already required the rated separation and this code change proposal only aligns the IBC with the existing requirement.

FS26-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee agreed that this is a needed clarification. However, the committee suggested to the proponent to work on a scoping statement between IBC and IFC. The committee also suggested providing limitations of implementation to the added text to avoid unintended consequences (Vote: 9-1).

FS26-24

Individual Consideration Agenda

Comment 1:

IBC: 707.3.12

Proponents: Micah Chappell, Seattle Department of Construction and Inspections, Seattle Department of Construction and Inspections

(micah.chappell@seattle.gov) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

Revise as follows:

707.3.12 Energy Storage Systems. Where required by the *International Fire Code* ~~T~~the *fire barrier* separating *energy storage systems* from other spaces in the building shall have a minimum 2-hour *fire-resistance rating*.

Reason: We request your approval of this modification that was requested by the Committee.

This modification mimics the language the Committee approved for FS34-24-Chappell-MP1 that provides a reference to the Fire Code were the requirement originates for energy storage systems.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This provides a reference to the fire code, no cost impact to the original proposal.

Comment (CAH2)# 623

FS31-24

IBC: 709.9 (New)

Proposed Change as Submitted

Proponents: Jeff O'Neil, Chair, Committee on Healthcare (ahc@iccsafe.org); William Koffel, Koffel Associates, Inc., California Solar and Storage Association (CALSSA) (wkoffel@koffel.com)

2024 International Building Code

Add new text as follows:

709.9 Separating smoke compartments. Where the horizontal assembly is required to be a smoke barrier, the assembly shall comply with Section 909.

Reason: The code does not completely address where the floors (horizontal assemblies) are required to also be designed as smoke barriers. Section 711.2.4.4 sends you to Section 709 for smoke barriers that are horizontal assemblies. Smoke compartments are required in ambulatory care, Group I-1 Condition 2, Group I-2 and Group I-3. Pressurized stairways also use horizontal smoke barriers. As indicated in Section 422.3, smoke barriers shall be provided on any story containing an ambulatory care facility which is greater than 10,000 sq. ft. in area. The creation of smoke compartments is required to allow a protect-in-place environment. These compartments allow staff a safer environment to stabilize the care recipients before evacuation and protection for fire personnel who may have to evacuate both care recipients and staff. The requirement for a smoke barrier is based solely on a story-by-story basis without consideration of fire-resistance ratings for the floor assemblies. As such, a smoke barrier is not required for the floor assemblies.

Since the primary performance of smoke barriers is to achieve protection on the fire floor, the supporting construction is not required to provide the same degree of fire resistance for buildings of Types IIB, IIIB and VB construction as specified in Section 709.4. These three construction types are identified since the floor construction is not otherwise required to have a fire-resistance rating and it is not considered essential to require fire-resistance-rated floor construction due to the floor supporting a smoke barrier. As such, since the building in question is of Type IIB construction, the supporting construction for the smoke barrier is not required to have a fire-resistance rating.

This proposal is submitted by the ICC Committee for Healthcare (CHC).
The Committee on Healthcare (CHC) was established by the ICC Board of Directors in 2011 to pursue opportunities to study and develop effective and efficient provisions for Hospital, Nursing Homes, Assisted Living and Ambulatory Care Facilities. This committee was formed in cooperation with the American Society for Healthcare Engineering (ASHE). In July of 2017, the ICC Board made CHC a standing committee. In 2023 the CHC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the CHC website at CHC webpage.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is a clarification with no change to construction requirements. Please refer to the reason statement.

Public Hearing Results (CAH1)

Committee Action: **As Submitted**

Committee Reason: The committee deemed the proposed code change is needed to clarify the requirements for separating smoke compartments. The committee agreed that the pointer to section 909 is needed where the horizontal assembly is required to be a smoke barrier (Vote: 9-2).

FS31-24

Individual Consideration Agenda

Comment 1:

Proponents: Ajay Prasad, Jensen Hughes, Self (aprasad@jensenhughes.com) requests Disapproved

Reason: This code change is not necessary. The intent of the change was stated as addressing where floors (horizontal assemblies) are required to be smoke barriers. The code change would require horizontal assemblies as smoke barriers to comply with Section 909 for smoke control systems. Section 909 broadly covers mechanical and passive smoke control systems.

Section 709 covers both vertical and horizontal smoke barriers but the scoping requirement for smoke barriers originates in other sections. Section 407.5 only requires vertical smoke barriers (i.e., walls) to comply with 709.Section 407.5.5 requires horizontal assemblies supporting smoke barriers to resist the movement of smoke but this section does not reference Section 709. Since smoke compartment in institutional occupancies is primarily passive, the current provisions in Section 709 are sufficient to limit the movement of smoke without the need to reference Section 909.

Section 709.4.1 requires continuity of smoke barrier walls.Section 709.5 requires openings in smoke barriers to be protected per Section 716 but has key exceptions for cross-corridor doors in Groups I-1, I-2 and ambulatory care facilities

Sections 709.6, 709.7, and 709.8 address with penetrations, joints, and duct/air transfer openings respectively. Specifically, limiting smoke spread through horizontal smoke barriers is already covered by references in Section 709. Section 709.6 references 714. 714.5.4 for penetrations of smoke barriers requires a L rating. Section 709.7 references 715. 715.9 requires L ratings for joints in smoke barriers. Section 709.8 references 717.5.5 which requires smoke dampers in duct/ATO penetrations of smoke barriers.

A code change to 407.5.5 to reference Section 709 is a more straightforward solution that should be considered by the submitters.

Proposed §709.10 would include compliance with §909.5 for smoke barrier construction which states, “Smoke barriers required for passive smoke control and a smoke control system using the pressurization methods shall comply with Section 709.” This is a circular reference. Furthermore, it could be read as only applying to both because of the “and: conjunction. Section 909.5 requires calculation of the maximum allowable leakage areas. Section 909.5.2 requires verification of passive smoke control through methods such as door fan testing or other methods approved by the code official. The forms of smoke protection specified in Section 709 for horizontal assemblies would be covered by special inspections.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Comment (CAH2)# 117

FS35-24

IBC: 711.2.4, 711.2.4.7 (New), 711.3, 711.3.3 (New)

Proposed Change as Submitted

Proponents: William Koffel, Koffel Associates, Inc., Firestop Contractors International Association (FCIA) (wkoffel@koffel.com)

2024 International Building Code

Revise as follows:

711.2.4 Fire-resistance rating. The *fire-resistance rating* of *horizontal assemblies* shall comply with Sections 711.2.4.1 through ~~711.2.4.6~~ 711.2.4.7 but shall be not less than that required by the *building* type of construction.

Add new text as follows:

711.2.4.7 Occupiable roofs. Occupiable roofs shall have penetrations protected in accordance with Section 714 and joints and voids protected in accordance with Section 715. Skylights shall not be located within the occupied area of occupiable roofs.

711.3 Nonfire-resistance-rated floor and roof assemblies. Nonfire-resistance-rated floor, floor/ceiling, roof and roof/ceiling assemblies shall comply with Sections 711.3.1 and ~~711.3.2~~ 711.3.3.

Add new text as follows:

711.3.3 Occupiable roofs. Occupiable roofs shall have penetrations, joints and voids protected with materials or systems that prevent the spread of fire through the roof assembly. Skylights shall not be located within the occupied area of occupiable roofs.

Reason: When a roof becomes occupied or occupiable, the safety of the occupants on the roof becomes the same as if they were standing on the floor below. Without a fire-resistance rating and protected penetrations, joints and voids along with restrictions for skylights in the occupied roof area, the occupants are exposed to a fire and life safety risk. When a roof becomes occupied or occupiable, the safety of the occupants on the roof becomes the same as if they were standing on the floor below. Without a fire-resistance rating and protected penetrations, joints and voids, along with regulations for skylights in the occupied roof area, the occupants are exposed to a fire and life safety risk.

The proposal builds on the concept of occupiable roofs, added to the 2024 IBC.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

The estimated cost is $35 - $50 per installed firestop system and $35 - $50 per lineal ft. of installed joint sytems.

Estimated Immediate Cost Impact Justification (methodology and variables):

The estimate includes materials and labor costs for any type of penetration system and fire-resistant joint system through a roof assembly. The total cost for any specific building will depend upon the number of penetrations and joint systems.

FS35-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee concluded that the proposal is unnecessary since the code already addresses this issue (Vote: 6-5).

FS35-24

Individual Consideration Agenda

Comment 1:

IBC: 711.2.4, 711.2.4.7, 711.3, 711.3.3

Proponents: Bill McHugh, CM Services, Firestop Contractors International Association (bill@mc-hugh.us); William Koffel, Koffel Associates, Inc., Firestop Contractors International Association (FCIA) (wkoffel@koffel.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

711.2.4 Fire-resistance rating. The *fire-resistance rating* of *horizontal assemblies* shall comply with Sections 711.2.4.1 through 711.2.4.7 but shall be not less than that required by the *building* type of construction.

711.2.4.7 Occupiable roofs. Occupiable roofs shall have penetrations protected in accordance with Section 714 and joints ~~joints and voids~~ protected in accordance with Section 715. Skylights shall not be located within the occupied area of occupiable roofs.

711.3 Nonfire-resistance-rated floor and roof assemblies. Nonfire-resistance-rated floor, floor/ceiling, roof and roof/ceiling assemblies shall comply with Sections 711.3.1 and 711.3.3.

711.3.3 Occupiable roofs. Occupiable roofs shall have penetrations and joints~~, joints and voids~~ protected with materials or systems that prevent the spread of fire through the roof assembly. Skylights shall not be located within the occupied area of occupiable roofs.

Reason: Occupiable rooftops change the roof from a weather resistant environment to both a weather resistant surface and life safety protection system. Fire from below should not cause rooftop occupants more risk than if they were standing on the floor below the roof. Even if a one story roof, people on the rooftop need protection from fire poking through penetrations, joints, and skylights - a huge opening with both fire and safety risks. This concept of occupiable rooftop regulation is relatively new to the code having been defined last cycle in the '24 IBC.

In Orlando, there were requests to clarify where protection is to be required. While the title of section 715 is Joints and Voids, there is no definition for voids in the IBC's Chapter 2, which may have caused confusion. Therefore, the word 'void' has been removed from the proposal.

At the Committee Action Hearings in Orlando, there was testimony by the Extruded Polystyrene Insulation Association (XPSA) others, that seemed misleading. When a roof assembly becomes fire-resistance-rated, it does not mean firestopping is now required in joints or voids between pieces or sections of the overburden walking surface.

The reason is that the fire-resistance test is conducted on the horizontal assembly from the bottom side for a specified time period. The horizontal assembly consists of the roof deck, the roof covering including the roof insulation, a roof membrane, and some protection beneath the roof deck. Joints (and voids) and penetrations, are protected at that fire-resistance-rated assembly – below the insulation and overburden. There is no need to protect joints between adjacent pieces of sections of the overburden walking surface.

Please reconsider this proposal to approved as modified.

Cost Impact: Increase

Estimated Immediate Cost Impact:

The estimated cost is $35 - $50 per installed firestop system and $35 - $50 per lineal ft. of installed joint systems.

Estimated Immediate Cost Impact Justification (methodology and variables):

The estimate includes materials and labor costs for any type of penetration system and fire-resistant joint system through a roof assembly. The total cost for any specific building will depend upon the number of penetrations and joint systems.

Comment (CAH2)# 452

FS36-24

IBC: 712.1.9

Proposed Change as Submitted

Proponents: Ronald Geren, RLGA Technical Services, LLC, Self (ron@specsandcodes.com)

2024 International Building Code

Revise as follows:

712.1.9 Two-story openings. In other than Groups I-2 and I-3, a vertical opening that is not used as one of the applications specified in this section shall be permitted if the opening complies with all of the following items:

1. Does not connect more than two *stories.*
2. Does not penetrate a *horizontal assembly* that separates *fire areas* or *smoke barriers* that separate *smoke compartments*.
3. Is not concealed within the construction of a wall or a floor/ceiling assembly.
4. Is ~~not open to~~ separated from a *corridor* in Group I and R occupancies by a fire-resistance-rated assembly tested under ASTM E119 or UL 263, or by *smoke partitions* complying with Section 710. In addition, doors protecting openings in *smoke partitions* shall comply with Sections 710.5.2.2 and 710.5.2.3. Doors in other fire-resistance-rated assemblies shall comply with Section 716.2.2.
5. Is ~~not open to~~ separated from a *corridor* on nonsprinklered floors by a fire-resistance-rated assembly tested under ASTM E119 or UL 263, or by *smoke partitions* complying with Section 710. In addition, doors protecting openings in *smoke partitions* shall comply with Sections 710.5.2.2 and 710.5.2.3. Doors in other fire-resistance-rated assemblies shall comply with Section 716.2.2 .
6. Is separated from floor openings and air transfer openings serving other floors by construction conforming to required *shaft enclosures.*

Reason: The words "not open to" in items #4 and #5 are not defined or described. "Not open to" could be interpreted to mean not atmospherically connected and separated by some physical barrier without openings. Or "not open to" could mean that openings are allowed, but there are means of controlling the passage of smoke between the two-story opening and the adjacent corridors.

This proposal eliminates the ambiguity by replacing the words "not open to" with specific provisions that define when a two-story opening is "not open to" a corridor.

Since the intent is to eliminate the passage of smoke from a two-story opening into a corridor under the stated circumstances, providing a means of controlling the smoke is the only option, and the provisions for fire-resistance-rated assemblies and smoke partitions offer that capability.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

For jurisdictions requiring some form of physical separation with no openings (i.e., doors and windows) between the two-story opening and a corridor, this change would allow the designer more flexibility, which may or may not reduce cost. If jurisdictions interpret this section to mean that corridors can open into two-story spaces as long as a door with a closer is provided, then this change would add some cost due to the minimal protection required by a smoke partition between the corridor and the two-story space that requires smoke and draft control for any doors. If the separation is already provided by a fire-resistance-rated assembly through some other code requirement, there would be no additional cost since openings would be required to be protected.

Estimated Immediate Cost Impact Justification (methodology and variables):

If minimal protection is required, the cost would be $65 to $100 per opening for "S" labels on the doors and frames and smoke seals

around the door perimeter. The majority of the cost will be for the "S" labels (about $40 for the door and frame) and $25 for the seals for a standard 3' by 7' door. Double doors will be at the higher end for the additional label and extra length of perimeter to seal.

FS36-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee determined that the proposed language still needs more work. The proposed text does not specify fire-resistance-rating. The committee also recommended looking into Section 509.4.2 (Vote: 11-0).

FS36-24

Individual Consideration Agenda

Comment 1:

IBC: 712.1.9

Proponents: Ronald Geren, RLGA Technical Services, LLC, Self (ron@specsandcodes.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

712.1.9 Two-story openings. In other than Groups I-2 and I-3, a vertical opening that is not used as one of the applications specified in this section shall be permitted if the opening complies with all of the following items:

1. Does not connect more than two *stories.*
2. Does not penetrate a *horizontal assembly* that separates *fire areas* or *smoke barriers* that separate *smoke compartments*.
3. Is not concealed within the construction of a wall or a floor/ceiling assembly.
4. Is separated from a *corridor* in Group I and R occupancies ~~by a fire-resistance-rated assembly tested under ASTM E119 or UL 263, or~~ by *smoke partitions* ~~complying with Section 710. In addition, doors~~ Doors protecting openings in *smoke partitions* shall comply with Sections 710.5.2.2 and 710.5.2.3. ~~Doors in other fire-resistance-rated assemblies shall comply with Section 716.2.2.~~
5. Is separated from a *corridor* on nonsprinklered floors ~~by a fire-resistance-rated assembly tested under ASTM E119 or UL 263, or~~ by *smoke partitions* ~~complying with Section 710. In addition, doors~~ Doors protecting openings in *smoke partitions* shall comply with Sections 710.5.2.2 and 710.5.2.3. ~~Doors in other fire-resistance-rated assemblies shall comply with Section 716.2.2.~~
6. Is separated from floor openings and air transfer openings serving other floors by construction conforming to required *shaft enclosures.*

Reason: The premise of the original proposal's reason statement is still valid. However, in response to opposition and committee comments, the confusing language referencing "fire-resistance-rated assemblies" and "other fire-resistance-rated assemblies" has been deleted for simplicity. Therefore, only the basic requirement of providing a smoke partition is stated.

Thus, if a wall separating the two-story opening from other building areas is required to have an assembly with more restrictive requirements, Section 702.1 would come into play. For example, suppose the wall separating a corridor from a two-story opening in a Group R occupancy is required to be a fire barrier for occupancy separation. In that case, the wall must conform to the more restrictive requirements of a fire barrier.

Additionally, references to Section 710 were deleted as superfluous since the assemblies mentioned in item #2 do not include references to their respective code sections.

Cost Impact: Increase

Estimated Immediate Cost Impact:

The immediate cost impact remains as stated in the original proposal.

Estimated Immediate Cost Impact Justification (methodology and variables):

The justification remains as stated in the original proposal.

Comment (CAH2)# 767

FS41-24

IBC: 714.2 (New), 715.2 (New)

Proposed Change as Submitted

Proponents: Robert Marshall, FCAC, FCAC (fcac@iccsafe.org)

2024 International Building Code

Add new text as follows:

714.2 System variations. Where variations between the installed system and the tested through- or membrane-penetration firestop system exist, sufficient documentation shall be provided to the building official to show that the required ratings are not reduced.

715.2 System variations. Where variations between the installed system and the tested fire-resistant joint system, perimeter fire containment system or continuity head-of wall system exist, sufficient documentation shall be provided to the building official to show that the required ratings are not reduced.

Reason: Despite the fact there are over 10,000 individual firestop systems, fire-resistant joint systems, perimeter fire containment systems and continuity head-of-wall systems, each with multiple construction variations tested as required by the IBC, field conditions frequently occur for which there are no tested system available. These two new sections are intended to address how these unique installations need to be addressed between the design professional, the contractor and the code official. The language proposed emulates the language contained in existing Section 703.2.1.4 other than the fact it addresses all variations and not just supplemental features. For example, it would cover situations where a required component of a tested assembly is not installed, or where some feature not described is installed.

The sufficient documentation required is normally provided in the form of an equivalent firestop system obtained from some knowledgeable party. This process is a necessary and well-established program used on a daily basis in the firestopping industry when not tested systems are available. Industry practice has been to use the equivalent firestop system process only when a tested system is not available.

FCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and early 2024 the FCAC has held several virtual meetings and one in-person meeting open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the **FCAC Website**

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

$0.00

Estimated Immediate Cost Impact Justification (methodology and variables):

Alternative means and methods submissions are costly to prepare. However, it has been common practice for AHJ's to accept either a system variation (e.g. engineering judgment) provided by the manufacturer, or a system variation stamped by a professional engineer to cover the installation. Manufacturers provide system variations at no cost. Even where an AHJ requires an Engineer's seal, this is still less costly than an alternative means and methods submission.

Using system variations as proposed will eliminate the need for a costly alternative means and methods submittal. Manufacturers provide system variations (e.g. engineering judgments) at no cost. If an AHJ requires an Engineer's seal, the cost can range is from $1000 to $2000 depending on the area of the country.

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee indicated that the proposed sections are needed. However, the committee suggested improving the proposed text. The committee wanted to see more clarification to the text, for example: "sufficient documentation", and "an installed system". The committee recommended adding "listed" systems (Vote: 7-4).

FS41-24

Individual Consideration Agenda

Comment 1:

IBC: 714.2, 715.2

Proponents: Steven Orlowski, Sundowne Building Code Consultants, LLC, Self (sorlowski@sbcc.codes); Robert Marshall, FCAC, FCAC (fcac@iccsafe.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

714.2 System variations. Where a *listed* ~~variations between the installed system and the tested~~ through- or membrane-penetration firestop system cannot be installed in compliance with the listing, the code officials is authorized to accept modifications where ~~exist, sufficient~~ documentation ~~shall be~~ is provided to the ~~building~~code official demonstrating that the firestop system will perform as intended. ~~to show that the required ratings are not reduced.~~

715.2 System variations. Where a *listed* ~~variations between the installed system and the tested~~ fire-resistant joint system, perimeter fire containment system or continuity head-of wall system cannot be installed in compliance with the listing, the code official is authorized to accept modifications where ~~exist, sufficient~~ documentation ~~shall be~~ is provided to the ~~building~~ code official demonstrating that the system will perform as intended. ~~to show that the required ratings are not reduced.~~

Reason:
During Committee Action Hearing No. 1, the committee indicated the proposed new sections are needed and offered suggestions for improvement. This comment addresses the committee's suggestions as noted;

1. Removed the word "installed system" to eliminate the confusion on if the system is already installed.
2. Replaced the word "tested" with "listed" to clearly show the variation is in the listed system.
3. Made clear that supporting documentation acceptable to the code official shall be provided which allows the code official to approve the source of the documentation and the necessary information within the documentation.

Despite the fact there are over 10,000 individual firestop systems, fire-resistant joint systems, perimeter fire containment systems and continuity head-of-wall systems, each with multiple construction variations tested as required by the IBC, field conditions frequently occur for which there are no tested system available. These two new sections are intended to address how these unique installations need to be addressed between the design professional, the contractor and the code official. The language proposed emulates the language contained in existing Section 703.2.1.4 other than the fact it addresses all variations and not just supplemental features. For example, it would cover situations where a required component of a tested assembly is not installed, or where some feature not described is

installed. The sufficient documentation required is normally provided in the form of an equivalent firestop system obtained from someknowledgeable party. This process is a necessary and well-established program used on a daily basis in the firestopping industry when not tested systems are available. Industry practice has been to use the equivalent firestop system process only when a tested system is not available.

FCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and early 2024 the FCAC has held several virtual meetings and one in-person meeting open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the FCAC Website

Cost Impact: Decrease

Estimated Immediate Cost Impact:

$0.00

Estimated Immediate Cost Impact Justification (methodology and variables):

Alternative means and methods submissions are costly to prepare. However, it has been common practice for AHJ’s to accept either a system variation (e.g. engineering judgment) provided by the manufacturer, or a system variation stamped by a professional engineer to cover the installation. Manufacturers provide system variations at no cost. Even where an AHJ requires an Engineer's seal, this is still less costly than an alternative means and methods submission.

Using system variations as proposed will eliminate the need for a costly alternative means and methods submittal. Manufacturers provide system variations (e.g. engineering judgments) at no cost. If an AHJ requires an Engineer's seal, the cost can range is from $1000 to $2000 depending on the area of the country.

Comment (CAH2)# 349

FS42-24

IBC: SECTION 202 (New), 714.2, 714.2.1 (New), 715.2, 715.2.3 (New)

Proposed Change as Submitted

Proponents: William Koffel, Koffel Associates, Inc., Firestop Contractors International Association (FCIA) (wkoffel@koffel.com)

2024 International Building Code

Add new definition as follows:

FIRESTOP IDENTIFICATION DEVICE. A label, placard, or device of any type that identifies the installed firestop system.

714.2 Installation. A *listed penetration firestop* system shall be installed in accordance with the manufacturer's installation instructions and the listing criteria.

Add new text as follows:

714.2.1 Firestop identification devices. Penetration firestop systems shall be permanently identified with a device, label or similar treatment. The device shall be handwritten with permanent ink, or pre-printed, legible tag or label, or format readable by an electronic device and readable from a distance of 24 in. (610 mm) at a 45-degree angle. The device shall at a minimum have the following information:

1. Listing system number or engineering judgement number.
2. Date of Installation
3. Installing company name, contact information.
4. "Warning, Penetration Firestop System - Do Not Remove or Tamper.

Adhesive or mechanically attached Identification devices shall be located within 6 in. (150 mm) below or beside the penetration firestop system edge, on the bottom of a horizontal assembly, or on both sides of a vertical barrier. For multiple penetrations of the same listing number arranged within 6 in. (150 mm) of each other, the device shall be located centered under or within 6 in. (150 mm) to either side of the grouping. Hanging tags shall be attached to the penetrating item with permanent wire, string or plastic tie, within 6 in. (150 mm) of the assembly.

Revise as follows:

715.2 Installation. Systems or materials protecting *joints* and voids shall be installed in accordance with Sections 715.2.1 and ~~715.2.2~~ 715.2.3.

Add new text as follows:

715.2.3 Firestop identification devices. Joint and void protection shall be permanently identified with a device, label or similar treatment. The device shall be handwritten with permanent ink, or pre-printed, legible tag or label, or format readable by an electronic device readable from a distance of 24 in. (610 mm) at a 45-degree angle, both sides of the fire barrier, smoke barrier or fire wall. The device shall at a minimum have the following information:

1. Listing system number or engineering judgement number.
2. Date of Installation.
3. Installing company name, contact information.
4. "Warning, Joint and Void Protection System - Do Not Remove or Tamper.

Adhesive or mechanically attached Identification devices shall be located within 6 in. (150 mm), of the joint and void system edge.

Reason: Installing penetration firestop systems looks as easy as applying red caulk into the annular space of a penetration or gap, breach created for a joint or void. Firestop systems are very complex, detailed listed systems that take understanding of the tolerances so they work when called upon by fire. Firestop systems are not easy to install once the listings are introduced to the installation – which is the only way to install and inspect firestopping.

The proposal adds a requirement to identify the system used to maintain fire-resistance of the assembly where a breach was made to pass penetrating item(s). This is a way for the firestop installation contractor to make others aware of what was installed. Knowing the system or engineering judgement/equivalent fire-resistance-rated assembly installed speeds up the special inspection agency inspector's work by eliminating the need to look up systems during the inspections. It also helps the building owner and manager compare the listings to the jobsite installations during the annual visual inspections required for the life cycle of the building.

This firestop system identification system allows all parties to understand what listing has been used, which then identifies the manufacturer's materials used in the system. The listing identifies the penetrating item(s), annular space size limitations, firestop material manufacturer, and assemblies to protect.

The assemblage of materials designed to keep fire from spreading outside a fire resistance rated assembly needs to be properly installed, inspected and maintained. The identification device makes the firestop special inspection verification process much more cost efficient and effective.

Labeling items at fire-barriers is consistent with other fire-resistance-rated assemblies. In Section 703.5, Marking and Identification, the walls are identified. Fire doors, fire dampers, and fire rated glazing are identified as well. The firestop labelling would be consistent with the requirements for the fire-resistance-rated wall assembly. This identification device provides confidence that the appropriate level of protection is provided, and the fire-resistance-rated design maintained easily.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

The identification device cost per penetration firestop system is approximately $0.10 US per penetration.

Estimated Immediate Cost Impact Justification (methodology and variables):

The cost increase is limited because the worker is already at the assembly, climbing a ladder or on a lift, with the materials, installing the system. All that needs to happen is adding the identification device, usually a label or tag. However, the device lowers the cost of inspection during construction and annual visual inspection because it saves the inspector time sorting through listings to find the right listing which was used.

FS42-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee concluded that the proposal needs more work to address different issues. For example, the committee had an issue with "device, label or similar treatment". The committee also recommended establishing limits on joints. The committee thought that an "electronic device readable from a distance of 24 in. (610 mm) at a 45-degree angle" is not needed" (Vote: 11-0).

Individual Consideration Agenda

Comment 1:

IBC: 714.2, 714.2.1 (New), 715.2, 715.2.3 (New), ASTM Chapter 35 (New)

Proponents: William Koffel, Koffel Associates, Inc., Firestop Contractors International Association (FCIA) (wkoffel@koffel.com) requests As Modified by Committee (AMC2)

Replace as follows:

2024 International Building Code

714.2 Installation. A *listed penetration firestop* system shall be installed in accordance with the manufacturer's installation instructions and the listing criteria.

Add new text as follows:

714.2.1 Identification Device. Penetration firestop systems shall be permanently identified with a device, label, or similar treatment installed in accordance with ASTM WK 70416.

715.2 Installation. Systems or materials protecting *joints* and voids shall be installed in accordance with Sections 715.2.1 ~~and~~ through ~~715.2.2~~ 715.2.3.

Add new text as follows:

715.2.3 Identification Device. Fire-resistant joint systems shall be permanently identified with a device, label or similar treatment installed in accordance with ASTM WK 70416.

Add new standard(s) as follows:

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box C700
West Conshohocken, PA 19428

WK70416	New Practice for On-Site Identification of Penetration Firestop Systems and Fire-Resistive Joint Systems and Perimeter Fire Barrier

Reason: The Committee voted for Disapproval based upon some of the proposed language. The Committee also voted for Disapproval of FS40-24 because the standard was not ready. Since FS42 addressed both firestop systems and fire-resistant joint systems, the approach proposed in FS40-24 (using a reference standard) is the language proposed in this Public Comment for both penetration firestop systems and fire-resistant joint systems. We expect that the ASTM standard will be completed by the Public Comment hearing. Assuming that to be the case, a Floor Modification will be submitted to revise the current reference to the correct ASTM Standard number. The ASTM Work Item as submitted, makes inspections easier, clears up inspection issues efficiently and effectively. Knowing the system or Engineering Judgement Number to properly identifying the system. Without the system number, code officials, special inspectors, and building owners don't know which system was used and wind up hunting multiple directories to identify the system description.

Identifying the system installed makes the enforcement process and special inspections easier and more efficient. In addition, the information provided is useful to building owners in the performance of the required visual inspections of penetration firestop systems and fire-resistant joint systems.

The identification devices allow all parties to understanding what listed system was used, which then identifies the manufacturer's

materials used in the system.

Cost Impact: Increase

Estimated Immediate Cost Impact:

The Public Comment, if approved, will increase the cost of construction by about $0.10 per device.

Estimated Immediate Cost Impact Justification (methodology and variables):

The number of devices varies based upon the type of building and the occupancy of the building. It should be noted that the current Working Document allows the grouping of joint systems, resulting in a single device for the group of joints where the same system is used. While the cost of construction could increase, the ability of the code official or special inspectors to enforce the code should decease by making the process for efficient.

Comment (CAH2)# 706

FS47-24

IBC: 714.5, 714.5.1

Proposed Change as Submitted

Proponents: Robert Marshall, FCAC, FCAC (fcac@iccsafe.org)

2024 International Building Code

714.5 Horizontal assemblies. Penetrations of a *fire-resistance-rated* floor, floor/ceiling assembly or the ceiling membrane of a roof/ceiling assembly not required to be enclosed in a *shaft* by Section 712.1 shall be protected in accordance with Sections 714.5.1 through 714.5.4.

Revise as follows:

714.5.1 Through penetrations. *Through penetrations* of *horizontal assemblies* shall comply with Section 714.5.1.1 or 714.5.1.2. **Exceptions:**

1. Penetrations by steel, ferrous or copper conduits, pipes, tubes or vents or concrete or *masonry* items through a single fire-resistance-rated floor assembly where the *annular space* is protected with materials that prevent the passage of flame and hot gases sufficient to ignite cotton waste when subjected to ASTM E119 or UL 263 time-temperature fire conditions under a minimum positive pressure differential of 0.01 inch of water (2.49 Pa) at the location of the penetration for the time period equivalent to the *fire-resistance rating* of the construction penetrated. Penetrating items with a maximum 6-inch (152 mm) nominal diameter shall not be limited to the penetration of a single fire-resistance-rated floor assembly, provided that the aggregate area of the openings through the assembly does not exceed 144 square inches (92 900 mm^2) in any 100 square feet (9.3 m^2) of floor area.
2. Penetrations in a single concrete floor by steel, ferrous or copper conduits, pipes, tubes or vents with a maximum 6-inch (152 mm) nominal diameter, provided that the concrete, grout or *mortar* is installed the full thickness of the floor or the thickness required to maintain the *fire-resistance rating*. The penetrating items shall not be limited to the penetration of a single concrete floor, provided that the area of the opening through each floor does not exceed 144 square inches (92 900 mm^2).
3. Penetrations by *listed* electrical boxes of any material, provided that such boxes have been tested for use in fire-resistance-rated assemblies and installed in accordance with the instructions included in the listing.
4. ~~Penetrations of concrete floors or ramps within parking garages or *structures* constructed in accordance with Sections 406.5 and 406.6 where the areas above and below the penetrations are parking areas.~~ Vehicle ramps within or adjacent to parking garages or structures constructed in accordance with Sections 406.5 and 406.6 that are not used for vehicle parking do not require penetrations to comply with Section 714.5.1.1, 714.5.1.2 or 714.5.1.3.

Reason: During the 2021 to 2024 code cycle, Proposal No. FS64-21 introduced a new Exception 4 to Section 714.5.1 which permits unprotected penetrations through floors and ramps of both enclosed and open parking garages where the areas above and below the penetrations are parking areas. We believe this new exception is does not represent good fire protection practices and as such are proposing modifications to the scope of the exception.

The modifications being proposed are intended to limit the application of the exception to vehicle ramps serving parking garage where the ramps are not directly above or below the parking areas. This limitation will minimize the chances of a fire from below involving parked vehicles.

Parking garages often have penetrants (roof drains, electrical conduit, cables, etc.) extending vertically throughout multiple levels of the parking garage. The need to protect penetrations above or below parking areas is critical in preventing ignition of parked vehicles.

The construction of modern vehicles has changed to include more plastics and other combustibles. While this benefits the vehicle weight and fuel economy, and lowers the vehicle price, it increases the fuel load and fire growth we see in parking garages. Modern vehicles present new hazards due to the incorporation of larger quantities of combustible materials (e.g. fuels, plastics, synthetic materials, etc.)

into their designs. Another recent vehicle construction change is the use of plastic fuel tanks. Plastic fuel tanks can result in an earlier release of fuel in a fire. Fire tests at Southwest Research Institute showed fuel leakage as a result of fire exposure occurs after less than five minutes of fire exposure. Fuel spill fires represent a likely means of vehicle-to-vehicle fire spread.1 As alternative fuel vehicles are popularized, concerns regarding their unique hazards, burn characteristics, and typical burn duration have been raised. Compared to older vehicles, modern vehicles burn differently. At the same time, modern parking garages have optimized space requirements for vehicle parking and storage. It is clear that the design assumption of only one or two fire burning has to be revisited. Cars are larger and have more fuel load than before, and the parking spaces have become smaller. This enhances the probability of fire spread between vehicles.

New electric vehicle battery and charging equipment technologies are also leading to much more rapid fire growth than previously contemplated in parking garage design. Fire accidents caused by the thermal runaway of lithium-ion battery have demonstrated that additional fire safety precautions are needed. It is particularly important to prevent these open and closed parking garage fires from occurring due to the challenges the fire services face in fighting parking garage fires.

There have been a number of recent cases and studies around the world that are demonstrating that fire safety in parking garages should be enhanced, not further reduced as done with Exception 4 of Section 714.5. In recent years, Europe has seen a series of large fires (Liverpool, UK (2017); Cork, Ireland (2018); Stavanger Airport in Sola, Norway (2020)1; Warsaw, Poland (2020)) that brought fires in parking garages into the focus of public discussions. In October, 2023, a major multi-storey parking garage fires occurred at the Luton Airport, London resulting in structural collapse.

A 2020 study on fires of electric vehicles concluded that in just 22 seconds, cell thermal runaway spreads flames throughout the battery compartment. A full-scale fire test was carried out on a battery system of seventeen 3P6S battery modules mounted with control systems in a car chassis. One battery module was overcharged until thermal runaway occurred. Within five seconds, thermal runaway spread to the four adjacent modules. Released gas was immediately ignited, with jet flame and smoke, and temperatures reached over 600 °C. These five modules then smouldered, and further modules ignited after around two minutes. The authors note that water fire suppression would be hindered by the battery pack casings.[1]

An NFPA Journal article published in 2019 indicated a typical garage fire today is much more likely to involve multiple vehicles than two decades ago, hinting that fires are in fact burning with more severity. In garage fires between 1995 and 1997, only 1 percent of fires involved more than five vehicles. By contrast, between 2010 and 2014, 8 percent of the garage fires involved more than five vehicles.[2]

The photos below show an example of a parking garage penetration. These photos were taken at the Marriott St Louis Grand Hotel multi-story parking garage. An approximate 12 in. by 12 in. opening was located approximately 4 ft from an adjacent parked car. By the 2024 IBC, this unprotected opening is permitted. Is the level of protection we should be permitting?

FCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and early 2024 the FCAC has held several virtual meetings and one in-person meeting open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the **FCAC Website**

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

The average cost of an installed firestop system for concrete floors is $35 - $50 per penetration.

Estimated Immediate Cost Impact Justification (methodology and variables):

The immediate cost impact estimate is based on industry and manufacturer input.This includes materials and labor costs for any type of penetrant through the floor assembly. The cost range includes, sealant based, intumescent, or mechanical devices. The total cost in any given parking garage will depend upon the number of penetrations.

FS47-24

Public Hearing Results (CAH1)

Committee Action: **As Submitted**

Committee Reason: The committee deemed that the proposed text is a necessary clarification. The committee agreed that the proposed text will limit the application of the exception to vehicle ramps serving parking garages where the ramps are not directly above or below the parking areas. This limitation will minimize the chances of a fire from below involving parked vehicles (Vote: 7-4).

FS47-24

Individual Consideration Agenda

Comment 1:

Proponents: David Renn, PE, SE, City and County of Denver, Code Change Committee of ICC Colorado Chapter (david.renn@denvergov.org) requests Disapproved

Reason: Exception 4 for penetrations in parking areas was put into the code as a common sense proposal to match other allowances in the code. In particular, IBC 712.1.10 allows unenclosed vertical openings in parking garages for automobile ramps, elevators, and mechanical duct systems. Also, IBC 715.3 allows unprotected joints in floors and ramps within parking garages and IBC 715.4 allows unprotected voids at the intersection of curtain walls and floors and ramps in parking garages.

Because of this, it is clear that there is no intent in the code to compartmentalize or separate floors or tiers of a parking garage. Note that vehicles can park immediately adjacent to the unenclosed vertical openings and other items mentioned above - there is no difference in hazard when a vehicle parks adjacent to an unprotected pipe penetration.

Until the larger issue of unenclosed vertical openings is addressed in the code, it does not make sense to require penetrations (or joints or voids at curtain walls) to be protected.

Cost Impact: No change to code.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Comment (CAH2)# 190

FS49-24

IBC: 714.5.2

Proposed Change as Submitted

Proponents: Jeffrey Grove, Southern Nevada ICC Chapter (jeff.grove@coffman.com)

2024 International Building Code

Revise as follows:

714.5.2 Membrane penetrations. Penetrations of membranes that are part of a *horizontal assembly* shall comply with Section 714.5.1.1 or 714.5.1.2. Where floor/ceiling assemblies are required to have a *fire-resistance rating*, recessed fixtures shall be installed such that the required *fire resistance* will not be reduced. **Exceptions:**

1. *Membrane penetrations* by steel, ferrous or copper conduits, pipes, tubes or vents, or concrete or *masonry* items where the *annular space* is protected either in accordance with Section 714.5.1 or to prevent the free passage of flame and the products of combustion. The aggregate area of the openings through the membrane shall not exceed 100 square inches (64 500 mm^2) in any 100 square feet (9.3 m^2) of ceiling area in assemblies tested without penetrations.
2. Ceiling *membrane penetrations* of maximum 2-hour *horizontal assemblies* by steel electrical boxes that do not exceed 16 square inches (10 323 mm^2) in area, provided that the aggregate area of such penetrations does not exceed 100 square inches (44 500 mm^2) in any 100 square feet (9.29 m^2) of ceiling area, and the *annular space* between the ceiling membrane and the box does not exceed $^1/_8$ inch (3.2 mm).
3. *Membrane penetrations* by electrical boxes of any size or type, that have been *listed* as part of an opening protective material system for use in *horizontal assemblies* and are installed in accordance with the instructions included in the listing.
4. *Membrane penetrations* by *listed* electrical boxes of any material, provided that such boxes have been tested for use in fire-resistance-rated assemblies and are installed in accordance with the instructions included in the listing. The *annular space* between the ceiling membrane and the box shall not exceed $^1/_8$ inch (3.2 mm) unless *listed* otherwise.
5. The *annular space* created by the penetration of a fire sprinkler, provided that it is covered by a metal escutcheon plate.
6. Noncombustible items that are cast into concrete building elements and that do not penetrate both top and bottom surfaces of the element.
7. The ceiling membrane of a maximum 2-hour fire-resistance-rated *horizontal assembly* is permitted to be interrupted with the double 2x wood top plate of a wall assembly that is sheathed with *Type X gypsum wallboard*, provided that all penetrating items through the double top plates are protected in accordance with Section 714.5.1.1 or 714.5.1.2 and the ceiling membrane is tight to the top plates.
8. The ceiling membrane of a maximum 1-hour fire-resistance-rated horizontal assembly is permitted to be interrupted with a single 2x wood top plate of a wall assembly that is sheathed with Type X gypsum wallboard, provided that all penetrating items through the top plate are protected in accordance with Section 714.5.1.1 or 714.5.1.2 and the ceiling membrane is tight to the top plates.

~~8.~~ 9. Ceiling *membrane penetrations* by *listed* luminaires (light fixtures) or by luminaires protected with *listed* materials, which have been tested for use in fire-resistance-rated assemblies and are installed in accordance with the instructions included in the listing.

Reason: The current code language merely requires a “double wood top plate”. As currently written, the top plate could consist of two ½” plywood strips or two 4x8s with no regard to the ability of the material to resist fire. The fact that a clarification statement needed to be added to the code commentary for this item is a clear indication this section needs to be revised. It is important to clarify exactly what the minimum is to achieve the continuity of the membrane rating at the penetration. This code change would allow for a single 2x top plate or a combination of a single 2x top plate with a 1x top plate as a minimum to add clarification to the section. An additional reason for this change is to allow for current construction methods. Standard construction methods in wood construction require a gap to be placed

between the bottom of the floor joists or truss and the top of a non-bearing partition. This allows for deflection of the truss without adverse loading from interference of a non-bearing partition. The standard method for creating this gap is to use a single 2x top plate with a 1x top plate to create a double top plate. Bearing walls and exterior walls are already required to use a double 2x top plate per IBC section 2308.9.3.2 and therefore are not generally affected by this code clarification.

Compliant nailing of the gypsum board can be maintained with a single 2x top plate. In a 1-hour assembly with a single layer of drywall, a single 2x top plate is sufficient to achieve drywall nailing. The standard 2x is 1 ½" thick. If you remove ⅝" for drywall, you are left with ⅞" of plate width for nailing. The required edge distance of a fastener in gypsum board is ⅜" per IBC Section 2508.6.3 allowing an edge distance of ½" on the plate. A standard joint at a stud in a fire rated wall would require ⅜" edge distance for each gypsum sheet leaving only ⅜" edge distance on each side of the stud. This shows that the proposed top plate configuration allows more nailing width than is required in the fire rated assembly.

In a 2 layer assembly, compliant nailing can be achieved with a 2x top plate with a 1x top plate. A 2x, which is 1 ½", and a 1x, which is ¾", will achieve a total top plate thickness of 2 ¼". If one subtracts 1 ¼" for 2 layers of ⅝" gypsum board from 2 ¼", there is 1" remaining. This will allow for ⅜" edge distance on the gypsum sheet as well as ⅝" edge distance on the top plate. This is also in excess of the minimums required for fire rated assemblies.

The 2x with a 1x plate application will also work with resilient channel (RC) and a single layer of gypsum board. The RC is ½" plus the ⅝" gypsum board for a total of 1 ⅛" leaving ¾" of edge distance on the top plate after subtracting the ⅜" drywall edge distance. This would even allow for a full ¾" RC without degrading the fire rating of the assembly.

The order of nailing can also be modified to provide even more edge distance. If the wall sheathing is nailed first, the installer could take full advantage of the entire top plate thickness for edge distance. The ceiling membrane could then be butted tightly to the wall sheathing to achieve the rating. This configuration is demonstrated in U.L. listed assembly system number F-C-2387.

The single wood top plate exceeds the fire resistance of a single layer of ⅝" gypsum board. IBC table 722.6.2(1) assigns a 40 minute rating to ⅝" type x gypsum wall board on wood frame. Table 16.2.1A of the ANSI/AWC National Design Specification for Wood Construction (NDS), as referenced in IBC Section 722.1, assigns a 1-hour char rating to 1 ½" of sawn lumber. Utilizing a single 2x wood top plate as a membrane penetration in a 1 hour application does not reduce the fire resistance rating of the assembly.

Testing has been performed on this condition and there are currently listed assemblies available. One listing is Specified Technologies Inc. system number F-C-2014 which allows for a single 2x4 or 2x6 top plate. Another listing is 3M system number F-C-2387 which also allows for a single 2x4 or 2x6 top plate. Both of these listings are approved by Underwriters Laboratories to maintain the fire rating of the floor ceiling assembly. It is inappropriate to eliminate options from the code that have been proven by testing to meet the fire resistant requirements.

This proposed change does not limit the design of the building. The design professionals are still free to use a double top plate including 2x and 3x in any situation they deem necessary. This merely allows flexibility for the designer to use different methods while still achieving the required fire ratings.

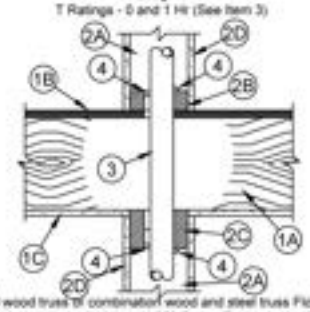
System No. F-C-2014

F Rating - 1 Hr
T Ratings - 0 and 1 Hr (See Item 3)



1. **Floor Assembly** - The 1 hr fire rated wood truss or combination wood and steel truss Floor-Ceiling assembly shall be constructed of the materials and in the manner described in the individual L500 Series Design in the UL Fire Resistance Directory, as summarized below:
   A. **Joists** - Nom 10 in. (254 mm) deep (or deeper) lumber, steel or combination lumber and steel joists, trusses or **Structural Wood Members*** with bridging as required and with ends firestopped.
   B. **Flooring System** - Lumber or plywood subfloor with finish floor of lumber, plywood or **Floor Topping Mixture*** as specified in the individual Floor-Ceiling Design. Diam of opening in flooring shall be 3/16 to 5/8 in. (5 to 16 mm) larger than the outside diam of nonmetallic pipe or conduit (Item 3).
   C. **Gypsum Board*** - Thickness, type, number of layers and fasteners shall be as specified in the individual Floor-Ceiling Design. Diam of opening shall be 3/16 to 5/8 in. (5 to 16 mm) larger than the outside diam of nonmetallic pipe or conduit (Item 3).
2. **Chase Wall** - (Optional) - The through penetrants (Item 3) may be routed through a single, double or staggered wood stud/gypsum board chase wall and shall include the following construction features:
   A. **Studs** - Nom 2 by 4 in. (51 by 102 mm), 2 by 6 in. (51 by 152 mm), 2 by 8 in. (51 by 203 mm) or double nom 2 by 4 in. (51 by 102 mm) lumber studs.
   B. **Sole Plate** - Nom 2 by 4 in. (51 by 102 mm) or 2 by 6 in. (51 by 152 mm) lumber plates or double nom 2 by 4 in. (51 by 102 mm) lumber plates tightly butted together. Diam of opening shall be 3/16 to 5/8 in. (5 to 16 mm) larger than the outside diam of nonmetallic pipe or conduit (Item 3).
   C. **Top Plate** - The single or double top plate shall consist of one or two nom 2 by 4 in. (51 by 102 mm) or 2 by 6 in. (51 by 152 mm) lumber plates or one or two sets of nom 2 by 4 in. (51 by 102 mm) lumber plates tightly butted together. Diam of opening shall be 3/16 to 5/8 in. (5 to 16 mm) larger than the outside diam of nonmetallic pipe or conduit (Item 3).
   D. **Gypsum Board*** - Min 1/2 in. thick rated or non-rated gypsum board.
3. **Through Penetrant** - One nonmetallic pipe or conduit to be installed concentrically or eccentrically within the firestop system. Annular space between pipe or conduit and edge of opening to be min 0 in. (point contact) to max 1/2 in. (0 to 13 mm). Pipe to be rigidly supported on both sides of floor-ceiling assembly. The following types and sizes of nonmetallic pipes may be used:
   A. **Polyvinyl Chloride (PVC) Pipe** - Nom 2 in. (51 mm) diam (or smaller) Schedule 40 solid or cellular core PVC pipe for use in closed (process or supply) or vented (drain, waste or vent) piping systems.
   B. **Chlorinated Polyvinyl Chloride (CPVC) Pipe** - Nom 2 in. (51 mm) diam (or smaller) SDR13.5 CPVC pipe for use in closed (process or supply) piping systems.

   Note: When the annular space is min 1/2 in. T Rating is 1 hr, otherwise the T Rating is 0 Hr.
4. **Fill, Void or Cavity Materials* - Caulk** - Min 1/2 in. (13 mm) thickness of fill material applied within the annulus, flush with top surface of sole plate or subfloor. Min 1/2 in. (13 mm) thickness of fill material applied within the annulus, flush with bottom surface of top plate or gypsum board. At the point contact location or when the annulus between the through penetrant and sole plate or subfloor or top plate or gypsum board is 1/8 in. (3 mm) or less, min 1/2 in. (13 mm) diam bead of fill material applied at the through penetrant/sole plate interface or penetreant/top plate or gypsum board interface.

   SPECIFIED TECHNOLOGIES INC - Type WF300 Caulk

   A. **Flooring System** – Lumber or plywood subfloor with finish floor of lumber, plywood or **Floor Topping Mixture*** as specified in the individual Floor-Ceiling Design. Diam of opening shall be 1/2 in. to 1 in. (13 to 25 mm) larger than the outside diam of nonmetallic pipe (Items 4 and 4).
   B. **Joists** – Nom 10 in. (254 mm) deep (or deeper) lumber, steel or combination lumber and steel joists, trusses or **Structural Wood Members*** with bridging as required and each floor topped.
   C. **Gypsum Board*** – Nom 4 ft (1.2 m) wide by 5/8 in. (16 mm) thick, attached as described in the individual Floor-Ceiling Design.
2. **Chase Wall** – The through penetrant (Item No. 3) shall be routed through a single, double or staggered wood stude/gypsum board chase wall and shall include the following construction features:
   A. **Studs** – Nom 2 by 4 in. (51 by 102 mm) or 2 by 6 in. (51 by 152 mm) lumber studs.
   B. **Sole Plate** – Nom 2 by 4 in. (51 by 102 mm) or 2 by 6 in. (51 by 152 mm) lumber plates. Diam of opening or length of notch-out in sole plate to be 1/2 in. to 1 in. (13 to 25 mm) larger than outside diam of pipe.
   C. **Top Plate** – The single or double top plate shall consist of one or two nom 2 by 4 in. (51 by 102 mm) or 2 by 6 in. (51 by 152 mm) lumber plates. Diam of opening or length of notch-out in top plate to be 1/2 in. to 1 in. (13 to 25 mm) larger than outside diam of pipe.
   D. **Gypsum Board** – Min ½ in. thick rated or nonrated gypsum board.
3. **Through Penetrant** – One nonmetallic pipe to be installed within the firestop system. Pipe to be rigidly supported on both sides of floor-ceiling assembly. The annular space between pipe and periphery of opening shall be min 0 in. (point contact) to max 1/2 in. (0 to max 13 mm). The following types and sizes of nonmetallic pipes may be used:
   A. **Polyvinyl Chloride (PVC) Pipe** – Nom 3 in. (76 mm) diam (or smaller) Schedule 40 solid-core PVC pipe for use in closed (process or supply) or vented (drain, waste or vent) piping system.
   B. **Cellular Core Polyvinyl Chloride (cePVC) Pipe** – Nom 3 in. (76 mm) diam (or smaller) Schedule 40 cellular core PVC pipe for use in closed (process or supply) or vented (drain, waste or vent) piping system.
   C. **Acrylonitrile Butadiene Styrene (ABS) Pipe** – Nom 3 in. (76 mm) diam (or smaller) Schedule 40 solid-core ABS pipe for use in closed (process or supply) or vented (drain, waste or vent) piping system.
   D. **Cellular Core Acrylonitrile Butadiene Styrene (ceABS) Pipe** – Nom 3 in. (76 mm) diam (or smaller) Schedule 40 cellular core ABS pipe for use in closed (process or supply) or vented (drain, waste or vent) piping system.
   E. **Chlorinated Polyvinyl Chloride (CPVC) Pipe** – Nom 3 in. (76 mm) diam (or smaller) SDR13.5 CPVC pipe for use in closed (process or supply) piping systems.
4. **Branch Piping** – (Optional) – One nonmetallic pipe to be connected to through penetrant (Item 3) and installed within opening as follows: The annular space between pipe and periphery of opening shall be min 0 in. (point contact) to max 1/2 in. (13 mm). The following types and sizes of nonmetallic pipes may be used:
   A. **Polyvinyl Chloride (PVC) Pipe** – Nom 3 in. (76 mm) diam (or smaller) Schedule 40 solid-core PVC pipe for use in closed (process or supply) or vented (drain, waste or vent) piping system.

System No. F-C-2387 *continued*

D. **Cellular Core Polyvinyl Chloride (cePVC) Pipe** – Nom 3 in. (76 mm) diam (or smaller) Schedule 40 cellular core PVC pipe for use in closed (process or supply) or vented (drain, waste or vent) piping systems.

C. **Acrylonitrile Butadiene Styrene (ABS) Pipe** – Nom 3 in. (76 mm) diam (or smaller) Schedule 40 solid core ABS pipe for use in closed (process or supply) or vented (drain, waste or vent) piping systems.

D. **Cellular Core Acrylonitrile Butadiene Styrene (ccABS) Pipe** – Nom 3 in. (76 mm) diam (or smaller) Schedule 40 cellular core ABS pipe for use in closed (process or supply) or vented (drain, waste or vent) piping systems.

3. **FILL, Void or Cavity Materials*** – **Caulk or Sealant** – Min 3/4 in. (19 mm) thickness of caulk applied within annular space around perimeter of through-penetrant (Item 3), flush with top surface of floor or sole plate and flush with bottom surface of lower top plate. Min 3/4 in. (19 mm) thickness of caulk applied within annular space around perimeter of branch piping (Item 4), flush with top surface of floor. Min 1/2 in. (13 mm) diam bead applied at the pipe/floor interface.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The code change proposal is not anticipated to increase or decrease the cost of construction This code change proposal is to clarify the intent of the original code change that brought this exception into the code.

FS49-24

Public Hearing Results (CAH1)

Committee Action: **As Submitted**

Committee Reason: The committee concluded that the proposed text is needed. The committee indicated that this is a necessary

requirement for the ceiling membrane of a maximum 1-hour fire-resistance-rated horizontal assembly to be permitted to be interrupted with a single 2x wood top plate of a wall assembly that is sheathed with Type X gypsum wallboard. The added text requires that all-penetrating items through the top plate are protected in accordance with Section 714.5.1.1 or 714.5.1.2 and the ceiling membrane is tight to the top plates (Vote: 6-5).

FS49-24

Individual Consideration Agenda

Comment 1:

IBC: 714.5.2

Proponents: Jeffrey Grove, Southern Nevada ICC Chapter (jeff.grove@coffman.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

Revise as follows:

714.5.2 Membrane penetrations. Penetrations of membranes that are part of a *horizontal assembly* shall comply with Section 714.5.1.1 or 714.5.1.2. Where floor/ceiling assemblies are required to have a *fire-resistance rating*, recessed fixtures shall be installed such that the required *fire resistance* will not be reduced. **Exceptions:**

1. *Membrane penetrations* by steel, ferrous or copper conduits, pipes, tubes or vents, or concrete or *masonry* items where the *annular space* is protected either in accordance with Section 714.5.1 or to prevent the free passage of flame and the products of combustion. The aggregate area of the openings through the membrane shall not exceed 100 square inches (64 500 mm^2) in any 100 square feet (9.3 m^2) of ceiling area in assemblies tested without penetrations.
2. Ceiling *membrane penetrations* of maximum 2-hour *horizontal assemblies* by steel electrical boxes that do not exceed 16 square inches (10 323 mm^2) in area, provided that the aggregate area of such penetrations does not exceed 100 square inches (44 500 mm^2) in any 100 square feet (9.29 m^2) of ceiling area, and the *annular space* between the ceiling membrane and the box does not exceed $^1/_8$ inch (3.2 mm).
3. *Membrane penetrations* by electrical boxes of any size or type, that have been *listed* as part of an opening protective material system for use in *horizontal assemblies* and are installed in accordance with the instructions included in the listing.
4. *Membrane penetrations* by *listed* electrical boxes of any material, provided that such boxes have been tested for use in fire-resistance-rated assemblies and are installed in accordance with the instructions included in the listing. The *annular space* between the ceiling membrane and the box shall not exceed $^1/_8$ inch (3.2 mm) unless *listed* otherwise.
5. The *annular space* created by the penetration of a fire sprinkler, provided that it is covered by a metal escutcheon plate.
6. Noncombustible items that are cast into concrete building elements and that do not penetrate both top and bottom surfaces of the element.
7. The ceiling membrane of a maximum 2-hour fire-resistance-rated *horizontal assembly* is permitted to be interrupted with the double 2x wood top plate of a wall assembly that is sheathed with *Type X gypsum wallboard*, provided that all penetrating items through the double top plates are protected in accordance with Section 714.5.1.1 or 714.5.1.2 and the ceiling membrane is tight to the top plates.

8. The ceiling membrane of a maximum 1-hour fire-resistance-rated horizontal assembly is permitted to be interrupted with a single 2x wood top plate of a wall assembly that is sheathed with Type X gypsum wallboard, provided that all penetrating items through the top plate are protected in accordance with Section 714.5.1.1 or 714.5.1.2 and the ceiling membrane is tight to the top plates. The bottom of the wood top plate must extend a minimum of ¾" below the ceiling membrane.

9. Ceiling *membrane penetrations* by *listed* luminaires (light fixtures) or by luminaires protected with *listed* materials, which have been tested for use in fire-resistance-rated assemblies and are installed in accordance with the instructions included in the listing.

Reason: During CAH 1, the opponents were concerned with the ability to achieve fastener edge distances. Upon speaking with the opponents after the hearing, it was determined they wanted clarification that there would be enough wood exposed to achieve proper fastening of the wall membrane. The 3/8" edge distance is in this code and other standards but is not easy to locate and is not associated with this section. Adding the ¾" of exposed bottom plate requirement would insure there is sufficient room to achieve the required fastener edge distance.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This code change proposal is to clarify the intent of the original code change that brought this exception into the code.

Comment (CAH2)# 487

Comment 2:

IBC: 714.5.2

Proponents: Richard Walke, Creative Technology Inc., Self (richwalke61@gmail.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

714.5.2 Membrane penetrations. Penetrations of membranes that are part of a *horizontal assembly* shall comply with Section 714.5.1.1 or 714.5.1.2. Where floor/ceiling assemblies are required to have a *fire-resistance rating*, recessed fixtures shall be installed such that the required *fire resistance* will not be reduced. **Exceptions:**

1. *Membrane penetrations* by steel, ferrous or copper conduits, pipes, tubes or vents, or concrete or *masonry* items where the *annular space* is protected either in accordance with Section 714.5.1 or to prevent the free passage of flame and the products of combustion. The aggregate area of the openings through the membrane shall not exceed 100 square inches (64 500 mm^2) in any 100 square feet (9.3 m^2) of ceiling area in assemblies tested without penetrations.
2. Ceiling *membrane penetrations* of maximum 2-hour *horizontal assemblies* by steel electrical boxes that do not exceed 16 square inches (10 323 mm^2) in area, provided that the aggregate area of such penetrations does not exceed 100 square inches (44 500 mm^2) in any 100 square feet (9.29 m^2) of ceiling area, and the *annular space* between the ceiling membrane and the box does not exceed $^1/_8$ inch (3.2 mm).
3. *Membrane penetrations* by electrical boxes of any size or type, that have been *listed* as part of an opening protective material system for use in *horizontal assemblies* and are installed in accordance with the instructions included in the listing.
4. *Membrane penetrations* by *listed* electrical boxes of any material, provided that such boxes have been tested for use in fire-resistance-rated assemblies and are installed in accordance with the instructions included in the listing. The *annular space* between the ceiling membrane and the box shall not exceed $^1/_8$ inch (3.2 mm) unless *listed* otherwise.

5. The *annular space* created by the penetration of a fire sprinkler, provided that it is covered by a metal escutcheon plate.
6. Noncombustible items that are cast into concrete building elements and that do not penetrate both top and bottom surfaces of the element.
7. The ceiling membrane of a maximum 2-hour fire-resistance-rated *horizontal assembly* is permitted to be interrupted with the double 2x wood top plate of a wall assembly that is sheathed with *Type X gypsum wallboard*, provided that all penetrating items through the double top plates are protected in accordance with Section 714.5.1.1 or 714.5.1.2 and the ceiling membrane is tight to the top plates.
8. The ceiling membrane of a maximum 1-hour fire-resistance-rated horizontal assembly is permitted to be interrupted with a minimum of a single 2x wood top plate of a wall assembly that is sheathed with Type X gypsum wallboard, provided the total depth of the top plate(s) exceed the total thickness of the gypsum board and resilient channel on the ceiling by a minimum of 3/4 in., ~~that~~ all penetrating items through the top plate are protected in accordance with Section 714.5.1.1 or 714.5.1.2 ,and the ceiling membrane is tight to the top plates.
9. Ceiling *membrane penetrations* by *listed* luminaires (light fixtures) or by luminaires protected with *listed* materials, which have been tested for use in fire-resistance-rated assemblies and are installed in accordance with the instructions included in the listing.

Reason: As originally written and as approved at Committee Action Hearing #1, the new Exception 8 is flawed. It specifies the top plate for the minimum 1 hr condition is to consist of a single 2x wood top plate, without regard to the thickness of the gypsum board, or the combination of resilient channel and gypsum board on the ceiling. The vast majority of wall assemblies published in either the UL Product iQ Online Directory or the GA-600 *Fire Resistance and Sound Control Design Manual* require the gypsum board on the wall to be secured to the top plate. The majority of the 1 hr fire-resistance-rated horizontal assemblies published in these same resources require two layers of 1/2 in. thick gypsum board, two layers of 5/8 in. thick gypsum board, or a layer of 1/2 in. deep resilient channel and one layer of 5/8 in. thick gypsum board on the ceiling. In all these conditions, there is insufficient top plate surface remaining to which to fasten the wall panels once the ceiling is installed.

The examples given in the Proponent's Reason statement would suggest compliant nailing can be achieved through the use of additional top plates. While it is true, the language of new Exception 8 does not require those additional top plates. Regardless of the thickness of the ceiling, the requirement of new Exception 8 is a single 2x top plate. As such, the only condition where compliant nailing is achievable with the single 2x top plate is with a ceiling consisting of one layer of 5/8 in. thick gypsum board.

As a reminder, a similar proposal FS67-21 was submitted during the previous code cycle suggesting the use of a single 2x top plate for the 1 hr condition. That proposal was disapproved for the same reason discussed above – an insufficient top plate surface onto which to fasten the wall panels.

In order to resolve this concern, this Comment adds an additional requirement which inter-relates the thickness of the resilient channel and gypsum board on the ceiling with the depth of the top plate member(s). The new requirement specifies the total depth of the top plate(s) exceed the total thickness of the resilient channel and gypsum board by a minimum of 3/4 in. This 3/4 in. then allows the gypsum board on the wall to be secured to the top plate with a minimum 3/8 in. edge clearance between the nail or screw and the edge of the gypsum board as specified by the Gypsum Association.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The code change proposal is not anticipated to increase or decrease the cost of construction. This code change proposal simply clarifies the intent of the original proposal.

Comment (CAH2)# 473

Comment 3:

Proponents: Edward Lisinski, American Wood Council (elisinski@awc.org) requests As Submitted

Reason: AWC supports the committee's approval of FS49-24 in Committee Action Hearing #1. This situation describes a very common issue in wood frame construction where the stud framing for walls are typically installed prior to the gypsum membrane of floor/ceiling assemblies. There is often debate if this is considered a membrane penetration or not. Item 7 in Section 714.5.2 gives criteria for a double top plate to penetrate a two-hour horizontal assembly, which would lead a code user to think that this situation should be considered a membrane penetration. However, this section did not give an option for a single top plate to penetrate a one-hour horizontal assembly. Because the ANSI/AWC *Fire Design Specification (FDS) for Wood Construction* and Chapter 16 of the ANSI/AWC *National Design Specification (NDS) for Wood Construction* both assign a char depth of 1-1/2" at 1-hour, therefore a single 2x wood top plate would be able to be a substitute for the gypsum membrane in these situations without reducing the fire-resistance rating of that horizontal assembly.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Comment (CAH2)# 104

FS50-24

IBC: 714.5.2, 714.5.2.1 (New)

Proposed Change as Submitted

Proponents: Jonathan Roberts, UL Solutions, UL Solutions (jonathan.roberts@ul.com)

2024 International Building Code

Revise as follows:

714.5.2 Membrane penetrations. Penetrations of membranes that are part of a *horizontal assembly* shall comply with Section 714.5.1.1 or 714.5.1.2.Membrane penetrations by luminaires shall comply with Section 714.5.2.1. ~~Where floor/ceiling assemblies are required to have a *fire-resistance rating*, recessed fixtures shall be installed such that the required *fire resistance* will not be reduced.~~ **Exceptions:**

1. *Membrane penetrations* by steel, ferrous or copper conduits, pipes, tubes or vents, or concrete or *masonry* items where the *annular space* is protected either in accordance with Section 714.5.1 or to prevent the free passage of flame and the products of combustion. The aggregate area of the openings through the membrane shall not exceed 100 square inches (64 500 mm^2) in any 100 square feet (9.3 m^2) of ceiling area in assemblies tested without penetrations.
2. Ceiling *membrane penetrations* of maximum 2-hour *horizontal assemblies* by steel electrical boxes that do not exceed 16 square inches (10 323 mm^2) in area, provided that the aggregate area of such penetrations does not exceed 100 square inches (44 500 mm^2) in any 100 square feet (9.29 m^2) of ceiling area, and the *annular space* between the ceiling membrane and the box does not exceed $^1/_8$ inch (3.2 mm).
3. *Membrane penetrations* by electrical boxes of any size or type, that have been *listed* as part of an opening protective material system for use in *horizontal assemblies* and are installed in accordance with the instructions included in the listing.
4. *Membrane penetrations* by *listed* electrical boxes of any material, provided that such boxes have been tested for use in fire-resistance-rated assemblies and are installed in accordance with the instructions included in the listing. The *annular space* between the ceiling membrane and the box shall not exceed $^1/_8$ inch (3.2 mm) unless *listed* otherwise.
5. The *annular space* created by the penetration of a fire sprinkler, provided that it is covered by a metal escutcheon plate.
6. Noncombustible items that are cast into concrete building elements and that do not penetrate both top and bottom surfaces of the element.
7. The ceiling membrane of a maximum 2-hour fire-resistance-rated *horizontal assembly* is permitted to be interrupted with the double wood top plate of a wall assembly that is sheathed with *Type X gypsum wallboard*, provided that all penetrating items through the double top plates are protected in accordance with Section 714.5.1.1 or 714.5.1.2 and the ceiling membrane is tight to the top plates.
8. ~~Ceiling *membrane penetrations* by *listed* luminaires (light fixtures) or by luminaires protected with *listed* materials, which have been tested for use in fire-resistance-rated assemblies and are installed in accordance with the instructions included in the listing.~~

Add new text as follows:

714.5.2.1 Membrane penetrations by luminaires. Penetrations of membranes that are part of a *horizontal assembly* by luminaires (light fixtures) shall comply with one of the following:

1. Luminaires *listed* and *labeled* for use in fire-resistance rated assemblies. The listing shall indicate that the luminaire is suitable for installation in the *horizontal assembly* penetrated with a fire-resistance rating not less than the required rating of the *horizontal assembly* penetrated.
2. Luminaires tested for use in a fire-resistance rated assemblies and are installed in accordance with tested assembly construction specifications.

3. Luminaires protected by an enclosure *listed* and *labeled* for use in fire-resistance designs certified by an *approved agency*.

Reason: This proposal accomplishes the following:

1. Section 714.5.2 currently covers two distinctly different requirements, (a) exceptions to the basic membrane penetration requirements and (b) description of how to cover penetrations by luminaires. This proposal separates the legacy exceptions from the distinctly different luminaire protection requirements, which move to a new 714.5.2.1

2. Section 714.5.2 has been revised to only cover exceptions 1 through 7, and remove reference to luminaires.

3. Section 714.5.2.1 now covers acceptable methods for addressing membrane penetrations by luminaires as follows:

Item 1 covers luminaires that are listed and labeled for use in fire-resistance rated horizontal assemblies. The reference to the listing indicating that the luminaire is suitable for the horizontal assembly penetrated is consistent with how these products are listed. Additional information on this can be found in the guide information for Luminaires, Luminaire Assemblies and Luminaire Enclosures Certified for Fire Resistance (CDHW).

Item 2 addresses the requirements that were previously in exception 8 in a more concise fashion. The reference in exception 8 allowing "luminaires protected with listed materials" was eliminated because we are not aware of materials that have been listed for this application.

Item 3 addresses the requirements for enclosures that have been tested for use in specific fire-resistance rated horizontal designs. The approved agency language is consistent with Section 703.2.2(5).

4. The ambiguous requirement in 713.5.2 that indicate "recessed fixtures shall be installed such that the required fire resistance will not be reduced" has been replaced in 714.5.2.1 with more definitive wording.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Listing for luminaires (light fixtures) that are membrane penetrations regulated by this section of the code currently have a "listing" option (part of the list of exceptions) for compliance with the requirement to maintain fire resistance. As listing as an option is currently included in this code, so there is no additional cost impact. The proposal is a simple editorial revision to provide clarity for the code official with the methods by which to determine code compliance.

FS50-24

Public Hearing Results (CAH1)

Committee Action: **As Submitted**

Committee Reason: The committee approved the proposed language based on the proposal's reason statement (Vote: 11-0).

FS50-24

Individual Consideration Agenda

Comment 1:

IBC: 714.5.2, 714.5.2.1

Proponents: Richard Walke, Creative Technology Inc., Self (richwalke61@gmail.com) requests As Modified by Committee (AMC2)

Further modify as follows:

2024 International Building Code

714.5.2 Membrane penetrations. Penetrations of membranes that are part of a *horizontal assembly* shall comply with Section 714.5.1.1 or 714.5.1.2. Membrane penetrations by luminaires shall comply with Section 714.5.2.1.

Exceptions:

1. *Membrane penetrations* by steel, ferrous or copper conduits, pipes, tubes or vents, or concrete or *masonry* items where the *annular space* is protected either in accordance with Section 714.5.1 or to prevent the free passage of flame and the products of combustion. The aggregate area of the openings through the membrane shall not exceed 100 square inches (64 500 mm^2) in any 100 square feet (9.3 m^2) of ceiling area in assemblies tested without penetrations.
2. Ceiling *membrane penetrations* of maximum 2-hour *horizontal assemblies* by steel electrical boxes that do not exceed 16 square inches (10 323 mm^2) in area, provided that the aggregate area of such penetrations does not exceed 100 square inches (44 500 mm^2) in any 100 square feet (9.29 m^2) of ceiling area, and the *annular space* between the ceiling membrane and the box does not exceed $^1/_8$ inch (3.2 mm).
3. *Membrane penetrations* by electrical boxes of any size or type, that have been *listed* as part of an opening protective material system for use in *horizontal assemblies* and are installed in accordance with the instructions included in the listing. Protected electrical boxes shall be installed such that the *fire-resistance rating* of the *horizontal assembly* is not reduced.
4. *Membrane penetrations* by *listed* electrical boxes of any material, provided that such boxes have been tested for use in fire-resistance-rated assemblies and are installed in accordance with the instructions included in the listing. The *annular space* between the ceiling membrane and the box shall not exceed $^1/_8$ inch (3.2 mm) unless *listed* otherwise.Electrical boxes shall be installed such that the *fire-resistance rating* of the *horizontal assembly* is not reduced.
5. The *annular space* created by the penetration of a fire sprinkler, provided that it is covered by a metal escutcheon plate.
6. Noncombustible items that are cast into concrete building elements and that do not penetrate both top and bottom surfaces of the element.
7. The ceiling membrane of a maximum 2-hour fire-resistance-rated *horizontal assembly* is permitted to be interrupted with the double wood top plate of a wall assembly that is sheathed with *Type X gypsum wallboard*, provided that all penetrating items through the double top plates are protected in accordance with Section 714.5.1.1 or 714.5.1.2 and the ceiling membrane is tight to the top plates.

714.5.2.1 Membrane penetrations by luminaires. Penetrations of membranes that are part of a *horizontal assembly* by luminaires (light fixtures) shall comply with one of the following:

1. Luminaires *listed* and *labeled* for use in fire-resistance rated assemblies. The *listing* shall indicate that the luminaire is suitable for installation in the *horizontal assembly* penetrated with a *fire-resistance rating* not less than the required rating of the *horizontal assembly* penetrated.
2. Luminaires tested for use in a fire-resistance rated ~~assemblies~~ assembly and are installed in accordance with tested assembly construction specifications.
3. Luminaires protected by an enclosure *listed* and *labeled* for use in fire-resistance designs certified by an *approved agency*. The *listing* shall indicate the enclosure is suitable for installation with luminaires in the *horizontal assembly* penetrated with a *fire-resistance rating* not less than the required rating of the *horizontal assembly* penetrated.

Reason: This Comment is intended to address two issues associated with FS50-24 which was Approved as Submitted in Committee Action Hearing #1, as follows:

1. In developing FS50-24, UL Solutions deleted the statement "Where floor/ceiling assemblies are required to have a *fire-resistance rating*, recessed fixtures shall be installed such that the required *fire-resistance* will not be reduced." This a key provision which differentiates the performance requirements between recessed membrane penetrations and other membrane penetrations such as pipe or cable penetrations. As such, it is needed to understand the expected level of performance for recessed membrane penetrations. If protecting a typical pipe or cable membrane penetration other than the configuration covered in Exception 1 of Section 714.5.2, the first sentence of the charging language of Section 714.5.2 would apply. These penetrations would be protected so as to comply with Sections 714.5.1.1 or 714.5.1.2. If tested in the approved fire-resistance-rated assembly based on Section 714.5.1.1, the temperature limitation of ASTM E119 or UL 263 would apply. If tested in accordance with ASTM E814 or UL 1479 based on Section 714.5.1.2, the temperature limitation component of a T Rating would be required unless the penetration met one of the exceptions of that Section. If protecting a recessed membrane penetration based on either Section 714.5.1.1 or 7145.1.2, the temperature limitation would always be required as none of the T Rating exceptions of Section 714.5.1.2 would apply. However, if protecting a recessed membrane penetration based on the performance-based Exceptions 3 or 4 of Section 714.5.2, that deleted sentence is needed in order to understand whether the temperature limitations apply or not. As such, this Comment adds the deleted sentence to Exceptions 3 and 4, in a clarified format.
2. This Comment corrects what is believed to be a typo in Section 714.5.2.1(2) of the original proposal.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The reinsertion of the phrase relating to "... recessed fixtures shall be installed such that the required fire-resistance is not reduced" into Exceptions 3 and 4 of Section 714.5.1 has no cost impact as this requirement is currently in the 2024 IBC.

Listing for luminaires (light fixtures) that are membrane penetrations regulated by this section of the code currently have a "listing" option (part of the list of exceptions) for compliance with the requirements to maintain fire resistance. As the listing option is currently included in the code, there is no additional cost impact for luminaires.

Comment (CAH2)# 640

FS53-24

IBC: 715.3

Proposed Change as Submitted

Proponents: Jeffrey Grove, Southern Nevada ICC Chapter (jeff.grove@coffman.com)

2024 International Building Code

Revise as follows:

715.3 Fire-resistance-rated assembly intersections. *Joints* installed in or between fire-resistance-rated walls, floor or floor/ceiling assemblies and roofs or roof/ceiling assemblies shall be protected by an *approved fire-resistant joint* system designed to resist the passage of fire for a time period not less than the required *fire-resistance rating* of the wall, floor or roof in or between which the system is installed. **Exception:** *Fire-resistant joint systems* shall not be required for *joints* in the following locations:

1. Floors within a single *dwelling unit*.
2. Floors where the *joint*s protected by a *shaft enclosure* in accordance with Section 713.
3. Floors within *atriums* where the space adjacent to the *atrium* is included in the volume of the *atrium* for smoke control purposes.
4. Floors within *malls*.
5. Floors and ramps within parking garages or *structures* constructed in accordance with Sections 406.5 and 406.6.
6. *Mezzanine* floors.
7. Walls that are permitted to have unprotected openings.
8. Roofs where openings are permitted.
9. Control *joints* not exceeding a maximum width of 0.625 inch (15.9 mm) and tested in accordance with ASTM E119 or UL 263.
10. The intersection of exterior curtain wall assemblies and the roof slab or *roof deck*.
11. Between the bottom of a fire-resistance-rated wall and a floor or floor/ceiling assembly, unless the wall abuts two or more interconnected levels.

Reason: Based on the following, fire-resistive joint systems are not required or necessary where a fire-resistance-rated wall is supported by (sits on) a floor or floor/ceiling assembly.

Although the charging section can be interpreted to apply, the assemblies in question do not meet the definition of a joint in Chapter 2 of the 2024 IBC.

> **JOINT.** The opening in or between adjacent assemblies that is created due to building tolerances, or is designed to allow independent movement of the building in any plane caused by thermal, seismic, wind or any other loading.

Where a wall is supported by a floor or floor/ceiling assembly, the bottom of a wall is not designed to allow independent movement. Although “building tolerances” is not defined in the IBC, these assemblies also have little if any tolerances due to the methods of construction. As such, the bottom of a fire-resistance-rated wall does not constitute a joint within the intent of Section 715 and additional protection is not required.

Furthermore, the Gypsum Association manual (GA-216) specifies that “Gypsum panel products applied to walls shall be applied with the bottom edge spaced a minimum of 1/4 in. (6 mm) above the floor.” Drywall is attached to studs, which are connected to a base plate and, as such, there will rarely if ever be a gap at the bottom of a wall sufficient to allow migration of fire, smoke or superheated gasses.

In addition, NFPA® 80, the Standard for Fire Doors and Other Opening Protectives specifies that “Clearance under the bottom of a door shall be a maximum of 3⁄4 in. (19 mm).” This is an indication that the bottom of a fire-resistance-rated wall assembly isn’t as critical as the

top, or even the sides.

Based on the preceding, it is clear that joint protection in accordance with Section 715.3 is not required for bottom of wall assemblies and provides little to no additional protection.

THE PHYSICS:

During a fire, the room of origin becomes positively pressurized above the neutral plane and negatively pressurized below the neutral plane. As such, fire, smoke and superheated gasses will rarely if ever migrate from the room of origin into adjacent spaces at the bottom of a wall and protection at the bottom of the wall contradicts the physics of the requirement.

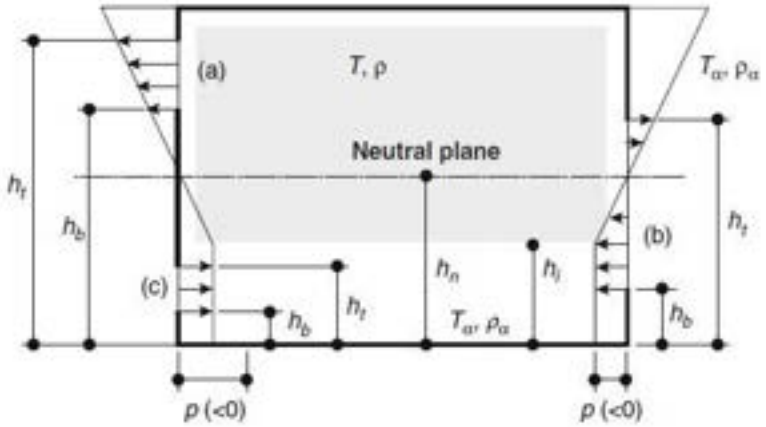

Figure 15.24 from the SFPE Handbook of Fire Protection Engineering – Fifth Edition.

Bibliography: SFPE Handbook of Fire Protection Engineering, Fifth Edition
NFPA® 80, the Standard for Fire Doors and Other Opening Protectives

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

Installation of a listed joint system between the bottom of a fire-resistance-rated wall and the floor that supports it ranges from $3 - $4.5 per lineal foot. As such, this clarification of code intent will reduce the cost of construction.

Estimated Immediate Cost Impact Justification (methodology and variables):

Cost information was obtained from mechanical vendors and contractors.

FS53-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee determined that the proposed text is too broad and needs more work. The committee encouraged the proponent to work on limited use (Vote: 12-0).

FS53-24

Individual Consideration Agenda

Comment 1:

Proponents: Jeffrey Grove, Southern Nevada ICC Chapter (jeff.grove@coffman.com) requests As Submitted

Reason: Movement is expected between the top plate and the floor/floor-ceiling assembly above, as well as vertical joints between rated walls. Where a wall is supported by a floor or floor/ceiling assembly, the bottom of a wall is not designed to allow independent movement. I'm sure we will all agree a CMU wall will have little to no associated gap at the bottom and additional protection is unnecessary. Drywall is rigidly attached vertically to studs and horizontally to the top plate and the sill plate/bottom plate. Due to the ridged attachment at the bottom of a wall, there will rarely if ever be a gap at the bottom sufficient to allow migration of fire, smoke or superheated gasses. Although "building tolerances" is not defined in the IBC, these assemblies also have little if any tolerances due to the methods of construction. As such, the bottom of a fire-resistance-rated wall does not constitute a joint within the intent of Section 715 and additional protection is not required.

Since drywall must be rigidly attached to the sill plate/bottom plate (typically a nominal 2 X 4 sleeper), it's unlikely drywall will ever be attached more than one inch above the floor and the space below the drywall will be filled by the sill plate/bottom plate. In addition, a base board will almost always be included to hide the gap between the wallboard and the sill plate/bottom plate. As such, there is essentially no gap at the bottom of a wall constructed of drywall.

Furthermore, the test furnace pressurizes the upper portion of the furnace and draws air into the furnace from the bottom of the wall assembly being tested. As such, almost any material (including nothing) can be expected to pass the test. If the concern is a room fire forcing super-heated gasses and flames under a wall assembly, the test must be modified to demonstrate this condition.

It needs to be clear that the bottom of a wall does not meet the definition of a joint and is not presently required to be protected, as well as present testing is not adequate to address this concern. If the voting members feel this level of protection is prudent, the code and the associated test must be modified appropriately to reflect this condition.

THE PHYSICS (Supplemented):

A shaft or other wall that abuts two or more interconnected levels may experience leakage through the gap at the bottom of a wall sufficient to allow migration of fire, smoke or superheated gasses as demonstrated in the figure included with this comment, which is from the SFPE Handbook of Fire Protection Engineering – Fifth Edition.

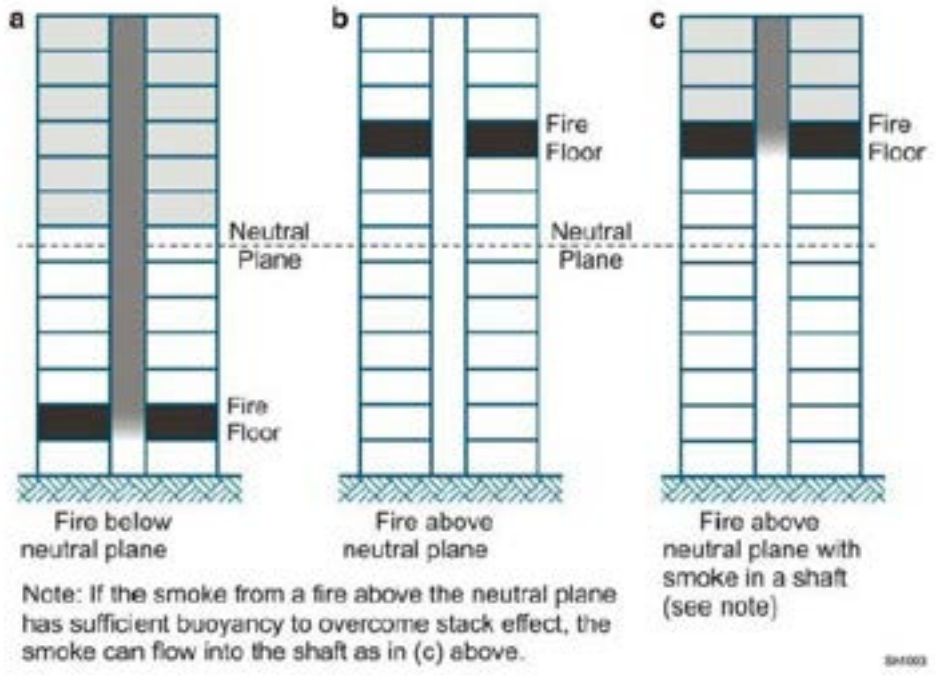

Fig. 50.6 Smoke movement in a high rise building due to normal stack effect

Bibliography: SFPE Handbook of Fire Protection Engineering, Fifth Edition

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

FS55-24

IBC: 715.3, 715.4

Proposed Change as Submitted

Proponents: William Koffel, Koffel Associates, Inc., Firestop Contractors International Association (FCIA) (wkoffel@koffel.com)

2024 International Building Code

Revise as follows:

715.3 Fire-resistance-rated assembly intersections. *Joints* installed in or between fire-resistance-rated walls, floor or floor/ceiling assemblies and roofs or roof/ceiling assemblies shall be protected by an *approved fire-resistant joint* system designed to resist the passage of fire for a time period not less than the required *fire-resistance rating* of the wall, floor or roof in or between which the system is installed. **Exception:** *Fire-resistant joint systems* shall not be required for *joints* in the following locations:

1. Floors within a single *dwelling unit*.
2. Floors where the *joint* is protected by a *shaft enclosure* in accordance with Section 713.
3. Floors within *atriums* where the space adjacent to the *atrium* is included in the volume of the *atrium* for smoke control purposes.
4. Floors within *malls*.
5. Floors and ramps within parking garages or *structures* constructed in accordance with Sections 406.5 and 406.6.
6. *Mezzanine* floors.
7. Walls that are permitted to have unprotected openings.
8. Roofs where openings are permitted.
9. Control *joints* not exceeding a maximum width of 0.625 inch (15.9 mm) and tested in accordance with ASTM E119 or UL 263.
10. ~~The intersection of exterior curtain wall assemblies and the roof slab or *roof deck*.~~

715.4 Exterior curtain wall/fire-resistance-rated floor intersections. Voids created at the intersection of exterior curtain wall assemblies and fire-resistance-rated floor, ~~or~~ floor/ceiling, roof, or roof/ceiling assemblies shall be protected with an *approved perimeter fire containment system* to prevent the ~~interior~~ spread of fire. Such systems shall provide an *F rating* for a time period not less than the *fire-resistance rating* of the floor or floor/ceiling assembly.

Exceptions: An approved perimeter fire containment system shall not be required for voids in the following locations:

1. Floors within a single *dwelling unit*.
2. Floors and ramps within parking garages or *structures* constructed in accordance with Sections 406.5 and 406.6.
3. *Mezzanine* floors.

Reason: Exception 10 is inappropriately located in Section 715. Section 715.3 addresses fire-resistant joint systems, whereas Exception 10 addresses perimeter fire containment systems and should be deleted.

Protecting the breach made at the roof level brings needed firefighter protection while handling firefighting operations from the rooftop.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

$35 - $50 per lineal foot of perimeter containment system to be protected.

Estimated Immediate Cost Impact Justification (methodology and variables):

Based on industry and manufacturer input, the average cost of an installed perimeter containment system is $35 - $50/ linear ft.

This includes materials and labor costs for application. The cost estimate is conservative in that if a perimeter containment system is not required, there is still some protection of the intersection that would be required at the roof or roof/ceiling level.

FS55-24

Public Hearing Results (CAH1)

Committee Action: **As Modified by Committee (AMC1)**

Committee Modification:
715.4 Exterior curtain wall/fire-resistance-rated floor intersections. Voids created at the intersection of exterior curtain wall assemblies and fire-resistance-rated floor, floor/ceiling, roof, or roof/ceiling assemblies shall be protected with an *approved perimeter fire containment system* to prevent the interior spread of fire. Such systems shall provide an *F rating* for a time period not less than the *fire-resistance rating* of the floor or floor/ceiling assembly.
Exceptions: An approved perimeter fire containment system shall not be required for voids in the following locations:

1. Floors within a single *dwelling unit*.
2. Floors and ramps within parking garages or *structures* constructed in accordance with Sections 406.5 and 406.6.
3. *Mezzanine* floors.

Committee Reason: The committee agreed that the modification adds back "interior" to the original proposal. The main proposal provides clarity to the code requirements (Vote: 11-1).

FS55-24

Individual Consideration Agenda

Comment 1:

Proponents: David Renn, PE, SE, City and County of Denver, Code Change Committee of ICC Colorado Chapter (david.renn@denvergov.org) requests Disapproved

Reason: Section 715.4: This proposal adds a requirement for a perimeter fire containment system between curtain wall assemblies and roof or roof/ceiling assemblies and the only reason given is that it brings needed firefighter protection while handling firefighting operations from the rooftop. This "needed" protection was not backed up with any information that indicates this is an actual issue that needs to be addressed. Since there is no smoke accumulation at the roof, a breach at the perimeter of the roof shouldn't affect firefighting operations. Also, if this is an issue, why didn't this proposal include a change to 715.5 for the void between curtain wall assemblies and nonfire-resistance-rated roof or roof/ceiling assemblies? 715.5 has no requirements for a roof condition.

Furthermore, 712.1.15 currently allows unprotected skylights and other penetrations through the roof and FS37-24 was approved that expands this to all roof openings. With unprotected openings allowed, why does the perimeter void need to be protected? The committee

indicated that this proposal was approved since it provides clarity to the code requirements, but instead it adds a code requirement without justification.

Lastly, this proposal doesn't change the F rating requirements for the added roof or roof/ceiling assemblies, so if approved would require the perimeter fire containment system at the roof or roof/ceiling assembly to have an F rating for the floor or floor/ceiling assembly, which is often a higher rating than required for a roof or roof/ceiling assembly.

Section715.3: This proposal deletes Exception 10 from the requirement for fire-resistant joint systems between fire-resistance-rated assemblies. The reason statement indicates that this was done since Exception 10 is for perimeter fire containment systems (which are in 715.4) so this should be deleted. This reason is incorrect in that 715.3 Exception 10 is for a joint between a fire-resistance-rated roof and a fire-resistance-rated curtain wall, while 715.4 deals with a nonfire-resistance-rated curtain wall. These two sections are for different conditions with different test requirements for fire-resistant joint systems versus perimeter fire containment systems. This exception should remain with the same reasoning as noted above for the perimeter fire containment systems.

Cost Impact: No change to code.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Comment (CAH2)# 191

FS56-24

IBC: 715.4, 715.5

Proposed Change as Submitted

Proponents: Tony Crimi, A.C. Consulting Solutions Inc., North American Insulation Manufacturers Association (tcrimi@sympatico.ca)

2024 International Building Code

Revise as follows:

715.4 Exterior curtain wall/fire-resistance-rated floor intersections. Voids created at the intersection of exterior curtain wall assemblies and fire-resistance-rated floor or floor/ceiling assemblies shall be protected with an *approved perimeter fire containment system* to prevent the interior spread of fire. Such systems shall provide an *F rating* for a time period not less than the *fire-resistance rating* of the floor or floor/ceiling assembly. **Exceptions:** An approved perimeter fire containment system shall not be required for voids in the following locations:

1. Floors within a single *dwelling unit*.
2. ~~Floors and ramps within parking garages or *structures* constructed in accordance with Sections 406.5 and 406.6.~~
3. ~~3~~ 2. *Mezzanine* floors.

715.5 Exterior curtain wall/nonfire-resistance-rated floor assembly intersections. Voids created at the intersection of exterior curtain wall assemblies and nonfire-resistance-rated floor or floor/ceiling assemblies shall be filled with an *approved* material or system to retard the interior spread of fire and hot gases.

Exceptions: An *approved* material or system to retard the interior spread of fire and hot gases shall not be required for voids in the following locations:

1. Floors within a single *dwelling unit*.
2. ~~Floors and ramps within parking garages or *structures* constructed in accordance with Sections 406.5 and 406.6.~~
3. ~~3~~ 2. *Mezzanine* floors.

Reason: During the 2024 code cycle, Proposal No. FS75-21 introduced several exceptions to the requirements to protect perimeter voids in open and closed parking garages for both rated and non-rated floor construction. With this change, perimeter openings are not required to be filled with any material, leaving them entirely open though all floors of the parking garage, in a direct vertical path for flames and hot gases to travel. Voids at curtain walls extend long distances throughout an entire parking structure. The openings will often be located directly above or below parked vehicles, which can further complicate fire fighting operations with multiple floors engaged in fire.

Modern vehicles present new hazards due to the incorporation of larger quantities of combustible materials (e.g. fuels, plastics, synthetic materials, etc.) into their designs. Another recent vehicle construction change is the use of plastic fuel tanks. According to the American Chemistry Council, modern vehicles are now composed of about 50 percent plastic by volume, even though plastics account for only 10 percent of the average vehicle's weight. Industry experts believe that as better technologies and additional fuel-efficiency mandates kick in, the percentage of plastics in cars will only increase.[1] As alternative fuel vehicles are popularized, concerns regarding their unique hazards, burn characteristics, and typical burn duration have been raised. Compared to older vehicles, modern vehicles burn differently. At the same time, modern parking garages have optimized space requirements for vehicle parking and storage. It is clear that the design assumption of only one or two fire burning has to be revisited. Cars are larger and have more fuel load than before, and the parking spaces have become smaller. This enhances the probability of fire spread between vehicles.

New electric vehicle battery and charging equipment technologies are also leading to much more rapid fire growth than previously contemplated in parking garage design. Fire accidents caused by the thermal runaway of lithium-ion battery have demonstrated that

additional fire safety precautions are needed. It is particularly important to prevent these open and closed parking garage fires from occurring due to the challenges the fire services face in fighting parking garage fires.

An NFPA Journal article published in 2019 indicated a typical garage fire today is much more likely to involve multiple vehicles than two decades ago, hinting that fires are in fact burning with more severity. In garage fires between 1995 and 1997, only 1 percent of fires involved more than five vehicles. By contrast, between 2010 and 2014, 8 percent of the garage fires involved more than five vehicles.[2] In the United States, Corporate Average Fuel Efficiency standards mandate that passenger vehicle fleets average 54.5 miles per gallon by 2025. To meet those requirements, it is expected that the average car will incorporate nearly 350 kilograms of plastics, up from 200 kilograms in 2014, according to an analysis by IHS Chemical, a chemical industry research group.[1]

Bibliography: [1] NFPA Journal - Protecting Parking Garages, Mar Apr 2019, Ramp Risk, By Jesse Roman.
[2]NFPA Research Foundation - Modern Vehicle Hazards in Parking Structures and Vehicle Carriers by Haavard Boehmer, PE, Michael Klassen, PhD, PE, Stephen Olenick, PE

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

Based on the 2024 IBC, the proposal will increase the cost of construction. However, the proposal would bring the cost of construction back to the level of the 2021 and prior IBC editions. Because the 2024 edition is not yet widely adopted, the cost impact is limited at this time.

Estimated Immediate Cost Impact Justification (methodology and variables):

The proposal would bring the cost of construction back to the level of the 2021 and prior IBC editions. The approximate installed cost is $7-10 per lineal foot.

FS56-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee disapproved the proposal to be consistent with the action taken on FS54-24 (Vote: 9-3).

FS56-24

Individual Consideration Agenda

Comment 1:

IBC: 715.4, 715.5

Proponents: Tony Crimi, A.C. Consulting Solutions Inc., North American Insulation Manufacturers Association (tcrimi@sympatico.ca) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

715.4 Exterior curtain wall/fire-resistance-rated floor intersections. Voids created at the intersection of exterior curtain wall

assemblies and fire-resistance-rated floor or floor/ceiling assemblies shall be protected with an *approved perimeter fire containment system* to prevent the interior spread of fire. Such systems shall provide an *F rating* for a time period not less than the *fire-resistance rating* of the floor or floor/ceiling assembly. **Exceptions:** An approved perimeter fire containment system shall not be required for voids in the following locations:

1. Floors within a single *dwelling unit*.
2. Ramps within parking garages or structures constructed in accordance with Sections 406.5 and 406.6.
2 3. *Mezzanine* floors.

715.5 Exterior curtain wall/nonfire-resistance-rated floor assembly intersections. Voids created at the intersection of exterior curtain wall assemblies and nonfire-resistance-rated floor or floor/ceiling assemblies shall be filled with an *approved* material or system to retard the interior spread of fire and hot gases.

Exceptions: An *approved* material or system to retard the interior spread of fire and hot gases shall not be required for voids in the following locations:

1. Floors within a single *dwelling unit*.
2. Ramps within parking garages or structures constructed in accordance with Sections 406.5 and 406.6.
2 3. *Mezzanine* floors.

Reason: During CAH #1, the committee mentioned that the code allows for open floors between levels in parking garages, so to have a protected joint adjacent to an opening that is floor-to-floor, does not make sense. However, those floor openings are only in areas without vehicle parking. The area at the perimeter of a parking garage would be open floor-to-floor directly adjacent to vehicle parking areas.

Since the CAH#1 hearings, NFPA Research Foundation has released their Phase II Report on vehicle hazards in parking structures. This Phase II effort aimed to update the 2020 report's analysis and identify fire safety knowledge gaps. The expanded analysis covered various aspects, including parking structure characteristics, parking garage fire statistics, vehicle composition data, applicable codes and standards, and representative fire incidents. Additionally, it reviewed published data on full-scale fire tests with modern vehicles, compiling this information into a database for further analysis.[1] The report concludes, in part:

"Based upon the analysis of the issues at hand and the available literature, three primary knowledge gaps were identified. First, the proper NFPA 13 hazard classification for modern vehicles in a parking garage is unclear. While codes and standards have evolved to require sprinklers in more new parking garages and have also increased the necessary sprinkler water density, the technical justification for selection of the water density is lacking. Code- and standards-making bodies have indicated uncertainty about what the proper sprinkler water density should be to prevent fire spread in parking structures. The review of the literature and incidents has indicated that, in general, if water is applied by sprinklers, the vehicle-to-vehicle fire spread does not occur. But there is a question of whether that is just because a worst-case scenario has not yet been encountered. The technical justification for the proper sprinkler water density in parking structures should be based on testing or data."[1]

In short, it is premature to permit open floor-to-floor perimeter areas that are adjacent to parked vehicles.

Bibliography: [1]NFPA Research Foundation - Classification of Modern Vehicle Hazards in Parking Structures & Systems – Ph II by Stephen Olenick, Michael Klassen, Nasir Hussain Combustion Science & Engineering, Maryland, USA, May 2024

Cost Impact: Increase

Estimated Immediate Cost Impact:

Based on the 2027 IBC, the proposal will increase the cost of construction. The proposal would bring the cost of construction back to the level of the 2024 and prior IBC editions.

Estimated Immediate Cost Impact Justification (methodology and variables):

The proposal would bring the cost of construction back to the level of the 2021 and prior IBC editions. The approximate installed cost is $7-10 per lineal foot.

TYPE OF ASSEMBLY	REQUIRED WALL ASSEMBLY RATING (hours)	MINIMUM FIRE DOOR AND FIRE SHUTTER ASSEMBLY RATING (hours)	DOOR VISION PANEL SIZE	FIRE-RATED GLAZING MARKING DOOR VISION PANEL	MINIMUM SIDELIGHT/TRANSOM ASSEMBLY RATING (hours)		FIRE-RATED GLAZING MARKING SIDE-LIGHT/TRANSOM PANEL	
					Fire protection	Fire resistance	Fire protection	Fire resistance
Smoke barriers	1	$^3/_4$	Maximum size tested	D-H-45	$^3/_4$[h]		D-H-45[h]	
	1	$^1/_3$	Maximum size tested	D-20	Fire protection $^3/_4$		D-H-OH-45	

For SI: 1 square inch = 645.2 mm.

a. Fire-resistance-rated glazing tested to ASTM E119 in accordance with Section 716.1.2.3 shall be permitted, in the maximum size tested.

b. Under the column heading “Fire-rated glazing marking door vision panel,” W refers to the fire-resistance rating of the glazing, not the frame.

c. See Section 716.1.2.2.1 and Table 716.1(1) for additional permitted markings.

d. Two doors, each with a fire protection rating of $1^1/_2$ hours, installed on opposite sides of the same opening in a fire wall, shall be deemed equivalent in fire protection rating to one 3-hour fire door.

e. As required in Section 706.4.

f. As allowed in Section 4.6 of NFPA 221.

g. See Section 716.2.5.1.2.

h. Fire-protection-rated glazing is not permitted for fire barriers required by Section 1207 of the *International Fire Code* to enclose energy storage systems. Fire-resistance-rated glazing assemblies tested to ASTM E119 or UL 263, as specified in Section 716.1.2.3, shall be permitted.

i. Two doors, each with a fire rating of 20 minutes, installed on opposite sides of the same opening in a fire partition, shall be deemed equivalent in fire protection rating to one 45-minute fire door.

j. See Section 716.2.5.4 for requirements for fire-resistance-rated glazing installed in sidelight/transom panels.

Reason: This proposal is intended to clarify the type of glazing and frame required in sidelights and transoms in applications where fire-protection-rated glazing is not permitted. Where this issue gets confusing is that for Door Vision Panels which exceed the allowable size for fire-protection-rated glazing, fire-resistance-rated glazing may be used within the typical glass light kit. These glass light kits are considered to be fire-protection-rated in that like the door in which they are installed, they will not meet the heat transmission requirements of ASTM E119 and UL 263. However, when fire-protection-rated glazing is not permitted in sidelights and transoms, a fire-resistance-rated glazing and frame assembly having a fire-resistance rating based on testing the combination of the glazing and frame assembly in accordance with ASTM E119 or UL 263 must be used. The new Footnote j clarifies this point by referencing the code user to Section 716.2.5.4 where the required glazing and frame are clarified. There are multiple fire resistance designs published by the various Nationally Recognized Testing Laboratories which can be used to show compliance with this requirement.

It is believed this new footnote will reduce the confusion on the type of glazing and frame required and help ensure the proper glazing and frame is used in this application.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposed changes simply clarity the existing requirements.

FS61-24

Public Hearing Results (CAH1)

Committee Action: **As Submitted**

Committee Reason: The committee agreed with the proposed clarification to the type of glazing and frame required in sidelights and transoms in applications where fire protection-rated glazing is not permitted (Vote: 11-1).

FS61-24

Individual Consideration Agenda

Comment 1:

Proponents: Thom Zaremba, Roetzel & Andress, National Glass Association (tzaremba@ralaw.com); Nicholas Resetar, Primary Fire Rated Glazing Manufacturers (nresetar@ralaw.com) requests Disapproved

Reason: Although FS61-24 may be well intentioned, it should be disapproved for three reasons. First, it will actually make Table 716.1(2) more, not less, confusing. Second, it is, simply, not necessary. Third, no evidence of any actual confusion has been presented to warrant adding yet another foot note to Table 716.2(1).

The first sentence of its reason statement says: "This proposal is intended to clarify the type of glazing and frame required in sidelights and transoms ...." However, the change approved at the Public Comment Hearing does not clarify Table 716.1(2). It will actually make Table 716.1(2) more confusing for those using it.

The confusion that FS61-24 creates is found in the lower half of the main vertical column where the Proponent places its proposed foot note. There, the main column goes back and forth several times from having two sub-columns to having only one sub-column. Where "Fire barriers having a required fire-resistance rating of 1 hour" changes to "Other fire barriers," the main column merges into a single column that only contains "fire protection" markings. Then, where "Other fire barriers" changes to "Exterior walls" the main column again breaks into two sub-columns, with both "fire protection" and "fire-resistance" markings. Finally, where "Exterior walls" changes to "Smoke barriers," the main column merges again into a single column containing only "fire protection" markings.

Putting the new foot note in the sub-column entitled "Fire Resistance," will leave those using Table 716.1(2) to ask whether the new foot note does or does not apply to those areas of the main vertical column that only has one sub-column? The foot note would only properly apply to fire-resistance rated assemblies, but where the main column has only one sub-column, the Table only references fire protection rated markings! Nothing in FS61-24 answers whether the text of FS61-24's foot note is intended to apply to those single sub-column areas or not.

In addition to adding confusion, FS61-24 is not even necessary. Table 716.1(2) was never intended to be a substitute for the mandatory requirements spelled out in the text of Chapter 7. Instead, it was added to Chapter 7 to summarize Chapter 7's requirements. Does every entry in Table 716.1(2) need a pointer, like the one proposed in FS61-24? No, of course not. Moving back and forth from one foot note to another to and from one cell after another and back again only makes the Table harder to read and harder to use.

Another pointer should only be added to this Table if it has been established that actual confusion exists requiring it. Here, no evidence of any actual confusion has been presented to warrant adding yet another foot note to Table 716.1(2).

Because it adds confusion, is unnecessary, and is without any substantiating evidence of actual confusion, we urge the Committee to

disapprove FS61-24.

Cost Impact: No change to code.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Comment (CAH2)# 506

For SI: 1 square inch = 645.2 mm.

a. Fire-resistance-rated glazing tested to ASTM E119 in accordance with Section 716.1.2.3 shall be permitted, in the maximum size tested.

b. Under the column heading “Fire-rated glazing marking door vision panel,” W refers to the fire-resistance rating of the glazing, not the frame.

c. See Section 716.1.2.2.1 and Table 716.1(1) for additional permitted markings.

d. Two doors, each with a fire protection rating of $1^1/_2$ hours, installed on opposite sides of the same opening in a fire wall, shall be deemed equivalent in fire protection rating to one 3-hour fire door.

e. As required in Section 706.4.

f. As allowed in Section 4.6 of NFPA 221.

g. See Section 716.2.5.1.2.

h. Fire-protection-rated glazing is not permitted for fire barriers required by Section 1207 of the *International Fire Code* to enclose energy storage systems. Fire-resistance-rated glazing assemblies tested to ASTM E119 or UL 263, as specified in Section 716.1.2.3, shall be permitted.

i. Two doors, each with a fire rating of 20 minutes, installed on opposite sides of the same opening in a fire partition, shall be deemed equivalent in fire protection rating to one 45-minute fire door.

716.2.5.4 Fire door frames with transom lights and sidelights. Fire-protection-rated glazing shall be permitted in door frames with transom lights, sidelights or both, where a $^3/_4$-hour *fire protection rating* or less is required ~~and in 2-hour fire-resistance-rated *exterior walls*~~ in accordance with Table 716.1(2). *Fire door* frames with transom lights, sidelights or both, installed with fire-resistance-rated glazing tested as an assembly in accordance with ASTM E119 or UL 263 shall be permitted where a *fire protection rating* exceeding $^3/_4$ hour is required in accordance with Table 716.1(2).

Reason: This proposal is intended to increase the required level of fire performance for glazing within fire door assemblies and within sidelights and transom panels in 2 hr exterior walls applications. In doing so, it also brings consistency within Table 716.1(2) for all applications requiring a fire door / fire shutter rating in excess of 3/4 hr.

The revisions to Table 716.1(2) and Section 716.2.5.4 are specifically intended to limit the allowable area of fire-protection-rated glazing in 1-1/2 hr fire-protection-rated fire door assemblies in exterior walls to a maximum of 100 sq. in. If more than 100 sq. in. of glazing is

needed, then fire-resistance-rated glazing is required. In addition, this proposal is intended to require sidelights and transoms adjacent to these doors to be glazed with fire-resistance-rated glazing in recognition of the relatively large sections of glazing typical installed in the sidelights and transoms.

Both fire-protection-rated glazing and fire-resistance-rated glazing are intended to stop the spread of flame and smoke. However, fire-resistance-rated glazing also complies with an unexposed surface temperature limitation on the glazing. The test standards utilized to determine the fire-resistance rating, ASTM E119 / UL 263, limit the temperature rise on the unexposed side to 250°F average / 325°F individual point for the entire duration of the fire exposure. The standards utilized to determine the fire-protection rating on the fire door assembly, NFPA 252 / UL 10B / UL 10C, and on the sidelights and transom panels, NFPA 257 / UL 9, do not have a temperature limitation. As a result, the glazing gets hot!

Many studies have been conducted over years to quantity the level of radiant heat from fire-protection-rated glazing. The radiant heat from the glazing is significant enough to cause a fire on the other side of the fire-resistance-rated barrier. Three individual Test Reports /Data Packages analyzing the heat transfer and radiant heat from the glazing are described below:

1. The June 9, 2006 **Fire Tests of Building Construction and Materials w/ Radiation Reaction of Mannequins** evaluated three variations of ceramic fire-protection-rated glazing, 44 in wide by 77 in. tall in SAFTI*FIRST*'s EZ frame, installed in a masonry wall assembly. Fully clothed mannequins were placed 20 in. for each of the glazing panels. The mannequin's ignited at 9:06, 12:15 and 16:10 for the three glazing variations. This report is available at https://www.dropbox.com/scl/fi/2vuykq3n8ztk7zkr3sk84/Radiant-Heat-Test-Report.pdf?rlkey=lk6ehccg0kgqjdtvmu0ndrrjs&dl=0

2. The March 20, 2006 **O'Keeffe's Inc. – Glass Profile** data package is a more complete data package of the thermal imaging camera data for fire test described in the June 9, 2006 Report. The data shows the temperature on each of the three glazing materials exceeded 1000°F in approximately 10 min. This report is available at https://www.dropbox.com/scl/fi/8u23sxu4f35g5jjrt08vg/Infrared-Inspection-V2.pdf?rlkey=xa847sn3hnnhk7rji24x9siqc&dl=0

3. The May 13, 2016 **Report of Testing Ceramic Glass with Reference SAFTI FIRST EZ Frame for compliance with the applicable requirements of the following criteria: Modified UL 9, Standard for Safety, Fire Tests of Window Assemblies, 2009** evaluated one 43 in. wide by 77 in. tall ceramic glazing panel in SAFTI*FIRST*'s EZ frame, installed in a gypsum board wall assembly. The thermal imaging camera data for this fire test shows an average temperature of approximately 970°F at 10 min. In addition, this report also shows a radiant heat flux of approximately 24 KW/m^2 at a distance of 1.0 meter from the glazing, at 45 min into the fire exposure test. A generally accepted level of heat flux sufficient to ignite wood under a piloted and nonpiloted scenario is 12.5 and 29 kW / m^2. This report is available at https://www.dropbox.com/scl/fi/knhapos5u2w68bwx4s8ha/Final-Test-Report.pdf?rlkey=0zhuwqmn8e7iazg5c73b8oqea&dl=0

Looking at the current Table 716.1(2), all applications requiring a Minimum Fire Door and Fire Shutter Assembly Rating greater than 3/4 hr other than 1-1/2 hr fire-door assemblies in 2 hr exterior walls, limits the area of fire-protection-rated glazing in the door to 100 sq. in. In addition, all applications other than 1-1/2 hr fire door assemblies in exterior walls do not permit the use of fire-protection-rated glazing in side-lights or transoms regardless of size. As such, the change proposed herein brings consistency to the various applications covered in Table 716.1(2).

In addition to the changes required in Table 716.1(2), Section 716.2.5.4 is also being changed to be consistent with the changes in Table 716.1(2).

On the surface this proposal appears to have major consequences. However, the applications where this proposed change would have an impact is very limited. Based on Tables 601 and 705.5, the applications where this change would have an impact are as follows:

1. Exterior Bearing Walls in Types IB, IIIA, IIIB, IVB, IVC and IVHT types of construction

2. Exterior Nonbearing Walls with Fire Separation Distances < 5 ft in all types of construction in F-1, M and S-1 occupancies

3. Exterior Nonbearing Walls with Fire Separation Distances of 5 ≤ X < 10 ft in all IA and IVA types of construction in F-1, M and S-1 occupancies

4. Exterior Nonbearing Walls with Fire Separation Distances of 5 ≤ X < 10 ft in all types of construction other than IA and IVA in H occupancies

5. Exterior Nonbearing Walls with Fire Separation Distances of 10 ≤ X < 30 ft in IA, IB, IVA and IVB types of construction in H occupancies

The applications where this proposal truly has an impact is further reduced through the application of Table 705.8. This table permits a combination of protected and unprotected openings based on fire separation distance and the use of sprinklers.

Bibliography: Radiant Heat Flux https://guides.firedynamicstraining.ca/g/structural-firefighting-fundamentals-of-fire-and-combustion/118132

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

The average additional installed cost of fire-resistance-rated glazing as compared to fire-protection-rated glazing is approximately $60 to $85 / sq. ft, depending on the rating. However as stated in the Reason Statement, the applications where this proposed change would have an impact is very limited.

Estimated Immediate Cost Impact Justification (methodology and variables):

This includes average materials and labor costs for the above items. In the end, the exact increase in cost is based on the fire separation distance, the type of construction, the occupancy and the specific building design in question.

FS62-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee determined that the proposed language is not necessary. The committee indicated that the proponent did not provide data to support the need for this code change (Vote: 9-3).

FS62-24

Individual Consideration Agenda

Comment 1:

Proponents: Richard Walke, Creative Technology Inc., SAFTIFIRST (richwalke61@gmail.com) requests As Submitted

Reason: This comment is asking that this proposal be approved as submitted (AS) for the reasons conveyed in the original Reason statement. The reports linked to that Reason statement provided data on the heat flux emitted from various types of fire-protection-rated glazing when exposed to an ASTM E119 / UL 263 time-temperature curve. These heat flux levels have the potential to ignite adjacent combustible construction as discussed below.

During the testimony at Committee Action Hearing #1, both supporters and opponents were asked by committee members if they were aware of actual fires where fire-protection-rated glazing stayed in place yet there was ignition of an adjacent structure. The answer from both sides was no. I have subsequently spent hours searching the web for fire incident reports documenting the performance of fire-protection-rated or fire-resistance-rated glazing in fire doors and side-light / transom panels in exterior walls. I was unable to locate any data which drilled down to that level of detail. As such, I don't believe we will be able to answer that question in a definitive manner either way.

Testimony at Committee Action Hearing #1 supported the theoretical position that radiant heat from fire-protection-rated glazing has the potential for igniting adjacent buildings. The potential of a fire to ignite adjacent buildings is dependent on a number of factors, including the construction of the adjacent building, the fire separation distance, the intensity of the fire, and the type of glazing used in fire doors and side-light / transom panels. These factors will dictate the heat flux seen by the adjacent construction. The heat flux level required for autoignition of wood is generally agreed to be approximately 12.5 kW/m2 for an exposure time of approximately 10 to 20 minutes.1 Based on the Reports referenced in the original Reason statement, the radiant heat through fire-protection-rated glazing certainly has the potential to ignite the adjacent construction.

As stated in the original Reason statement, this proposal, if approved, will impact only a very limited number of buildings. The original Reason statement detailed the impacted Types of Construction and Occupancies based on the fire separation distance. Beyond those limitations, Table 705.9 further limits the need for protected openings to fire separation distances of less than 3 ft for sprinklered and nonsprinklered applications, and 3 ft to less than 5 ft for nonsprinklered applications. Exterior walls with larger fire separation distances are permitted some percentage of unprotected openings.

Exterior walls	>1	$1\frac{1}{2}$	OH-90 or W-XXX [bc]
	1	3/4	OH-45 or W-60
	0.5	1/3	OH-20 or W-30

TYPE OF WALL ASSEMBLY	REQUIRED WALL ASSEMBLY RATING (hours)	MINIMUM FIRE WINDOW ASSEMBLY RATING (hours)	FIRE-RATED GLAZING MARKING
Party wall	All	NP	Not Applicable

NP = Not Permitted.

a. Where required, glazing shall also comply with the safety glazing requirements and identification specified in Section 716.1.2.1.

~~a~~ b. Not permitted except fire-resistance-rated glazing assemblies tested to ASTM E119 or UL 263, as specified in Section 716.1.2.3.

~~b~~ c. XXX = The fire rating duration period in minutes, which shall be equal to the fire-resistance rating required for the wall assembly.

~~c~~ d. Fire-protection-rated glazing is not permitted for fire barriers required by Section 1207 of the *International Fire Code* to enclose energy storage systems. Fire-resistance-rated glazing assemblies tested to ASTM E119 orUL 263, as specified in Section 716.1.2.3, shall be permitted.

Reason: This proposal is intended to ensure code users are aware that glazing in or around door assemblies and in fire window assemblies is in most cases required to meet the safety glazing requirements of Chapter 24. The new footnote a to Tables 716.1(2) and 716.1(3) points the code users to Section 716.1.2.1, which in turn points the code readers to Chapter 24. Within Chapter 24, Section 2406 covers the requirements for safety glazing including the marking requirements.

The identification of all subsequent footnotes has been shifted one character as a result of the new Footnote a.

In addition to the new footnote, the titles of Tables 716.1(2) and 716.1(3) have been changed to more accurately reflect the information conveyed in the tables.

It is believed this new footnote a will help ensure the proper glazing is used in applications requiring safety glazing.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposed changes simply clarify the existing requirements.

FS63-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee determined that the proposed language is not necessary and already addressed in the code (Vote: 9-3).

FS63-24

Exterior walls	>1	$1\,^1/_2$	OH-90 or W-XXX[c]
	1	$^3/_4$	OH-45 or W-60
	0.5	$^1/_3$	OH-20 or W-30
Party wall	All	NP	Not Applicable

NP = Not Permitted.

a. ~~Where required, glazing~~Glazing shall also comply with the safety glazing requirements and identification specified in ~~Section 716.1.2.1~~ Chapter 24 where applicable.

b. Not permitted except fire-resistance-rated glazing assemblies tested to ASTM E119 or UL 263, as specified in Section 716.1.2.3.

c. XXX = The fire rating duration period in minutes, which shall be equal to the fire-resistance rating required for the wall assembly.

d. Fire-protection-rated glazing is not permitted for fire barriers required by Section 1207 of the *International Fire Code* to enclose energy storage systems. Fire-resistance-rated glazing assemblies tested to ASTM E119 orUL 263, as specified in Section 716.1.2.3, shall be permitted.

Reason: This proposal is intended to ensure code users are aware that glazing in or around fire door assemblies and in fire window assemblies is in most cases required to meet the safety glazing requirements of Chapter 24 of the IBC. The new footnote a to Tables 716.1(2) and 716.1(3) points the code users to the requirements for safety glazing including the marking requirements.

The identification of all subsequent footnotes has been shifted one character as a result of the new Footnote a.

In addition to the new footnote, the titles of Tables 716.1(2) and 716.1(3) have been changed to more accurately reflect the information conveyed in the tables.

Since the Committee Action Hearing, one change has been made to this proposed footnote. The footnote now points directly to Chapter 24 where the specific requirements are found, instead of Section 716.2.1.

During Committee Action Hearing #1, opposition stated the safety glazing requirements are already contained in Section 716.1.2.1. While that is true, the dynamics relating to the use of Tables 716.1(2) and 716.1(3) have changed as a result of the expansion of these tables which occurred with the 2012 IBC. Realistically, these tables have become primary reference in Section 716 for enforcing the code. One of the few required elements missing in the Tables is a reference to the safety glazing requirements. As such, this proposal adds a pointer to the safety glazing requirements through a new Footnote a. Opposition also stated everyone already knows the IBC contains safety glazing requirements. As such, this footnote is not needed. Unfortunately, “everyone” does not already know this. There are new design professionals, contractors and code officials entering the construction field on a regular basis. They may not be aware of these requirements. If we can prevent one serious injury by adding one short footnote to each of these tables, it is worth the effort.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposed changes simply clarify the existing requirements.

Comment (CAH2)# 453

FS65-24

IBC: 716.2.6.1

Proposed Change as Submitted

Proponents: Jeff O'Neil, Chair, Committee on Healthcare (ahc@iccsafe.org)

2024 International Building Code

Revise as follows:

716.2.6.1 Door closing. *Fire doors* shall be latching and self- or automatic-closing in accordance with this section. **Exceptions:**

1. *Fire doors* located in common walls separating *dwelling units* or *sleeping units* in Group R-1 shall be permitted without automatic- or *self-closing* devices.
2. Fire doors located in corridors and serving sleeping rooms in Group I-1, Condition 2 shall be permitted without automatic- or self-closing devices.
3 ~~2~~. The elevator car doors and the associated elevator hoistway doors at the floor level designated for recall in accordance with Section 3003.2 shall be permitted to remain open during Phase I emergency recall operation.
4 ~~3~~. Fire doors required solely for compliance with ICC 500 shall not be required to be *self-closing* or automatic-closing.

Reason: Nursing homes (Group I-2, Condition 2) are not required to have self-closing or automatic-closing corridor doors. This is due to the facilities having smoke compartments to subdivide care recipient sleeping areas, the building being fully sprinklered, and staff trained in fire and safety evacuation plans. Assisted living (Group I-1, Condition 2) are also required to have smoke compartments, the building to be fully sprinklered and the staff trained in fire and safety evacuation plans. In Assisted living (Group I-1, Condition 2), residents, while slower, are required to be capable of self preservation. In these facilities, it is beneficial to allow for door to be open to improved supervision and to increase social interaction - both of which shown to improve the environment and comfort of care recipients.

Care recipients in Assisted Living (I-1, Condition 2) facilities quite often use mobility devices and/or have balance and gait issues that take them longer to move through door openings. Additionally, I-1, Condition 2 Assisted Living care recipients are often frail and quite often struggle to have enough strength to open doors with automatic closers. It is a constant challenge to adjust closers to be able to reduce the amount of force needed to open the door, plus keep it open long enough for occupants to move through the opening, and then create enough force for the door to close and latch properly. Often, the last bit of the door swing closes fast to provide the proper latching, but then the door often hits the care recipient causing injury or even knocking them over.

The intent of this proposal is to allow for Group I-1, Condition 2 facilities to not require self-closing or automatic-closing corridor doors. The Healthcare committee feels that this will improve patient safety on a daily basis. There is a good balance of passive and active fire protection that will still be in place, and the fire and safety plans can include closing doors.

This is not intended to allow for the removal of self-closers or automatic-closers on the fire barriers around stairways or on the cross-corridor doors for smoke compartment.

This proposal is submitted by the ICC Committee for Healthcare (CHC).
The Committee on Healthcare (CHC) was established by the ICC Board of Directors in 2011 to pursue opportunities to study and develop effective and efficient provisions for Hospital, Nursing Homes, Assisted Living and Ambulatory Care Facilities. This committee was formed in cooperation with the American Society for Healthcare Engineering (ASHE). In July of 2017, the ICC Board made CHC a standing committee. In 2023 the CHC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the CHC website at CHC webpage.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

The average cost of door closers, not including the cost of labor for installation, ranges from $150 to $600 dollars. The total decrease would depend on the number of sleeping room doors in the facility.

Estimated Immediate Cost Impact Justification (methodology and variables):

If a designer chooses to utilize this exception, closers would not be required on corridor doors.

FS65-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee determined that the proposed language is confusing on the location of the fire door. The committee mentioned that the assumption is that the building is sprinkled. The committee disagreed that smoke compartments are the same in Nursing homes vs Assisted living (Vote: 10-2).

FS65-24

Individual Consideration Agenda

Comment 1:

IBC: 716.2.6.1

Proponents: Jeff O'Neil, Chair, Committee on Healthcare (ahc@iccsafe.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

716.2.6.1 Door closing. *Fire doors* shall be latching and self- or automatic-closing in accordance with this section. **Exceptions:**

1. *Fire doors* located in common walls separating *dwelling units* or *sleeping units* in Group R-1 shall be permitted without automatic- or *self-closing* devices.
2. In Group I-1, Condition 2, fire ~~Fire~~ doors located in corridors and serving sleeping ~~rooms~~ units that do not include a cooktop or range ~~in Group I-1, Condition 2~~ shall be permitted without automatic- or self-closing devices.
3. The elevator car doors and the associated elevator hoistway doors at the floor level designated for recall in accordance with Section 3003.2 shall be permitted to remain open during Phase I emergency recall operation.
4. Fire doors required solely for compliance with ICC 500 shall not be required to be *self-closing* or automatic-closing.

Reason: First, it is important to note that Group I-1, Condition 2 facilities require the residents to be capable of self-preservation with limited limited verbal or physical assistance (Section 308.2.2). This is defined as following: [BG]LIMITED VERBAL OR PHYSICAL ASSISTANCE. Describes persons who, because of age, physical limitations, cognitive limitations, treatment or chemical dependency, may not independently recognize, respond or evacuate without limited verbal or physical assistance during an emergency situation. Limited verbal assistance includes prompting, giving and repeating instructions. Limited physical assistance includes assistance with transfers to walking aids or mobility devices and assistance with egress. The committee expressed concern about the staffing to resident

ratio for assisted living. The following active and passive fire protection requirements are applicable for Group I-1, Condition 2: 1.
1 hour rated corridors (Table 1020.2)
2. Separation between units (Section 420.2, 420.3, 708, 711)
3. Smoke compartments (Section 420.6, 709)
4. NFPA 13 Sprinkler system (Section 420.4, 903.2.6)
5. Fire alarms and smoke detection systems; immediate notification of residents and some units with visible alarms (Section 420.5, 907.2.6, 907.2.6.1, 907.5.2.3.2)
6. Smoke alarms in the units (Section 420.5, 907.2.6.1.1, 907.2.11)
7. Common cooking areas limited the same as Group I-2, Condition 2 (Section 420.7)
So a Group I-1, Condition 2 will have rated corridors and rated doors on the sleeping unit doors, in addition to the smoke compartments. Nursing homes have smoke compartments, but not rated corridors, rated unit doors or separation of units. In addition, Group I-1, Condition 2 have smoke alarms in the units, which nursing homes do not require. This exception to remove closers is limited to the rated entrance doors to sleeping units, not other rooms and spaces in the facility. A person using a walker or crutches does not have an extra hand to hold open a door with a closer. Person's using canes or walkers tend to move slower through a door. Closers are difficult for these individuals to deal with. Many people have been injured attempting to move into and out of their sleeping units. The extra passive fire protections systems in place in an assisted living facility should provided a reasonable level of safety to balance the removal of the closers in these limited situations. The definition for sleeping unit states that sleeping units can include kitchen facilities. **[A] SLEEPING UNIT.** A single unit that provides rooms or spaces for one or more persons, includes permanent provisions for sleeping and can include provisions for living, eating and either sanitation or kitchen facilities but not both. Such rooms and spaces that are also part of a dwelling unit are not sleeping units. In assisted living facilities, almost all the cooking is in a central location. Units might have microwaves, sinks and refrigerators, but not cooktops or ovens. Most fires in residences (apartments or homes) start in the kitchen. Therefore, we are also suggesting that sleeping units with full kitchens cannot use this exception. The doors and corridors will still be rated, so it doors are closed, this passive protection is still in place. It is our opinion that the additional passive and active fire protections required will balance with the need to for resident safety as they move in and out of their unit. Below are pictures illustrating people with crutches and walkers moving through doors
.

We were able to find some statistics for falls related to persons over 65 and Assisted Living Facilities.

Most Impactful Statistics on Falls and Fires in Assisted Living Facilities Injuries Due to Falls in Assisted Living Facilities CDC Data on Older Adult Falls (2018):- Prevalence: Falls are the leading cause of injury among adults aged 65 and older.- Incidence: 27.5% of older adults reported falling at least once in the past year, and 10.2% reported a fall-related injury.- Impact: In 2018, there were approximately 35.6 million falls and 8.4 million fall-related injuries among older adults.- Risk Factors: Older adults with difficulties in functional abilities (e.g., walking, climbing stairs, dressing) reported higher percentages of falls and fall-related injuries.- Geographic Variability: A higher percentage of older adults living in rural areas reported falls compared to those in urban areas.- STEADI Initiative: Focuses on providing healthcare providers with tools and resources to screen, assess, and intervene to reduce fall risk. It emphasizes the importance of clinical fall prevention programs and offers training and materials to support healthcare providers.

AHCA/NCAL Data on Falls in Assisted Living Facilities:- Annual Statistics: Each year, there are over 37 million falls among older adults, with 9 million resulting in injuries, 3 million in emergency department visits, 1 million in hospitalizations, and 36,000 deaths.- Screening and Prevention: The CDC Foundation launched a toolkit that includes Falls Free Check-ups aimed at preventing falls and fall-related injuries by developing and implementing risk factor prevention programs.

Additional Data:- SafelyYou Report: Assisted living communities report an average of 260 resident falls per year.- Impact on Care Levels: Approximately 24% of falls in assisted living result in moving residents to an increased level of care.- Quality of Care: Falls can impact staffing, quality of care, and consistency of care in senior living communities.- Economic Impact: The average cost of assisted living liability claims related to falls is $267,000 per claim.

The Inaugural 2022 State of Falls Report:- Prevalence: About 36 million people aged 65 and older experience a fall each year.- Economic Impact: $50 billion spent on medical costs related to non-fatal fall injuries annually.- Emotional Impact: Nearly half (45%) of American adults over 42 have experienced a fall in the past five years. Emotions following a fall include embarrassment/shame (44%), anxiety (43%), and fear about getting older (28%).- Move-Outs Due to Falls : 1 in 7 move-outs in assisted living communities are related to falls.

CDC Fall-Related Data:- Leading Cause of Injury: Falls are the leading cause of injury for adults aged 65 years and older.- Incidence: Over 14 million older adults report falling each year.- Injuries from Falls: About 37% of those who fall report an injury requiring medical treatment or restricting activity for at least one day, resulting in an estimated nine million fall injuries annually.- State Variability: Falls are common across all states but show variability.- Fall Deaths: Falls are the leading cause of injury-related death among adults 65 and older, with the age-adjusted fall death rate increasing by 41% from 2012 to 2021.

Fires in Sprinklered Assisted Living Facilities NFPA Report on Sprinklers:- Effectiveness: Sprinklers are highly effective in controlling fires. From 2017 to 2021, sprinklers operated in 92% of reported structure fires and were effective in 97% of those cases.- Impact on Fire Spread: In properties with sprinklers, 94% of fires were confined to the object or room of origin, compared to 70% in properties without automatic extinguishing systems (AES).- Injury and Death Reduction: Civilian fire death rates were 90% lower, and civilian injury rates were 32% lower in properties with sprinklers compared to those without.- Firefighter Safety: The rate of firefighter injuries per fire was 35% lower in properties with sprinklers.

AHCA/NCAL on Sprinklers:- Compliance Issues: Common issues include obstructions near sprinkler heads, improper attachments to sprinkler piping, and lack of proper maintenance and inspection.- Maintenance: Regular testing, inspection, and cleaning of sprinkler heads are crucial to ensure they operate effectively during a fire.- Training: Proper training for staff on how to maintain and inspect sprinkler systems is essential for compliance and safety.

General NFPA Data:- Residential Properties: In residential properties, sprinklers are present in only 8% of fires but are highly effective in controlling fire spread and reducing casualties and property damage.- Multiple-Death Fires: There has never been a multiple-death fire in a nursing home with a functional automatic sprinkler system.

Fire Systems Data:- Annual Response: Fire departments in the US respond to more than 1,800 fires within residential board and care facilities annually, including senior housing facilities.- Fire Containment: 88% of these fires do not spread beyond the area of origin due to stringent code requirements for fully functional fire sprinkler and detection systems.- Case Example: At the Victory Centre of Park Forest in Illinois, a single fire sprinkler controlled a fire started by an unattended stovetop. The resident was unharmed, and no other apartments were damaged.- Fire Impact: The majority of fires in assisted living facilities are confined fires that typically do not result in serious injury or property damage.

The Committee on Healthcare (CHC) was established by the ICC Board of Directors in 2011 to pursue opportunities to study and develop effective and efficient provisions for Hospital, Nursing Homes, Assisted Living and Ambulatory Care Facilities. This committee was formed in cooperation with the American Society for Healthcare Engineering (ASHE). In July of 2017, the ICC Board made CHC a standing committee. In 2024 the CHC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the CHC website at CHC webpage.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

The average cost of door closers, not including the cost of labor for installation, ranges from $150 to $600 dollars. The total decrease would depend on the number of sleeping room doors in the facility.

Estimated Immediate Cost Impact Justification (methodology and variables):

If a designer chooses to utilize this exception, closers would not be required on corridor doors.

For SI: 1 square inch = 645.2 mm.

a. Fire-resistance-rated glazing tested to ASTM E119 in accordance with Section 716.1.2.3 shall be permitted, in the maximum size tested.

b. Under the column heading “Fire-rated glazing marking door vision panel,” W refers to the fire-resistance rating of the glazing, not the frame.

c. See Section 716.1.2.2.1 and Table 716.1(1) for additional permitted markings.

d. Two doors, each with a fire protection rating of 1 1/2 hours, installed on opposite sides of the same opening in a fire wall, shall be deemed equivalent in fire protection rating to one 3-hour fire door.

e. As required in Section 706.4.

f. As allowed in Section 4.6 of NFPA 221.

g. See Section 716.2.5.1.2.

h. Fire-protection-rated glazing is not permitted for fire barriers required by Section 1207 of the *International Fire Code* to enclose energy storage systems. Fire-resistance-rated glazing assemblies tested to ASTM E119 or UL 263, as specified in Section 716.1.2.3, shall be permitted.

i. Two doors, each with a fire rating of 20 minutes, installed on opposite sides of the same opening in a fire partition, shall be deemed equivalent in fire protection rating to one 45-minute fire door.

j. *Fire protective curtain assemblies* in accordance with Section 716.4 shall be deemed equivalent in *fire protection rating* to 20-minute fire doors in *fire-resistance rated corridor* walls and *smoke barrier* walls.

Add new text as follows:

716.4 Fire protective curtain assemblies in corridors and smoke barriers. *Fire protective curtain assemblies* shall have a minimum *fire protection rating* of 20 minutes without the hose stream test where located in *corridor* walls and *smoke barrier* walls having a *fire-resistance rating* in accordance with Table 716.1(2) and shall comply with the provisions of this section.

716.4.1 Testing requirements. Approved fire protective curtain assemblies shall be constructed of any materials or assembly of component materials that conforms to the following test requirements:

1. Fire protective curtain assemblies shall be tested without hose stream in accordance with UL 10D.
2. Fire protective curtain assemblies shall comply with the smoke and draft control door assembly requirements in Section 716.2.2.1.1 when tested in accordance with UL 1784.

716.4.2 Labeled protective assemblies. *Fire protective curtain assemblies* shall be labeled by an *approved agency*. The *labels* shall comply with NFPA 80, and shall be permanently affixed to the bottom bar.

716.4.2.1 Fire protective curtain assembly labeling requirements. *Fire protective curtain assemblies* shall be *labeled* showing the name of the manufacturer or other identification readily traceable back to the manufacturer, the name or trademark of the third-party inspection agency and the *fire protection rating*. Smoke and draft control assemblies complying with UL 1784 shall be *labeled* as such and shall comply with Section 716.4.2.3. Labels shall be approved and permanently affixed. The label shall be applied at the factory or location where fabrication and assembly are performed.

716.4.2.2 Oversized assemblies. Oversized fire protective curtain assemblies shall bear an oversized label by an approved agency or shall be provided with a certificate of inspection furnished by an approved testing agency. Where a certificate of inspection is furnished by an approved testing agency, the certificate shall state that the fire protective curtain assembly conforms to the requirements of design, materials and construction, but has not been subjected to the fire test.

716.4.2.3 Smoke and draft control assembly labeling requirements. Smoke and draft control assemblies complying with UL 1784 shall be labeled in accordance with Section 716.4.2.1 and shall show the letter “S” on the fire-rating label of the assembly.

716.4.3 Installation. *Installation of fire protective curtain assemblies* in corridors and smoke barriers shall be in accordance with NFPA 105.

716.4.4 Means of egress. *Fire protective curtain assemblies* shall not be used as required *means of egress* doors in accordance with Section 1010.

Reason: The fire protective curtain assembly definition in Section 202 and the UL 10D test standard in Section 716.4 have been recognized by the IBC since they were added in the 2021 code cycle. However, the full inclusion of these opening protectives in the IBC is incomplete as there is no mention of fire protective curtain assemblies in Table 716.1(2) nor are there any references to Section 716.4 anywhere in the code. This code change connects those missing links and assigns fire protective curtain assemblies to their rightful place in the IBC.

UL 10D test criteria is essentially the same positive pressure fire endurance test criteria in UL 10C, but without the requirement for a hose stream integrity test at the end of the burn. Therefore, our current codes will only allow the use of UL 10D tested products where fire door assemblies are not required to meet hose stream performance. This condition only occurs in Section 716.2.2.1:

716.2.2.1 Door assemblies in corridors and smoke barriers.

Fire door assemblies required to have a minimum fire protection rating of 20 minutes where located in corridor walls or smoke barrier walls having a fire-resistance rating in accordance with Table 716.1(2) shall be tested in accordance with NFPA 252 or UL 10C without the hose stream test.

There were attempts in the 2024 code cycle to add the UL 10D test standard to Section 716.2.2.1. But these attempts were disapproved largely because it was determined that this section is not the correct location since Section 716.2 covers fire door assemblies and Section 716.2.2.1 specifically refers to Table 716.1(2) which does not currently contain a reference to fire protective curtain assemblies. Based on that feedback, this code change accomplishes the following:

First, since fire protective curtain assemblies are a separate category of opening protective in Section 716.4, they cannot simply be placed under the requirements for fire door assemblies in Section 716.2. The only place fire protective curtain assemblies and fire door assemblies can be linked is through Table 716.1(2), which encompasses opening protectives of all types. Actually adding fire protective curtain assemblies within Table 716.1(2) is a complex task and unnecessary due to the limited applications that a UL 10D tested product can be legitimately placed. The simpler and more effective approach is to add the proposed footnote “j.” to Table 716.1(2) where Section 716.4 is now referenced. This proposed note, in accordance with the applications described in Section 716.2.2.1, will only be applied to the minimum fire door and fire shutter assembly ratings for “Fire partitions: Corridor Walls” and “Smoke Barriers”.

Next, Section 716.4 requires a complete rewrite in order to align it specifically with these applications. Since fire protective curtain assemblies are only deemed equivalent in fire protection rating to 20 minute fire doors in fire-resistance rated corridor walls and smoke barrier walls, Section 716.4 is rewritten to include similar language and layout found in Section 716.2.2.1. Furthermore, the subsections have been reformatted to create consistency in the layout with fire door assemblies and fire window assemblies in Sections 716.2 and 716.3, respectively.

The fire testing requirements for fire protective curtain assemblies in corridors and smoke barriers remains unchanged from the previous edition of the IBC. Additionally, these assemblies shall also serve as smoke and draft control assemblies meeting the criteria for air leakage for fire door assemblies in corridors and smoke barriers in Section 716.2.2.1.1 and being tested in accordance UL 1784.

Labeling requirements for fire protective curtain assemblies in the previous edition of the code referred back to labeling requirements for fire door assemblies in Section 716.2.9 which do not all apply to these types of opening protectives. Fire protective curtain assemblies have their own dedicated chapter in NFPA 80 and have been recognized as a separate and distinct category of opening protective by the IBC. This code change acknowledges the labeling requirements specific to fire protective curtain assemblies and has been structured in a format that is consistent with fire door assemblies.

Installation of all rated opening protectives must comply with NFPA 80 as required by Section 716.1. It is redundant and unnecessary to repeat this requirement in Section 716.4 so it has been removed in this code change. However, it is necessary to require fire protective curtain assemblies in corridors and smoke barriers to additionally be installed in accordance with NFPA 105 because of the smoke and draft control requirements. These installation requirements are consistent with fire door assemblies in the same applications as required by Section 716.2.10.

Finally, this code change confirms these products shall not be used as required means of egress doors. Fire protective curtain assemblies currently available in the market include many different features or options to travel through the opening protectives. These options include swinging flaps, grab straps, pass-through slots, push-to-open buttons and delayed deployment. None of these options that currently exist in fire protective curtain assemblies comply with means of egress doors in Section 1010.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal recognizes the current practice of testing and use of these assemblies.

FS67-24

Public Hearing Results (CAH1)

Errata: This proposal includes unpublished errata **See below requirement #2 correct text:716.4.1 Testing requirements.** Approved fire protective curtain assemblies shall be constructed of any materials or assembly of component materials that conforms to the following test requirements:

1. Fire protective curtain assemblies shall be tested without hose stream in accordance with UL 10D.
2. ~~Fire protective curtain assemblies shall be tested without hose stream in accordance with UL 10D.~~ Fire protective curtain assembl control door assembly requirements in Section 716.2.2.1.1 when tested in accordance with UL 1784.

Committee Action: **Disapproved**

Committee Reason: The committee determined that the proposed language is confusing between the sections indicated in the code proposal. The committee has an issue with the means of egress portion of the proposal. The committee has an issue with the table footnote and mentioned that the text needs to be revised from "deemed equivalent" to "the same test" (Vote: 12-0).

FS67-24

Individual Consideration Agenda

Comment 1:

IBC: TABLE 716.1(2), 716.4, 716.4.1, 716.4.2, 716.4.2.1, 716.4.2.2, 716.4.2.3, 716.4.3, 716.4.4

Proponents: Paul Armstrong, McKEON; Doug Zachary, McKEON (dzachary@mckeondoor.com); David Dodge, McKeon Door Company, McKEON (ddodge@mckeondoor.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

Revise as follows:

For SI: 1 square inch = 645.2 mm.

a. Fire-resistance-rated glazing tested to ASTM E119 in accordance with Section 716.1.2.3 shall be permitted, in the maximum size tested.

b. Under the column heading “Fire-rated glazing marking door vision panel,” W refers to the fire-resistance rating of the glazing, not the frame.

c. See Section 716.1.2.2.1 and Table 716.1(1) for additional permitted markings.

d. Two doors, each with a fire protection rating of $1\frac{1}{2}$ hours, installed on opposite sides of the same opening in a fire wall, shall be deemed equivalent in fire protection rating to one 3-hour fire door.

e. As required in Section 706.4.

f. As allowed in Section 4.6 of NFPA 221.

g. See Section 716.2.5.1.2.

h. Fire-protection-rated glazing is not permitted for fire barriers required by Section 1207 of the *International Fire Code* to enclose energy storage systems. Fire-resistance-rated glazing assemblies tested to ASTM E119 or UL 263, as specified in Section 716.1.2.3, shall be permitted.

i. Two doors, each with a fire rating of 20 minutes, installed on opposite sides of the same opening in a fire partition, shall be deemed equivalent in fire protection rating to one 45-minute fire door.

j. *Fire protective curtain assemblies* in accordance with Section 716.4 shall be deemed equivalent in *fire protection rating* to 20-minute fire doors in ~~*fire-resistance-rated corridor* walls and *smoke barrier* walls~~ accordance with Section 716.2.2.1.

716.4 Fire protective curtain assemblies in corridors and smoke barriers. *Fire protective curtain assemblies* shall have a minimum *fire protection rating* of 20 minutes without the hose stream test where located in *corridor* walls and *smoke barrier* walls having a *fire-resistance rating* in accordance with Table 716.1(2) and shall comply with the provisions of this section.

716.4.1 Testing requirements. Approved fire protective curtain assemblies shall be constructed of any materials or assembly of component materials that conforms to the following test requirements:

1. Fire protective curtain assemblies shall be tested without hose stream in accordance with UL 10D.
2. Fire protective curtain assemblies shall comply with the smoke and draft control door assembly requirements in Section 716.2.2.1.1 when tested in accordance with UL 1784.

716.4.2 Labeled protective assemblies. *Fire protective curtain assemblies* shall be labeled by an *approved agency*. The *labels* shall comply with NFPA 80, and shall be permanently affixed to the bottom bar.

716.4.2.1 Fire protective curtain assembly labeling requirements. *Fire protective curtain assemblies* shall be *labeled* showing the name of the manufacturer or other identification readily traceable back to the manufacturer, the name or trademark of the third-party inspection agency ~~and~~ the *fire protection rating* *and show the letter "S" to confirm compliance with UL 1784 as smoke and draft control doors*. ~~Smoke and draft control assemblies complying with UL 1784 shall be *labeled* as such and shall comply with Section 716.4.2.3. Labels shall be approved and permanently affixed.~~ The label shall be applied at the factory or location where fabrication and assembly are performed.

716.4.2.2 Oversized assemblies. Oversized fire protective curtain assemblies shall bear an oversized label by an approved agency or shall be provided with a certificate of inspection furnished by an approved testing agency. Where a certificate of inspection is furnished by an approved testing agency, the certificate shall state that the fire protective curtain assembly conforms to the requirements of design, materials and construction, but has not been subjected to the fire test.

~~**716.4.2.3 Smoke and draft control assembly labeling requirements.** Smoke and draft control assemblies complying with UL 1784 shall be labeled in accordance with Section 716.4.2.1 and shall show the letter "S" on the fire-rating label of the assembly.~~

~~**716.4.3 Installation.** *Installation of fire protective curtain assemblies* in corridors and smoke barriers shall be in accordance with NFPA 105.~~

716.4.3~~4~~ Means of egress. *Fire protective curtain assemblies* shall not be used as required *means of egress* doors in accordance with Section 1010.

Reason: This code change does not increase the market potential for fire protective curtain assemblies. FS67 is intended to provide clear guidelines within the code as to where and when they can be used safely and legitimately.

The current language, Section 716.4 Fire protective curtain assembly, does not provide clear and concise direction for the use of these fire protective curtains as opening protectives in the IBC. It is incomplete and leaves room for misinterpretation as evidenced by several attempts since the 2015 code development cycle to bring clarity in the application of these provisions.

There is no mention of fire protective curtain assemblies in Table 716.1(2) nor are there any references to Section 716.4 anywhere in the code. These major holes in the code make it difficult to enforce and appropriately apply the code to these systems and they are often misapplied due to this lack of direction. This code change connects those missing links and assigns fire protective curtain assemblies to their rightful place in the IBC.

One helpful connection is that without a hose stream test, fire protective curtain assemblies tested to UL 10D only meet the fire protection rating of 20-minute fire doors in corridors and smoke barrier walls. All other opening protectives require a hose stream performance test and fire protective curtain assemblies cannot be applied in any walls requiring opening protectives to be rated higher than 20 minutes. Examples of where they cannot be used are anytime a Fire Barrier wall is required such as shafts, occupancy separations, etc. This code change clarifies that fire protective curtains are not the same as hose-stream tested opening protectives.

It was clear there is overwhelming support to better define the use of these products when this code change was proposed in CAH #1 of this code cycle. We listened to the concerns of the structure of this code change presented by the opponents and committee and have addressed them with the edits in this updated code change proposal.

During CAH #1, a comment was made by a committee member regarding the language in footnote j and the need to clarify that fire protective curtain assemblies would undergo the same test as a 20-minute fire door. This revised code change addresses that comment with the new language that deems fire protective curtain assemblies equivalent to 20-minute fire doors in accordance with Section 716.2.2.1. In other words, fire protective curtain assemblies tested to UL 10D do undergo the same testing requirements as UL 10C without hose stream for these 20-minute applications. We feel this change satisfies the comment from the committee member.

There were also comments from the committee and opponents regarding the layout of the testing and installation requirements in the original proposal. We agree with those comments and therefore this revised code change proposal has been cleaned up to avoid any confusion.

Finally, there were concerns expressed in CAH #1 that this code change would allow for the use of fire protective curtain assemblies to replace swinging egress doors in a means of egress system. This code change does the opposite. The language in this code change specifically states that fire protective curtain assemblies SHALL NOT be used as means of egress doors.

There are applications in which a 20-minute fire rating without hose stream is acceptable, yet not as a required element in a means of egress system. Included are photos of those applications. The intended purpose of this code change is to limit the use of fire protective curtain assemblies to only these applications that do not require egress.

The following photos are examples of corridor separation in two-story openings where egress through the assembly is not required:

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal, like the original code change, is to clarify the current intended application of the IBC for these assemblies.

Comment (CAH2)# 738

FS69-24

IBC: TABLE 717.3.2.1; IMC®: [BF] TABLE 607.3.2.1

Proposed Change as Submitted

Proponents: Jeanne Rice, NYSDOS (jeanne.rice@dos.ny.gov); Chad Sievers, NYS, NYS DOS (chad.sievers@dos.ny.gov); Kevin Duerr-Clark, NYS DOS, NYS DOS (kevin.duerr-clark@dos.ny.gov); China Clarke, New York State Dept of State, Manager Technical Support Unit (china.clarke@dos.ny.gov)

2024 International Building Code

Revise as follows:

TABLE 717.3.2.1 FIRE DAMPER RATING[a]

TYPE OF PENETRATION	MINIMUM DAMPER RATING (hours)
Less than 3-hour fire-resistance-rated assemblies	1.5
3-hour or greater fire-resistance-rated assemblies	3

a. Corridor fire dampers shall also comply with the provisions of section 717.3.2.4.

2024 International Mechanical Code

Revise as follows:

[BF] TABLE 607.3.2.1 FIRE DAMPER RATING[a]

TYPE OF PENETRATION	MINIMUM DAMPER RATING (hour)
Less than 3-hour fire-resistance-rated assemblies	$1\frac{1}{2}$
3-hour or greater fire-resistance-rated assemblies	3

a. Corridor fire dampers shall also comply with the provisions of section 607.3.2.4.

Reason: When looking for the required rating for fire dampers, users may consult Table 717.3.2.1 and determine the rating based solely on the information in this table, without noticing the provisions for corridor fire dampers in Section 717.3.2.4. The proposed change adds a footnote to Table 717.3.2.1 which references Section 717.3.2.4, to ensure users are aware of the corridor fire damper provisions.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposed change adds a reference to an existing section into the footnotes for an existing table. This change is for clarification only and does not add any provisions.

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee did not approve adding the proposed text. The committee indicated that the proposed text needs more clarification (Vote: 12-0).

Individual Consideration Agenda

Comment 1:

IBC: TABLE 717.3.2.1; IMC®: [BF] TABLE 607.3.2.1

Proponents: Jeanne Rice, NYSDOS (jeanne.rice@dos.ny.gov); Chad Sievers, NYS, NYS DOS (chad.sievers@dos.ny.gov); Kevin Duerr-Clark, NYS DOS, NYS DOS (kevin.duerr-clark@dos.ny.gov); Stephen Van Hoose, NYS DOS, NYS DOS (stephen.vanhoose@dos.ny.gov); China Clarke, New York State Dept of State, Manager Technical Support Unit (china.clarke@dos.ny.gov) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

Revise as follows:

TABLE 717.3.2.1 FIRE DAMPER RATING[a]

TYPE OF PENETRATION	MINIMUM DAMPER RATING (hours)
Less than 3-hour fire-resistance-rated assemblies	1.5
3-hour or greater fire-resistance-rated assemblies	3

a. The requirements of this table are not applicable to *corridor dampers.* ~~Corridor fire dampers shall also comply with the provisions of~~ See section 717.3.2.4 for corridor damper provisions.

2024 International Mechanical Code

Revise as follows:

[BF] TABLE 607.3.2.1 FIRE DAMPER RATING[a]

TYPE OF PENETRATION	MINIMUM DAMPER RATING (hour)
Less than 3-hour fire-resistance-rated assemblies	$1^1/_2$
3-hour or greater fire-resistance-rated assemblies	3

a. The requirements of this table are not applicable to *corridor dampers.* ~~Corridor fire dampers shall also comply with the provisions of~~ See section 607.3.2.4 for corridor damper provisions.

Reason: NYSDOS has received numerous questions regarding how to apply the Table 717.3.2.1 of the IBC (Table 607.3.2.1 of the IMC) requirements to corridor dampers. However, this table provides requirements for fire dampers, not corridor dampers. Fire dampers prevent the passage of fire, but are not specifically designed to limit the spread of smoke. Corridor dampers are a specific type of damper that is only utilized in ducts which penetrate corridor ceilings in fire-resistance-rated corridors - ceilings which are permitted to be constructed as required for corridor walls. Corridor dampers act as both fire and smoke dampers, preserving the horizontal barrier created by the ceiling.

The modified proposal is intended to clearly delineate that Table 717.3.2.1 (Table 607.3.2.1 of the IMC) should not be used for corridor dampers, and provide a reference to Section 717.3.2.4 of the IBC (Section 607.3.2.4 of the IMC), which provides requirements for corridor dampers. This pointer, included as a footnote to the table, should direct users to the proper requirements for the type of damper they intend to use, and limit the incorrect use of this table to provide requirements for corridor dampers. Corridor dampers are required to be 1 hour fire-resistance-rated, while the shortest allowed fire resistance rating for fire dampers is 1.5 hours. This pointer will ensure the appropriate level of protection for corridor ceiling penetrations while ensuring that corridor dampers are not over-designed or over-built.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposed modification, as well as the original proposal, merely add a pointer to the correct section for corridor damper requirements. No new requirements are added.

Comment (CAH2)# 417

FS75-24

IBC: 717.6.1; IMC®: [BF] 607.6.1

Proposed Change as Submitted

Proponents: Tony Crimi, A.C. Consulting Solutions Inc., International Firestop Council (tcrimi@sympatico.ca)

2024 International Building Code

Revise as follows:

717.6.1 Through penetrations. A duct constructed of *approved* materials in accordance with the *International Mechanical Code* that penetrates a fire-resistance-rated floor/ceiling assembly that connects not more than two *stories*is permitted without *shaft enclosure* protection, provided that a *listed fire damper* is installed at the floor line or the duct is protected in accordance with Section 714.5. For air transfer openings, see Section 712.1.9. **Exceptions:**

1. In occupancies other than Groups I-2 and I-3, a duct is permitted to penetrate three floors or less without a *fire damper* at each floor, provided that such duct meets all of the following requirements:
   - ~~1~~ 1.1. The duct shall be contained and located within the cavity of a wall and shall be constructed of steel having a minimum wall thickness of 0.0187 inches (0.4712 mm) (No. 26 gage).
   - ~~2~~ 1.2. The duct shall open into only one *dwelling unit* or *sleeping unit* and the duct system shall be continuous from the unit to the exterior of the *building*.
   - ~~3~~ 1.3. The duct shall not exceed 4-inch (102 mm) nominal diameter and the total area of such ducts shall not exceed 100 square inches (0.065 m^2) in any 100 square feet (9.3 m^2) of floor area.
   - ~~4~~ 1.4. The *annular space* around the duct is protected with materials that prevent the passage of flame and hot gases sufficient to ignite cotton waste where subjected to ASTM E119 or UL 263 time-temperature conditions under a minimum positive pressure differential of 0.01 inch of water (2.49 Pa) at the location of the penetration for the time period equivalent to the *fire-resistance rating* of the construction penetrated.
   - ~~5~~ 1.5. Grille openings located in a ceiling of a fire-resistance-rated floor/ceiling or roof/ceiling assembly shall be protected with a *listed ceiling radiation damper* installed in accordance with Section 717.6.2.1.2
2. A duct is permitted to penetrate three floors or less without a fire damper at each floor provided the surface of the duct is continuously covered on all sides from a point at which the duct penetrates a ceiling or floor to the outlet terminal with a classified, listed and labeled system specifically evaluated for such purpose in accordance with nationally recognized standards for such enclosure materials, and penetrations comply with the requirements of Section 714.5 of the International Building Code.

2024 International Mechanical Code

Revise as follows:

[BF] 607.6.1 Through penetrations. A duct constructed of *approved* materials in accordance with Section 603 that penetrates a fire-resistance-rated floor/ceiling assembly that connects not more than two stories is permitted without shaft enclosure protection provided that a *listed* fire damper is installed at the floor line or the duct is protected in accordance with Section 714.5 of the International Building Code. For air transfer openings, see Item 6, Section 712.1.9 of the International Building Code.

~~**Exception**~~ **Exceptions:**

1. In occupancies other than Groups I-2 and I-3, a duct is permitted to penetrate three floors or less without a fire damper at each floor provided that it meets all of the following requirements:

   ~~1~~ 1.1. The duct shall be contained and located within the cavity of a wall and shall be constructed of steel having a minimum thickness of 0.0187 inch (0.4712 mm) (No. 26 gage).

   ~~2.~~ 1.2. The duct shall open into only one *dwelling unit* or *sleeping unit* and the duct system shall be continuous from the unit to the exterior of the *building*.

   ~~3.~~ 1.3. The duct shall not exceed a 4-inch (102 mm) nominal diameter and the total area of such ducts shall not exceed 100 square inches for any 100 square feet (64 516 mm^2 per 9.3 m^2) of the floor area.

   ~~4.~~ 1.4. The annular space around the duct is protected with materials that prevent the passage of flame and hot gases sufficient to ignite cotton waste when subjected to ASTM E119 or UL 263 time-temperature conditions under a minimum positive pressure differential of 0.01 inch (2.49 Pa) of water at the location of the penetration for the time period equivalent to the fire-resistance rating of the construction penetrated.

   ~~5.~~ 1.5. Grille openings located in a ceiling of a fire-resistance-rated floor/ceiling or roof/ceiling assembly shall be protected with a *listed ceiling radiation damper* installed in accordance with Section 607.6.2.1.

2. A duct is permitted to penetrate three floors or less without a fire damper at each floor provided the surface of the duct is continuously covered on all sides from a point at which the duct penetrates a ceiling or floor to the outlet terminal with a classified, listed and labeled system specifically evaluated for such purpose in accordance with nationally recognized standards for such enclosure materials, and penetrations comply with the requirements of Section 714.5 of the International Building Code.

Reason: This proposal provides an additional option for ducts that penetrate three or less floors. Third-party certification organizations like UL and Intertek provide listing and labelling services for fire-resistant duct systems using a variety of nationally recognized Standards and applicable ICC-ES criteria. These Listings have been in the marketplace for many years and have proven their effectiveness.

The many Listings for fire-resistant duct systems provide an alternate to required fire dampers when ducts pass through a fire separation. They also cover criteria to assess performance as shaft enclosures for vertical ducts.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal adds an additional option for protection of ducts. It does not remove any existing provisions or mandate additional costs.

FS75-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee mentioned that the proposed text needs more work and the language needs to be specific. The committee indicated that there is a lack of data to support the proposed text. The committee suggested adding the proper standard (Vote: 11-0).

FS75-24

Individual Consideration Agenda

Comment 1:

IBC: 717.6.1; IMC®: [BF] 607.6.1

Proponents: Tony Crimi, A.C. Consulting Solutions Inc., International Firestop Council (tcrimi@sympatico.ca) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

717.6.1 Through penetrations. A duct constructed of *approved* materials in accordance with the *International Mechanical Code* that penetrates a fire-resistance-rated floor/ceiling assembly that connects not more than two *stories* is permitted without *shaft enclosure* protection, provided that a *listed fire damper* is installed at the floor line or the duct is protected in accordance with Section 714.5.    1.3. The duct shall not exceed a 4-inch (102 mm) nominal diameter and the total area of such ducts shall not exceed 100 square inches for any 100 square feet (64 516 mm^2 per 9.3 m^2) of the floor area.

   1.4. The annular space around the duct is protected with materials that prevent the passage of flame and hot gases sufficient to ignite cotton waste when subjected to ASTM E119 or UL 263 time-temperature conditions under a minimum positive pressure differential of 0.01 inch (2.49 Pa) of water at the location of the penetration for the time period equivalent to the fire-resistance rating of the construction penetrated.

   1.5. Grille openings located in a ceiling of a fire-resistance-rated floor/ceiling or roof/ceiling assembly shall be protected with a *listed ceiling radiation damper* installed in accordance with Section 607.6.2.1.

2. A duct is permitted to penetrate three floors or less without a fire damper at each floor provided the surface of the duct is continuously covered on all sides from a point at which the duct penetrates a ceiling or floor to the outlet terminal with a tested, classified, listed and labeled system using the standard time-temperature curve of ASTM E119 or UL 263, specifically evaluated for such purpose. ~~in accordance with nationally recognized standards for such enclosure materials, and penetrations~~ Penetrations shall comply comply with the requirements of Section 714.5 of the International Building Code.

Reason: This proposal provides an additional option for ducts that penetrate three or less floors. Third-party certification organizations like UL and Intertek provide listing and labelling services for fire-resistant duct systems using a variety of nationally recognized Standards and applicable ICC-ES criteria. These Listings have been in the marketplace for many years and have proven their effectiveness. All of the Listings are based on the ASTM E119, UL 263 or equivalent time-temperature exposure.

The many Listings for fire-resistant duct systems provide an alternate to required fire dampers when ducts pass through a fire separation. They also cover criteria to assess performance as shaft enclosures for vertical ducts.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal adds an additional option for protection of ducts. It does not remove any existing provisions or mandate additional costs.

Comment (CAH2)# 431

FS76-24

IBC: 717.6.2.1.1, 717.6.2.1.2; IMC®: [BF] 607.6.2.1.1, [BF] 607.6.2.1.2

Proposed Change as Submitted

Proponents: Amanda Hickman, The Hickman Group, Air Movement and Control Association International, Inc. (AMCA) (amanda@thehickmangroup.com)

2024 International Building Code

Revise as follows:

717.6.2.1.1 Dynamic systems. Only *ceiling radiation dampers labeled* for use in dynamic systems shall be installed in heating, *ventilation* and air-conditioning systems that do not automatically shut down~~designed to operate with fans on~~ during a fire.

717.6.2.1.2 Static systems. Static *ceiling radiation dampers* shall only be installed in ~~provided with~~ systems that ~~are~~ automatically shut down in the event of~~not designed to operate during~~ a fire. ~~**Exceptions:**~~

1. ~~Where a static *ceiling radiation damper* is installed at the opening of a duct, a *smoke detector* shall be installed inside the duct or outside the duct with sampling tubes protruding into the duct. The detector or tubes in the duct shall be within 5 feet (1524 mm) of the damper. Air outlets and inlets shall not be located between the detector or tubes and the damper. The detector shall be *listed* for the air velocity, temperature and humidity anticipated at the point where it is installed. Other than in mechanical smoke control systems, dampers shall be closed upon fan shutdown where local *smoke detectors* require a minimum velocity to operate.~~
2. ~~Where a static *ceiling radiation damper* is installed in a ceiling, the *ceiling radiation damper* shall be permitted to be controlled by a smoke detection system installed in the same room or area as the *ceiling radiation damper.*~~
3. ~~A static *ceiling radiation damper* shall be permitted to be installed in a room where an occupant sensor is provided within the room that will shut down the system.~~

2024 International Mechanical Code

Revise as follows:

[BF] 607.6.2.1.1 Dynamic systems. *Ceiling radiation dampers* installed in heating, ventilation and air-conditioning systems that do not automatically shut down~~designed to operate with fans on~~ during a fire shall be labeled for use in dynamic systems.

[BF] 607.6.2.1.2 Static systems. Static *ceiling radiation dampers* shall only be installed ~~only~~ in systems that automatically shut down in the event of~~are not designed to operate during~~ a fire.

~~**Exceptions:**~~

1. ~~Where a static *ceiling radiation damper* is installed at the opening of a duct, a smoke detector shall be installed inside the duct or outside the duct with sampling tubes protruding into the duct. The detector or tubes within the duct shall be within 5 feet (1524 mm) of the damper. Air outlets and inlets shall not be located between the detector or tubes and the damper. The detector shall be *listed* for the air velocity, temperature and humidity anticipated at the point where it is installed. Other than in mechanical smoke control systems, dampers shall be closed upon fan shutdown where local smoke detectors require a minimum velocity to operate.~~
2. ~~Where a static *ceiling radiation damper* is installed in a ceiling, the *ceiling radiation damper* shall be permitted to be controlled by a smoke detection system installed within the same room or area as the *ceiling radiation damper.*~~
3. ~~A static *ceiling radiation damper* shall be permitted to be installed within a room where an occupant sensor is provided within the room that will shut down the system.~~

Reason:

The changes to Sections 717.6.2.1.1 and 717.6.2.1.2 are editorial and align the description of dynamic and static systems with the code language already used in IBC section 717.2.3 outlining static dampers.

Exception 1 and Exception 2 are not exceptions to the charging language, but rather are specific methods for automatically shutting down a system in the event of a fire. Additionally, exception 2 as written, allows a static rated ceiling radiation damper to be controlled by a smoke detector without shutting down the system. This would result in the static damper having to close under airflow, which it is not listed to do.

Exception 3 does outline a true exception to the charging language as it describes a method for shutting down the system other than in the event of a fire. However, using an occupancy sensor to shut down the system could still result in the static rated damper having to close under airflow because many occupancy sensors utilize a delay prior to shutting the system down.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposed changes will not impact the cost of construction as they are only editorial and align system definitions with existing code language.

FS76-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee agreed with the concept of the proposal but the language needs to be correlated better for the CAH2 (Vote: 11-0).

FS76-24

Individual Consideration Agenda

Comment 1:

IBC: 717.6.2.1.1; IMC®: [BF] 607.6.2.1.1

Proponents: Amanda Hickman, The Hickman Group, Air Movement and Control Association International, Inc. (AMCA) (amanda@thehickmangroup.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

Revise as follows:

717.6.2.1.1 Dynamic systems. Only *ceiling radiation dampers labeled* for use in dynamic systems shall be installed in heating, *ventilation* and air-conditioning systems that do not automatically shut down during a fire.

Exception: *Ceiling radiation dampers* tested and *listed* in combination with specific fan models shall not be required to be *labeled* for dynamic systems.

2024 International Mechanical Code

Revise as follows:

[BF] 607.6.2.1.1 Dynamic systems. *Ceiling radiation dampers* installed in heating, ventilation and air-conditioning systems that do not automatically shut down during a fire shall be labeled for use in dynamic systems.

Exception: *Ceiling radiation dampers* tested and *listed* in combination with specific fan models shall not be required to be *labeled* for dynamic systems.

Reason:
Proposals FS76 and FS77 were both submitted in an attempt to clarify the current language which was originally intended to provide direction on various ceiling radiation damper (CRD) installations, where the static CRD will perform as intended because a static condition had been created. In reviewing the existing code language, it became apparent that the current exceptions to Section 717.6.2.1.2 are not exceptions to a static system, but are describing various methods of changing a dynamic condition into a static condition, which would then allow for the use of a static CRD. If those exceptions are kept in the code, they create confusion, as well as place limitations on what can be done to make the installation a static condition during a fire event.

Thus, the proponents of FS76 and FS77 worked together after each requested disapproval of our respective proposals at the first committee action hearing in order to work out an acceptable solution. This Public Comment represents that agreed solution. The committee indicated that they liked the clarity of FS76 so we built upon that structure to add a clean and concise exception to the dynamic section which provides a codified means to shutting down the system in a manner where a static CRD will perform as intended.

The proposed exception to Dynamic Systems outlines a scenario in which a ceiling radiation damper, though labeled as a static CRD, has been tested and certified to function correctly under fire conditions when paired with specific fan models. These combinations can either be integrated at the factory or assembled separately for use in the field in accordance with the CRD manufacturer's installation instructions. There are several different manufacturers who have obtained testing and third party certification of these combinations in accordance with UL 555C, which is already referenced in the code. If this proposed language is approved for inclusion in the 2027 code, we recommend updating the current commentary for this section to incorporate the aforementioned information.

This approach maintains the integrity and performance of fire-rated assemblies while providing clear guidance for practical implementation. Furthermore, the public comment enhances the clarity and application of the provisions concerning ceiling radiation dampers in both static and dynamic systems. This collaborative effort addresses the committee's feedback and provides a viable comprehensive solution for industry practitioners.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposed changes will not impact the cost of construction as they are only editorial and align system definitions with existing code language. Allowing the use of static CRDs that are tested and listed in combination with specific fan models provides another installation option for the installer.

Comment (CAH2)# 282

FS79-24

IBC: 718.2.1, AWC Chapter 35 (New)

Proposed Change as Submitted

Proponents: Edward Lisinski, American Wood Council (elisinski@awc.org)

2024 International Building Code

Revise as follows:

718.2.1 Fireblocking materials. *Fireblocking* shall consist of the following materials:

1. Two-inch (51 mm) nominal lumber.
2. Two thicknesses of 1-inch (25 mm) nominal lumber with broken lap joints.
3. One thickness of 0.719-inch (18.3 mm) *wood structural panels* with joints backed by 0.719-inch (18.3 mm) *wood structural panels*.
4. One thickness of 0.75-inch (19.1 mm) *particleboard* with joints backed by 0.75-inch (19 mm) *particleboard*.
5. One-half-inch (12.7 mm) *gypsum board*.
6. One-fourth-inch (6.4 mm) cement-based millboard.
7. Batts or blankets of *mineral wool*, *mineral fiber* or other *approved* materials installed in such a manner as to be securely retained in place.
8. Cellulose insulation tested in the form and manner intended for use to demonstrate its ability to remain in place and to retard the spread of fire and hot gases.
9. *Mass timber* complying with Section 2304.11.
10. One thickness of $^{19}/_{32}$-inch (15.1 mm) *fire-retardant-treated wood* structural panel complying with Section 2303.2.
11. Fireblocking materials in accordance with ANSI/AWC FDS.

Add new standard(s) as follows:

AWC

American Wood Council
222 Catoctin Circle SE, Suite 201
Leesburg, VA 20175

ANSI/AWC FDS-2024: Fire Design Specification (FDS) for Wood Construction

Reason: This proposal recognizes fireblocking materials in accordance with ANSI/AWC *2024 Fire Design Specification (FDS) for Wood Construction* Section 2.5.2 and adds a new reference to that standard in the code. The FDS includes prescriptive options for wood fireblocking of structural composite lumber and engineered wood rim board and for use of other wood members and wood protection materials designed in accordance with Chapter 3 of ANSI/AWC FDS to limit the passage of flames for at least 15 minutes. The minimum performance time of 15 minutes is based on performance associated with ½" gypsum board in Item 5 of IBC Section 718.2.1.

The FDS was developed as an American National Standard through the AWC ANSI-approved consensus standards development process, and is available on the AWC website at the following location: https://awc.org/wp-content/uploads/2023/11/AWC_FDS2024_20231103_AWCWEBSITE.pdf

Bibliography: ANSI/AWC *2024 Fire Design Specification (FDS) for Wood Construction*. View this document online: https://awc.org/wp-content/uploads/2023/11/AWC_FDS2024_20231103_AWCWEBSITE.pdf

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

$0

Estimated Immediate Cost Impact Justification (methodology and variables):

The proposal provides a reference to the FDS, which contains additional options for fireblocking materials which are not currently listed in Section 718.2.1, such as structural composite lumber and engineered wood rim board. The inclusion of this additional option does not in and of itself increase or decrease the overall cost impact of the code, because this option may or may not be chosen. The existing options are still relevant, and if chosen, have no cost impact on the actual code requirements.

FS79-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee disapproved the proposal due to the fact that the text only referred to the standard. The committee suggested that more details need to be added to the proposed text instead of only referring to the standard (Vote: 10-1).

FS79-24

Individual Consideration Agenda

Comment 1:

IBC: 718.2.1, AWC Chapter 35

Proponents: Edward Lisinski, American Wood Council (elisinski@awc.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

Revise as follows:

718.2.1 Fireblocking materials. *Fireblocking* shall consist of the following materials:

1. Two-inch (51 mm) nominal lumber.
2. Two thicknesses of 1-inch (25 mm) nominal lumber with broken lap joints.
3. One thickness of 0.719-inch (18.3 mm) *wood structural panels* with joints backed by 0.719-inch (18.3 mm) *wood structural panels.*
4. One thickness of 0.75-inch (19.1 mm) *particleboard* with joints backed by 0.75-inch (19 mm) *particleboard.*
5. One-half-inch (12.7 mm) *gypsum board.*
6. One-fourth-inch (6.4 mm) cement-based millboard.
7. Batts or blankets of *mineral wool*, *mineral fiber* or other *approved* materials installed in such a manner as to be securely retained in place.

8. Cellulose insulation tested in the form and manner intended for use to demonstrate its ability to remain in place and to retard the spread of fire and hot gases.
9. *Mass timber* complying with Section 2304.11.
10. One thickness of $^{19}/_{32}$-inch (15.1 mm) *fire-retardant-treated wood* structural panel complying with Section 2303.2.
11. ~~Fireblocking materials in accordance with ANSI/AWC FDS.~~ One layer of 1 1/8-inch (29 mm) *structural composite lumber.*
12. One layer of 1 1/8-inch (29 mm) *engineered wood rim board.*

Delete without substitution:

AWC

American Wood Council
222 Catoctin Circle SE, Suite 201
Leesburg, VA 20175

~~ANSI/AWC FDS-2024:~~ ~~Fire Design Specification (FDS) for Wood Construction~~

Reason: This proposal adds one layer of 1⅛-inch thick structural composite lumber and one layer of 1⅛-inch thick engineered wood rim board to the prescriptive list of approved fireblocking materials in Section 718.2.1. In Committee Action Hearing #1, the Code Development Committee recommended adding specific materials to the prescriptive list of fireblocking materials instead of making a reference to the ANSI/AWC *Fire Design Specification (FDS) for Wood Construction*. By directly including these materials in the list, builders and designers have additional options for fireblocking without having to reference another document. The reference to the FDS was removed as it no longer is proposed to be referenced in this particular section, however it should be noted that the justification for inclusion of these materials as acceptable fireblocking materials can be found in the FDS.

Note that the proposed language in this comment follows the formatting for the rest of this section that was approved by the committee in FS78-24. The unchanged portions of this section are not intended to revert back to the current code language. It is intended that they should continue to be modified as approved in FS78-24.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

$0 This proposal may or may not decrease the cost of construction if these materials are used, but it cannot increase the cost of construction because these materials are not required to be used. Any existign method of providing fireblocking can still be used if this proposal is accepted.

Estimated Immediate Cost Impact Justification (methodology and variables):

This is not a mandatory proposal and all existing methods of providing fireblocking are still preserved. These additional materials provide more options for a designer or builder. If a designer or builder does not want to use these materials, they can continue to build with whatever code compliant fireblocking materials they are currently using or specifying. However, if they have excess engineered wood products on a job site, or if these materials are used in a construction detail, by approving this proposal they could then be used as fireblocking. This could potentially decrease the cost of construction, reduce waste and/or reduce the need for additional fireblocking materials to be installed.

Comment (CAH2)# 25

FS85-24

IBC: SECTION 722, 722.1

Proposed Change as Submitted

Proponents: Bonnie Manley, AISC, AISC (manley@aisc.org); Jon-Paul Cardin, The CFSteel Group, The CFSteel Group (jp@cfsteelgroup.org)

2024 International Building Code

SECTION 722
CALCULATED FIRE RESISTANCE

Revise as follows:

722.1 General. The provisions of this section contain procedures by which the *fire resistance* of specific materials or combinations of materials is established by calculations. These procedures apply only to the information contained in this section and shall not be otherwise used. The calculated *fire resistance* of specific materials or combinations of materials shall be established by one of the following:

1. *Concrete,*concrete *masonry* and clay*masonry* assemblies shall be permitted in accordance with ACI 216.1/TMS 0216.
2. Precast and precast, prestressed *concrete* assemblies shall be permitted in accordance with PCI 124.
3. Steel assemblies and composite steel and concrete assemblies shall be permitted in accordance with AISC 360 Appendix 4, Section 4.3 ~~Chapter 5 of ASCE 29~~.
4. Exposed wood members and wood decking shall be permitted in accordance with Chapter 16 of ANSI/AWC NDS.

Reason: This proposal is one of three that fully update Chapter 7 provisions of the IBC to reflect current structural steel industry standards. The 2024 edition of the IBC has already adopted the 2022 edition of AISC 360, *Specification for Structural Steel Buildings*, in Chapter 35 and elsewhere (Sections 722.5.2.2.1, 1604.3.3, 1705.2.1, 2202.1, and 2202.2.1.1). The purpose of this proposal is to update the methodology for the calculation of fire resistance for structural steel assemblies to recognize the applicable portion of AISC 360-22's mandatory Appendix 4, Structural Design for Fire Conditions (specifically Appendix 4, Section 4.3). The proposal also expands the reference to include composite steel and concrete assemblies, which are newly added in the 2022 edition of AISC 360, Appendix 4, Section 4.3.

Since the 2003 edition, the IBC has included ASCE 29, *Standard Calculation Methods for Structural Fire Protection,* as the only means to calculate the fire resistance of steel assemblies. The first edition of ASCE 29 referenced in the 2003 IBC was the 1999 edition; today, the 2024 IBC references the 2005 edition (although the 11/1/23 IBC-24 errata notes a 2017 edition; however, it is not available on the ASCE website for purchase as of 1/8/24). Since the 2006 edition of the IBC, the IBC has mandated AISC 360 as the basis for the design, fabrication, and erection of structural steel buildings. The first edition of AISC 360 referenced in the 2006 IBC was the 2005 edition, and today, the 2024 IBC references the 2022 edition.

In 2005, the committee charged with the development of AISC 360 created a new AISC 360 Appendix 4, Section 4.3 to provide calculation methods for establishing fire-resistance ratings of steel assemblies that would otherwise be determined by standard testing. AISC 360-05, Appendix 4, Section 4.3 also included a direct reference to the ASCE 29-05 calculation procedures for determining the fire-resistance ratings of steel assemblies. While intervening editions of AISC 360 Appendix 4, Section 4.3 have included this reference to ASCE 29-05, for the 2022 edition of AISC 360, the committee chose to extract the applicable calculation procedures directly from ASCE 29-05 and combine them with newly developed provisions. So, the 2024 IBC now effectively includes references to two (2) documents containing the same material on the prescriptive calculation of fire resistance for steel assemblies. However, while ASCE 29 has remained static, the methodology now found in Appendix 4, Section 4.3 of AISC 360-22 has been enhanced to reflect the latest requirements based on research, analysis, and testing. By deleting the direct reference to ASCE 29 and, instead, referencing AISC 360,

this proposal streamlines the IBC by citing only one (1) document with the most complete and up-to-date provisions for determining the fire resistance of steel assemblies and composite steel and concrete assemblies.

AISC makes its standards available to all free of charge. AISC 360-22 can be downloaded for free from https://www.aisc.org/publications/steel-standards/. Please refer to the full AISC 360-22 commentary for technical background and guidance on applying the provisions.

From the AISC-360 Commentary on Appendix 4, Section 4.3: "The primary source of accepted fire-resistance calculations for structural steel has been AISI and its ASTM E119 fire research conducted throughout the 1970s and 1980s. These industry-sponsored developments were originally captured in three AISI design guide publications (AISI, 1980, 1981, 1984), which were subsequently included in the preceding and current editions of Section 5 of SEI/ASCE/SFPE Standard 29, Standard Calculation Methods for Structural Fire Protection (ASCE, 2005) and in the U.S. model building codes. More recently, all of this information was summarized and well illustrated in AISC Design Guide 19. The standard fire protection and fire-resistance calculation methods for structural steel have now also been consistently transferred into the current National Fire Protection Association (NFPA) and International Code Council (ICC) model building codes. The inclusion of provisions for fire-resistance calculations in this Specification was motivated by AISC's and the steel industry's interest in duly maintaining this important content and contributing to its future progress. In this manner, AISC desires to parallel the development of prescriptive fire-resistive criteria for the concrete, masonry, and timber industries that are embodied in separate standards authored by the respective committees."

Bibliography: AISC (2022), *Specification for Structural Steel Buildings*, ANSI/AISC 360-22, American Institute of Steel Construction, Chicago, Ill., August 1, 2022.

Available at: https://www.aisc.org/publications/steel-standards/.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal the application of a standard already adopted in the 2024 IBC.

FS85-24

Public Hearing Results (CAH1)

Committee Action: **As Submitted**

Committee Reason: The committee determined that the proposed language reflects current structural steel industry standards. The committee agreed with updating the methodology for the calculation of fire resistance for structural steel assemblies to recognize the applicable portion of AISC 360-22's mandatory Appendix 4, Structural Design for Fire Conditions (specifically Appendix 4, Section 4.3) (Vote: 11-0).

FS85-24

Individual Consideration Agenda

Comment 1:

IBC: 722.1

Proponents: Bonnie Manley, AISC, AISC (manley@aisc.org); Richard Walke, Creative Technology Inc. and CM Services, National Fireproofing Contractors Association (richwalke61@gmail.com) requests As Modified by Committee (AMC2)

Further modify as follows:

2024 International Building Code

722.1 General. The provisions of this section contain procedures by which the *fire resistance* of specific materials or combinations of materials is established by calculations. These procedures apply only to the information contained in this section and shall not be otherwise used. The calculated *fire resistance* of specific materials or combinations of materials shall be established by one of the following:

1. *Concrete,*concrete *masonry* and clay*masonry* assemblies shall be permitted in accordance with ACI 216.1/TMS 0216.
2. Precast and precast, prestressed *concrete* assemblies shall be permitted in accordance with PCI 124.
3. Steel assemblies and composite steel and concrete assemblies shall be permitted in accordance with AISC 360 Appendix 4, Section 4.3. **Exception:** Establishing equivalency to the standard fire-resistance rating using the advanced methods of analysis of AISC 360 Appendix 4.2 in combination with the fire exposure specified in ASTM E119 or UL 263 as the design-basis fire, as permitted in AISC 360 Appendix 4, Section 4.3.1, shall be in accordance with the requirements of Section 104.2.3
4. Exposed wood members and wood decking shall be permitted in accordance with Chapter 16 of ANSI/AWC NDS.

Reason: AISC 360-22, Appendix Section 4.3.1 permits the use of an advanced analysis procedure in accordance with Appendix Section 4.2.4c as an equivalent method when combined with the fire exposure specified in ASTM E119 or UL 263 as follows:

> **4.3.1. Qualification Standards**
>
> Structural members and components in steel buildings shall be qualified for the rating period in conformance with ASTM E119 or ANSI/UL 263. Demonstration of compliance with these requirements using the procedures specified for steel construction in Section 5 of Standard Calculation Methods for Structural Fire Protection (ASCE/SEI/SFPE 29) is permitted. **It is also permitted to demonstrate equivalency to such standard fire-resistance ratings using the advanced analysis methods in Section 4.2 in combination with the fire exposure specified in ASTM E119 or ANSI/UL 263 as the design-basis fire.**
>
> The generic steel assemblies described in Table A-4.3.1 shall be deemed to have the fire-resistance ratings prescribed therein.

The proposed exception clarifies that this method must follow the requirements of the alternate materials, design, and methods of construction and equipment as specified in IBC Section 104.2.3.

The need for this clarification was first identified in testimony by NFCA at the ICC CAH#1. AISC and NFCA have worked together to develop this comment addressing their concern. Additionally, work is now underway on the next edition of AISC 360 (2027). It is anticipated that this will be better clarified in that next edition and that this exception will be unneeded after the 2027 edition of the IBC.

Bibliography: AISC (2022), *Specification for Structural Steel Buildings*, ANSI/AISC 360-22, American Institute of Steel Construction, Chicago, Ill., August 1, 2022.
Available at: https://www.aisc.org/publications/steel-standards/.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal references a standard already adopted in the 2024 IBC.

Comment (CAH2)# 484

FS86-24

IBC: 722.1

Proposed Change as Submitted

Proponents: Stephen Szoke, American Concrete Institute, American Concrete Institute (steve.szoke@concrete.org); Steve Skalko, Stephen V. Skalko, P.E. & Associates LLC, Precast/Prestressed Concrete Institute (svskalko@svskalko-pe.com); Shamim Rashid-Sumar, National Ready Mixed Concrete Association, National Ready Mixed Concrete Association (ssumar@nrmca.org); Nicholas Lang, Concrete Masonry & Hardscapes Association, Representing Masonry Alliance for Codes and Standards, Masonry Alliance for Codes & Standards (nlang@ncma.org)

2024 International Building Code

Revise as follows:

722.1 General. The provisions of this section contain procedures by which the *fire resistance* of specific materials or combinations of materials is established by calculations. These procedures apply only to the information contained in this section and shall not be otherwise used. The calculated *fire resistance* of specific materials or combinations of materials shall be established by one of the following:

1. *Concrete,*concrete *masonry* and clay*masonry* assemblies shall be permitted in accordance with ACI 216.1/TMS 0216.
2. Precast and precast, prestressed *concrete* assemblies shall be permitted in accordance with PCI 124.
3. Steel assemblies shall be permitted in accordance with Chapter 5 of ASCE 29.
4. Exposed wood members and wood decking shall be permitted in accordance with Chapter 16 of ANSI/AWC NDS.
5. Steel columns protected with concrete or masonry and hollow steel tubes filled with concrete shall be permitted in accordance with ACI/TMS 216.1

Reason: This code change proposal adds ACI/TMS 216.1 as a compliance path for structural steel columns protected with concrete or masonry and hollow structural steel columns filled with concrete. ACI/TMS 216.1 continues to provide the methods to provide fire protection for structural steel columns using concrete or masonry and fire resistance ratings for hollow steel columns filled with concrete. This adds an alternative to ASCE 29 as an additional resource for determining compliance.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This changes does not increase cost as it provides an alternative compliance method to those already permitted in the code.

FS86-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee disapproved the proposal based on the approval of FS89-24 and as requested by the proponent (Vote: 10-0).

FS86-24

Individual Consideration Agenda

Comment 1:

Proponents: Stephen Szoke, American Concrete Institute, American Concrete Institute (steve.szoke@concrete.org) requests As Submitted

Reason: Approval as submitted based on original reason statement.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Comment (CAH2)# 380

FS87-24

IBC: 722.1

Proposed Change as Submitted

Proponents: Stephen Szoke, American Concrete Institute, American Concrete Institute (steve.szoke@concrete.org); Shamim Rashid-Sumar, National Ready Mixed Concrete Association, National Ready Mixed Concrete Association (ssumar@nrmca.org)

2024 International Building Code

Revise as follows:

722.1 General. The provisions of this section contain procedures by which the *fire resistance* of specific materials or combinations of materials is established by calculations. These procedures apply only to the information contained in this section and shall not be otherwise used. The calculated *fire resistance* of specific materials or combinations of materials shall be established by one of the following:

1. *Concrete,*concrete *masonry* and clay*masonry* assemblies shall be permitted in accordance with ACI 216.1/TMS 0216.
2. Precast and precast, prestressed *concrete* assemblies shall be permitted in accordance with PCI 124 or ACI/TMS 216.1.
3. Steel assemblies shall be permitted in accordance with Chapter 5 of ASCE 29.
4. Exposed wood members and wood decking shall be permitted in accordance with Chapter 16 of ANSI/AWC NDS.

Reason: This proposal clarifies that ACI/TMS 216.1 is a appropriate for determining the fire resistance ratings of precast, prestressed concrete assemblies. Item 1, does not distinguish between prestressed and non-prestressed assemblies and both are covered in ACI/TMS 216.1. By reading Item 2 as currently written implies that only compliance with PCI 124 is acceptable precast, prestressed concrete assemblies. Prior to the addition of PCI 124 to the IBC, the user was directed to ACI/TMS 216.1 for all concrete assemblies including precast, prestressed concrete. This change provides clarity that ACI/TMS 216.1 remains an appropriate compliance path for precast, prestressed concrete assemblies.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

No technical change, simply clarifies that ACI/TMS 216.1 remains applicable for precast, prestressed concrete, per Item 1

FS87-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee disapproved the proposal based on the approval of FS89-24 and as requested by the proponent (Vote: 10-0).

Comment (CAH2)# 385

FS94-24

IBC: 803.13, TABLE 803.13

Proposed Change as Submitted

Proponents: Jeff Grove, Chair, Building Code Action Committee (BCAC) (bcac@iccsafe.org)

2024 International Building Code

803.13 Interior finish requirements based on occupancy. *Interior wall and ceiling finish* shall have a classification such that the *flame spread index* and *smoke-developed index* values are not higher than those corresponding to the classification specified in Table 803.13 for the group and location designated. *Interior wall and ceiling finish* materials tested in accordance with NFPA 286 and meeting the acceptance criteria of Section 803.1.1.1, shall be permitted to be used where a Class A classification in accordance with ASTM E84 or UL 723 is required.

Revise as follows:

TABLE 803.13 INTERIOR WALL AND CEILING FINISH REQUIREMENTS BY OCCUPANCY[k]

	SPRINKLERED[l] S, S13R, S13D			NONSPRINKLERED - NS		
GROUP	Interior exit stairways and ramps and exit passageways[a, b]	Corridors and enclosure for exit access stairways and ramps	Rooms and enclosed spaces[c]	Interior exit stairways and ramps and exit passageways[a, b]	Corridors and enclosure for exit access stairways and ramps	Rooms and enclosed spaces[c]
A-1 & A-2	B	B	C	A	A[d]	B[e]
A-3[f], A-4, A-5	B	B	C	A	A[d]	C
B, E, M, R-1	B	C[lm]	C	A	B	C
R-4	B	C	C	A	B	B
F	C	C	C	B	C	C
H	B	B	C[g]	A	A	B
I-1	B	C	C	A	B	B
I-2	B	B	B[h, i]	A	A	B
I-3	A	A[j]	C	A	A	B
I-4	B	B	B[h, i]	A	A	B
R-2	C	C	C	B	B	C
R-3	C	C	C	C	C	C
S	C	C	C	B	B	C
U	No restrictions			No restrictions		

For SI: 1 inch = 25.4 mm, 1 square foot = 0.0929 m^2.

NS = Buildings not equipped throughout with an automatic sprinkler system; S = Buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1; S13R = Buildings equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.2; S13D = Buildings equipped throughout with an automatic sprinkler system installed in accordance with Sections 903.2.8 and 903.3.1.3.

a. Class C interior finish materials shall be permitted for wainscotting or paneling of not more than 1,000 square feet of applied surface area in the grade lobby where applied directly to a noncombustible base or over furring strips applied to a noncombustible base and fireblocked as required by Section 803.15.1.

b. In other than Group I-3 occupancies in buildings less than three stories above grade plane, Class B interior finish for nonsprinklered buildings and Class C interior finish for sprinklered buildings shall be permitted in interior exit stairways and ramps.

c. Requirements for rooms and enclosed spaces shall be based on spaces enclosed by partitions. Where a fire-resistance rating is required for structural elements, the enclosing partitions shall extend from the floor to the ceiling. Partitions that do not comply with this shall be considered to be enclosing spaces and the rooms or spaces on both sides shall be considered to be one room or space. In determining the applicable requirements for rooms and enclosed spaces, the specific occupancy thereof shall be the governing factor regardless of the group classification of the building or structure.

d. Lobby areas in Group A-1, A-2 and A-3 occupancies shall be not less than Class B materials.

e. Class C interior finish materials shall be permitted in places of assembly with an occupant load of 300 persons or less.

f. For places of religious worship, wood used for ornamental purposes, trusses, paneling or chancel furnishing shall be permitted.

g. Class B material is required where the building exceeds two stories.

h. Class C interior finish materials shall be permitted in administrative spaces.

i. Class C interior finish materials shall be permitted in rooms with a capacity of four persons or less.

j. Class B materials shall be permitted as wainscotting extending not more than 48 inches above the finished floor in corridors and exit access stairways and ramps.

k. Finish materials as provided for in other sections of this code.

~~l. Applies when protected by an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.~~

l ~~m~~. Corridors in ambulatory care facilities shall be provided with Class A or B materials.

Reason: The intent of this group of proposal is to make the tables in Chapter 8 and 10 consistent with the revisions to Table 504.3, 504.4, 506.2 – using S13, S13R, S13D and NP for sprinkler requirements. This would clarify what happens when an NFPA 13D sprinkler system is used. This is not intent to change current allowances; just to clarify what requirements are applicable for an NFPA13D system. Discussion during the BCAC calls has indicated that it is needed to identifying specific code sections so that everyone has the same understanding.

Group R-4 requirements do not always have to be stated as Section 310.5 states “Group R-4 occupancies shall meet the requirements for construction as defined for Group R-3, except as otherwise provided for in this code.” However, since a lot of people miss that, we are including R-4 in the proposed applicable footnotes.

Townhouses are defined as attached dwelling units that extend from foundation to grade and are open on at least two sides. If a townhouse is 3 stories or less, it can choose to comply with the IBC or IRC (Section 101.2). The IRC Section P2904 is similar to an NFPA 13D system. If the IBC is used, townhouses subdivided by firewalls into 1 or 2 units per building is a Group R-3 (Section 310.4) and townhouses subdivided by fire partitions (Section 420.2) are a Group R-2 (Section 310.3). This is important to clarify because all townhouses can use a 13D sprinkler system: Section 903.2.8 references 903.3, and 903.1.3.3 specifically stating that “Automatic sprinkler systems installed in … and townhouses shall be permitted to be installed throughout in accordance with NFPA 13D.” To make this obvious in the tables, a reference to 903.2.8 and 903.1.3.3 are added in the footnote.

Specifics for this change –

· adds the S13, S13R, S13D and NS in the table titles and footnotes with the section references for sprinklers.· Footnote l with the sprinkler reference is redundant and deleted.

This proposal is submitted by the ICC Building Code Action Committee (BCAC).

BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 the BCAC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the BCAC website at BCAC webpage.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is a clarification of requirements for Group R where an NFPA13D system is permitted. There are no changes to construction requirements.

FS94-24

Public Hearing Results (CAH1)

Committee Action: **As Submitted**

Committee Reason: The committee deemed the proposed code change clarifies the table requirements (Vote: 11-0).

FS94-24

Individual Consideration Agenda

Comment 1:

Proponents: Kevin Scott, KH Scott & Associates LLC, self (khscottassoc@gmail.com) requests Disapproved

Reason: This item was Approved at CAH 1, and the comment proposes to Disapprove this item in its entirety.

While I agree that in the room where a sprinkler is located, a sprinkler attached to a NFPA 13D system would be beneficial, that is not what this code change says. This code change says that if the building has an NFPA 13D sprinkler system, then any room in that building is considered sprinklered and therefore is given the benefit of reducing the flame spread rating. That is an incorrect application of this logic.

The logic should be applied in a manner that provides the room containing the sprinkler to realize the benefit of being sprinklered. The footnotes indicate that NS means the the building is not equipped throughout with a sprinkler system. It has already been established that the ICC interpretation is "sprinklered throughout" means sprinklers are located where they are required. In accordance with NFPA 13D there are many areas where sprinklers are not required, yet those "rooms and enclosed spaces" would now fall under the sprinklered category and benefit from the building being sprinklered.

The intent of this sprinkler benefit in this table is that the sprinkler is located in the room where the flame spread reduction is taken. Until those two items are correlated, this code change should not be approved.

Cost Impact: No change to code.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Comment (CAH2)# 800

2024 International Building Code

Revise as follows:

1402.2 Weather protection. Buildings shall be provided with a weather-resistant *exterior wall assembly* . The *exterior wall assembly* shall include flashing, as described in Section 1404.4. The *exterior wall assembly* shall be designed and constructed in such a manner as to prevent the accumulation of water within the exterior wall assembly by providing a *water-resistive barrier* behind the exterior *veneer*, as described in Section 1403.2, and a means for draining water that enters the assembly to the exterior. Where not otherwise addressed by the materials and methods for weather protection prescribed by this code, rainwater resistance shall be permitted to be demonstrated in accordance with Section 1402.3. Protection against condensation in the *exterior wall* assembly shall be provided in accordance with Section 1404.3. **Exceptions:**

1. A weather-resistant *exterior wall assembly* shall not be required over concrete or *masonry* walls designed in accordance with Chapters 19 and 21, respectively.
2. Compliance with the requirements for a means of drainage, and the requirements of Sections 1403.2 and 1404.4, shall not be required for an *exterior wall assembly* that has been demonstrated through testing to resist wind-driven rain, including joints, penetrations and intersections with dissimilar materials, in accordance with ASTM E331 under the following conditions:
   The *exterior wall* design shall be considered to resist wind-driven rain where the results of testing, in accordance with ASTM E331, indicate that water did not penetrate control joints in the *exterior wall* , joints at the perimeter of openings or intersections of terminations with dissimilar materials.

   2.1. *Exterior wall* test assemblies shall include not fewer than one opening, one control joint, one wall/eave interface and one wall sill. Tested openings and penetrations shall be representative of the intended end-use configuration.

   2.2. *Exterior wall* test assemblies shall be not less than 4 feet by 8 feet (1219 mm by 2438 mm) in size.

   2.3. *Exterior wall* test assemblies shall be tested at a minimum differential pressure of 6.24 pounds per square foot (0.297 kN/m^2).

   2.4. *Exterior wall* test assemblies shall be subjected to a minimum test exposure duration of 2 hours.

3. *Exterior insulation and finish systems* (EIFS) complying with Section 1407.4.1.

Add new text as follows:

1402.3 Rainwater resistance.. The rainwater resistance of *exterior wall* assemblies, including the *exterior wall covering* assembly or only the *water-resistive barrier* system, shall be permitted to be tested in accordance with ASTM E331 to demonstrate compliance with the weather protection requirements of Section 1402.2. The following test conditions shall apply:

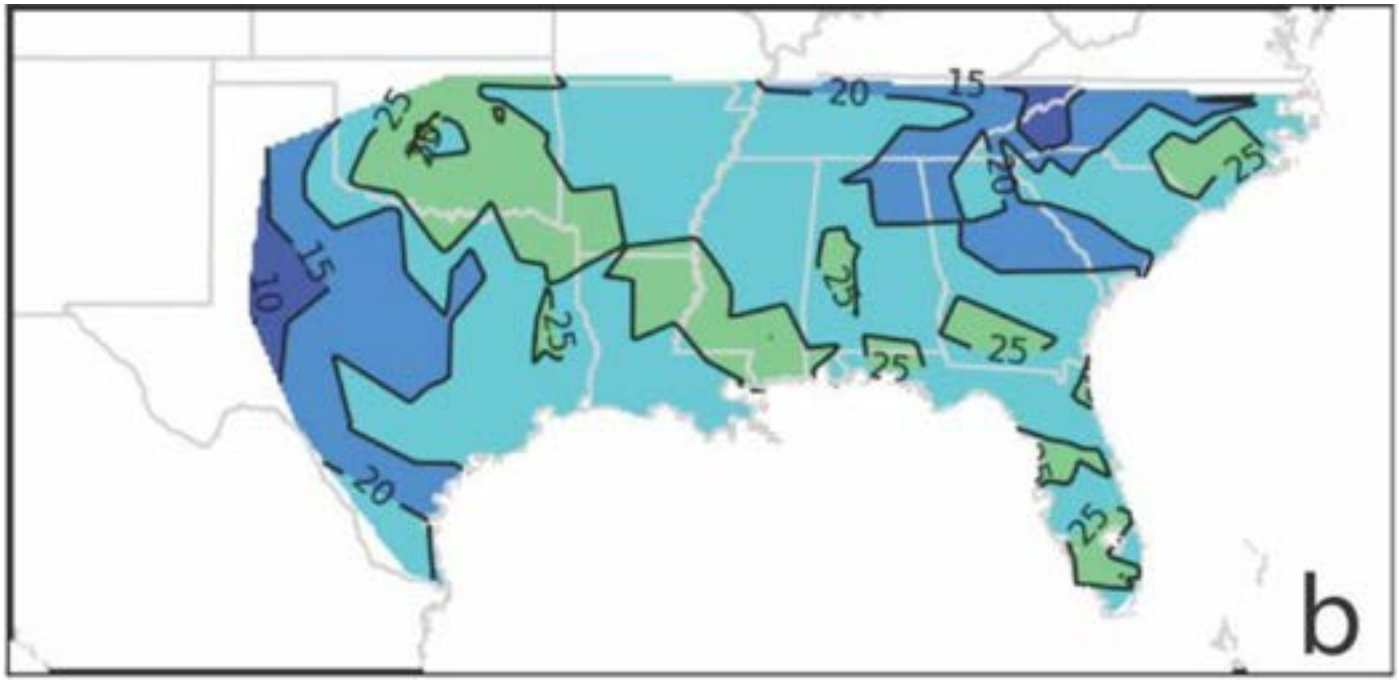
1. The ASTM E331 test pressure shall be determined in accordance with Table 1402.3 and Figure 1402.3 or by calculations in accordance with ASCE 7 using a design wind-driven rain wind speed in accordance with Figure 1402.3. The test pressure shall not be less than 2.86 psf (137 Pa) and shall not be required to exceed 12.0 psf (575 Pa).
2. The duration of test shall not be less than 15 minutes. Subsequent tests with increased test pressure shall be permitted with leakage assessment after each test.

3. The tested assembly shall be considered to resist wind-driven rain at the greatest test pressure increment where water did not penetrate the innermost layer intended to provide water resistance protection of the remainder of the wall assembly.
4. Test assemblies shall be constructed in accordance with the applicable manufacturer's installation instructions for each component and shall comply with the following minimum assembly configuration requirements:
   4.1. Not fewer than one opening element or blank, and flashing condition.
   4.2. Not fewer than one vertical and horizontal joint in the *water-resistive barrier* assembly where representative of installed conditions
   4.3. Where exterior *veneer* or cladding is included on the test assembly, it shall include not fewer than one control joint or transition joint as applicable and the results shall be limited to the type of *veneer* or cladding used.
   4.4. Test assemblies shall not be less than 4 feet by 8 feet (1.2 m by 2.4 m) in size.

Revise as follows:

[BS] 1402.4 ~~1402.3~~ Wind resistance. *Exterior walls*, exterior wall coverings, exterior soffits and fascias, and the associated openings, shall be designed and constructed to resist safely the superimposed *loads* required by Chapter 16.

Add new text as follows:



Source: Cornell University / NOAA - ***to be replaced with full U.S. map with smoothed wind speed contours and units of MPH instead of m/s.***

FIGURE 1402.3 Wind-driven rain wind speed (m/s) hazard map to determine ASTM E331 test pressure criteria [1 m/s = 2.24 mph]

TABLE 1402.3 Pre-calculated Wind-Driven Rain ASTM E331 Test Pressure (PSF)

For SI: 1 psf = 47.9 Pa

Reason: The code lacks a risk-consistent basis for addressing wind-driven rain and resistance to water intrusion. This proposal provides a wind-driven rain hazard map (Figure 1402.3) that properly characterizes the hazard as it varies across wind-driven rain climatology of the U.S. This map of the southeastern U.S. is a placeholder until a map of the entire U.S. becomes available in 2024.

The proposal “permits” and does not mandate use of proposed Section 1402.3, the wind-driven rain map of Figure 1402.3, or the associated ASTM E331 test pressures of Table 1402.3. Instead, the reference to Section 1402.3 in Section 1402.2 uses permissive language (“shall be permitted”) to allow for current practice to continue unchanged for existing materials and methods recognized in the code. This optional or voluntary approach will allow time for various stake-holders and standards developers to align their standards with this new risk-based approach without changing requirements for materials and methods currently recognized in the code at this time.

Various portions and details of this proposal are further explained below.

Figure 1402.3

– As reported in the Bibliography reference, the climatology of wind-driven rain is developed from recently available 1-min weather observations from National Weather Service Automated Surface Observing Systems (ASOS). One-minute data better represent the joint occurrence of the extremes that define wind-driven rain occurrence than hourly data, which previously was the shortest available temporal resolution. After adjusting the winds speeds to standardize for exposure and anemometer type, the wind data corresponding to

specific rainfall thresholds were fit to a statistical distribution to obtain estimates of the recurrence of wind speeds associated with different rainfall intensities. The values serve as the basis for a wind-driven rain climatology for the United States that is analogous to climatologies that exist and inform building codes in Europe and Canada. The wind-driven rain map shown in Figure 1402.3 is based on the currently completed research for the southeastern U.S. and represents a 3-sec gust wind speed (meters per second) for a 10-yr mean recurrence interval with a threshold coincidental rainfall rate of 2.54 mm/min (see JAMC article referenced in Bibliography). It is anticipated that research to complete a similar map for the entire U.S. (at an appropriate return period wind speed and threshold for coincidental rainfall rate) will be completed prior to the second committee hearing in 2024.

Section 1402.3 & Table 1402.3

– The test procedure and requirements used in proposed new Section 1402.3 rely on a standard test method commonly used for assessing wind-driven rain resistance, ASTM E331. While similar to testing requirements in Exception 2 of Section 1402.2, the application of Section 1402.3 is not limited to evaluation of “barrier claddings” that lack a means of drainage. The main purpose of the mapped wind-driven rain hazard (Figure 1402.3) is to provide a wind-driven rain wind speed from which an appropriate, risk-consistent test pressure can be used to evaluate the water-resistance of wall assemblies and exterior wall covering assemblies or components using ASTM E331. The test pressure may be determined in two ways. One way is to use the prescriptive (pre-calculated) test pressures in Table 1402.3. The other way is to calculate the test pressure using the ASCE 7 provisions for wind loads, but substituting the appropriate wind-driven rain wind speed from Figure 1402.3 for the basic wind speed used for structural design purposes in ASCE 7. The latter method was how Table 1402.3 was generated. An example of calculating the test pressure using Figure 1402.3 and the wind load provisions of ASCE 7 is as follows:

Wind-driven rain wind speed: 44.8 mph (20 m/s – Figure 1402.3)

Wind Exposure: B (suburban/wooded)

Building Height: 30 feet

Wall Pressure coefficients – GCp = 1.0 (positive); GCpi = -0.18 (negative internal pressure)

Kz = 0.7 (exposure B, 30’ height)

Kd = 1.0 (directionality not considered)

Kzt = 1.0 (no topographic wind speed up effects considered)

Ke = 1.0 (no elevation effects considered w/r to lower density of air at higher elevations)

$p = [0.00256\ Kz\ Kzt\ Kd\ Ke\ V^2] \times [GCp - GCpi]$

$= 0.00256(0.7)(1.0)(1.0)(1.0)(44.8)^2 \times [1.0 + 0.18]$

= (3.6 psf) x [1.18] = **4.24 psf** test pressure

The above calculation method was used to develop Table 1402.3 as shown also in the table below. This table is provided for transparency and informational purposes.

	Mean			WDR Wind Speed, m/s (MPH)							
Wind	Roof	10	15	20	25	30	35	40	45	50	60
Exposure	Height (ft)	22.4	33.6	44.8	56	67.2	78.4	89.6	100.8	112	134.4
	15	0.86	1.94	3.46	5.40	7.78	10.58	13.82	17.50	21.60	31.10
	20	0.94	2.11	3.76	5.87	8.46	11.51	15.04	19.03	23.49	33.83

C	30	1.49	3.34	5.94	9.28	13.37	18.20	23.77	30.08	37.14	53.47
	40	1.58	3.55	6.31	9.85	14.19	19.31	25.22	31.92	39.41	56.75
	50	1.65	3.72	6.61	10.33	14.87	20.24	26.43	33.46	41.30	59.48
	60	1.71	3.85	6.85	10.70	15.41	20.98	27.40	34.68	42.82	61.66
	15	1.56	3.51	6.24	9.76	14.05	19.12	24.98	31.61	39.03	56.20
	20	1.64	3.68	6.55	10.23	14.73	20.05	26.19	33.15	40.92	58.93
	25	1.70	3.82	6.79	10.61	15.28	20.80	27.16	34.38	42.44	61.11
D	30	1.76	3.96	7.03	10.99	15.82	21.54	28.13	35.60	43.96	63.30
	40	1.85	4.16	7.40	11.56	16.64	22.65	29.59	37.45	46.23	66.57
	50	1.92	4.33	7.70	12.03	17.32	23.58	30.80	38.98	48.12	69.30
	60	1.99	4.47	7.94	12.41	17.87	24.32	31.77	40.21	49.64	71.48

It is important to note that the failure mode that this proposal addresses is the initiation of a leak (water intrusion) at a specified extreme event level. Therefore, it provides protection for routine and lesser extreme events that have equal or lower wind-driven rain wind speed (even if the rainfall rate is substantially greater than the threshold used to develop Figure 1402.3). Events that exceed the wind-driven rain wind speed and given recurrence interval (return period or annual extreme probability) tend to have lower coincidental rainfall rates as based on the natural tendency in the climatological data (see JAMC article referenced in Bibliography).

Finally, as indicated in Section 1402.3 (Item 1) and shown in Table 1402.3, the lower limit of 2.86 psf (137 Pa) for test pressure is used to correspond with the minimum test pressure specified in ASTM E331 (despite the table above showing that lower pressure could be justified in regions of low wind-driven rain hazard). The upper limit of 12.0 psf (575 Pa) in Table 1402.3 also is based on current accepted practice for worst-case wind-driven rain climate conditions in the U.S. and ensures the availability of solutions (it also ensures equivalency with current accepted practices for regions or conditions considered to have high wind-driven rain hazard). These limits ensure that this new approach is “calibrated” to accepted practice and that solutions are available while also better aligning solutions with actual variation in U.S. wind-driven rain hazard. Even so, the 12 psf cap will provide substantial protection against significant water-intrusion and contents damage in greater wind-driven rain hazard conditions or events (higher wind speed at greater return periods) up to the point where structural failures begin to occur and the general integrity of the building envelope is compromised. Such extreme structural safety-level events are beyond the scope of a serviceability concern underlying the current and proposed approach to water resistance. Regardless, the proposed approach deals with the matter of wind-driven rain water resistance in a much more risk-consistent fashion based on the variation in hazard across the U.S. (wind-driven rain wind speed) and for different building conditions (e.g., wind exposure and building height).

Bibliography: Belcher, B.N., DeGaetano, A.T., Masters, F.J., Crandell, J., and Morrison, M.J. (2023). Development of an Extreme Wind-Driven Rain Climatology for the Southeastern United States Using 1-Min Rainfall and Peak Wind Speed Data. *Journal of Applied Meteorology and Climatology*, American Meteorological Society, DOI: https://doi.org/10.1175/JAMC-D-22-0156.1

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

$0.00

While the cost impact indicates “increased cost” (there was no suitable default answer in cdpACCESS), the proposal does not mandate any new requirements. It provides a new means or option to evaluate building wall assemblies and components for water resistance using an improved methodology based on actual wind-driven rain hazard. If voluntarily used, it could result in an increase or decrease cost for material or assembly qualification purposes relative to existing practices. But, the increase or decrease in cost to the end user may be very small. This proposal also does not require any existing materials or methods recognized in the code to alter current

requirements, methods, or standards. So, it should be considered cost neutral.

Estimated Immediate Cost Impact Justification (methodology and variables):

Zero

Estimated Life Cycle Cost Impact:

Zero

Estimated Life Cycle Cost Impact Justification (methodology and variables):

See cost impact statement.

FS98-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The proposal was disapproved as requested by the proponent to work on the proposal for the CAH2 (Vote: 12-0).

FS98-24

Individual Consideration Agenda

Comment 1:

IBC: 1402.3

Proponents: Jay Crandell, P.E., ABTG / ARES Consulting, myself (jcrandell@aresconsulting.biz) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

1402.3 Rainwater resistance.. The rainwater resistance of *exterior wall* assemblies, including the *exterior wall covering* assembly or only the *water-resistive barrier* system, shall be permitted to be tested in accordance with ASTM E331 to demonstrate compliance with the weather protection requirements of Section 1402.2. The following test conditions shall apply:

1. The ASTM E331 test pressure shall be determined in accordance with Table 1402.3 and Figure 1402.3 or by calculations in accordance with ASCE 7 using a design wind-driven rain wind speed in accordance with Figure 1402.3 or an *approved source*. The test pressure shall not be less than 2.86 psf (137 Pa) and shall not be required to exceed 12.0 psf (575 Pa).
2. The duration of test shall not be less than 15 minutes. Subsequent tests with increased test pressure shall be permitted with leakage assessment after each test.
3. The tested assembly shall be considered to resist wind-driven rain at the greatest test pressure increment where water did not penetrate the innermost layer intended to provide water resistance protection of the remainder of the wall assembly.

4. Test assemblies shall be constructed in accordance with the applicable manufacturer's installation instructions for each component and shall comply with the following minimum assembly configuration requirements:
    4.1. Not fewer than one opening element or blank, and flashing condition.
    4.2. Not fewer than one vertical and horizontal joint in the *water-resistive barrier* assembly where representative of installed conditions
    4.3. Where exterior *veneer* or cladding is included on the test assembly, it shall include not fewer than one control joint or transition joint as applicable and the results shall be limited to the type of *veneer* or cladding used.
    4.4. Test assemblies shall not be less than 4 feet by 8 feet (1.2 m by 2.4 m) in size.

Reason: This proposal was disapproved at CAH#1 at the request of the proponent to allow time for additional work on the wind-drive rain map (Figure 1402.3) to be completed. This modified proposal provides flexibility to use an "approved source" in lieu of the mapped wind-driven rain wind speeds of proposed Figure 1402.3 given its limited scope of the southeastern U.S. Otherwise the proposal is unchanged. The intent remains to replace the southeastern US map in Figure 1402.3 with a full US map, but the NOAA-funded research at Cornell University was not completed in time for this comment submission. Therefore, the map replacement may occur as a modification during CAH#2. If not, it will be addressed during the public comment phase.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposed modification to FS98-24 only adds the option to use an "approved source" as an alternative to the mapped wind-driven rain wind speed data. This is editorial in nature and has no cost impact. For the overall proposal's cost impact, refer to the originally submitted proposal cost impact statement which remains applicable. The overall proposal is considered to be "cost neutral" because it is providing an option, not a new requirement that changes any existing requirements.

Comment (CAH2)# 364

FS101-24

IBC: 1402.5, 1402.5.1, 1402.5.2, 1402.5.3, 1402.5.4, 1402.5.5, 1402.5.6 (New)

Proposed Change as Submitted

Proponents: Theresa Weston, The Holt Weston Consultancy, Rainscreen Association in North America (holtweston88@gmail.com)

2024 International Building Code

Revise as follows:

1402.5 Vertical and lateral flame propagation. *Exterior walls* on *buildings* of Type I, II, III and IV construction that contain a combustible *exterior wall covering*, combustible insulation or a combustible *water-resistive barrier* shall comply with Sections 1402.5.1 through ~~1402.5.5~~ 1402.5.6, as applicable. Where compliance with NFPA 285 and associated acceptance criteria is required in Sections 1402.5.1 through ~~1402.5.5~~ 1402.5.6, the *exterior wall assembly* shall be tested in accordance with and comply with the acceptance criteria of NFPA 285.

1402.5.1 Combustible water-resistive barrier. *Exterior walls* containing a combustible *water-resistive barrier* shall comply with Section 1402.6.

1402.5.2 Metal composite material (MCM) . *Exterior walls* containing metal composite material (MCM) systems shall comply with Section 1406.

1402.5.3 Exterior insulation and finish system (EIFS) . *Exterior walls* containing an exterior insulation and finish system (EIFS) shall comply with Section 1407.

1402.5.4 High-pressure decorative exterior-grade compact laminate (HPL) system . *Exterior walls* containing a high-pressure decorative exterior-grade compact laminate (HPL) system shall comply with Section 1408.

1402.5.5 Foam plastic insulation. *Exterior walls* containing *foam plastic insulation* shall comply with Section 2603.

Add new text as follows:

1402.5.6 Fiber-Reinforced Polymer. *Exterior Walls* containing *fiber-reinforced polymer* shall comply with Section 2613.

Reason: This proposal completes the list of pointers added in the last code change cycle. Section 2613.5 contains requirements for fiber-reinforced polymer materials used in exterior walls and further links to NFPA285 testing requirements. The inclusion of pointers was accepted in the last cycle as it "assists users of the Code by providing reference to all the relevant sections of Chapter 14 and Chapter 26 containing specific requirements for exterior wall assemblies needing testing to NFPA 285" (as stated in the 2021 Report of the Committee Action Hearings on the 2021 Editions of the Group A International Codes" Item FS122-21). This proposal has the same purpose of assisting users of the Code.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal does not change requirements but only provides a pointer to existing requirements to aid the user of the code.

Public Hearing Results (CAH1)

Committee Action: **As Submitted**

Committee Reason: The committee deemed that the proposed code change is necessary to clarify the technical requirements. The committee also indicated that the proposal is a good first step (Vote: 10-2).

FS101-24

Individual Consideration Agenda

Comment 1:

IBC: 1402.5.6

Proponents: Stephen Szoke, American Concrete Institute, American Concrete Institute (steve.szoke@concrete.org); Stephen Skalko, Stephen V. Skalko, P.E. & Associates LLC, Masonry Alliance for Codes and Standards (svskalko@svskalko-pe.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

Revise as follows:

1402.5.6 Fiber-Reinforced Polymer. Exterior Walls containing fiber-reinforced polymer shall comply with Section 2613.

Exception: Exterior walls where the only FRP is fiber reinforced polymer reinforcing bars embedded in concrete in accordance with Section 1901.2.1 or masonry in accordance with Section 2101.2.

Reason: Exempts testing of concrete and masonry internally reinforced with FRP reinforcing bars. This modification clarifies the intent of the current code provisions provided for concrete or masonry cover in Section 2603.5.7 and 20% aggregate area exception in Section 2613.5. The revised language simplifies code compliance without directing the user to seek out exceptions and interpret criteria in multiple sections of Chapter 26.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Clarifies code and simplifies compliance by placing exemption in initial charging language.

Comment (CAH2)# 393

FS103-24

IBC: 1402.6

Proposed Change as Submitted

Proponents: David Bueche, Hoover Treated Wood Products (dbueche@frtw.com)

2024 International Building Code

Revise as follows:

1402.6 Water-resistive barriers. *Exterior walls* on *buildings* of Type I, II, III or IV construction that are greater than 40 feet (12 192 mm) in height above *grade plane* and contain a combustible *water-resistive barrier* shall be tested in accordance with and comply with the acceptance criteria of NFPA 285.Combustibility shall be determined in accordance with Section 703.3. For the purposes of this section, *fenestration* products, flashing of *fenestration* products and *water-resistive-barrier* flashing and accessories at other locations, including through wall flashings, shall not be considered part of the *water-resistive barrier*. **Exceptions:**

1. *Exterior walls* in which the *water-resistive barrier* is the only combustible component and the *exterior wall* has an *exterior wall* covering of brick, concrete, stone, terra cotta, stucco or steel with minimum thicknesses in accordance with Table 1404.2.
2. *Exterior walls* in which the *water-resistive barrier* is the only combustible component and the *water-resistive barrier* complies with the following:
   2.1 A peak heat release rate of less than 150 kW/m^2, a total heat release of less than 20 MJ/m^2 and an effective heat of combustion of less than 18 MJ/kg when tested on specimens at the thickness intended for use, in accordance with ASTM E1354, in the horizontal orientation and at an incident radiant heat flux of 50 kW/m^2.
   2.2 A *flame spread* index of 25 or less and a *smoke-developed index* of 450 or less as determined in accordance with ASTM E84 or UL 723, with test specimen preparation and mounting in accordance with ASTM E2404.
3. Walls constructed of *fire-retardant-treated wood* complying with Section 2303.2 and tested in accordance with and comply with the acceptance criteria of NFPA 285, and the *water-resistive barrier* complies with either Exception 1 or Exception 2.

Reason: Building cladding fires, such as the Grenfell Tower fire in London, UK, have prompted review of the application of the NFPA 285 test standard to identify potential existing conflicts and areas of needed improvement or clarification. Section 1402.5 appears to create a conflict resulting in significant industry confusion regarding the use of fire-retardant-treated wood (FRTW) in Types I, II, III, & IV construction as allowed by Section 602 and 603. This section suggests that FRTW cannot be used with a NFPA 285-compliant water-resistive barrier beyond 40 feet in height. The code currently allows FRTW used in Type III construction to extend to 85 feet in height. As FRTW does not meet the definition of “noncombustible” per Section 703.5, exceptions 1 and 2 cannot be applied. This change provides for the needed clarification to permit FRTW to be used as permitted in Section 602 and 603 in conjunction with a NFPA 285 compliant water-resistive barrier.

One of the arguments from the last code cycle was that the industry wanted this exception because they cannot pass NFPA 285. However, recent tests have resulted in a UL exterior wall system (UL-EWS0045) for an FRTW lumber and plywood assembly with two weather-resistive barrier options demonstrating compliance with NFPA 285.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

There is a potential for construction savings where FRTW use was denied due to existence of a combustible water-resistive barrier.

A cost decrease of $27.46 per square foot is possible in an R-2 Occupancy if Type IIIA Construction can be used in lieu of Type IIA Construction. See the August 2023 ICC Building Valuation Data where an R-2 Occupancy of Type IIIA Construction has a square foot construction cost $175.96 and an R-2 Occupancy of Type IIA Construction has a square foot construction cost of $203.42.

.

Estimated Immediate Cost Impact Justification (methodology and variables):

Fire-retardant-treated wood is generally less expensive than noncombustible materials. Because FRTW may be used as an alternate to these materials, the cost may be less.

FS103-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The proposal was disapproved as requested by the proponent to work on the proposal for the CAH2 (Vote: 11-0).

FS103-24

Individual Consideration Agenda

Comment 1:

IBC: 1402.6

Proponents: David Bueche, Hoover Treated Wood Products, Hoover Treated Wood Products (dbueche@frtw.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

1402.6 Water-resistive barriers. *Exterior walls* on *buildings* of Type I, II, III or IV construction that are greater than 40 feet (12 192 mm) in height above *grade plane* and contain a combustible *water-resistive barrier* shall be tested in accordance with and comply with the acceptance criteria of NFPA 285.Combustibility shall be determined in accordance with Section 703.3. For the purposes of this section, *fenestration* products, flashing of *fenestration* products and *water-resistive-barrier* flashing and accessories at other locations, including through wall flashings, shall not be considered part of the *water-resistive barrier*. **Exceptions:**

1. *Exterior walls* in which the *water-resistive barrier* is the only combustible component and the *exterior wall* has an *exterior wall* covering of brick, concrete, stone, terra cotta, stucco or steel with minimum thicknesses in accordance with Table 1404.2.
2. *Exterior walls* in which the *water-resistive barrier* is the only combustible component and the *water-resistive barrier* complies with the following:
   2.1 A peak heat release rate of less than 150 kW/m^2, a total heat release of less than 20 MJ/m^2 and an effective heat of combustion of less than 18 MJ/kg when tested on specimens at the thickness intended for use, in accordance with ASTM E1354, in the horizontal orientation and at an incident radiant heat flux of 50 kW/m^2.
   2.2 A *flame spread* index of 25 or less and a *smoke-developed index* of 450 or less as determined in accordance with ASTM E84 or UL 723, with test specimen preparation and mounting in accordance with ASTM E2404.
3. Exterior ~~Walls~~ walls constructed of *fire-retardant-treated wood* complying with Section 2303.2 and which have been tested ~~in accordance~~ with and comply with the acceptance criteria of NFPA 285~~,~~ and the *water-resistive barrier* complies with ~~either~~ the ~~Exception 1 or~~ Exception 2 criteria.

Reason: This comment addresses concerns the water-resistive barrier industry had with the original proposal.

Building cladding fires, such as the Grenfell Tower fire in London, UK, have prompted review of the application of the NFPA 285 test standard to identify potential existing conflicts and areas of needed improvement or clarification. Section 1402.5 appears to create a conflict resulting in significant industry confusion regarding the use of fire-retardant-treated wood (FRTW) in Types I, II, III, & IV construction as allowed by Section 602 and 603. This section suggests that FRTW cannot be used with a NFPA 285-compliant water-resistive barrier beyond 40 feet in height. The code currently allows FRTW used in Type III construction to extend to 85 feet in height. As FRTW does not meet the definition of “noncombustible” per Section 703.5, exceptions 1 and 2 cannot be applied. This change provides for the needed clarification to permit FRTW to be used as permitted in Section 602 and 603 in conjunction with a NFPA 285 compliant water-resistive barrier.

One of the arguments from the last code cycle was that the industry wanted this exception because they cannot pass NFPA 285. However, recent tests have resulted in a UL exterior wall system (UL-EWS0045) for an FRTW lumber and plywood assembly with two water-resistive barrier options demonstrating compliance with NFPA 285.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

There is a potential for construction savings where FRTW use was denied due to existence of a combustible water-resistive barrier. A cost decrease of $27.46 per square foot is possible in an R-2 Occupancy if Type IIIA Construction can be used in lieu of Type IIA Construction. See the August 2023 ICC Building Valuation Data where an R-2 Occupancy of Type IIIA Construction has a square foot construction cost $175.96 and an R-2 Occupancy of Type IIA Construction has a square foot construction cost of $203.42.

Estimated Immediate Cost Impact Justification (methodology and variables):

Fire-retardant-treated wood is generally less expensive than noncombustible materials. Because FRTW may be used as an alternate to these materials, the cost may be less.

Comment (CAH2)# 621

FS104-24

IBC: 1402.6, 2603.5.7

Proposed Change as Submitted

Proponents: Alexander Haldeman, James Hardie Building Products, James Hardie Building Products (alex.haldeman@jameshardie.com)

2024 International Building Code

Revise as follows:

1402.6 Water-resistive barriers. *Exterior walls* on *buildings* of Type I, II, III or IV construction that are greater than 40 feet (12 192 mm) in height above *grade plane* and contain a combustible *water-resistive barrier* shall be tested in accordance with and comply with the acceptance criteria of NFPA 285.Combustibility shall be determined in accordance with Section 703.3. For the purposes of this section, *fenestration* products, flashing of *fenestration* products and *water-resistive-barrier* flashing and accessories at other locations, including through wall flashings, shall not be considered part of the *water-resistive barrier*. **Exceptions:**

1. *Exterior walls* in which the *water-resistive barrier* is the only combustible component and the *exterior wall* has an *exterior wall* covering of brick, concrete, stone, terra cotta, stucco, ~~or~~ steel or fiber-cement with minimum thicknesses in accordance with Table 1404.2.
2. *Exterior walls* in which the *water-resistive barrier* is the only combustible component and the *water-resistive barrier* complies with the following:
   2.1 A peak heat release rate of less than 150 kW/m^2, a total heat release of less than 20 MJ/m^2 and an effective heat of combustion of less than 18 MJ/kg when tested on specimens at the thickness intended for use, in accordance with ASTM E1354, in the horizontal orientation and at an incident radiant heat flux of 50 kW/m^2.
   2.2 A *flame spread* index of 25 or less and a *smoke-developed index* of 450 or less as determined in accordance with ASTM E84 or UL 723, with test specimen preparation and mounting in accordance with ASTM E2404.

2603.5.7 Ignition. *Exterior walls* shall not exhibit sustained flaming where tested in accordance with NFPA 268. Where a material is intended to be installed in more than one thickness, tests of the minimum and maximum thickness intended for use shall be performed.

Exception: Assemblies protected on the outside with one of the following:

1. A thermal barrier complying with Section 2603.4.
2. A minimum 1-inch (25 mm) thickness of concrete or *masonry*.
3. Glass-fiber-reinforced concrete panels of a minimum thickness of $^3/_8$ inch (9.5 mm).
4. Metal-faced panels having minimum 0.019-inch-thick (0.48 mm) aluminum or 0.016-inch-thick (0.41 mm) corrosion-resistant steel outer facings.
5. A minimum $^7/_8$-inch (22.2 mm) thickness of stucco complying with Section 2510.
6. A minimum $^1/_4$-inch (6.4 mm) thickness of *fiber-cement* lap, panel or shingle siding complying with Section 1404.17 and Section 1404.17.1 or 1404.17.2.

Reason: This change proposal is editorial in nature, and harmonizes materials listed in section 1402.6 with those listed in 2603.5.7

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal provides harmonization of materials listed as exceptions. No additional requirements are being added.

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The proposal was disapproved as requested by the proponent to work on the proposal for the CAH2 (Vote: 12-0).

FS104-24

Individual Consideration Agenda

Comment 1:

IBC: 1402.6

Proponents: Alexander Haldeman, James Hardie Building Products, James Hardie Building Products (alex.haldeman@jameshardie.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

Revise as follows:

1402.6 Water-resistive barriers. *Exterior walls* on *buildings* of Type I, II, III or IV construction that are greater than 40 feet (12 192 mm) in height above *grade plane* and contain a combustible *water-resistive barrier* shall be tested in accordance with and comply with the acceptance criteria of NFPA 285.Combustibility shall be determined in accordance with Section 703.3. For the purposes of this section, *fenestration* products, flashing of *fenestration* products and *water-resistive-barrier* flashing and accessories at other locations, including through wall flashings, shall not be considered part of the *water-resistive barrier*. **Exceptions:**

1. *Exterior walls* in which the *water-resistive barrier* is the only combustible component and the *exterior wall* has ~~a~~n noncombustible *exterior wall* covering of brick, concrete, stone, terra cotta, stucco, steel or fiber-cement with minimum thicknesses in accordance with Table 1404.2.
2. *Exterior walls* in which the *water-resistive barrier* is the only combustible component and the *water-resistive barrier* complies with the following:
   2.1 A peak heat release rate of less than 150 kW/m^2, a total heat release of less than 20 MJ/m^2 and an effective heat of combustion of less than 18 MJ/kg when tested on specimens at the thickness intended for use, in accordance with ASTM E1354, in the horizontal orientation and at an incident radiant heat flux of 50 kW/m^2.
   2.2 A *flame spread* index of 25 or less and a *smoke-developed index* of 450 or less as determined in accordance with ASTM E84 or UL 723, with test specimen preparation and mounting in accordance with ASTM E2404.

Reason: During CAH1, this proposal was requested to be disapproved due to concerns from stakeholders prior to the hearing regarding the noncombustibility of materials listed within.

This clarification to the original proposal is the result of working with with various stakeholders, and clarifies that all materials listed must be noncombustible; addressing concerns that not all materials listed in all forms necessarily passes ASTM E136 criteria using methods E136 or E2652 due to potential addition of organic / combustible ingredients such as foaming agents or fibers which would result in a

failed test.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal is clarifying in nature and will not result in cost impacts.

Comment (CAH2)# 357

FS108-24

IBC: 1403.2, 1403.2.1 (New), 1705.21 (New)

Proposed Change as Submitted

Proponents: Theresa Weston, The Holt Weston Consultancy, Air Barrier Association of America (ABAA) (holtweston88@gmail.com)

2024 International Building Code

1403.2 Water-resistive barrier. Not fewer than one layer of *water-resistive barrier* material shall be attached to the studs or sheathing, with flashing as described in Section 1404.4, in such a manner as to provide a continuous *water-resistive barrier* behind the exterior wall *veneer*. The intersection between the *water-resistive barrier* material and fenestration openings shall be flashed and assembled in accordance with the fenestration manufacturer's installation instructions, or other *approved* methods for applications not addressed by the fenestration manufacturer's instructions. The water-resistive barrier material shall be continuous to the top of walls and terminated at penetrations and *building* appendages in a manner to meet the requirements of the exterior wall envelope as described in Section 1402.2.
Water-resistive barriers shall comply with one of the following:

1. No. 15 felt complying with ASTM D226, Type 1.
2. ASTM E2556, Type I or II.
3. Foam plastic insulating sheathing *water-resistive barrier* systems complying with Section 1402.2 and installed in accordance with manufacturer's installation instructions.
4. ASTM E331 in accordance with Section 1402.2.
5. Other *approved* materials installed in accordance with the manufacturer's installation instructions.

No. 15 asphalt felt and water-resistive barriers complying with ASTM E2556 shall be applied horizontally with the upper layer lapped over the lower layer not less than 2 inches (51 mm). Where joints occur, the upper and lower layer shall be lapped not less than 6 inches (152 mm).

Add new text as follows:

1403.2.1 Special inspections. The installation of the *water-resistive barrier* shall comply with the provisions of Sections 1704.2 and 1705.21.

1705.21 Water-resistive barrier Installation. *Special inspections* shall be required for the installation of the *water-resistive barrier* and the intersection of the *water-resistive barrier* with flashing in accordance with Sections 1403.2.

Reason: It is estimated that 70% of construction claims are due to water and moisture issues in the enclosure. [2,5] According to a recent report on building enclosure damage, "Water intrusion... .dreaded by homeowners, contractors, and insurance adjusters alike. It is evident why, as it ranks as the second most common cause for property insurance claims and first for the most expensive type of claim. In addition, water intrusion accounts for 70% of construction litigation. On average, each incident costs $11,098; collectively, water intrusion costs over $20 billion annually throughout the United States.[6] Furthermore, data suggests these water intrusion issues are a result of incorrect installation:

- A survey of "top 100" general contracting firms found the "53% of all defects of defects originate from poor workmanship, supervision and inspection of trade contractors during construction." [2]
- A third party quality assurance inspection firm lists several defects in water-resistive barrier and flashing integration among the "top 10 construction defects observed across the U.S. in 2018." [3]

This proposal seeks to reduce water intrusion issues resulting from incorrect installation of the water-resistive barrier and/or integration of flashings with the water-resistive barrier through requiring a special inspection of water-resistive barrier installation.

It should be noted that EIFS and EIFS water-resistive barriers already are subject to special inspections.

6. Swart, Amelia, "Damage Report: Water Intrusion", Forum Forensics, September 20, 2022, https://www.forumforensics.com/blog/damage-report-water-intrusion

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

$.20 to .40 per square foot of opaque wall area.

Estimated Immediate Cost Impact Justification (methodology and variables):

This estimate was based on the cost of quality audits reported by the Air Barrier Association of America [1] and is likely a high estimate as an air barrier quality audit would cover more items than a special inspection of the water-resistive barrier and flashing alone. The increased immediate cost needs to be weighed against the liability for potential water intrusion damage if the water-resistive barrier and flashing are not installed correctly. Experience has shown that because of the relative inaccessibility of the water management components in the building enclosures, rebuilding a wall system can cost twice as much as the original wall cost per sq. ft. [4]

FS108-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee deemed that the proposed code change is needed but the language needs to be developed. The committee indicated that inspection and installation need to be addressed in detail (Vote: 9-3).

FS108-24

Individual Consideration Agenda

Comment 1:

IBC: 1403.2.1, TABLE 1403.2 (New), 1705.21

Proponents: Theresa Weston, The Holt Weston Consultancy, Air Barrier Association of America (ABAA) (holtweston88@gmail.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

1403.2.1 Special inspections. Not less than one *special inspection* shall be required for the installation of the water-resistive barrier and the intersection of the water-resistive barrier with flashing in accordance with Table 1403.2.The *special inspection* of the installation of the *water-resistive barrier* shall comply with the provisions of Sections 1704.2 and 1705.21. A statement of special inspections shall be included in the construction documents in accordance with Section 107.1 and shall include the proposed inspection schedule, the list of inspection items, and inspection documentation to provided.The periodic inspection shall be conducted during construction while the water-resistive barrier is still accessible for inspection and repair.

Add new text as follows:

TABLE 1403.2 REQUIRED SPECIAL INSPECTIONS FOR *WATER-RESISTIVE BARRIER* INSTALLATION

***WATER-RESISTIVE BARRIER* TYPE**		**INSPECTION ITEM**
All *water-resistive barriers*		Verify the *water-resistive barrier* is continuous to the top of walls.
		Verify the *water-resistive barrier* is integrated with flashing installed at wall and roof intersections as described in section 1503.2
		Verify the *water-resistive barrier* is terminated at penetrations and building appendages in a manner to meet the requirements of the exterior wall envelope as described in Section 1402.2 and is integrated with flashings in accordance with Section 1404.4
Applicable to specific types of *water-resistive barriers.*	No 15 felt, and *water-resistive barriers* complying with ASTM E2556	Verify the *water-resistive barrier* is applied shingle fashion with the upper layer lapped over the lower layer not less than 2 inches (51 mm).
		Verify vertical joints in the *water-resistive barrier* sheets are lapped not less than 6 inches (152 mm)
	Foam plastic insulating sheathing *water-resistive barriers* systems	Verify installation in accordance with manufacturer's installation instructions.
	Water-resistive barrier approved through ASTM E331 testing in accordance with Section 1402.2	Verify installation is in accordance with the installation specified in the testing report.
	Water-resistive barriers approved as alternative materials	Verify the *water-resistive barrier* is installed in accordance with the manufacturer's installation instructions.

1705.21 Water-resistive barrier Installation. *Special inspections* shall be required for the installation of the *water-resistive barrier* and the intersection of the *water-resistive barrier* with flashing in accordance with Section~~s 1403.2~~ 1403.2.1.

Reason: In the reason statement of disapproval of this proposal at the 1st Committee Hearing "the committee deemed code change is needed but the language needs to be developed". This comment provides modifications which develop the language relating to the inspection and installation needs. This comment also addresses questions which were raised during the testimony at the committee hearings.

To address **who** will perform the special inspections. Section 1704.2, referenced in both the original and modified proposals, contains the qualifications for the special inspector. It states "the *approved agencies* shall provide written documentation to the *building official* demonstrating competence and relevant experience or training of the *special inspectors* who will perform the *special inspections* and tests during constructions." It also states "The *registered design professional in responsible charge* and engineers of record involved in the design of the project are permitted to act as an *approved agency* and their personnel are permitted to act as *special inspectors* for the work designed by them, provided they qualify as *special inspectors*." In many cases, staff already engaged in oversight of the construction project will be eligible to conduct the *special inspection*. Another option would be to engage the services of a third party to conduct the special inspection. If the third party route was chosen there are several talent pools from which to draw, including:

- IIBEC: Which has 2200 + credentialed members, including a specific credential for Registered Exterior Wall Observer (https://iibec.org/credentials/)
- ABAA QAP Certified Auditors: Available across the US with providers located in 2/3 of the states (https://www.airbarrier.org/qap/)
- RESNET HERS Raters: There are 6203 active HERS raters active across America (https://www.resnet.us/raters/) and HERS raters are eligible for a joint IECC/HERS Compliance Specialist Designation (https://www.iccsafe.org/content/ecs-designation/)
- Finally there are over 10,579 Home Inspectors in US (https://www.zippia.com/home-inspector-jobs/demographics/), many of whom would have the ability to conduct *water-resistive barrier* installation inspection.

There are sufficient trained professionals available to conduct the proposed special inspections.

To address **how** the *special inspections* would be conducted. Modifications to the proposal in this comment provide more detail on the *special inspection* process. This process is based on existing code requirements and is consistent with other required *special inspections*. The process involves:

- The inclusion of the *water-resistive barrier* installation in the statement of *special inspection* in the construction documents as required in Section 107.1.The statement will include the proposed inspection schedule, the list of inspection items and inspection documentation.
- At least one periodic special inspection of the *water-resistive barrier* installation is required. The number of inspections would be dependent on the size and complexity of the building.
- The periodic inspection is conducted while the *water-resistive barrier* is accessible.

To address **what** characteristics of installation will be inspected. The modified proposal contains a table of inspection items which are based on the requirements in Sections 1403.2 and a survey of common errors in *water-resistive barrier* installation based on industry audit information, interviews with industry professionals, and internet searches.[2, 5, 7] The table aligns with requirements based on requirements for specific types of *water-resistive barriers* 1403.2.

The reason **why** this proposal, now modified, is needed was provided in the original proposal, but is repeated here for the reader's convenience:

It is estimated that 70% of construction claims are due to water and moisture issues in the enclosure. [3,8] According to a recent report on building enclosure damage, "Water intrusion... .dreaded by homeowners, contractors, and insurance adjusters alike. It is evident why, as it ranks as the second most common cause for property insurance claims and first for the most expensive type of claim. In addition, water intrusion accounts for 70% of construction litigation. On average, each incident costs $11,098; collectively, water intrusion costs over $20 billion annually throughout the United States.[9] Furthermore, data suggests these water intrusion issues are a result of incorrect installation:

- A survey of "top 100" general contracting firms found the "53% of all defects of defects originate from poor workmanship, supervision and inspection of trade contractors during construction." [3]
- A third party quality assurance inspection firm lists several defects in water-resistive barrier and flashing integration among the "top 10 construction defects observed across the U.S. in 2018." [4]

This proposal seeks to reduce water intrusion issues resulting from incorrect installation of the water-resistive barrier and/or integration of flashings with the water-resistive barrier through requiring a special inspection of water-resistive barrier installation.
It should be noted that EIFS and EIFS water-resistive barriers already are subject to special inspections.

9. Swart, Amelia, “Damage Report: Water Intrusion”, Forum Forensics, September 20, 2022,

https://www.forumforensics.com/blog/damage-report-water-intrusion

Cost Impact: Increase

Estimated Immediate Cost Impact:

As stated in the original proposal, $.20 to .40 per square foot of opaque wall area is likely a high estimate.

Estimated Immediate Cost Impact Justification (methodology and variables):

The above estimate was based on the cost of quality audits reported by the Air Barrier Association of America [1] and is likely a high estimate as
an air barrier quality audit would cover more items than a special inspection of the water-resistive barrier and flashing alone. The increased immediate cost needs to be weighed against the liability for potential water intrusion damage if the water-resistive barrier and flashing are not installed correctly. Experience has shown that because of the relative inaccessibility of the water management components in the building enclosures, rebuilding a wall system can cost twice as much as the original wall cost per sq. ft. Proposed Change as Submitted

Proponents: Robert Marshall, FCAC, FCAC (fcac@iccsafe.org)

2024 International Building Code

Add new text as follows:

1403.15 Plastic lumber or wood-plastic composite exterior wall covering materials. Where plastic lumber materials and wood-plastic composite materials are used as exterior wall coverings, such materials shall be *listed* and labeled in accordance with ASTM D8484 and shall be installed in accordance with the requirements of Section 1404.19 and the manufacturer's instructions. The materials shall be secured to the building so as to provide weather protection for the exterior walls of the building.

1404.19 Plastic lumber or wood-plastic composite exterior wall covering materials. Plastic lumber materials and wood-plastic composite materials used as exterior wall coverings shall comply with this section and Section 1403.15.

1404.19.1 Design wind pressure 30 pounds per square foot or less. Plastic lumber and wood-plastic composite exterior wall coverings materials shall be limited to exterior walls located in areas where the design wind pressure determined in Section 1609 speed does not exceed 30 pounds per square foot (1.44 kN/m^2) except as provided for in 1404.19.2.

1404.19.2 Design wind pressure greater than 30 pounds per square foot. Where the design wind pressured determined in Section 1609 exceeds 30 pounds per square foot (1.44 kN/m^2), tests or calculations indicating compliance with Chapter 16 shall be submitted.

2605.4 Plastic lumber or wood-plastic composite exterior wall covering materials. Plastic lumber materials or wood-plastic composite materials used as exterior wall covering shall comply with Sections 1403 and 1404.

Add new standard(s) as follows:

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box C700
West Conshohocken, PA 19428

D8484-23	Standard Specification for Plastic Lumber Materials and Wood-Plastic Composite Materials Used as Exterior Wall Coverings

Reason: The IBC code includes requirements for a variety of materials that are used as exterior wall coverings, meaning as components of exterior wall assemblies. They include some plastic siding materials, such as vinyl siding and polypropylene siding. The code also includes requirements for the use of plastic composite materials (which are defined in the IBC as "A generic designation that refers to wood/plastic composites, plastic lumber and similar materials.") in "exterior deck boards, stair treads, handrails and guards" (section 1409), with the requirements shown in section 2612.

In recent years some plastic lumber materials and/or wood-plastic composite materials have been used as components of exterior wall assemblies. However, neither section 1403 (Materials) nor section 1404 (Installation of wall coverings) nor section 1405 (Combustible materials on the exterior side of exterior walls) discuss the requirements for plastic lumber materials or wood-plastic composite materials when used as exterior wall coverings, and clearly there needs to be a difference between the use of materials as deck boards (horizontally) and as exterior wall coverings (vertically).

ASTM has recently developed a specification (ASTM D8484, Standard Specification for Plastic Lumber Materials and Wood-Plastic Composite Materials Used as Exterior Wall Coverings) that contains all the appropriate requirements. The properties contained in ASTM D8484 include the following: conditioning, wind load resistance, linear thermal expansion, resistance to moisture and temperature effects, weatherability (resistance to UV0, freeze-thaw resistance, biodeterioration, flame spread index (testing to ASTM E84), ignitability (testing to NFPA 268), exterior to wall assembly fire performance (testing to NFPA 285, when required), and effect on fire resistance

rating (when required).

The requirements contained in ICC-ES AC524 (Wood-plastic Composite Products Used as Exterior Siding) formed the basis of the requirements contained in ASTM D8484.

This proposal recommends incorporating these materials specifically into the code, with reference to them meeting the requirements from ASTM D8484.

Some relevant existing code sections are shown below, for comparison.

1403.9 Vinyl siding. Vinyl siding shall be certified and labeled as conforming to the requirements of ASTM D3679 by an *approved* quality control agency.

1404.14 Vinyl siding. Vinyl siding conforming to the requirements of this section and complying with ASTM D3679 shall be permitted on exterior walls where the design wind pressure determined in accordance with Section 1609 does not exceed 30 pounds per square foot (1.44 kN/m2). Where the design wind pressure exceeds 30 pounds per square foot (1.44 kN/m2), tests or calculations indicating compliance with Chapter 16 shall be submitted. Vinyl siding shall be secured to the building so as to provide weather protection for the exterior walls of the building.

1404.14.1 Application. The siding shall be applied over sheathing or materials listed in Section 2304.6. Siding shall be applied to conform to the water-resistive barrier requirements in Section 1402. Siding and accessories shall be installed in accordance with the approved manufacturer's instructions.

1403.12 Polypropylene siding. Polypropylene siding shall be certified and labeled as conforming to the requirements of ASTM D7254 and those of Section 1403.12.1 or 1403.12.2 by an approved quality control agency. Polypropylene siding shall be installed in accordance with the requirements of Section 1404.18 and in accordance with the manufacturer's instructions. Polypropylene siding shall be secured to the building so as to provide weather protection for the exterior walls of the building.

1403.12.1 Flame spread index. The certification of the flame spread index shall be accompanied by a test report stating that all portions of the test specimen ahead of the flame front remained in position during the test in accordance with ASTM E84 or UL 723.

1403.12.2 Fire separation distance. The fire separation distance between a building with polypropylene siding and the adjacent building shall be not less than 10 feet (3048 mm).

1404.18 Polypropylene siding. Polypropylene siding conforming to the requirements of this section and complying with Section 1403.12 shall be limited to exterior walls located in areas where the wind speed specified in Chapter 16 does not exceed 100 miles per hour (45 m/s) and the

building height is less than or equal to 40 feet (12 192 mm) in Exposure C. Where construction is located in areas where the basic wind speed exceeds 100 miles per hour (45 m/s), or building heights are in excess of 40 feet (12 192 mm), tests or calculations indicating compliance with Chapter 16 shall be submitted. Polypropylene siding shall be installed in accordance with the manufacturer's instructions. Polypropylene siding shall be secured to the building so as to provide

weather protection for the exterior walls of the building.

2605.3 Plastic siding. Plastic siding shall comply with the requirements of Sections 1403 and 1404.

FCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and early 2024 the FCAC has held several virtual meetings and one in-person meeting open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the **FCAC Website**

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposed code change ensures that existing requirements for exterior wall assemblies and exterior wall coverings are applied to the use of plastic lumber and wood-plastic composite materials in those applications.

FS112-24

Public Hearing Results (CAH1)

Committee Action: **As Submitted**

Committee Reason: The committee concluded that the proposal adds good clarification to the code text and addresses an issue that the code is silent on(Vote: 12-0).

FS112-24

Individual Consideration Agenda

Comment 1:

IBC: 1404.19, 1404.19.1, 1404.19.2

Proponents: Theresa Weston, The Holt Weston Consultancy, Rainscreen Association in North America (holtweston88@gmail.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

1404.19 Plastic lumber or wood-plastic composite exterior wall covering materials. Plastic lumber materials and wood-plastic composite materials used as exterior wall coverings shall comply with this section and Section 1403.15.

Delete without substitution:

~~**1404.19.1 Design wind pressure 30 pounds per square foot or less.** Plastic lumber and wood-plastic composite exterior wall coverings materials shall be limited to exterior walls located in areas where the design wind pressure determined in Section 1609 speed does not exceed 30 pounds per square foot (1.44 kN/m^2) except as provided for in 1404.19.2.~~

Revise as follows:

~~**1404.19.2**~~ **1404.19.1 Design wind pressure** ~~**greater than 30 pounds per square foot.** Where the design wind pressured determined in Section 1609 exceeds 30 pounds per square foot (1.44 kN/m^2), tests~~ Tests or calculations indicating compliance with Chapter 16 shall be submitted.

Reason: While we do not dispute the inclusion of plastic lumber products in the code, we believe that the current proposal does not adequately address the structural performance and that "tests or calculations indicating compliance with Chapter 16 shall be submitted" at all wind pressures and not just those over 30 pounds per square foot. The proposal reason statement invokes ASTM D8484 as providing requirements for wind-load resistance. However, ASTM D8484 contains only circuitous and vague requirements for wind

design. Specifically, Table 1 "Requirements for Plastic Lumber Materials and Wood-Plastic Composite Materials: in ASTM D8484, states the criterion for "Wind Load Resistance" as "IBC or IRC". This criterion would presumably point the user back to IBC Chapter 16, but if the code in Chapter 14 excludes wind-pressures of 30 pounds per square foot or less, products would not need to comply for these lower pressures. Currently, these products are allowed as alternate materials evaluated to ICC-ES AC524. A review of published evaluation reports(1-3) shows that wind load design includes specific products, cladding orientation, and attachment spacing.

Bibliography:

1. ICC-ES Evaluation Report ESR-3923 https://icc-es.org/report-listing/esr-3923/
2. ICC-ES Evaluation Report ESR-4441 https://icc-es.org/report-listing/esr-4441/
3. ICC-ES Evaluation Report ESR-4944 https://icc-es.org/report-listing/esr-4944/

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposal clarifies that the structural requirements of the siding are those in the IBC Chapter 16, rather than following a circuitous route through the ASTM standards and either the IBC or the IRC.

Comment (CAH2)# 248

FS113-24

IBC: SECTION 202 (New), 1403.15 (New), 1403.15.1 (New), 1403.15.1.1 (New), ICC Chapter 35 (New)

Proposed Change as Submitted

Proponents: Keith P Nelson, DuPont, DuPont (keith.nelson@dupont.com)

2024 International Building Code

Add new definition as follows:

MAGNESIUM-OXIDE-CEMENT PANEL PRODUCT. The general name for a family of panel, board, and sheet products having a core consisting essentially of magnesium-oxide-cement and reinforced with organic or inorganic fibers.

Add new text as follows:

1403.15 Magnesium-oxide-cement panel product. *Magnesium-oxide-cement panel product* shall conform tothe requirements of ICC 1125. Installation shall be in accordance with the manufacturer's installation instructions or an *approved* design.

1403.15.1 Surface burning characteristics. *Magnesium-oxide-cement panel product* shall have, when tested in accordance with ASTM E84 or UL 723, a *listed flame spread index* of 25 or less. The ASTM E84 or UL 723 test shall be continued for an additional 20-minute period and the flame front shall not progress more than 10.5 feet (3200 mm) beyond the centerline of the burners at any time during the test.

1403.15.1.1 Alternate fire testing. *Magnesium-oxide-cement panel product* shall have,when tested in accordance with ASTM E2768, a *listed flame spread index* of 25 or less and where the flame front does not progress more than 10.5 feet (3200 mm) beyond the centerline of the burners at any time during the test.

Add new standard(s) as follows:

ICC

International Code Council, Inc.
200 Massachusetts Avenue, NW, Suite 250
Washington, DC 20001

1125 Standard for Classification of Magnesium Oxide Boards in Building and Construction (IS-MGOB)

Reason: The code change is introducing a new, North American construction material as defined by the ICC-1125 performance standard under development. The MgO industry desires to add these requirements to the IBC given the import of offshore materials, the scaling of North American production capacity, and the use of all these materials in commercial construction.

The surface burning characteristics limitation is similar to an existing exterior sheathing material in Section 2303.2. Applicable code requirements such as assembly fire performance tests still apply. Installation is to be in accordance with the manufacturer's instructions or an approved structural design for sheathing. The product is currently evaluated under ICC-ES Acceptance Criteria AC-386 for Fiber-Reinforced Magnesium-Oxide-Based Sheets and AC-530 for Fiber-Reinforced Magnesium-Oxide-Based Sheets with a Factory-Bonded Water-Resistive Overlay Membrane.

A Group B code proposal will be submitted for IBC Chapter 6 to address use of MgO in Type I, II and III construction:

602.3 Type III. Type III construction is that type of construction in which the exterior walls are of noncombustible materials and the interior building elements are of any material permitted by this code. Fire-retardant-treated wood framing and sheathing complying with Section 2303.2 and magnesium-oxide-cement panel product conforming with Section 1403.15 shall be permitted within exterior wall assemblies of a 2-hour rating or less.

603.1 Allowable materials. Combustible materials shall be permitted in buildings of Type I or II construction in the following applications and in accordance with Sections 603.1.1 through 603.1.3:
[...]

29. Magnesium-oxide-cement panel product conforming with Section 1403.15.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposal provides another sheathing product alternative and as such does not raise or decrease the cost of construction. The designer is free to choose which sheathing product is most effective for the application. The cost to the manufacturer is neutral as the testing requirements are similar for ICC-1125 and the ICC-ES Acceptance Criteria.

FS113-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee determined that the reason for the disapproval is due to the fact that the proposed language is based on a standard that has not been approved yet (Vote: 12-0).

FS113-24

Individual Consideration Agenda

Comment 1:

IBC: SECTION 202, 1403.15, 1403.15.1, 1403.15.1.1, ICC Chapter 35

Proponents: Keith P Nelson, DuPont, DuPont (keith.nelson@dupont.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

MAGNESIUM-OXIDE-CEMENT PANEL PRODUCT. The general name for a family of panel, board, and sheet products having a core consisting essentially of magnesium-oxide-cement and reinforced with organic or inorganic fibers.

Revise as follows:

1403.15 Magnesium-oxide-cement panel product. *Magnesium-oxide-cement panel product* shall conform to the requirements of ICC 1125 or as *approved* by the *building official. Magnesium-oxide-cement panel products* conforming to ICC 1125 shall be identified by the manufacturer's designation to indicate compliance with this standard. Where used structurally, the products shall be identified by the *label* of an *approved agency.* Installation shall be in accordance with the manufacturer's installation instructions or an *approved* design.

1403.15.1 Surface burning characteristics. *Magnesium-oxide-cement panel product* shall have, when tested in accordance with ASTM E84 or UL 723, a *listed flame spread index* of 25 or less. The ASTM E84 or UL 723 test shall be continued for an additional 20-minute period and the flame front shall not progress more than 10.5 feet (3200 mm) beyond the centerline of the burners at any time during the test.

1403.15.1.1 Alternate fire testing. *Magnesium-oxide-cement panel product* shall have,when tested in accordance with ASTM E2768, a *listed flame spread index* of 25 or less and where the flame front does not progress more than 10.5 feet (3200 mm) beyond the

centerline of the burners at any time during the test.

ICC

International Code Council, Inc.
200 Massachusetts Avenue, NW, Suite 250
Washington, DC 20001

1125 Standard for Classification of Magnesium Oxide Boards in Building and Construction (IS-MGOB)

Reason: In the last hearing we asked for disapproval because ICC 1125 committee had not been formed. We also received comments from interested stakeholders at the hearing and in the public comment period.

In discussion with interested parties, there was a request to identify the product and its conformance with the standard. We are proposing to mark the product to identify conformance with the standard following the language of 2024 IBC 2507.1 for Gypsum Panel Products. When used structurally, the revised proposal labeling requirement follows the language of 2303.1.7 for Hardboard.

ICC 1125 is in development and is projected to be complete and published prior to the April 2026 deadline; the content is largely based on ICC-ES AC386. The main committee has been formed and as of this writing has met twice with multiple meetings with the four work groups including: WG1 Administration and Definitions, WG2 Wall Sheathing and Floor Underlayment, WG3 Roof and Floor Sheathing, and WG4 Tile Substrate.

This proposal is to address the increased use of magnesium-oxide-cement panel product in buildings utilizing alternative means and methods provisions. Acceptance of this proposal will establish minimum performance requirements, quality, and consistency with the intent of the original code proposal.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The modification to the original proposal presented in this comment provides additional clarification to the original proposal with regard to compliance of magnesium-oxide-cement panel products. The proposal remains one that regards another sheathing product alternative that, as such, does not increase or decrease the cost of construction.

Comment (CAH2)# 309

FS117-24

IBC: 2603.1.1, IAPMO/ANSI (New)

Proposed Change as Submitted

Proponents: Justin Davis, Self

2024 International Building Code

Revise as follows:

2603.1.1 Spray-applied foam plastic. Single- and multiple-component *spray-applied foam plastic* insulation shall comply with the provisions of Section 2603 and either ICC 1100 or IAPMO/ANSI ES1000.

Add new text as follows:

IAPMO/ANSI ES. 1000-2020- Building Code Compliance Spray-Applied Polyurethane Foam

Reason: To allow the use of an additional active consensus standard for use showing compliance with the International Building Code. Historically, the codes have included multiple standards that have been used to show compliance. IAPMO/ANSI ES1000 is in the process of being updated at this time.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The new standard is an option to what is already in place in the code.

FS117-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee disapproved the proposal due to the fact that there are many questions regarding the standard. The committee indicated that the reason statement does not include details on the necessity of the proposal (Vote: 12-0).

FS117-24

Individual Consideration Agenda

Comment 1:

Proponents: Justin Davis, Self, Self requests As Submitted

Reason: Approving the IAPMO/ANSI ES1000 standard provides many advantages to both the building industry and to the general public. The spray foam industry is very innovative and constantly developing methods to use spray foam products. As of Summer 2024, the existing standard in the 2021 International Codes is 5 years old. One update in the past five years does not capture the progress the

spray foam industry has made. Multiple standards will offer more opportunities to reflect the progress.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Comment (CAH2)# 557

FS121-24

IBC: 2603.9

Proposed Change as Submitted

Proponents: Eric Banks, e.w.banks consulting llc, North American Modern Building Alliance (NAMBA) (eric.banks@ewbanksconsulting.com)

2024 International Building Code

Revise as follows:

2603.9 Special approval. Foam plastic and assemblies containing foam plastic shall not be required to comply with the requirements of Section 2603.4 or those of Section 2603.6 where specifically *approved* based on one of the following large-scale tests:

1. NFPA 286 using the acceptance criteria of Section 803.1.1.1.
2. Room Test of FM 4880.
3. ~~UL 1040.~~
4. ~~4~~ 3. UL 1715.

Such testing shall be performed on the finished manufactured foam plastic assembly in the maximum thickness intended for use. Foam plastics that are used as *interior finish* on the basis of these tests shall also conform to the *flame spread* and smoke-developed requirements of Chapter 8. Assemblies tested shall include seams, joints and other typical details used in the installation of the assembly and shall be tested in the manner intended for use.

Reason: The proposed change brings the approved test methods of 2603.9 Special Approval in-line with the Integrity Fire Tests (Part II) of NFPA 275 *Standard Method of Fire Tests for the Evaluation of Thermal Barriers*. NFPA 275 is a performance testing option referenced in the requirements of Section 2603.4 Thermal barrier. Section 2603.9 Special approval provides another performance test option to permit the use of foam plastic insulation without the thermal barrier required in Section 2603.4 by demonstrating equivalent performance – i.e., no flashover for a period of at least 15-minutes.

The FM 4880 approval standard contains four (4) different large-scale fire tests (Room Test, 16-ft High Parallel Panel Test, 25-ft High Corner Test, and 50-ft High Corner Test) and a series of performance ratings defined by insulation type, facer type, and a prescribed series of tests. It is understood that the 25-ft and 50-ft High Corner Tests have not been performed on foam plastic panels / assemblies for many years, in part due to the availability of the Room Test option provided in FM 4880.

The NFPA 275 Standard Method of Fire Tests for the Evaluation of Thermal Barriers, referenced in Section 2603.4, also generically referenced FM 4880 among the approved test methods for the Integrity Fire Tests (Part II) of the evaluation. The 2022 Edition of NFPA 275, however, was revised to was more clearly and specifically reference the Room Test of FM 4880.

The UL 1040 is also a very large-scale test, using a 20-ft by 20-ft by 30-ft high open-corner configuration, a 764-pound wood crib ignition source and a 30-minute test duration. This test has also not been performed in many years due, to its size, associated cost, and the availability of NFPA 286 and UL 1715 . The NFPA 275 Standard Method of Fire Tests for the Evaluation of Thermal Barriers, referenced in Section 2603.4, referenced UL 1040 among the approved test methods for the Integrity Fire Tests (Part II), however, it was removed from the 2022 Edition of NFPA 275.

The changes will improve the consistency of the evaluations performed under Section 2603.9 and its intent in terms of the Special Approval in reference to Section 2603.4.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposed code change provides clarification regarding the existing tests required for compliance with Section 2603.9.

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee stated that the reason for the disapproval is because the proposal deletes a necessary standard that needs to be maintained in the code (Vote: 11-1).

FS121-24

Individual Consideration Agenda

Comment 1:

IBC: 2603.9

Proponents: Eric Banks, e.w.banks consulting llc, North American Modern Building Alliance (NAMBA) (eric.banks@ewbanksconsulting.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

2603.9 Special approval. Foam plastic and assemblies containing foam plastic shall not be required to comply with the requirements of Section 2603.4 or those of Section 2603.6 where specifically *approved* based on one of the following large-scale tests:

1. NFPA 286 using the acceptance criteria of Section 803.1.1.1.
2. Room Test of FM 4880.
3. UL 1040.
4. ~~3~~ 4. UL 1715.

Such testing shall be performed on the finished manufactured foam plastic assembly in the maximum thickness intended for use. Foam plastics that are used as *interior finish* on the basis of these tests shall also conform to the *flame spread* and smoke-developed requirements of Chapter 8. Assemblies tested shall include seams, joints and other typical details used in the installation of the assembly and shall be tested in the manner intended for use.

Reason:
We, the proponent, are submitting this comment to modify proposal FS121-24 based on testimony provided during Group A CAH #1, the committee discussion, and the committee action. The modification reverses the original proposal's removal of UL 1040 from Section 2603.9.

Committee action for disapproval of FS121-24 indicated agreement with testimony opposed to removing UL 1040 as a compliance option for the Special Approval under Section 2603.9. Subsequent further review of UL's Product iQ online directory shows four (4) of the five (5) active listings for UL 1040 (UL Category Code: NYWR) were updated between 2018 and 2023 with the fifth listing as last updated in 1996. These recent updates demonstrate that manufacturers are maintaining listings regarding UL 1040, regardless of whether or not new tests are being conducted.

No testimony was provided in opposition to clarifying the Room Test of ANSI / FM 4880, nor did the committee discuss the issue or

comment on it in the Committee Reason for disapproval of FS121-24.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The modification presented in this public comment reverses the as-submitted proposal's removal of an existing compliance option, therefore, the proposal remains one that is editorial in nature or a clarification and with no impact on the cost of construction.

Comment (CAH2)# 294

PART II AND III WILL BE HEARD BY THE FIRE/WILDLAND-URBAN INTERFACE CODE COMMITTEE.

PART IV WILL BE HEARD BY THE MECHANICAL CODE COMMITTEE.

PART V WILL BE HEARD BY THE RESIDENTIAL CODE - PLUMBING & MECHANICAL CODE COMMITTEE.
SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Building Code

Add new definition as follows:

ACCESS (TO). That which enables a device, an *appliance* or equipment to be reached by *ready access* or by a means that first requires the removal or movement of a panel or similar obstruction [see also “Ready access (to)”].

READY ACCESS (TO). That which enables a device, *appliance* or equipment to be directly reached, without requiring the removal or movement of any panel or similar obstruction [see also “Access (to)”].

Revise as follows:

703.5 Marking and identification. Where ~~there is an accessible~~ access is provided to a concealed space that is located under a floor, within a floor-ceiling or an *attic* space, *fire walls*, *fire barriers*, *fire partitions*, *smoke barriers* and *smoke partitions* or any other wall required to have protected openings or penetrations shall be effectively and permanently identified with signs or stenciling in the concealed space. Such identification shall:

1. Be located within 15 feet (4572 mm) of the end of each wall and at intervals not exceeding 30 feet (9144 mm) measured horizontally along the wall or partition.
2. Include lettering not less than 3 inches (76 mm) in height with a minimum $^{3}/_{8}$-inch (9.5 mm) stroke in a contrasting color incorporating the suggested wording, “FIRE AND/OR SMOKE BARRIER—PROTECT ALL OPENINGS,” or other wording.

1004.7 Outdoor areas. *Yards*, patios, *occupiable roofs* , *courts* and similar outdoor areas ~~accessible to and usable~~ intended for use by the *building* occupants shall be provided with *means of egress* as required by this chapter. The *occupant load* of such outdoor areas shall be assigned by the *building official* in accordance with the anticipated use. Where outdoor areas are to be used by *persons* in addition to the occupants of the *building*, and the path of egress travel from the outdoor areas passes through the *building*, *means of egress* requirements for the *building* shall be based on the sum of the *occupant loads* of the *building* plus the outdoor areas. **Exceptions:**

1. Outdoor areas used exclusively for service of the building need only have one *means of egress*.
2. Both outdoor areas associated with Group R-3 and individual *dwelling units* of Group R-2.

1011.5.5.3 Solid risers. Risers shall be solid. **Exceptions:**

1. Solid risers are not required for *stairways* that are not required to comply with Section 1009.3, provided that the opening between treads does not permit the passage of a sphere with a diameter of 4 inches (102 mm).
2. Solid risers are not required for occupancies in Group I-3 or in Group F, H and S occupancies other than areas ~~accessible~~ open to the public. The size of the opening in the riser is not restricted.
3. Solid risers are not required for *spiral stairways* constructed in accordance with Section 1011.10.

1011.7.1 Stairway walking surface. The walking surface of treads and landings of a *stairway* shall not be sloped steeper than one unit vertical in 48 units horizontal (2-percent slope) in any direction. *Stairway* treads and landings shall have a solid surface. Finish floor surfaces shall be securely attached. **Exceptions:**

1. Openings in *stair* walking surfaces shall be a size that does not permit the passage of $^1/_2$-inch-diameter (12.7 mm) sphere. Elongated openings shall be placed so that the long dimension is perpendicular to the direction of travel.
2. In Group F, H and S occupancies, other than areas of parking *structures* ~~accessible~~ open to the public, openings in treads and landings shall not be prohibited provided that a sphere with a diameter of $1^1/_8$ inches (29 mm) cannot pass through the opening.

1015.2 Where required. *Guards* shall be located along open-sided walking surfaces, such as *mezzanines*, *equipment platforms*, *aisles*, *stairs*, *ramps* and landings, that are located more than 30 inches (762 mm) measured vertically to the floor or grade below at any point within 36 inches (914 mm) horizontally to the edge of the open side and at the perimeter of *occupiable roofs* . *Guards* shall be adequate in strength and attachment in accordance with Section 1607.9. **Exceptions:** *Guards* are not required for the following locations:

1. On the loading side of loading docks or piers.
2. On the audience side of *stages* and raised *platforms*, including *stairs* leading up to the *stage* and raised *platforms*.
3. On raised *stage* and *platform* floor areas, such as runways, *ramps* and side *stages* used for entertainment or presentations.
4. At vertical openings in the performance area of *stages* and *platforms*.
5. At elevated walking surfaces appurtenant to *stages* and *platforms* for access to and utilization of special lighting or equipment.
6. Along vehicle service pits not ~~accessible~~ open to the public.
7. In assembly seating areas at cross *aisles* in accordance with Section 1030.17.2.
8. On the loading side of station platforms on fixed guideway transit or passenger rail systems.
9. Portions of an *occupiable roof* located less than 30 inches (762 mm) measured vertically to adjacent unoccupiable roof areas where *approved guards* are present at the perimeter of the roof.
10. At portions of an *occupiable roof* where an *approved* barrier is provided.

1607.9.1.1 Uniform load. *Handrails* and *guards* shall be designed to resist a linear *load* of 50 pounds per linear foot (plf) (0.73 kN/m) in accordance with Section 4.5.1.1 of ASCE 7. This load need not be assumed to act concurrently with the concentrated load specified in Section 1607.9.1. **Exceptions:**

1. For one- and two-family *dwellings*, only the single concentrated *load* required by Section 1607.9.1 shall be applied.
2. In Group I-3, F, H and S occupancies, for areas that are not ~~accessible~~ open to the ~~general~~ public and that have an *occupant load* less than 50, the minimum *load* shall be 20 pounds per foot (0.29 kN/m).
3. For roofs not intended for occupancy, only the single concentrated load required by Section 1607.9.1 shall be applied.

1704.2.2 Access for special inspection. The construction or work for which *special inspection* or testing is required shall remain ~~accessible and~~ exposed and with access for *special inspection* or testing purposes until completion of the required *special inspections* or tests.

1807.2.5 Guards. *Guards* shall be provided at retaining walls in accordance with Sections 1807.2.5.1 through 1807.2.5.3. **Exception:** *Guards* are not required at retaining walls in areas not ~~accessible~~ open to the public.

2111.3.1 Ash dump cleanout. Cleanout openings, located within foundation walls below fireboxes, where provided, shall be equipped with ferrous metal or *masonry* doors and frames constructed to remain tightly closed, except when in use. Cleanouts shall be ~~accessible~~ provided with access and located so that ash removal will not create a hazard to combustible materials.

2113.9.2 Spark arrestors. Where a spark arrestor is installed on a *masonry* chimney, the spark arrestor shall meet all of the following requirements:

1. The net free area of the arrestor shall be not less than four times the net free area of the outlet of the chimney flue it serves.
2. The arrestor screen shall have heat and *corrosion resistance* equivalent to 19-gage galvanized steel or 24-gage stainless steel.
3. Openings shall not permit the passage of spheres having a diameter greater than $^1/_2$ inch (12.7 mm) nor block the passage of spheres having a diameter less than $^3/_8$ inch (9.5 mm).
4. The spark arrestor shall be ~~accessible~~ provided with access for cleaning and the screen or chimney cap shall be removable to allow for cleaning of the chimney flue.

2405.3.3 Screening not required in monolithic and multiple-layer sloped glazing systems. In monolithic and multiple-layer sloped glazing systems, retention screens are not required for any of the following:

1. Fully tempered glass where glazed between intervening floors at a slope of 30 degrees (0.52 rad) or less from the vertical plane, and the highest point of the glass is 10 feet (3048 mm) or less above the walking surface.
2. Any glazing material, including annealed glass, where the walking surface below the glazing material is permanently protected from the risk of falling glass or the area below the glazing material is not a walking surface.
3. Any glazing material, including annealed glass, in the sloped glazing systems of commercial or detached noncombustible *greenhouses* used exclusively for growing plants and not open to the public, provided that the height of the *greenhouse* at the ridge does not exceed 30 feet (9144 mm) above grade.
4. Individual *dwelling units* in Groups R-2, R-3 and R-4 where fully tempered glass is used as single glazing or as both panes in an insulating glass unit, and all of the following conditions are met:
   4.1. Each pane of the glass is 16 square feet (1.5 m^2) or less in area.
   4.2. The highest point of the glass is 12 feet (3658 mm) or less above any walking surface ~~or other accessible area~~.
   4.3. The glass thickness is $^3/_{16}$ inch (4.8 mm) or less.
5. Laminated glass with a 15-mil (0.38 mm) polyvinyl butyral or equivalent interlayer used in individual *dwelling units* in Groups R-2, R-3 and R-4 where both of the following conditions are met:
   5.1. Each pane of glass is 16 square feet (1.5 m^2) or less in area.
   5.2. The highest point of the glass is 12 feet (3658 mm) or less above a walking surface ~~or other accessible area~~.

2406.4.3 Glazing in windows. Glazing in an individual fixed or operable panel that meets all of the following conditions shall be considered to be a hazardous location:

1. The exposed area of an individual pane is greater than 9 square feet (0.84 m^2).
2. The bottom edge of the glazing is less than 18 inches (457 mm) above the floor or adjacent walking surface.
3. The top edge of the glazing is greater than 36 inches (914 mm) above the floor or adjacent walking surface.
4. One or more walking surface(s) are within 36 inches (914 mm), measured horizontally and in a straight line, of the plane of the glazing.

Exceptions:

1. *Decorative glazing*.
2. Where a horizontal rail is installed on the ~~accessible~~ walking surfaces side ~~(s)~~ of the glazing at 34 to 38 inches (864 to 965 mm) above the walking surface, the ~~. The~~ rail shall be capable of withstanding a horizontal *load* of 50 pounds per linear foot (730 N/m) without contacting the glass and be not less than $1\,^{1}/_{2}$ inches (38 mm) in cross-sectional height.
3. Outboard panes in insulating glass units or multiple glazing where the bottom exposed edge of the glass is 8 feet (2438 mm) or more above any grade or walking surface adjacent to the glass exterior.

3008.9 Emergency voice/alarm communication system. The *building* shall be provided with an *emergency voice/alarm communication system*. ~~The *emergency voice/alarm communication system* shall be accessible to the fire department. The system shall be provided~~ in accordance with Section 907.5.2.2.

F101.5.1 Rodent ~~accessible~~ access to openings. Windows and other openings for the purpose of light and ventilation in the *exterior walls* not covered in this chapter, ~~accessible to~~ that are susceptible to entry by rodents by way of exposed pipes, wires, conduits and other appurtenances, shall be covered with wire cloth of at least 0.035-inch (0.89 mm) wire. In lieu of wire cloth covering, said pipes, wires, conduits and other appurtenances shall be blocked from rodent usage by installing solid sheet metal guards 0.024 inch (0.61 mm) thick or heavier. Guards shall be fitted around pipes, wires, conduits or other appurtenances. In addition, they shall be fastened securely to and shall extend perpendicularly from the *exterior wall* for not less than 12 inches (305 mm) beyond and on either side of pipes, wires, conduits or appurtenances.

H110.1 General. *Roof signs* shall be constructed entirely of metal or other *approved* noncombustible material except as provided for in Sections H106.1.1 and H107.1. Provisions shall be made for electric grounding of metallic parts. Where combustible materials are permitted in letters or other ornamental features, wiring and tubing shall be kept free and insulated therefrom. *Roof signs* shall be so constructed as to leave a clear space of not less than 6 feet (1829 mm) between the roof level and the lowest part of the *sign* and shall have not less than 5 feet (1524 mm) clearance between the vertical supports thereof. *Roof sign structures* shall not project beyond an *exterior wall*. **Exception:** *Signs* on flat roofs ~~with every part of the roof accessible~~ where there is access to the signs.

2024 International Fire Code

Revise as follows:

[BE] 1004.7 Outdoor areas. *Yards*, patios, *occupiable roofs* , *courts* and similar outdoor areas ~~accessible to and usable~~ intended for use by the *building* occupants shall be provided with *means of egress* as required by this chapter. The *occupant load* of such outdoor areas shall be assigned by the *building official* in accordance with the anticipated use. Where outdoor areas are to be used by *persons* in addition to the occupants of the *building*, and the path of egress travel from the outdoor areas passes through the *building*, *means of egress* requirements for the *building* shall be based on the sum of the *occupant loads* of the *building* plus the outdoor areas.

Exceptions:

1. Outdoor areas used exclusively for service of the building need only have one *means of egress*.
2. Both outdoor areas associated with Group R-3 and individual *dwelling units* of Group R-2.

[BE] 1011.5.5.3 Solid risers. Risers shall be solid. **Exceptions:**

1. Solid risers are not required for *stairways* that are not required to comply with Section 1009.3, provided that the opening between treads does not permit the passage of a sphere with a diameter of 4 inches (102 mm).
2. Solid risers are not required for occupancies in Group I-3 or in Group F, H and S occupancies other than areas ~~accessible~~ open to the public. The size of the opening in the riser is not restricted.
3. Solid risers are not required for *spiral stairways* constructed in accordance with Section 1011.10.

[BE] 1011.7.1 Stairway walking surface. The walking surface of treads and landings of a *stairway* shall not be sloped steeper than 1 unit vertical in 48 units horizontal (2-percent slope) in any direction. *Stairway* treads and landings shall have a solid surface. Finish floor surfaces shall be securely attached. **Exceptions:**

1. Openings in *stair* walking surfaces shall be a size that does not permit the passage of $^{1}/_{2}$-inch-diameter (12.7 mm) sphere. Elongated openings shall be placed so that the long dimension is perpendicular to the direction of travel.
2. In Group F, H and S occupancies, other than areas of parking *structures* ~~accessible~~ open to the public, openings in treads and landings shall not be prohibited provided that a sphere with a diameter of $1^{1}/_{8}$ inches (29 mm) cannot pass through the opening.

[BE] 1015.2 Where required. *Guards* shall be located along open-sided walking surfaces, such as *mezzanines*, equipment platforms, *aisles*, *stairs*, *ramps* and landings, that are located more than 30 inches (762 mm) measured vertically to the floor or grade below at any point within 36 inches (914 mm) horizontally to the edge of the open side and at the perimeter of *occupiable roofs* . *Guards* shall be adequate in strength and attachment in accordance with Section 1607.9 of the International Building Code. **Exception:** *Guards* are not required for the following locations:

1. On the loading side of loading docks or piers.
2. On the audience side of stages and raised platforms, including *stairs* leading up to the stage and raised platforms.
3. On raised stage and platform floor areas, such as runways, *ramps* and side stages used for entertainment or presentations.
4. At vertical openings in the performance area of stages and platforms.
5. At elevated walking surfaces appurtenant to stages and platforms for access to and utilization of special lighting or equipment.
6. Along vehicle service pits not ~~accessible~~ open to the public.
7. In assembly seating areas at cross *aisles* in accordance with Section 1030.17.2.
8. On the loading side of station platforms on fixed guideway transit or passenger rail systems.
9. Portions of an *occupiable roof* located less than 30 inches (762 mm) measured vertically to adjacent unoccupiable roof areas where approved guards are present at the perimeter of the roof.
10. At portions of an *occupiable roof* where an *approved* barrier is provided.

Reason: Because the term ‘accessible’ is most commonly understood as requiring access for persons with disabilities we are making the changes to delete the word accessible from the remaining codes and replace it with other words, defined terms or phrases that are not attributed to requiring access for the physically disabled. Many of the codes use the defined term ‘access (to)’ or ‘ready access (to)’ for access by maintenance and service personnel or fire departments. This proposal provides clarity and consistency in the remaining codes where those coordination modifications missed or came in as part of new code changes.
This a correlation piece for proposals over the last couple of cycles. This effort was started by the CACs in 2015/16 code change cycle, and continued in 2018/19. This proposal is to provide coordination with the action taken with -P84-15, M2-15, RB2-16, F12-16, CE137-16 Part 1, CE29-19 Part 1 and 2 . G1-21 Part 1 was disapproved; however Part 2 through 7 were approved.
Correlative pieces will be entered in Group B for parts of IRC, IPMC, IZC and IECC.

This proposal is submitted by the ICC Building Code Action Committee (BCAC), the ICC Fire Code Action Committee (FCAC) and ICC Plumbing Mechanical Gas Code Action Committee (PMGCAC)

BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 the BCAC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the BCAC website at BCAC webpage.

Insert FCAC paragraph

PMGCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned

International Codes or portions thereof. In 2023 PMGCAC has held 26 virtual meetings open to any interested party. In addition, there were several virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the PMGCAC website at PMGCAC.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is a coordination of terms with no changes to construction requirements. See reason statement for additional information on coordination with previous proposals.

E1-24 Part I

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: While this is a good clarification for the defined term accessible, in several sections, there was concern about "open" being interpreted as open for business, and not unrestricted access. This would be consistent with comments on E1-24 Part III heard by the Fire Committee. (Vote: 8-4)

E1-24 Part I

Individual Consideration Agenda

Comment 1:

IBC: 1011.5.5.3, 1011.7.1, 1015.2, 1607.9.1.1, 1807.2.5, 2405.3.3; IFC: [BE] 1011.5.5.3, [BE] 1011.7.1, [BE] 1015.2

Proponents: Jeff Grove, Chair, Building Code Action Committee (BCAC) (bcac@iccsafe.org) requests As Modified by Committee (AMC2)

Replace as follows:

2024 International Building Code

Revise as follows:

1011.5.5.3 Solid risers. Risers shall be solid. **Exceptions:**

1. Solid risers are not required for *stairways* that are not required to comply with Section 1009.3, provided that the opening between treads does not permit the passage of a sphere with a diameter of 4 inches (102 mm).
2. Solid risers are not required for occupancies in Group I-3 or in Group F, H and S occupancies other than areas ~~open to~~ that can be accessed by the public. The size of the opening in the riser is not restricted.
3. Solid risers are not required for *spiral stairways* constructed in accordance with Section 1011.10.

1011.7.1 Stairway walking surface. The walking surface of treads and landings of a *stairway* shall not be sloped steeper than one unit vertical in 48 units horizontal (2-percent slope) in any direction. *Stairway* treads and landings shall have a solid surface. Finish floor surfaces shall be securely attached. **Exceptions:**

1. Openings in *stair* walking surfaces shall be a size that does not permit the passage of $^1/_2$-inch-diameter (12.7 mm) sphere. Elongated openings shall be placed so that the long dimension is perpendicular to the direction of travel.
2. In Group F, H and S occupancies, other than areas of parking *structures* ~~open to~~ that can be accessed by the public, openings in treads and landings shall not be prohibited provided that a sphere with a diameter of $1^1/_8$ inches (29 mm) cannot pass through the opening.

1015.2 Where required. *Guards* shall be located along open-sided walking surfaces, such as *mezzanines*, *equipment platforms*, *aisles*, *stairs*, *ramps* and landings, that are located more than 30 inches (762 mm) measured vertically to the floor or grade below at any point within 36 inches (914 mm) horizontally to the edge of the open side and at the perimeter of *occupiable roofs* . *Guards* shall be adequate in strength and attachment in accordance with Section 1607.9. **Exceptions:** *Guards* are not required for the following locations:

1. On the loading side of loading docks or piers.
2. On the audience side of *stages* and raised *platforms*, including *stairs* leading up to the *stage* and raised *platforms*.
3. On raised *stage* and *platform* floor areas, such as runways, *ramps* and side *stages* used for entertainment or presentations.
4. At vertical openings in the performance area of *stages* and *platforms*.
5. At elevated walking surfaces appurtenant to *stages* and *platforms* for access to and utilization of special lighting or equipment.
6. Along vehicle service pits ~~not open to~~ that cannot be accessed by the public.
7. In assembly seating areas at cross *aisles* in accordance with Section 1030.17.2.
8. On the loading side of station platforms on fixed guideway transit or passenger rail systems.
9. Portions of an *occupiable roof* located less than 30 inches (762 mm) measured vertically to adjacent unoccupiable roof areas where *approved guards* are present at the perimeter of the roof.
10. At portions of an *occupiable roof* where an *approved* barrier is provided.

1607.9.1.1 Uniform load. *Handrails* and *guards* shall be designed to resist a linear *load* of 50 pounds per linear foot (plf) (0.73 kN/m) in accordance with Section 4.5.1.1 of ASCE 7. This load need not be assumed to act concurrently with the concentrated load specified in Section 1607.9.1. **Exceptions:**

1. For one- and two-family *dwellings*, only the single concentrated *load* required by Section 1607.9.1 shall be applied.
2. In Group I-3, F, H and S occupancies, for areas that are ~~not open to~~ that cannot be accessed by the public and that have an *occupant load* less than 50, the minimum *load* shall be 20 pounds per foot (0.29 kN/m).
3. For roofs not intended for occupancy, only the single concentrated load required by Section 1607.9.1 shall be applied.

1807.2.5 Guards. *Guards* shall be provided at retaining walls in accordance with Sections 1807.2.5.1 through 1807.2.5.3. **Exception:** *Guards* are not required at retaining walls in areas ~~not open to~~ that cannot by accessed by the public.

2405.3.3 Screening not required in monolithic and multiple-layer sloped glazing systems. In monolithic and multiple-layer sloped glazing systems, retention screens are not required for any of the following:

1. Fully tempered glass where glazed between intervening floors at a slope of 30 degrees (0.52 rad) or less from the vertical plane, and the highest point of the glass is 10 feet (3048 mm) or less above the walking surface.
2. Any glazing material, including annealed glass, where the walking surface below the glazing material is permanently protected from the risk of falling glass or the area below the glazing material is not a walking surface.
3. Any glazing material, including annealed glass, in the sloped glazing systems of commercial or detached noncombustible *greenhouses* used exclusively for growing plants and ~~not open to~~ that cannot be access by the public, provided that the height of the *greenhouse* at the ridge does not exceed 30 feet (9144 mm) above grade.

4. Individual *dwelling units* in Groups R-2, R-3 and R-4 where fully tempered glass is used as single glazing or as both panes in an insulating glass unit, and all of the following conditions are met:

   4.1. Each pane of the glass is 16 square feet (1.5 m^2) or less in area.

   4.2. The highest point of the glass is 12 feet (3658 mm) or less above any walking surface .

   4.3. The glass thickness is $^3/_{16}$ inch (4.8 mm) or less.

5. Laminated glass with a 15-mil (0.38 mm) polyvinyl butyral or equivalent interlayer used in individual *dwelling units* in Groups R-2, R-3 and R-4 where both of the following conditions are met:

   5.1. Each pane of glass is 16 square feet (1.5 m^2) or less in area.

   5.2. The highest point of the glass is 12 feet (3658 mm) or less above a walking surface .

2024 International Fire Code

Revise as follows:

[BE] 1011.5.5.3 Solid risers. Risers shall be solid. **Exceptions:**

1. Solid risers are not required for *stairways* that are not required to comply with Section 1009.3, provided that the opening between treads does not permit the passage of a sphere with a diameter of 4 inches (102 mm).
2. Solid risers are not required for occupancies in Group I-3 or in Group F, H and S occupancies other than areas ~~open to~~ that can be accessed by the public. The size of the opening in the riser is not restricted.
3. Solid risers are not required for *spiral stairways* constructed in accordance with Section 1011.10.

[BE] 1011.7.1 Stairway walking surface. The walking surface of treads and landings of a *stairway* shall not be sloped steeper than 1 unit vertical in 48 units horizontal (2-percent slope) in any direction. *Stairway* treads and landings shall have a solid surface. Finish floor surfaces shall be securely attached. **Exceptions:**

1. Openings in *stair* walking surfaces shall be a size that does not permit the passage of $^1/_2$-inch-diameter (12.7 mm) sphere. Elongated openings shall be placed so that the long dimension is perpendicular to the direction of travel.
2. In Group F, H and S occupancies, other than areas of parking *structures* ~~open to~~ that can be accessed by the public, openings in treads and landings shall not be prohibited provided that a sphere with a diameter of $1^1/_8$ inches (29 mm) cannot pass through the opening.

[BE] 1015.2 Where required. *Guards* shall be located along open-sided walking surfaces, such as *mezzanines*, equipment platforms, *aisles*, *stairs*, *ramps* and landings, that are located more than 30 inches (762 mm) measured vertically to the floor or grade below at any point within 36 inches (914 mm) horizontally to the edge of the open side and at the perimeter of *occupiable roofs* . *Guards* shall be adequate in strength and attachment in accordance with Section 1607.9 of the International Building Code. **Exception:** *Guards* are not required for the following locations:

1. On the loading side of loading docks or piers.
2. On the audience side of stages and raised platforms, including *stairs* leading up to the stage and raised platforms.
3. On raised stage and platform floor areas, such as runways, *ramps* and side stages used for entertainment or presentations.
4. At vertical openings in the performance area of stages and platforms.
5. At elevated walking surfaces appurtenant to stages and platforms for access to and utilization of special lighting or equipment.
6. Along vehicle service pits ~~not open to~~ that cannot be accessed by the public.
7. In assembly seating areas at cross *aisles* in accordance with Section 1030.17.2.

8. On the loading side of station platforms on fixed guideway transit or passenger rail systems.
9. Portions of an *occupiable roof* located less than 30 inches (762 mm) measured vertically to adjacent unoccupiable roof areas where approved guards are present at the perimeter of the roof.
10. At portions of an *occupiable roof* where an *approved* barrier is provided.

Reason: The BCAC has split this comment into two parts. The proposed definitions, and the remainder of the proposal are in our 2nd comment with no revisions.

The MOE committee had a concern about 'open to the public' and how that would be understood. This modification provides an alternative. In addition, Section 2405.3.3 Item 3, where 'open to the public' is currently used, has been revised for consistency. This provides coordination across codes and remove the use of 'accessible' where it does not meet the same intent as the defined term. The BCAC has a proposal in for Part 3 for IWUIC for a similar issue. Part 2, 4 and 5 for IFC, IMC and IRC were approved.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is a coordination of terms with no changes to construction requirements. See original reason statement for additional information on coordination with previous proposals.

Comment (CAH2)# 121

Comment 2:

IBC: SECTION 202, 703.5, 1004.7, 1704.2.2, 2111.3.1, 2113.9.2, 2405.3.3, 2406.4.3, 3008.9, F101.5.1, H110.1; IFC: [BE] 1004.7

Proponents: Jeff Grove, Chair, Building Code Action Committee (BCAC) (bcac@iccsafe.org) requests As Modified by Committee (AMC2)

Replace as follows:

2024 International Building Code

ACCESS (TO). That which enables a device, an *appliance* or equipment to be reached by *ready access* or by a means that first requires the removal or movement of a panel or similar obstruction [see also “Ready access (to)”].

READY ACCESS (TO). That which enables a device, *appliance* or equipment to be directly reached, without requiring the removal or movement of any panel or similar obstruction [see also “Access (to)”].

703.5 Marking and identification. Where ~~there is an accessible~~ access is provided to a concealed space that is located under a floor, within a floor-ceiling or an *attic* space, *fire walls*, *fire barriers*, *fire partitions*, *smoke barriers* and *smoke partitions* or any other wall required to have protected openings or penetrations shall be effectively and permanently identified with signs or stenciling in the concealed space. Such identification shall:

1. Be located within 15 feet (4572 mm) of the end of each wall and at intervals not exceeding 30 feet (9144 mm) measured horizontally along the wall or partition.
2. Include lettering not less than 3 inches (76 mm) in height with a minimum $^{3}/_{8}$-inch (9.5 mm) stroke in a contrasting color incorporating the suggested wording, “FIRE AND/OR SMOKE BARRIER—PROTECT ALL OPENINGS,” or other wording.

1004.7 Outdoor areas. *Yards*, patios, *occupiable roofs* , *courts* and similar outdoor areas ~~accessible to and usable~~ intended for use by the *building* occupants shall be provided with *means of egress* as required by this chapter. The *occupant load* of such outdoor areas shall be assigned by the *building official* in accordance with the anticipated use. Where outdoor areas are to be used by *persons* in addition to the occupants of the *building*, and the path of egress travel from the outdoor areas passes through the *building*, *means of*

egress requirements for the *building* shall be based on the sum of the *occupant loads* of the *building* plus the outdoor areas. **Exceptions:**

1. Outdoor areas used exclusively for service of the building need only have one *means of egress*.
2. Both outdoor areas associated with Group R-3 and individual *dwelling units* of Group R-2.

1704.2.2 Access for special inspection. The construction or work for which *special inspection* or testing is required shall remain ~~accessible and~~ exposed and with access for *special inspection* or testing purposes until completion of the required *special inspections* or tests.

2111.3.1 Ash dump cleanout. Cleanout openings, located within foundation walls below fireboxes, where provided, shall be equipped with ferrous metal or *masonry* doors and frames constructed to remain tightly closed, except when in use. Cleanouts shall be ~~accessible~~ provided with access and located so that ash removal will not create a hazard to combustible materials.

2113.9.2 Spark arrestors. Where a spark arrestor is installed on a *masonry* chimney, the spark arrestor shall meet all of the following requirements:

1. The net free area of the arrestor shall be not less than four times the net free area of the outlet of the chimney flue it serves.
2. The arrestor screen shall have heat and *corrosion resistance* equivalent to 19-gage galvanized steel or 24-gage stainless steel.
3. Openings shall not permit the passage of spheres having a diameter greater than $^{1}/_{2}$ inch (12.7 mm) nor block the passage of spheres having a diameter less than $^{3}/_{8}$ inch (9.5 mm).
4. The spark arrestor shall be ~~accessible~~ provided with access for cleaning and the screen or chimney cap shall be removable to allow for cleaning of the chimney flue.

2405.3.3 Screening not required in monolithic and multiple-layer sloped glazing systems. In monolithic and multiple-layer sloped glazing systems, retention screens are not required for any of the following:

1. Fully tempered glass where glazed between intervening floors at a slope of 30 degrees (0.52 rad) or less from the vertical plane, and the highest point of the glass is 10 feet (3048 mm) or less above the walking surface.
2. Any glazing material, including annealed glass, where the walking surface below the glazing material is permanently protected from the risk of falling glass or the area below the glazing material is not a walking surface.
3. Any glazing material, including annealed glass, in the sloped glazing systems of commercial or detached noncombustible *greenhouses* used exclusively for growing plants and not open to the public, provided that the height of the *greenhouse* at the ridge does not exceed 30 feet (9144 mm) above grade.
4. Individual *dwelling units* in Groups R-2, R-3 and R-4 where fully tempered glass is used as single glazing or as both panes in an insulating glass unit, and all of the following conditions are met:
   4.1. Each pane of the glass is 16 square feet (1.5 m^2) or less in area.
   4.2. The highest point of the glass is 12 feet (3658 mm) or less above any walking surface ~~or other accessible area~~.
   4.3. The glass thickness is $^{3}/_{16}$ inch (4.8 mm) or less.
5. Laminated glass with a 15-mil (0.38 mm) polyvinyl butyral or equivalent interlayer used in individual *dwelling units* in Groups R-2, R-3 and R-4 where both of the following conditions are met:
   5.1. Each pane of glass is 16 square feet (1.5 m^2) or less in area.
   5.2. The highest point of the glass is 12 feet (3658 mm) or less above a walking surface or other accessible area
   .

2406.4.3 Glazing in windows. Glazing in an individual fixed or operable panel that meets all of the following conditions shall be

considered to be a hazardous location:

1. The exposed area of an individual pane is greater than 9 square feet (0.84 m^2).
2. The bottom edge of the glazing is less than 18 inches (457 mm) above the floor or adjacent walking surface.
3. The top edge of the glazing is greater than 36 inches (914 mm) above the floor or adjacent walking surface.
4. One or more walking surface(s) are within 36 inches (914 mm), measured horizontally and in a straight line, of the plane of the glazing.

Exceptions:

1. *Decorative glazing*.
2. Where a horizontal rail is installed on the ~~accessible~~ walking surfaces side of the glazing at 34 to 38 inches (864 to 965 mm) above the walking surface, the . ~~The~~ rail shall be capable of withstanding a horizontal *load* of 50 pounds per linear foot (730 N/m) without contacting the glass and be not less than $1\,^1/_2$ inches (38 mm) in cross-sectional height.
3. Outboard panes in insulating glass units or multiple glazing where the bottom exposed edge of the glass is 8 feet (2438 mm) or more above any grade or walking surface adjacent to the glass exterior.

3008.9 Emergency voice/alarm communication system. The *building* shall be provided with an *emergency voice/alarm communication system* ~~The emergency voice/alarm communication system shall be accessible to the fire department. The system shall be provided~~ in accordance with Section 907.5.2.2.

Revise as follows:

F101.5.1 Rodent access to openings. Windows and other openings for the purpose of light and ventilation in the *exterior walls* not covered in this chapter, ~~accessible to~~ that are susceptible to entry by rodents by way of exposed pipes, wires, conduits and other appurtenances, shall be covered with wire cloth of at least 0.035-inch (0.89 mm) wire. In lieu of wire cloth covering, said pipes, wires, conduits and other appurtenances shall be blocked from rodent usage by installing solid sheet metal guards 0.024 inch (0.61 mm) thick or heavier. Guards shall be fitted around pipes, wires, conduits or other appurtenances. In addition, they shall be fastened securely to and shall extend perpendicularly from the *exterior wall* for not less than 12 inches (305 mm) beyond and on either side of pipes, wires, conduits or appurtenances.

H110.1 General. *Roof signs* shall be constructed entirely of metal or other *approved* noncombustible material except as provided for in Sections H106.1.1 and H107.1. Provisions shall be made for electric grounding of metallic parts. Where combustible materials are permitted in letters or other ornamental features, wiring and tubing shall be kept free and insulated therefrom. *Roof signs* shall be so constructed as to leave a clear space of not less than 6 feet (1829 mm) between the roof level and the lowest part of the *sign* and shall have not less than 5 feet (1524 mm) clearance between the vertical supports thereof. *Roof sign structures* shall not project beyond an *exterior wall*. **Exception:** *Signs* on flat roofs with every part of the roof accessible where there is access to the signs
.

2024 International Fire Code

[BE] 1004.7 Outdoor areas. *Yards*, patios, *occupiable roofs* , *courts* and similar outdoor areas ~~accessible to and usable~~ intended for use by the *building* occupants shall be provided with *means of egress* as required by this chapter. The *occupant load* of such outdoor areas shall be assigned by the *building official* in accordance with the anticipated use. Where outdoor areas are to be used by *persons* in addition to the occupants of the *building*, and the path of egress travel from the outdoor areas passes through the *building*, *means of egress* requirements for the *building* shall be based on the sum of the *occupant loads* of the *building* plus the outdoor areas.

Exceptions:

1. Outdoor areas used exclusively for service of the building need only have one *means of egress*.
2. Both outdoor areas associated with Group R-3 and individual *dwelling units* of Group R-2.

Reason: The BCAC committee has split this proposal into two part. The testimony at the spring hearings were all in regard to 'open to the public'. This is addressed in a separate comment.

These sections are for the removal of 'accessible' where it is not related to access for people with disabilities, and to add the appropriate definitions for access to equipment. The IFC already contains these definitions, as well as multiple other I-Codes. There are no proposed revision to these sections from the original proposal.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is a coordination of terms with no changes to construction requirements. See reason statement for additional information on coordination with previous proposals.

Comment (CAH2)# 223

NOTE: E1-24 PART II DID NOT RECEIVE A COMMENT (CAH2) AND IS REPRODUCED FOR INFORMATIONAL PURPOSES ONLY

E1-24 Part II

IFC: SECTION 202, 907.8.2

Proposed Change as Submitted

Proponents: Jeff Grove, Chair, Building Code Action Committee (BCAC) (bcac@iccsafe.org); Andrew Bevis, Chair, Plumbing, Mechanical and Fuel Gas Code Action Committee (pmgcac@iccsafe.org); Robert Marshall, FCAC, FCAC (fcac@iccsafe.org)

2024 International Fire Code

Revise as follows:

WILDFIRE RISK AREA. Land that is covered with grass, grain, brush or forest, whether privately or publicly owned, ~~which is so situated or is of such inaccessible location that~~ where a fire originating upon it would present an abnormally difficult job of suppression or would result in great or unusual damage through fire or such areas designated by the *fire code official*.

907.8.2 Testing. Testing shall be performed in accordance with the schedules in NFPA 72 or more frequently where required by the *fire code official*. Records of testing shall be maintained. **Exception:** Devices or equipment ~~that are inaccessible~~ located without access because of safety considerations shall be tested during scheduled shutdowns where *approved* by the *fire code official*, but not less than every 18 months.

Reason: Because the term 'accessible' is most commonly understood as requiring access for persons with disabilities we are making the changes to delete the word accessible from the remaining codes and replace it with other words, defined terms or phrases that are not attributed to requiring access for the physically disabled. Many of the codes use the defined term 'access (to)' or 'ready access (to)' for access by maintenance and service personnel or fire departments. This proposal provides clarity and consistency in the remaining codes where those coordination modifications missed or came in as part of new code changes.
This a correlation piece for proposals over the last couple of cycles. This effort was started by the CACs in 2015/16 code change cycle, and continued in 2018/19. This proposal is to provide coordination with the action taken with -P84-15, M2-15, RB2-16, F12-16, CE137-16 Part 1, CE29-19 Part 1 and 2 . G1-21 Part 1 was disapproved; however Part 2 through 7 were approved.
Correlative pieces will be entered in Group B for parts of IRC, IPMC, IZC and IECC.

This proposal is submitted by the ICC Building Code Action Committee (BCAC), the ICC Fire Code Action Committee (FCAC) and ICC Plumbing Mechanical Gas Code Action Committee (PMGCAC)

BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 the BCAC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the BCAC website at BCAC webpage.

Insert FCAC paragraph

PMGCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 PMGCAC has held 26 virtual meetings open to any interested party. In addition, there were several virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the PMGCAC website at PMGCAC.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is a coordination of terms with no changes to construction requirements. See reason statement for additional information on

coordination with previous proposals.

E1-24 Part II

Public Hearing Results (CAH1)

Committee Action: **As Submitted**

Committee Reason: The committee stated that the reason for the approval of the proposal was that it is a good clean up to coordinate the codes and eliminates any confusion by replacing words that can be misunderstood. (Vote: 13-0)

E1-24 Part II

E1-24 Part III

IWUIC: A103.2, TABLE C101.1, G101.3.2

Proposed Change as Submitted

Proponents: Jeff Grove, Chair, Building Code Action Committee (BCAC) (bcac@iccsafe.org); Andrew Bevis, Chair, Plumbing, Mechanical and Fuel Gas Code Action Committee (pmgcac@iccsafe.org); Robert Marshall, FCAC, FCAC (fcac@iccsafe.org)

2024 International Wildland Urban Interface Code

Revise as follows:

A103.2 ~~Trespassing on posted private property~~ Restricted areas. Where the *code official* determines that a specific area within a *wildland-urban interface area* presents an exceptional and continuing fire danger because of the density of natural growth, difficulty of terrain, proximity to structures or ~~accessibility~~ open to the public, such areas shall be restricted or closed until changed conditions warrant termination of such restriction or closure. Such areas shall be posted in accordance with Section A103.2.1.

TABLE C101.1 FIRE HAZARD SEVERITY FORM

Portions of table not shown remain unchanged.

A. Subdivision Design Points	
3. ~~Accessibility~~ Vehicle access	
Road grade 5% or less	1___
Road grade more than 5%	3___

G101.3.2 Alternative water supply systems for exposure protection. Pools and spas are often offered as an alternative water source for fire departments. These water sources must be reliable and able to be accessed to be of any use by fire protection forces. ~~Accessibility~~ Access means that the fire department ~~must be~~ is able to withdraw the water without having to go through extraordinary measures such as knocking down fences or having to set up drafting situations. Designs have been created to put liquid- or gas-fueled pumps or gravity valves on pools and spas to allow fire departments to access these water systems. A key vulnerability to the use of these alternative water systems is loss of electrical power. When the reliability of a water system depends on external power sources, it cannot be relied upon by fire fighters to be available in a worst-case scenario.

Reason: Because the term ‘accessible’ is most commonly understood as requiring access for persons with disabilities we are making the changes to delete the word accessible from the remaining codes and replace it with other words, defined terms or phrases that are not attributed to requiring access for the physically disabled. Many of the codes use the defined term ‘access (to)’ or ‘ready access (to)’ for access by maintenance and service personnel or fire departments. This proposal provides clarity and consistency in the remaining codes where those coordination modifications missed or came in as part of new code changes.
This a correlation piece for proposals over the last couple of cycles. This effort was started by the CACs in 2015/16 code change cycle, and continued in 2018/19. This proposal is to provide coordination with the action taken with -P84-15, M2-15, RB2-16, F12-16, CE137-16 Part 1, CE29-19 Part 1 and 2 . G1-21 Part 1 was disapproved; however Part 2 through 7 were approved.

Correlative pieces will be entered in Group B for parts of IRC, IPMC, IZC and IECC.

This proposal is submitted by the ICC Building Code Action Committee (BCAC), the ICC Fire Code Action Committee (FCAC) and ICC Plumbing Mechanical Gas Code Action Committee (PMGCAC)

BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 the BCAC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the BCAC website at BCAC webpage.

Related documents and reports are posted on the PMGCAC website at PMGCAC.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is a coordination of terms with no changes to construction requirements. See reason statement for additional information on coordination with previous proposals.

E1-24 Part III

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee stated that the reasons for the disapproval of the proposal were: There was disagreement over the deletion and replacement of the existing word “accessibility” in Section A103.2 and that the word replacement needs to be determined outside of the hearings. (Vote: 12-1)

E1-24 Part III

Individual Consideration Agenda

Comment 1:

IWUIC: A103.2

Proponents: Jeff Grove, Chair, Building Code Action Committee (BCAC) (bcac@iccsafe.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Wildland Urban Interface Code

Revise as follows:

A103.2 Restricted areas. Where the *code official* determines that a specific area within a *wildland-urban interface area* presents an exceptional and continuing fire danger because of the density of natural growth, difficulty of terrain, proximity to structures or that can be accessed by ~~open to~~ the public, such areas shall be restricted or closed until changed conditions warrant termination of such restriction or closure. Such areas shall be posted in accordance with Section A103.2.1.

Reason: The committee had a concern about 'open to the public' and how that would be understood. This modification provides an alternative. The remainder of the proposal has no revisions. This provides coordination across codes and remove the use of 'accessible' where it does not meet the same intent as the defined term. The BCAC has a proposal in for Part 1 for IBC for a similar issue. Part 2, 4 and 5 for IFC, IMC and IRC were approved.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is a coordination of terms with no changes to construction requirements. See original reason statement for additional information on coordination with previous proposals.

Comment (CAH2)# 124

NOTE: E1-24 PART IV DID NOT RECEIVE A COMMENT (CAH2) AND IS REPRODUCED FOR INFORMATIONAL PURPOSES ONLY

E1-24 Part IV

IFC: SECTION 202; IFGC: SECTION 202; IMC®: SECTION 202, 506.3.8, 603.4.1; IPC: SECTION 202, 712.2, 1111.1

Proposed Change as Submitted

Proponents: Jeff Grove, Chair, Building Code Action Committee (BCAC) (bcac@iccsafe.org); Andrew Bevis, Chair, Plumbing, Mechanical and Fuel Gas Code Action Committee (pmgcac@iccsafe.org); Robert Marshall, FCAC, FCAC (fcac@iccsafe.org)

2024 International Fire Code

[M] ACCESS (TO). That which enables a device, appliance or equipment to be reached by *ready access* or by a means that first requires the removal or movement of a panel or similar obstruction [see also "Ready access (to)"].

Revise as follows:

[M] READY ACCESS (TO). That which enables a device, appliance or equipment to be directly reached, without requiring the removal or movement of any panel or similar obstruction [see also "Access (to)"].

2024 International Fuel Gas Code

Revise as follows:

[M] ACCESS (TO). That which enables a device, *appliance* or *equipment* to be reached by *ready access* or by a means that first requires the removal or movement of a panel, ~~door~~ or similar obstruction (see also "Ready access (to)").

[M] READY ACCESS (TO). That which enables a device, *appliance* or *equipment* to be directly reached, without requiring the removal or movement of any panel~~, door~~ or similar obstruction (see also "*Access (to)*").

2024 International Mechanical Code

ACCESS (TO). That which enables a device, *appliance* or *equipment* to be reached by *ready access* or by a means that first requires the removal or movement of a panel or similar obstruction [see also "*Ready access (to)*"].

Revise as follows:

NET OCCUPIABLE FLOOR AREA. The floor area of an *occupiable space* defined by the inside surfaces of its walls but excluding shafts, column enclosures and other permanently enclosed, ~~inaccessible and~~ unoccupiable areas and not provided with access. Obstructions in the space such as furnishings, display or storage racks and other obstructions, whether temporary or permanent, shall not be deducted from the space area.

READY ACCESS (TO). That which enables a device, *appliance* or *equipment* to be directly reached, without requiring the removal or movement of any panel or similar obstruction [see also "*Access (to)*"].

506.3.8 Grease duct cleanouts and openings. Grease duct cleanouts and openings shall comply with all of the following:

1. Grease ducts shall not have openings except where required for the operation and maintenance of the system.
2. Sections of grease ducts ~~that are inaccessible~~ that cannot be accessed from the hood or discharge openings shall be provided with cleanout openings spaced not more than 20 feet (6096 mm) apart and not more than 10 feet (3048 mm) from changes in direction greater than 45 degrees (0.79 rad).
3. Cleanouts and openings shall be equipped with tight-fitting doors constructed of steel having a thickness not less than that required for the grease duct.

4. Cleanout doors shall be installed liquid tight.
5. Door assemblies including any frames and gaskets shall be *approved* for the application and shall not have fasteners that penetrate the grease duct.
6. Gasket and sealing materials shall be rated for not less than 1,500°F (816°C).
7. *Listed* door assemblies shall be installed in accordance with the manufacturer's instructions.

603.4.1 Minimum fasteners. Round metallic ducts shall be mechanically fastened by means of not less than three sheet metal screws or rivets spaced equally around the joint.

Exception: Where a duct connection is made that ~~is~~ partially ~~inaccessible~~ cannot be accessed, three screws or rivets shall be equally spaced on the exposed portion so as to prevent a hinge effect.

2024 International Plumbing Code

Revise as follows:

[M] ACCESS (TO). That which enables a fixture, appliance or equipment to be reached by *ready access* or by a means that first requires the removal or movement of a panel or similar obstruction (see also "Ready access (to)").

[M] READY ACCESS (TO). That which enables a fixture, appliance or equipment to be directly reached without requiring the removal or movement of any panel or similar obstruction ~~and without the use of a portable ladder, step stool or similar device~~ (see also "Access (to)").

712.2 Valves required. A check valve and a full-open valve located on the discharge side of the check valve shall be installed in the pump or ejector discharge piping between the pump or ejector and the gravity drainage system. *Access* shall be provided to such valves. Such valves shall be located above the sump cover required by Section 712.1 or, where the discharge pipe from the ejector is below grade, the valves shall be ~~accessibly~~ located outside the sump below grade in an access pit with a removable *access* cover.

1111.1 Subsoil drains. Subsoil drains shall be open-jointed, horizontally split or perforated pipe conforming to one of the standards listed in Table 1102.5. Such drains shall be not less than 4 inches (102 mm) in diameter. Where the building is subject to backwater, the subsoil drain shall be protected by ~~an accessibly located~~ a backwater valve that is provided with access. Subsoil drains shall discharge to a trapped area drain, sump, dry well or *approved* location above ground. The subsoil sump shall not be required to have either a gastight cover or a vent. The sump and pumping system shall comply with Section 1113.1.

Reason: Because the term 'accessible' is most commonly understood as requiring access for persons with disabilities we are making the changes to delete the word accessible from the remaining codes and replace it with other words, defined terms or phrases that are not attributed to requiring access for the physically disabled. Many of the codes use the defined term 'access (to)' or 'ready access (to)' for access by maintenance and service personnel or fire departments. This proposal provides clarity and consistency in the remaining codes where those coordination modifications missed or came in as part of new code changes.
This a correlation piece for proposals over the last couple of cycles. This effort was started by the CACs in 2015/16 code change cycle, and continued in 2018/19. This proposal is to provide coordination with the action taken with -P84-15, M2-15, RB2-16, F12-16, CE137-16 Part 1, CE29-19 Part 1 and 2 . G1-21 Part 1 was disapproved; however Part 2 through 7 were approved.
Correlative pieces will be entered in Group B for parts of IRC, IPMC, IZC and IECC.

This proposal is submitted by the ICC Building Code Action Committee (BCAC), the ICC Fire Code Action Committee (FCAC) and ICC Plumbing Mechanical Gas Code Action Committee (PMGCAC)

BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 the BCAC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the BCAC website at BCAC webpage.

Insert FCAC paragraph

PMGCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 PMGCAC has held 26 virtual meetings open to any interested party. In addition, there were several virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the PMGCAC website at PMGCAC.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is a coordination of terms with no changes to construction requirements. See reason statement for additional information on coordination with previous proposals.

E1-24 Part IV

Public Hearing Results (CAH1)

Committee Action: **As Submitted**

Committee Reason: The committee voted to approve the proposal as submitted by 12-2. Since the word "accessible" is most frequently associated with the need for access for people with disabilities, the committee has agreed with the proponent to change the remaining codes to remove the word "accessible" and replace it with other words, defined terms, or phrases that do not imply the need for access for people who are physically disabled. Where coordination changes were either overlooked or included in new code changes, this proposal brings clarity and consistency to the remaining codes. It aims to facilitate correlation with earlier proposal initiatives.

E1-24 Part V

IRC: TABLE M1306.2, M1803.4.1, M2006.2, P2704.1, P2706.1, P2712.6, P2720.2, P2722.4, P2903.9.5, P2903.10.1, P2903.10.2, P2903.10.3, P2903.11, P2911.5, P2911.8.1, P2911.9, P2912.4, P2912.8, P2912.12, P3005.1.5, P3007.2, P3007.3.2, P3302.1, P3303.1.2, P3303.1.4

Proposed Change as Submitted

Proponents: Jeff Grove, Chair, Building Code Action Committee (BCAC) (bcac@iccsafe.org); Andrew Bevis, Chair, Plumbing, Mechanical and Fuel Gas Code Action Committee (pmgcac@iccsafe.org); Robert Marshall, FCAC, FCAC (fcac@iccsafe.org)

2024 International Residential Code

Revise as follows:

TABLE M1306.2 REDUCTION OF CLEARANCES WITH SPECIFIED FORMS OF PROTECTION [a, c, d, e, f, g, h, i, j, k, l]

Portions of table not shown remain unchanged.

For SI: 1 inch = 25.4 mm, 1 pound per cubic foot = 16.019 kg/m^3, °C = [(°F) – 32/1.8], 1 Btu/(h × ft^2 × °F/in.) = 0.001442299 (W/cm^2 × °C/cm).

a. Reduction of clearances from combustible materials shall not interfere with combustion air, draft hood clearance and relief, and ~~accessibility of~~ access for servicing.

b. Clearances shall be measured from the surface of the heat-producing appliance or equipment to the outer surface of the combustible material or combustible assembly.

c. Spacers and ties shall be of noncombustible material. Spacers and ties shall not be used directly opposite appliance or connector.

d. Where all clearance reduction systems use a ventilated airspace, adequate provision for air circulation shall be provided as described (see Figures M1306.1 and M1306.2).

e. There shall be not less than 1 inch between clearance reduction systems and combustible walls and ceilings for reduction systems using ventilated airspace.

f. If a wall protector is mounted on a single flat wall away from corners, adequate air circulation shall be permitted to be provided by leaving only the bottom and top edges or only the side and top edges open with not less than a 1-inch air gap.

g. Mineral wool and glass fiber batts (blanket or board) shall have a minimum density of 8 pounds per cubic foot and a minimum melting point of 1,500°F.

h. Insulation material used as part of a clearance reduction system shall have a thermal conductivity of 1.0 Btu inch per square foot per hour °F or less. Insulation board shall be formed of noncombustible material.

i. There shall be not less than 1 inch between the appliance and the protector. The clearance between the appliance and the combustible surface shall not be reduced below that allowed in this table.

j. All clearances and thicknesses are minimum; larger clearances and thicknesses are acceptable.

k. Listed single-wall connectors shall be permitted to be installed in accordance with the terms of their listing and the manufacturer's instructions.

l. For limitations on clearance reduction for solid-fuel-burning appliances, see Section M1306.2.3.

M1803.4.1 Closure and ~~accessibility~~ access. A noncombustible seal shall be provided below the point of connection to prevent entry of room air into the flue. Means shall be provided for *access to* the flue for inspection and cleaning.

M2006.2 Clearances. The clearances shall not interfere with *combustion air*, draft hood or flue terminal relief, or ~~accessibility~~ access for servicing.

P2704.1 Slip joints. Slip-joint connections shall be installed only for tubular waste piping and only between the waste outlet of a fixture and the connection to the drainage piping. Slip-joint connections shall be made with an *approved* elastomeric sealing gasket. Slip-joint connections shall ~~be accessible. Such access shall provide~~ be provided with access. Such access shall be provided by an opening that is not less than 12 inches (305 mm) in its smallest dimension.

P2706.1 General. For other than hub drains that receive only clear-water waste and standpipes, a removable strainer or basket shall cover the waste outlet of waste receptors. Waste receptors shall not be installed in concealed spaces. Waste receptors shall not be installed in plenums, attics, *crawl spaces* or interstitial spaces above ceilings and below floors. Ready access to waste ~~Waste~~ receptors shall be provided~~readily accessible~~.

P2712.6 Access. ~~Parts~~ Access to the parts in a flush tank shall be ~~accessible~~ provided for repair and replacement.

P2720.2 Piping drainage. The circulation pump shall be ~~accessibly~~ located above the crown weir of the trap. Access to the circulation pump shall be provided. The pump drain line shall be properly graded to ensure minimum water retention in the volute after fixture use. The circulation piping shall be installed to be self-draining.

P2722.4 Individual pressure-balancing in-line valves for individual fixture fittings. Individual pressure-balancing in-line valves for individual fixture fittings shall comply with ASSE 1066. Such valves ~~shall be installed in an accessible location and~~ shall not be used as a substitute for the balanced pressure, thermostatic or combination shower valves required in Section P2708.4. Access to such valves shall be provided.

P2903.9.5 Hose bibb bleed. ~~A *readily accessible*~~ An air bleed shall be installed in hose bibb supplies at the manifold or at the hose bibb exit point. Ready access to the air bleed shall be provided.

P2903.10.1 Service valve. Each *dwelling unit* shall be provided with a ~~an accessible~~ *main* shutoff valve near the entrance of the water service. The valve shall be of a full-open type having nominal restriction to flow, with provision for drainage such as a bleed orifice or installation of a separate drain valve. Additionally, the water service shall be valved at the curb or *lot line* in accordance with local requirements.

P2903.10.2 Water heater valve. A ~~readily accessible~~ full-open valve with ready access shall be installed in the cold-water supply pipe to each water heater at or near the water heater.

P2903.10.3 Fixture valves and access. Shutoff valves shall be required on each fixture supply pipe to each plumbing *appliance* and to each plumbing fixture other than bathtubs and showers. ~~Valves~~ Access shall be provided to valves serving individual plumbing fixtures, *plumbing appliances,* risers and branches ~~shall be accessible~~.

P2903.11 Hose bibb. Hose bibbs subject to freezing, including the "frostproof" type, shall be equipped with ~~an accessible~~ a stop-and-waste-type valve inside the *building* so that they can be controlled and drained during cold periods. **Exception:** Frostproof hose bibbs installed such that the stem extends through the building insulation into an open heated or *semiconditioned space* need not be separately valved (see Figure P2903.11).

P2911.5 Filtration. Untreated water collected for reuse shall be filtered as required for the intended end use. Access shall be provided to filters ~~Filters shall be accessible~~ for inspection and maintenance. Filters shall utilize a pressure gauge or other *approved* method to provide indication when a filter requires servicing or replacement. Filters shall be installed with shutoff valves immediately upstream and downstream to allow for isolation during maintenance.

P2911.8.1 Bypass valve. One three-way diverter valve certified to NSF 50 or other *approved* device shall be installed on collection piping upstream of each storage tank, or drainfield, as applicable, to divert untreated on-site reuse sources to the sanitary sewer to allow servicing and inspection of Bypass valves shall be *labeled* to indicate the direction of flow, connection and storage tank or drainfield connection. Access shall be provided to bypass ~~Bypass~~ valves ~~shall be installed in accessible locations~~. Two shutoff valves shall not be installed to serve as a bypass valve.

P2911.9 Pumping and control system. Access shall be provided to mechanical ~~Mechanical~~ equipment including pumps, valves and filters ~~shall be accessible~~ and shall be removable in order to perform *repair*, maintenance and cleaning. The minimum flow rate and *flow pressure* delivered by the pumping system shall be appropriate for the application and in accordance with Section P2903.

P2912.4 Roof washer. An amount of rainwater shall be diverted at the beginning of each rain event, and not allowed to enter the storage tank, to wash accumulated debris from the collection surface. The amount of rainfall to be diverted shall be field adjustable as necessary to minimize storage tank water contamination. The roof washer shall not rely on manually operated valves or devices and shall operate automatically. Diverted rainwater shall not be drained to the roof surface and shall be discharged in a manner consistent with the stormwater runoff requirements of the *jurisdiction*.Access shall be provided to roof ~~Roof~~ washers ~~shall be accessible~~ for maintenance and service.

P2912.8 Filtration. Collected rainwater shall be filtered as required for the intended end use. Access shall be provided to filters ~~Filters shall be accessible~~ for inspection and maintenance. Filters shall utilize a pressure gauge or other *approved* method to provide indication when a filter requires servicing or replacement. Filters shall be installed with shutoff valves installed immediately upstream and downstream to allow for isolation during maintenance.

P2912.12 Pumping and control system. Access shall be provided to mechanical ~~Mechanical~~ equipment, including pumps, valves and filters ~~shall be easily accessible~~ and shall be removable in order to perform repair, maintenance and cleaning. The minimum flow rate and *flow pressure* delivered by the pumping system shall be appropriate for the application and in accordance with Section P2903.

P3005.1.5 Provisions for future fixtures. Where drainage has been roughed-in for future fixtures, the drainage unit values of the future fixtures shall be considered in determining the required drain sizes. Such future installations shall be terminated with ~~an accessible~~ a permanent plug or cap fitting. Access to such plugs or caps shall be provided.

P3007.2 Valves required. A check valve and a *full open valve* located on the discharge side of the check valve shall be installed in the pump or ejector discharge piping between the pump or ejector and the gravity drainage system. Access shall be provided to such valves. Such valves shall be located above the sump cover required by Section P3007.3.2 or, where the discharge pipe from the ejector is below grade, the valves shall be ~~accessibly~~ located outside the sump below grade in an access pit with a removable access cover.

P3007.3.2 Sump. The sump shall be not less than 18 inches (457 mm) in diameter and 24 inches (610 mm) deep, unless otherwise *approved*. ~~The sump shall be accessible and~~ Access shall be provided to the sump. The sump shall be located so that drainage flows into the sump by gravity. The sump shall be constructed of tile, concrete, steel, plastic or other *approved* materials. The sump bottom shall be solid and provide permanent support for the pump. The sump shall be fitted with a gastight removable cover that is installed not more than 2 inches (51 mm) below grade or floor level. The cover shall be adequate to support anticipated loads in the area of use. The sump shall be vented in accordance with Chapter 31.

P3302.1 Subsoil drains. *Subsoil drains* shall be open-jointed, horizontally split or perforated pipe conforming to one of the standards indicated in Table P3302.1. Such drains shall be not less than 4 inches (102 mm) in diameter. Where the *building* is subject to backwater, the *subsoil drain* shall be protected by ~~an accessibly located~~ backwater valve. Access shall be provided to the backwater valve. *Subsoil drains* shall discharge to a trapped area drain, sump, dry well or *approved* location above ground. The subsoil sump shall not be required to have either a gastight cover or a vent. The sump and pumping system shall comply with Section P3303.

P3303.1.2 Sump pit. The sump shall be not less than 18 inches (457 mm) in diameter and 24 inches (610 mm) deep, unless otherwise *approved*. ~~The sump shall be *accessible* and The sump shall be accessible~~ Access shall be provided to the sump. The sump shall be located so that all drainage flows into the sump by gravity. The sump shall be constructed of tile, steel, plastic, cast iron, concrete or other *approved* material, with a removable cover adequate to support anticipated loads in the area of use. The sump floor shall be solid and provide permanent support for the pump.

P3303.1.4 Piping. Discharge piping shall meet the requirements of Sections P3002.1, P3002.2, P3002.3 and P3003. Discharge piping shall include ~~an *accessible*~~ afull-flow check valve that is provided with access. Pipe and fittings shall be the same size as, or larger than, the pump discharge tapping.

Reason: Because the term 'accessible' is most commonly understood as requiring access for persons with disabilities we are making the changes to delete the word accessible from the remaining codes and replace it with other words, defined terms or phrases that are not attributed to requiring access for the physically disabled. Many of the codes use the defined term 'access (to)' or 'ready access (to)' for access by maintenance and service personnel or fire departments. This proposal provides clarity and consistency in the remaining codes where those coordination modifications missed or came in as part of new code changes.
This a correlation piece for proposals over the last couple of cycles. This effort was started by the CACs in 2015/16 code change cycle, and continued in 2018/19. This proposal is to provide coordination with the action taken with -P84-15, M2-15, RB2-16, F12-16, CE137-16 Part 1, CE29-19 Part 1 and 2 . G1-21 Part 1 was disapproved; however Part 2 through 7 were approved.
Correlative pieces will be entered in Group B for parts of IRC, IPMC, IZC and IECC.

This proposal is submitted by the ICC Building Code Action Committee (BCAC), the ICC Fire Code Action Committee (FCAC) and ICC Plumbing Mechanical Gas Code Action Committee (PMGCAC)

BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 the BCAC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the BCAC website at BCAC webpage.

Insert FCAC paragraph

PMGCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 PMGCAC has held 26 virtual meetings open to any interested party. In addition, there were several virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the PMGCAC website at PMGCAC.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is a coordination of terms with no changes to construction requirements. See reason statement for additional information on coordination with previous proposals.

E1-24 Part V

Public Hearing Results (CAH1)

Committee Action: **As Modified by Committee**

Committee Modification:
2024 International Residential Code

P2903.10.1 Service valve. Each *dwelling unit* shall be provided with a *main* shutoff valve, provided with access and located near the

P2903.10.1 Service valve. Each *dwelling unit* shall be provided with a *main* shutoff valve, provided with access and located near the entrance of the water service. The valve shall be of a full-open type having nominal restriction to flow, with provision for drainage such as a bleed orifice or installation of a separate drain valve. Additionally, the water service shall be valved at the curb or *lot line* in accordance with local requirements.

P2903.11 Hose bibb. Hose bibbs subject to freezing, including the "frostproof" type, shall be equipped with a stop-and-waste-type valve located inside the *building* and provided with access so that they can be controlled and drained during cold periods.

Exception: Frostproof hose bibbs installed such that the stem extends through the building insulation into an open heated or *semiconditioned space* need not be separately valved (see Figure P2903.11).

Committee Reason: The committee voted 10-0 to approve Grove-MP1's modified proposal. The final vote is 10-0, as modified. The revised code language clarifies the original suggested code language to reduce any possibility of misunderstanding the intent of the code section.

E1-24 Part V

E3-24

IBC: 1003.3.1, 1003.4; IFC: [BE] 1003.3.1, [BE] 1003.4

Proposed Change as Submitted

Proponents: Jeff Grove, Chair, Building Code Action Committee (BCAC) (bcac@iccsafe.org)

2024 International Building Code

Revise as follows:

1003.3.1 Headroom. Protruding objects are permitted to extend below the minimum ceiling height required by Section 1003.2 where a minimum headroom of 80 inches (2032 mm) is provided over any *circulation paths*, including walks, *corridors*, *aisles* and passageways. Not more than 50 percent of the ceiling area of a ~~*means of egress*~~ circulation path shall be reduced in height by protruding objects. **Exception:** Door closers, *overhead doorstops*, frame stops, power door operators and electromagnetic door locks shall be permitted to project into the door opening height not lower than 78 inches (1980 mm) above the floor.A barrier shall be provided where the vertical clearance above a *circulation path* is less than 80 inches (2032 mm) high above the finished floor. The leading edge of such a barrier shall be located 27 inches (686 mm) maximum above the finished floor.

1003.4 Slip-resistant surface. *Circulation paths* ~~of the *means of egress*~~ shall have a slip-resistant surface and be securely attached.

2024 International Fire Code

Revise as follows:

[BE] 1003.3.1 Headroom. Protruding objects are permitted to extend below the minimum ceiling height required by Section 1003.2 where a minimum headroom of 80 inches (2032 mm) is provided over any circulation paths, including walks, *corridors*, *aisles* and passageways. Not more than 50 percent of the ceiling area of a ~~*means of egress*~~ circulation path shall be reduced in height by protruding objects. **Exception:** Door closers, overhead doorstops, frame stops, power door operators and electromagnetic door locks shall be permitted to project into the door opening height not lower than 78 inches (1980 mm) above the floor.A barrier shall be provided where the vertical clearance above a circulation path is less than 80 inches (2032 mm) high above the finished floor. The leading edge of such a barrier shall be located 27 inches (686 mm) maximum above the finished floor.

[BE] 1003.4 Slip-resistant surface. Circulation paths ~~of the *means of egress*~~ shall have a slip-resistant surface and be securely attached.

Reason: Section 1003 applies to all parts of the *means of egress* system.

- In IBC/IFC 1003.3 “*circulation path*” is not followed by “of the *means of egress*”.
- In IBC/IFC 1003.4 “*circulation path*” is followed by “of the *means of egress*”.

The inclusion of “of the *means of egress*” in one, but not the other, gives the unintended mistaken interpretation that the provisions of section 1003.3 apply to all circulation paths and the provisions of section 1003.4 applies only circulations paths of the means of egress.

This proposal is primarily editorial and to remove the possibility of misinterpretation.

Please refer to the definition of 'circulation path'. The term is also used in Sections 1003.3 and 1003.3.3.

This proposal is submitted by the ICC Building Code Action Committee (BCAC).
BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 the BCAC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the BCAC website at BCAC webpage.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is an editorial clarification for circulation paths. There are not change to construction requirements.

E3-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The proposal was disapproved because the change in verbiage could be interpreted to broaden this requirement from means of egress to all parts of the building, such as catwalks and tunnel. (Vote: 8-6)

E3-24

Individual Consideration Agenda

Comment 1:

IBC: 1003.3, 1003.3.1, 1003.3.3, 1003.4; IFC: [BE] 1003.3, [BE] 1003.3.1, [BE] 1003.3.3, [BE] 1003.4

Proponents: Jeff Grove, Chair, Building Code Action Committee (BCAC) (bcac@iccsafe.org) requests As Submitted

Reason: The committee had concerns that removing “of the means of egress” would change the scope of 1003.3 and 1003.4. IBC 1001.1 defines the scope of these two, so the deletion “of the means of egress” would not change the scope.

> **1001.1 General.** Buildings or portions thereof shall be provided with a means of egress system as required by this chapter. The provisions of this chapter shall control the design, construction and arrangement of means of egress components required to provide an approved means of egress from structures and portions thereof.

Consideration was given to adding “of the means of egress” where missing; however, that only pushes the proverbial can down the road. If someone submitted a code change and did not say “of the means of egress” immediately following circulation paths, the issue today would present. Catwalks and similar areas are considered part of the means of egress for occupants working in those areas (see Section 410.5.3.4 as an example). Tunnels are commonly used as means of egress in underground structures such as subways, parking garages, or underground shelters. In these cases, tunnels provide a designated route for individuals to safely evacuate the building or structure during an emergency.

This proposal is editorial, has no technical effects, and removes the possibility of misinterpretation, currently and in the future.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Comment (CAH2)# 126

Rink and pool	50 gross
Decks	15 gross
Stages and platforms	15 net
Warehouses	500 gross

For SI: 1 square foot = 0.0929 m^2, 1 foot = 304.8 mm.

a. Floor area in square feet per occupant.

Add new text as follows:

1004.9 Automated fabrication and manufacturing areas. The *occupant load* factor for Group H-5 automated fabrication and manufacturing areas with a lower density of occupants than would normally be expected in a typical Group H-5occupancy environment shall be applied to such areas. Where *approved* by the *building official*, the *occupant load* for automated fabrication and manufacturing areas shall be the actual *occupant load*, but not less than one occupant per 300 square feet (27.87 m^2) of gross occupiable floor space.

Reason: As the manufacturing of semiconductors is becoming increasingly automated, there are few personnel in the fabrication and manufacturing areas. Similar to what is done for other occupancies, the proposed language provides the code official with the ability to approve an occupant load determination that uses a concentration of something less than 1 person per 200 sq. ft, with a limit that the concentration cannot be less than 1 person per 300 sq. ft.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

$0

Estimated Immediate Cost Impact Justification (methodology and variables):

While reducing the occupant load itself does not reduce construction cost, the associated code requirements for egress capacity, plumbing fixtures, etc. could result in a decrease in the cost of construction.

E8-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: This proposal was disapproved. What about automated facilities other than Group H-5? Is this not already permitted in the exception to Section 1004.4? 300 square feet per occupant might not be an accurate number for all facilities - this appears to take away options. Why can this not just be addressed in the occupant load table? The first sentence in the new section is unclear - it needs to be broken up. (Vote: 9-5)

E8-24

Individual Consideration Agenda

Comment 1:

Proponents: William Koffel, Koffel Associates, Inc., Semiconductor Industry Association (wkoffel@koffel.com) requests As Submitted

Reason: The Committee raised a few concerns when this item was Disapproved by a vote of 9-5.**What about automated facilities other than Group H-5?** This is a legitimate question to ask but we have not included other automated facilities because our data is unique to

semiconductor manufacturing facilities.**Is this not already permitted by Section 1004.4?** Yes, the Exception to Section 1004.5 does allow the code official to allow an occupant load lower than that calculated using the occupant load factor in Table 1004.5. However, that requires a determination made by the code official on a project specific basis. Our data indicates that the proposed occupant load is relevant to most newer projects with automated manufacturing. Note that should the occupant load be greater than calculated using 1 person per 300 sq. ft., Section 1004.5.1 addresses the increased occupant load. It should also be noted that the Exception to Section 1004.5 provides no recommended value to be used, which could be too open ended resulting in significant inconsistencies regarding enforcement.**Why not just put the occupant load in the table?** We chose a format similar to existing Section 1004.8. If the 1 person per 300 sq. ft. is inserted in the table, there is no analysis to indicate that the density is lower than commonly found in other fabs and there would be no review process by the code official. **The first sentence is unclear.** As noted above, we chose a format similar to existing Section 1004.8.In summary, we do not simply support a line in the table that provides an occupant load of 1 person per 300 sq. ft. for any semiconductor manufacturing facility that has one or more pieces of automatic equipment. While the exception to Section 1004.5 does using an occupant load factor lower than what is calculated, we believe that due to the frequency that this will occur, a separate occupant load factor is warranted. In other words, we are supporting language that is between an automatic allowance to use 1 person per 300 sq. ft. and the existing language that would allow it, but is silent on the conditions and what would be a reasonable occupant load factor.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

a. Floor area in square feet per occupant.

Reason: Most motor vehicle repair garages will never have an occupant load as high as one would be calculated for by using the

industrial occupant load factor of 100 gross square feet per person. On average, most vehicle repair garages will average closer to 500 square feet per person in terms of actual employees on a given shift. Even if a change in shifts is occurring, the occupant load would still not be anywhere near the 100 square feet per person load factor. What I have tried to provide is two different load factors, as commercial vehicles will take up much more space in a repair garage than the typical passenger vehicles. The term "Commercial Motor Vehicle (CMV)" is a term recognized by the Department of Transportation and applies to vehicles whose weight is more than 10,000 pounds. All other vehicles would then be non-CMV, which would include passenger vehicles. The smaller proposed occupant load factor would apply to these facilities. This would recognize there is more space available for smaller vehicles and thus the potential for an increased occupant load. While this proposed occupant load factor for the CMV is the same as a warehouse, I did not want to add this to the warehouse classification as that should stand on its own.

To give an example, we have a client that builds truck repair garages for CMV's across the country. On average, one of their facilities will be 14,000 square feet. At any given point during the day, the most workers they will have in the building is ten, which would yield an occupant load factor of 1,400, which is not reasonable. By the time one takes into account the space the equipment occupies, the 500 square feet per person is a reasonable occupant load factor for this specific application.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

If anything this would reduce costs as the number of occupants would reduce the number of plumbing fixtures required.

E10-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: A definition for commercial motor vehicles should be added into the code so that this can be uniformly enforced across jurisdictions. There was not justification provided for the occupant load factor for non-CMV areas. What would non-CMV areas include? If aircraft hangers have occupant load factors of 300 sq.ft., the 500 sq.ft. occupant load factor seems high. (Vote: 9-5)

E10-24

Individual Consideration Agenda

Comment 1:

IBC: SECTION 202 (New); IFC: SECTION 202 (New)

Proponents: Eirene Knott, BRR Architecture, BRR Architecture (eirene.knott@brrarch.com) requests As Modified by Committee (AMC2)

Further modify as follows:

2024 International Building Code

Add new definition as follows:

COMMERCIAL MOTOR VEHICLE. Any motor vehicle used on a highway in interstate commerce to transport property or passengers when the vehicle has a gross vehicle weight rating of 10,001 pounds or more.

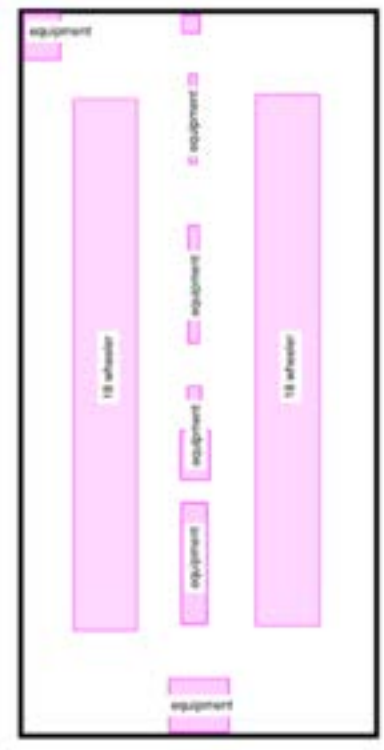
2024 International Fire Code

Add new definition as follows:

COMMERCIAL MOTOR VEHICLE. Any motor vehicle used on a highway in interstate commerce to transport property or passengers when the vehicle has a gross vehicle weight rating of 10,001 pounds or more.

Reason: The committee asked for a definition of commercial motor vehicle, which I have included. This comes from the USDOT. I stand by my original proposal request of 500 square feet per person for a commercial motor vehicle repair garage. In my original reason statement I indicated that we have a client that builds commercial vehicle repair garages. In the attached illustration, I have provided a two bay repair garage which is approximately 4800 square feet. The items in color represent either the trucks themselves being repaired or equipment within the garage utilized for servicing the trucks. After subtracting these areas, which occupy approximately 1500 square feet, we're left with approximately 3,300 square feet. Using the current provisions of 100 square feet per person, this will yield an occupant load of 33 people. I'm not sure where 33 people would fit unless they're on top of each other. Using the proposed load of 500 square feet per person, we get an occupant load of 7, which based on client information is about how many people will actually be in this space. If we take this one step further and use the proposed load by the committee of 300 square feet per person, we get an occupant load of 11.

There needs to be a distinction between a commercial vehicle garage and a non-commercial vehicle garage in terms of occupant loads as the commercial garage will have much larger equipment and the vehicles themselves take up more space. An average 18 wheeler truck is 72 feet in length, 8.5 feet in width and 13.5 feet in height, which yields about 612 square feet. If we assume an average pickup truck is 20 feet in length and 7 feet in width, that's only 140 square feet so approximately one-fourth the size of the commercial truck. Even with some of the equipment used on passenger vehicles, the 100 square foot per person is not realistic, which is why I proposed the 200 for the passenger vehicles and 500 for the commercial.



Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

If anything this would reduce costs as the number of occupants would reduce the number of plumbing fixtures required. (same notation as original proposal)

E15-24

IBC: 1005.3, 1030.6; IFC: [BE] 1005.3, [BE] 1030.6

Proposed Change as Submitted

Proponents: Jeff Grove, Chair, Building Code Action Committee (BCAC) (bcac@iccsafe.org)

2024 International Building Code

Revise as follows:

1005.3 Required capacity based on occupant load. The required capacity, in inches (mm), of the *means of egress* for any room, area, space or *story* shall be not less than that determined in accordance with Sections 1005.3.1 and 1005.3.2.
The capacity, in inches, of means of egress stairways between stories or mezzanines that also serve as a stepped aisle for tiered platforms used for seating shall be the aggregate of both of the following:

1. The occupant load served by the stairway from the story or mezzanine in accordance with Sections 1005.3.1.
2. The occupant load of the tiered platforms used for seating determined in accordance with Section 1030.6.

1030.6 Capacity of aisle for assembly. The required capacity of aisles shall be not less than that determined in accordance with Section 1030.6.1 where *smoke-protected assembly seating* is not provided, Section 1030.6.2 where *smoke-protected assembly seating* is provided and Section 1030.6.3 where *open-air assembly seating* is provided.
The capacity, in inches, of means of egress stairways between stories or mezzanines that also serve as a stepped aisle for tiered platforms used for seating shall be the aggregate of both of the following:

1. The occupant load served by the stairway from the story or mezzanine in accordance with Sections 1005.3.1.
2. The occupant load of the tiered platforms used for seating determined in accordance with Section 1030.6.

2024 International Fire Code

Revise as follows:

[BE] 1005.3 Required capacity based on occupant load. The required capacity, in inches (mm), of the *means of egress* for any room, area, space or story shall be not less than that determined in accordance with Sections 1005.3.1 and 1005.3.2.
The capacity, in inches, of means of egress stairways between stories or mezzanines that also serve as a stepped aisle for tiered platforms used for seating shall be the aggregate of both of the following:

1. The occupant load served by the stairway from the story or mezzanine in accordance with Sections 1005.3.1.
2. The occupant load of the tiered platforms used for seating determined in accordance with Section 1030.6.

[BE] 1030.6 Capacity of aisle for assembly. The required capacity of *aisles* shall be not less than that determined in accordance with Section 1030.6.1 where *smoke-protected assembly seating* is not provided, with Section 1030.6.2 where *smoke-protected assembly seating* is provided, and with Section 1030.6.3 where open-air assembly seating is provided.
The capacity, in inches, of means of egress stairways between stories or mezzanines that also serve as a stepped aisle for tiered platforms used for seating shall be the aggregate of both of the following:

1. The occupant load served by the stairway from the story or mezzanine in accordance with Sections 1005.3.1.
2. The occupant load of the tiered platforms used for seating determined in accordance with Section 1030.6.

Reason: E106-18 added criteria to 1030.16 to address social stairways.

“Where stepped aisles have seating on one side and the aisle width is 74 inches (1880 mm) or greater, two handrails are required.

Where two handrails are required, one of the handrails shall be within 30 inches (762 mm) horizontally of the stepped aisle."

The question at this point is where there is this type assembly seating immediately adjacent to the egress from the upper floor – how should the capacity of the combined stairway/stepped aisle be calculated? We feel that the proposed language would clarify this issue.

This proposal is submitted by the ICC Building Code Action Committee (BCAC).

BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 the BCAC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the BCAC website at BCAC webpage.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is a clarification of requirements to calculate width for the stairway/stepped aisle. There are no change to construction requirements.

E15-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The intent is good, but there are some additional clean ups needed. This might be better located in a subsection. The terminology mixes 'required capacity' and occupant load - this needs to be separated. There should be a pointer in one of the sections to reduce duplication. (Vote: 13-1)

E15-24

Individual Consideration Agenda

Comment 1:

IBC: 1005.3, 1005.3.1, 1005.3.1.1 (New), 1005.3.2, 1030.6, 1003.6.4 (New); IFC: [BE] 1005.3, [BE] 1005.3.1, [BE]1005.3.1.1 (New), [BE] 1005.3.2, [BE] 1030.6, [BE] 1003.6.4 (New)

Proponents: Jeff Grove, Chair, Building Code Action Committee (BCAC) (bcac@iccsafe.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

1005.3 Required capacity based on occupant load. The required capacity, in inches (mm), of the *means of egress* for any room, area, space or *story* shall be not less than that determined in accordance with Sections 1005.3.1 and 1005.3.2. Stepped aisles adjacent to tiered platforms used as seating shall comply with Section 1005.3.3. ~~The capacity, in inches, of means of egress stairways between stories or mezzanines that also serve as a stepped aisle for tiered platforms used for seating shall be the aggregate of both of the following:~~

~~1. The occupant load served by the stairway from the story or mezzanine in accordance with Sections 1005.3.1.~~

~~2. The occupant load of the tiered platforms used for seating determined in accordance with Section 1030.6.~~

1005.3.1 Stairways. The capacity, in inches, of means of egress *stairways* shall be calculated by multiplying the *occupant load* served by such *stairways* by a *means of egress* capacity factor of 0.3 inch (7.6 mm) per occupant. Where *stairways* serve more than one *story*, only the *occupant load* of each *story* considered individually shall be used in calculating the required capacity of the *stairways* serving that *story*. **Exceptions:**

1. For other than Group H and I-2 occupancies, the capacity, in inches, of means of egress *stairways* shall be calculated by multiplying the *occupant load* served by such *stairways* by a means of egress capacity factor of 0.2 inch (5.1 mm) per occupant in *buildings* equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1 or 903.3.1.2 and an *emergency voice/alarm communication system* in accordance with Section 907.5.2.2.
2. *Facilities* with *smoke-protected assembly seating* shall be permitted to use the capacity factors in Table 1030.6.2 indicated for stepped *aisles* for *exit access* or exit *stairways* where the entire path for *means of egress* from the seating to the *exit discharge* is provided with a smoke control system complying with Section 909.
3. *Facilities* with *open-air assembly seating* shall be permitted to the capacity factors in Section 1030.6.3 indicated for stepped *aisles* for *exit access* or *exit stairways* where the entire path for *means of egress* from the seating to the *exit discharge* is open to the outdoors.

Add new text as follows:

1005.3.1.1 Stepped aisles for tiered platforms used as seating. The capacity, in inches, of the means of egress stairways between

stories or mezzanines that also serve as a stepped aisle for tiered platforms used for seating shall comply with Section 1030.6.1.

1005.3.2 Other egress components. The capacity, in inches, of *means of egress* components other than *stairways* shall be calculated by multiplying the *occupant load* served by such component by a means of egress capacity factor of 0.2 inch (5.1 mm) per occupant.

Exceptions:

1. For other than Group H and I-2 occupancies, the capacity, in inches, of *means of egress* components other than *stairways* shall be calculated by multiplying the *occupant load* served by such component by a means of egress capacity factor of 0.15 inch (3.8 mm) per occupant in *buildings* equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1 or 903.3.1.2 and an emergency voice/alarm communication system in accordance with Section 907.5.2.2.
2. *Facilities* with *smoke-protected assembly seating* shall be permitted to use the capacity factors in Table 1030.6.2 indicated for level or ramped *aisles* for *means of egress* components other than *stairways* where the entire path for *means of egress* from the seating to the *exit discharge* is provided with a smoke control system complying with Section 909.
3. *Facilities* with *open-air assembly seating* shall be permitted to the capacity factors in Section 1030.6.3 indicated for level or ramped *aisles* for *means of egress* components other than *stairways* where the entire path for *means of egress* from the seating to the *exit discharge* is open to the outdoors.

1030.6 Capacity of aisle for assembly. The required capacity of aisles shall be not less than that determined in accordance with Section 1030.6.1 where *smoke-protected assembly seating* is not provided, Section 1030.6.2 where *smoke-protected assembly seating* is provided, ~~and~~ Section 1030.6.3 where *open-air assembly seating* is provided and Section 1030.6.4 where tiered platforms used as seating is provided.

~~The capacity, in inches, of means of egress stairways between stories or mezzanines that also serve as a stepped aisle for tiered platforms used for seating shall be the aggregate of both of the following:~~

1. ~~The occupant load served by the stairway from the story or mezzanine in accordance with Sections 1005.3.1.~~
2. ~~The occupant load of the tiered platforms used for seating determined in accordance with Section 1030.6.~~

Add new text as follows:

1003.6.4 Stepped aisles for tiered platforms used as seating. The capacity, in inches, of means of egress stairways between stories or mezzanines that also serve as a stepped aisle for tiered platforms used for seating shall be the aggregate of the following:

1. The capacity, in inches, of the means of egress stairway from the story or mezzanine in accordance with Sections 1005.3.1.
2. The capacity, in inches, as determined by the occupant load of the tiered platforms used for seating in accordance with Section 1030.6.1, 1030.6.2, or 1030.6.3, as applicable.

2024 International Fire Code

[BE] 1005.3 Required capacity based on occupant load. The required capacity, in inches (mm), of the *means of egress* for any room, area, space or story shall be not less than that determined in accordance with Sections 1005.3.1 and 1005.3.2. Stepped aisles adjacent to tiered platforms used as seating shall comply with Section 1005.3.3.

~~The capacity, in inches, of means of egress stairways between stories or mezzanines that also serve as a stepped aisle for tiered platforms used for seating shall be the aggregate of both of the following:~~

1. ~~The occupant load served by the stairway from the story or mezzanine in accordance with Sections 1005.3.1.~~
2. ~~The occupant load of the tiered platforms used for seating determined in accordance with Section 1030.6.~~

[BE] 1005.3.1 Stairways. The capacity, in inches, of *means of egress stairways* shall be calculated by multiplying the *occupant load* served by such *stairways* by a means of egress capacity factor of 0.3 inch (7.6 mm) per occupant. Where *stairways* serve more than one

story, only the *occupant load* of each story considered individually shall be used in calculating the required capacity of the *stairways* serving that story. **Exceptions:**

1. For other than Group H and I-2 occupancies, the capacity, in inches, of *means of egress stairways* shall be calculated by multiplying the *occupant load* served by such *stairways* by a *means of egress* capacity factor of 0.2 inch (5.1 mm) per occupant in buildings equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1 or 903.3.1.2 and an emergency voice/alarm communication system in accordance with Section 907.5.2.2.
2. Facilities with *smoke-protected assembly seating* shall be permitted to use the capacity factors in Table 1030.6.2 indicated for stepped *aisles* for *exit access* or *exit stairways* where the entire path for *means of egress* from the seating to the *exit discharge* is provided with a smoke control system complying with Section 909.
3. Facilities with *open-air assembly seating* shall be permitted to the capacity factors in Section 1030.6.3 indicated for stepped *aisles* for *exit access* or *exit stairways* where the entire path for *means of egress* from the seating to the *exit discharge* is open to the outdoors.

Add new text as follows:

[BE]1005.3.1.1 Stepped aisles for tiered platforms used as seating. The capacity, in inches, of the means of egress stairways between stories or mezzanines that also serve as a stepped aisle for tiered platforms used for seating shall comply with Section 1030.6.1.

[BE] 1005.3.2 Other egress components. The capacity, in inches, of *means of egress* components other than *stairways* shall be calculated by multiplying the *occupant load* served by such component by a *means of egress* capacity factor of 0.2 inch (5.1 mm) per occupant. **Exceptions:**

1. For other than Group H and I-2 occupancies, the capacity, in inches, of *means of egress* components other than *stairways* shall be calculated by multiplying the *occupant load* served by such component by a *means of egress* capacity factor of 0.15 inch (3.8 mm) per occupant in buildings equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1 or 903.3.1.2 and an emergency voice/alarm communication system in accordance with Section 907.5.2.2.
2. Facilities with *smoke-protected assembly* seating shall be permitted to use the capacity factors in Table 1030.6.2indicated for level or ramped *aisles* for *means of egress* components other than *stairways* where the entire path for *means of egress* from the seating to the *exit discharge* is provided with a smoke control system complying with Section 909.
3. Facilities with *open-air assembly seating* shall be permitted to the capacity factors in Section 1030.6.3 indicated for level or ramped *aisles* for *means of egress* components other than *stairways* where the entire path for *means of egress* from the seating to the *exit discharge* is open to the outdoors.

[BE] 1030.6 Capacity of aisle for assembly. The required capacity of *aisles* shall be not less than that determined in accordance with Section 1030.6.1 where *smoke-protected assembly seating* is not provided, with Section 1030.6.2 where *smoke-protected assembly seating* is provided, ~~and~~ Section 1030.6.3 where *open-air assembly seating* is provided and Section 1030.6.4 where tiered platforms used as seating is provided.

~~The capacity, in inches, of means of egress stairways between stories or mezzanines that also serve as a stepped aisle for tiered platforms used for seating shall be the aggregate of both of the following:~~

1. ~~The occupant load served by the stairway from the story or mezzanine in accordance with Sections 1005.3.1.~~
2. ~~The occupant load of the tiered platforms used for seating determined in accordance with Section 1030.6.~~

Add new text as follows:

[BE] 1003.6.4 Stepped aisles for tiered platforms used as seating. The capacity, in inches, of means of egress stairways between stories or mezzanines that also serve as a stepped aisle for tiered platforms used for seating shall be the aggregate of the following:

1. The capacity, in inches, of the means of egress stairway from the story or mezzanine in accordance with Sections 1005.3.1.

2. The capacity, in inches, as determined by the occupant load of the tiered platforms used for seating in accordance with Section 1030.6.1, 1030.6.2, or 1030.6.3, as applicable..

Reason: The intent of this proposal remains the same (see original reason). The modifications were made to address the committee comments.

In response to the Committee's comment that this would be better in its own subsection, subsection 1030.6.4 was created, with a pointer being added in a new subsection 1005.3.1.1. While either location would be acceptable, 1030.6 was chosen on the belief that a user may start in Section 1030 when designing a social stairway.

To address the committee's concerns about the mixing of terminology, Section 1030.6.4, Items 1 and 2 were re-written slightly to better address that the minimum width of the stairway is the aggregate of widths as determined by the two conditions.

Throughout the means of egress sections, the minimum size of egress components is stated with the phrase "capacity, in inches". It was used in this proposal to keep the text consistent with the remainder of the established means of egress sections. See Section 1005.3, 1005.3.1, 1005.3.2, 1030.6.1, 1030.6.2 and 1030.6.3 for examples of this phrase in current text. If it was the committees desire for that phrasing to be addressed in some way throughout the code, BCAC would happily consider it in a proposal for next cycle, but changing here it is beyond the intent and scope of this proposal.

Example:

200 occupants egressing on the stairway from the 2nd floor and 150 occupants on the tiered platforms in a college student union.

(200 occupants x 0.3") + (150 occupants x 0.3") = 60" + 45" = a minimum stairway width of 105"

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is a clarification of requirements to calculate width for the stairway/stepped aisle. There are no change to construction requirements.

Comment (CAH2)# 127

E18-24

IBC: 1006.2.2.5; IFC: [BE] 1006.2.2.5

Proposed Change as Submitted

Proponents: Jeff Grove, Chair, Building Code Action Committee (BCAC) (bcac@iccsafe.org)

2024 International Building Code

Revise as follows:

1006.2.2.5 Vehicular ramps. Vehicular ramps intended only for vehicle traffic shall not be considered as an *exit access ramp* ~~unless pedestrian *facilities* are~~ except where a walkway used exclusively as a pedestrian trafficway is provided.

2024 International Fire Code

Revise as follows:

[BE] 1006.2.2.5 Vehicular ramps. Vehicular ramps intended only for vehicle traffic shall not be considered as an *exit access ramp* ~~unless pedestrian *facilities* are~~ except where a walkway used exclusively as a pedestrian trafficway is provided.

Reason: Are vehicular ramps the driveways and crossovers for cars only with no parking on either side; or are they wherever a car drives in a parking garage. Pedestrian walkways are used for bridges between buildings in Chapter 31, so we did not want to use the defined term, but the words in the defined term would add clarity to this requirement. The term “pedestrian facilities” is not defined and is not clear.

This proposal is submitted by the ICC Building Code Action Committee (BCAC).

BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 the BCAC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the BCAC website at BCAC webpage.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is a clarification of requirements for pedestrians on vehicular ramps. There are no changes to construction requirements.

E18-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The change adds confusion. Does a pedestrian trafficway require a sidewalk or barriers along the vehicle ramp? If you have a pedestrian route, this is not longer a "vehicular ramp only for vehicle traffic." (Vote: 14-0)

E18-24

Individual Consideration Agenda

Comment 1:

IBC: 1006.2.2.5; IFC: [BE] 1006.2.2.5

Proponents: Jeff Grove, Chair, Building Code Action Committee (BCAC) (bcac@iccsafe.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

1006.2.2.5 Vehicular ramps. Vehicular ramps intended only for vehicle traffic shall not be considered as an *exit access ramp* except where a demarcated walkway used exclusively ~~as a~~ for pedestrian traffic ~~way~~ is provided.

2024 International Fire Code

[BE] 1006.2.2.5 Vehicular ramps. Vehicular ramps intended only for vehicle traffic shall not be considered as an *exit access ramp* except where a demarcated walkway used exclusively ~~as a~~ for pedestrian traffic ~~way~~ is provided.

Reason: The modifications are intended to address the committee's concerns.

Vehicular ramps are driveways and crossovers for cars only with no parking on either side; they are not sloped surfaces between parking where vehicles enter or exit spaces. Typically pedestrians are not using these entrance ramps. The allowance is for emergency egress if needed.

The requirement for the walkway to be **demarcated** is added to clarify the need for separation but leaves the method of such separation open (barriers, marking, sidewalks, curbs, etc.). The term demarcated is already used in 1016.2 (item 6, exception 2).

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is a clarification of requirements for pedestrians on vehicular ramps. There are no changes to construction requirements.

Comment (CAH2)# 128

E19-24

IBC: 1006.2.2, 1006.2.2.7 (New); IFC: [BE] 1006.2.2, 1006.2.2.7 (New)

Proposed Change as Submitted

Proponents: Adam Henson, U.S. Chemical Safety and Hazard Investigation Board (adam.henson@csb.gov)

2024 International Building Code

Revise as follows:

1006.2.2 Egress based on use. The numbers, configuration and types of components of *exits* or access to *exits* shall be provided in the uses described in Sections 1006.2.2.1 through ~~1006.2.2.6~~ 1006.2.2.7.

Add new text as follows:

1006.2.2.7 Equipment Platforms. Equipment platforms in Group H-1, H-2, H-3 and H-4 occupancies, and equipment platforms located outside servicing industrial processes, storing or using hazardous materials in excess of the maximum allowable quantity per control area specified in Tables 5003.1.1 (3) or 5003.1.1(4) of the *International Fire Code*, shall have at least two exits or exit access doorways.

Exception: Equipment platforms with less than 4 occupants and with an exit access travel distance less than 200 feet (61 m) shall be permitted to have a single exit or exit access doorway.

2024 International Fire Code

Revise as follows:

[BE] 1006.2.2 Egress based on use. The numbers, configurations, and types of components of exits or access to exits shall be provided in the uses described in Sections 1006.2.2.1 through ~~1006.2.2.6~~ 1006.2.2.7

Add new text as follows:

1006.2.2.7 Equipment Platforms. Equipment platforms in Group H-1, H-2, H-3 and H-4 occupancies, and equipment platforms located outside servicing industrial processes, storing or using hazardous materials in excess of the maximum allowable quantity per control area specified in Tables 5003.1.1 (3) or 5003.1.1(4), shall have at least two exits or exit access doorways.

Exception: Equipment platforms with less than 4 occupants and with an exit access travel distance less than 200 feet (61 m) shall be permitted to have a single exit or exit access doorway.

Reason: On November 13, 2020, hydrogen chloride gas, which is corrosive and toxic, was released from an industrial chemical process at the Wacker Polysilicon North America (Wacker) facility in Charleston, TN. The release occurred when excessive torque was applied to the bolts of the graphite heat exchanger in the unit. The release occurred on the fifth floor of an equipment platform located outdoors. At the time of the release, there were seven workers on the fifth floor of the equipment platform some in chemical resistant suits and others not.

Four of the workers remained in place during the release. Three of the workers who were not wearing chemical resistant suits attempted to escape by climbing over the edge of the equipment platform approximately 70 feet above the ground and climbing down piping on the side of the structure. During the climb down all three workers fell fatally injuring one and seriously injuring the other two. One of the employees who remained in place suffered chemical burns when their chemical resistant suit ripped. In addition to the human toll of this incident damages of $214,000 were reported by the facility.

Access to/egress from the fourth and fifth floors of the equipment platform was provided by a single staircase. The release cut off the employees from the staircase. In the months immediately preceding the incident Wacker identified this area having a single means of egress as a hazard during a process hazard analysis. At the time of the incident, Wacker had not followed up on this PHA recommendation. In response to concerns brought by employees Wacker cited IBC/IFC as justification for the arrangement of the

platform's means of egress.

During its investigation the CSB concluded that had an additional means of egress been installed that the workers affected by the release would not have had to climb over the edge of the platform to escape the release and the fatality and serious injuries associated with the falls could have been prevented. The CSB also concludes that current egress requirements, including those found in the IBC/IFC, are insufficient for equipment platforms used for accessing equipment containing hazardous materials.

As part of its investigation into this incident, the CSB reviewed the requirements of the International Building Code (IBC) and the International Fire Code (IFC) and determined that there are no requirements for means of egress from equipment platforms even those serving equipment with hazardous materials under any circumstances.

As the result of the investigation, the CSB issued the following recommendation to the International Code Council:

CSB Recommendation No. 2021-01-I-TN-R9

Amend the International Building Code (IBC) to address conditions that may require multiple means of egress from elevated equipment platforms used for accessing equipment containing materials that pose physical and health hazards, such as the one used at Wacker in this incident. Specify the minimum number of egress points to increase the likelihood of worker escape in the event of a hazardous material release.

The language proposed is intended to satisfactorily implement this recommendation.

Bibliography: U.S. Chemical Safety and Hazard Investigation Board (CSB), "Equipment Fracture and Fatal Hydrogen Chloride Release at Wacker Polysilicon North America," 15 June 2023. [Online]. Available: https://www.csb.gov/file.aspx?DocumentId=6226. [Accessed 30 November 2023].

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

Between $17,000 and $362,000

Estimated Immediate Cost Impact Justification (methodology and variables):

Recent projects to increase the number of means of egress on elevated equipment platforms were completed, or are underway, at a chemical plant in Tennessee. Addressing the following scenarios resulted in the following final and estimated costs.

Scenario 1: A piece of equipment is kept on the third floor, near the edge of the platform.

Solution:

Ladders were added on each side of the building from the third floor to an adjacent building. Modifications were also made to the rood access door.

Final Cost: $17,000

Scenario 2: The existing finger rack dead-ends.

Solution:

A ladder and platform were installed to connect the finger rack to the adjacent pipe rack.

Final Cost: $24,000

Scenario 3: The existing finger rack dead-end on either side of a process vessel.

Solution:

Ladders and platforms were added on each of the finger racks.

Final Cost: $147,000

Scenario 4: Material from a third-floor skid is piped through upper floors and is located in various vessels on the upper floors. Maintenance and operations personnel frequently access these areas and there is a single means of egress.

Solution:

Ladders are being added from the 6^{th} to 5^{th} floors, 5^{th} to 4^{th} floors, and 4^{th} floor to the roof of the adjacent building.

Estimated Cost: $175,000

Scenario 5: Chemical process equipment is located on the fifth floor of an elevated equipment platform with a single means of egress.

Solution:

A stair tower serving each floor of the elevated equipment platform was constructed.

Final Cost: $362,000

Cost Source:

This information was provided by the chemical company previously mentioned based on their efforts to install secondary means of egress on the existing elevated equipment platforms located throughout their facility. The cost of these items for new construction will likely be less expensive if secondary means of egress for these structures is considered in their original design.

E19-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: There were several questions about the proposal. Does this apply to equipment platforms inside and outside a building? How would you determine the occupant load of an equipment platform when this space is defined as non-occupied. How would a code official determine and occupant load where there is no occupant load in the table? Would ladders be permitted as a exit - they are permitted in Section 505.3? What is the justification for the size limits? Should there be separation requirements for the two exits? (Vote: 14-0)

E19-24

Individual Consideration Agenda

Comment 1:

IBC: 1006.2.2.7; IFC: 1006.2.2.7

Proponents: Adam Henson, U.S. Chemical Safety and Hazard Investigation Board (adam.henson@csb.gov) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

Revise as follows:

1006.2.2.7 Equipment Platforms. Equipment platforms in Group H-1, H-2, H-3 and H-4 occupancies, and equipment platforms located outside servicing industrial processes, storing or using hazardous materials in excess of the maximum allowable quantity per control area specified in Tables 5003.1.1 (3) or 5003.1.1(4) of the *International Fire Code,* shall have ~~at least~~ not less than two exits, ~~or~~ exit access doorways, or exit access stairways. The requirements of this section are permitted to be met by the installation of one or more fixed ladders or alternating tread devices.

Exception: Equipment platforms less than 20 feet (6.1 m) above the lower level ~~with less than 4 occupants and with an exit access travel distance less than 200 feet (61 m)~~ shall be permitted to have a single exit, ~~or~~ exit access doorway, or exit access stairway.

2024 International Fire Code

Revise as follows:

[BE] 1006.2.2.7 Equipment Platforms. Equipment platforms in Group H-1, H-2, H-3 and H-4 occupancies, and equipment platforms located outside servicing industrial processes, storing or using hazardous materials in excess of the maximum allowable quantity per control area specified in Tables 5003.1.1 (3) or 5003.1.1(4), shall have ~~at least~~ not less than two exits, ~~or~~ exit access doorways, or exit access stairways. The requirements of this section are permitted to be met by the installation of one or more fixed ladders or alternating tread devices.

Exception: Equipment platforms less than 20 feet (6.1 m) above the lower level ~~with less than 4 occupants and with an exit access travel distance less than 200 feet (61 m)~~ shall be permitted to have a single exit, ~~or~~ exit access doorway, or exit access stairway.

Reason: This proposal has been updated in an attempt to address the concerns shared by the committee at CAH #1. The proposal does apply to platforms inside and outside of buildings as addressed by the first sentence of 1006.2.2.7 of updated the proposal. The reference in the exception necessitating the calculation of the occupant load of the platforms has been replaced with an exception based on the height of the equipment platform. The height chosen is based on a research paper titled: *Falls from Great Heights: Risk to Sustain Severe Thoracic and Pelvic Injuries Increases with Height of Fall*. This paper was published June 10, 2021 and is available through the U.S. National Library of Medicine. According to this paper researchers have described a fall from a height of at least 20 feet (6.1 M) as the threshold for suffering major trauma. NIOSH published a paper in 1975 calling for every elevated work surface servicing a hazardous process to have two means of egress, but the exception as proposed seems necessary and appropriate. This information is located in Section 3 of the document. Yes, ladders would be acceptable to meet these requirements. Alternating tread devices would also suffice. There is nothing in the proposal seeking to limit the size of equipment platforms. The reference to travel distance in the original proposal was not intended to limit the size of the platform, but rather to denote equipment platforms that would be excepted from the proposal's requirements because of their small size. The distance was from NFPA 101 Section 11.2 Open Structures. A requirement for separation similar to the one found for Refrigeration Machinery Rooms (1006.2.2.2). The entire proposal is meant to mirror the existing egress requirements for boiler rooms, refrigeration machinery rooms, and others in the Egress Based on Use Section of the IBC/IFC (1006.2.2) because of the similarity between these spaces and how they are used. The definition of equipment platforms identifies them as unoccupied. The definition of floor area, net identifies mechanical rooms, such as boiler rooms and refrigeration mechanical rooms, as unoccupied accessory areas. They should be treated the same.

Proposed Change as Submitted

Proponents: Jeff Grove, Chair, Building Code Action Committee (BCAC) (bcac@iccsafe.org)

2024 International Building Code

1006.3.4 Single exits. A single *exit* or access to a single *exit* shall be permitted from any *story* or *occupiable roof* where one of the following conditions exists:

1. The *occupant load*, number of *dwelling units* and exit access travel distance do not exceed the values in Table 1006.3.4(1) or 1006.3.4(2).
2. Rooms, areas and spaces complying with Section 1006.2.1 with *exits* that discharge directly to the exterior at the *level of exit discharge*, are permitted to have one *exit* or access to a single *exit*.
3. Parking garages where vehicles are mechanically parked shall be permitted to have one *exit* or access to a single *exit*.
4. Group R-3 and R-4 occupancies shall be permitted to have one *exit* or access to a single *exit*.
5. Individual single-story or multistory *dwelling units* shall be permitted to have a single *exit* or access to a single *exit* from the *dwelling unit* provided that both of the following criteria are met:
   5.1. The *dwelling unit* complies with Section 1006.2.1 as a space with one *means of egress*.
   5.2. Either the exit from the *dwelling unit* discharges directly to the exterior at the *level of exit discharge*, or the *exit access* outside the *dwelling unit's* entrance door provides access to not less than two *approved* independent *exits*.

Revise as follows:

TABLE 1006.3.4(1) STORIES AND OCCUPIABLE ROOFS WITH ONE EXIT OR ACCESS TO ONE EXIT FOR R-2 OCCUPANCIES

STORY OR OCCUPIABLE ROOF	OCCUPANCY	MAXIMUM NUMBER OF DWELLING UNITS	MAXIMUM EXIT ACCESS TRAVEL DISTANCE
Basement, first, second or third story above grade plane and occupiable roofs over the first or second story above grade plane	R-2[a, b, c]	4 dwelling units	125 feet
Fourth story above grade plane and higher	NP	NA	NA

For SI: 1 foot = 304.8 mm.

NP = Not Permitted.

NA = Not Applicable.

a. Buildings classified as Group R-2 equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1, ~~or~~ 903.3.1.2 or 903.3.1.3, and provided with emergency escape and rescue openings in accordance with Section 1031.

b. This table is used for Group R-2 occupancies consisting of dwelling units. For Group R-2 occupancies consisting of sleeping units, use Table 1006.3.4(2).

c. This table is for occupiable roofs accessed through and serving individual dwelling units in Group R-2 occupancies. For Group R-2 occupancies with occupiable roofs that are not accessed through and serving individual units, use Table 1006.3.4(2).

TABLE 1006.3.4(2) STORIES AND OCCUPIABLE ROOFS WITH ONE EXIT OR ACCESS TO ONE EXIT FOR OTHER OCCUPANCIES

STORY AND OCCUPIABLE ROOF	OCCUPANCY	MAXIMUM OCCUPANT LOAD PER STORY AND OCCUPIABLE ROOF	MAXIMUM EXIT ACCESS TRAVEL DISTANCE (feet)
First story above or below grade plane and occupiable roofs over the first story above grade plane	A, B[b], E, F[b], M, U	49	75
	H-2, H-3	3	25
	H-4, H-5, I, R-1, R-2[a, c]	10	75
	S[b, d]	29	75
Second story above grade plane	B, F, M, S[d]	29	75
Third story above grade plane and higher	NP	NA	NA

For SI: 1 foot = 304.8 mm.

NP = Not Permitted.

NA = Not Applicable.

a. Buildings classified as Group R-2 equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1, ~~or~~ 903.3.1.2 or 903.3.1.3, and provided with emergency escape and rescue openings in accordance with Section 1031.

b. Group B, F and S occupancies in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or an occupiable roof of such buildings shall have a maximum exit access travel distance of 100 feet.

c. This table is used for Group R-2 occupancies consisting of sleeping units. For Group R-2 occupancies consisting of dwelling units, use Table 1006.3.4(1).

d. The length of exit access travel distance in a Group S-2 open parking garage shall be not more than 100 feet.

2024 International Fire Code

[BE] 1006.3.4 Single exits. A single *exit* or access to a single *exit* shall be permitted from any story or *occupiable roof*, where one of the following conditions exists:

1. The *occupant load*, number of *dwelling units* and *exit access* travel distance do not exceed the values in Table 1006.3.4(1) or 1006.3.4(2).
2. Rooms, areas and spaces complying with Section 1006.2.1 with *exits* that discharge directly to the exterior at the *level of exit discharge*, are permitted to have one *exit* or access to a single *exit*.
3. Parking garages where vehicles are mechanically parked shall be permitted to have one *exit* or access to a single *exit*.
4. Group R-3 and R-4 occupancies shall be permitted to have one *exit* or access to a single *exit*.
5. Individual single-story or multistory *dwelling units* shall be permitted to have a single *exit* or access to a single *exit* from the *dwelling unit* provided that both of the following criteria are met:
   5.1. The *dwelling unit* complies with Section 1006.2.1 as a space with one means of egress.
   5.2. Either the *exit* from the *dwelling unit* discharges directly to the exterior at the *level of exit discharge*, or the *exit* access outside the *dwelling unit*'s entrance door provides access to not less than two *approved* independent *exits*.

Revise as follows:

[BE] TABLE 1006.3.4(1) STORIES AND OCCUPIABLE ROOFS WITH ONE EXIT OR ACCESS TO ONE EXIT FOR R-2 OCCUPANCIES

STORY OR OCCUPIABLE ROOF	OCCUPANCY	MAXIMUM NUMBER OF DWELLING UNITS	MAXIMUM EXIT ACCESS TRAVEL DISTANCE
Basement, first, second or third story above grade plane and occupiable roofs over the first or second story above grade plane	R-2[a, b, c]	4 dwelling units	125 feet

STORY OR OCCUPIABLE ROOF	OCCUPANCY	MAXIMUM NUMBER OF DWELLING UNITS	MAXIMUM EXIT ACCESS TRAVEL DISTANCE
Fourth story above grade plane and higher	NP	NA	NA

For SI: 1 foot = 304.8 mm.

NP = Not Permitted.

NA = Not Applicable.

a. Buildings classified as Group R-2 equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1, or 903.3.1.2 or 903.3.1.3 and provided with emergency escape and rescue openings in accordance with Section 1031.

b. This table is used for Group R-2 occupancies consisting of dwelling units. For Group R-2 occupancies consisting of sleeping units, use Table 1006.3.4(2).

c. This table is for occupiable roofs accessed through and serving individual dwelling units in Group R-2 occupancies. For Group R-2 occupancies with occupiable roofs that are not accessed through and serving individual units, use Table 1006.3.4(2).

[BE] TABLE 1006.3.4(2) STORIES AND OCCUPIABLE ROOFS WITH ONE EXIT OR ACCESS TO ONE EXIT FOR OTHER OCCUPANCIES

STORY AND OCCUPIABLE ROOF	OCCUPANCY	MAXIMUM OCCUPANT LOAD PER STORY AND OCCUPIABLE ROOF	MAXIMUM EXIT ACCESS TRAVEL DISTANCE (feet)
First story above or below grade plane and occupiable roofs over the first story above grade plane	A, B[b], E, F[b], M, U	49	75
	H-2, H-3	3	25
	H-4, H-5, I, R-1, R-2[a, c]	10	75
	S[b, d]	29	75
Second story above grade plane	B, F, M, S[d]	29	75
Third story above grade plane and higher	NP	NA	NA

For SI: 1 foot = 304.8 mm.

NP = Not Permitted.

NA = Not Applicable.

a. Buildings classified as Group R-2 equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1, ~~or~~ 903.3.1.2 or 903.3.1.3 and provided with emergency escape and rescue openings in accordance with Section 1031.

b. Group B, F and S occupancies in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or an occupiable roof of such buildings shall have a maximum exit access travel distance of 100 feet.

c. This table is used for Group R-2 occupancies consisting of sleeping units. For Group R-2 occupancies consisting of dwelling units, use Table 1006.3.4(1).

d. The length of exit access travel distance in a Group S-2 open parking garage shall be not more than 100 feet.

Reason: A townhouse can be a Group R-2 and be permitted to use an NFPA13D sprinkler system. Footnote a of Table 1006.3.4(1) and 1006.3.4(2) should include a requirement for townhouses with a single exit to have emergency escape and rescue openings consistent with Group R-2 with an NFPA 13 or NFPA 13R systems.

This proposal is submitted by the ICC Building Code Action Committee (BCAC).

BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned

International Codes or portions thereof. In 2023 the BCAC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the BCAC website at BCAC webpage.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is a clarification of requirements for Group R where an NFPA13D system is permitted. There are no changes to construction requirements.

E22-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: Is a NFPA13D permitted in a townhouse? It needs to be clarified that a NFPA13D system is limited to three story units so it will not be interpreted to be allowed in taller Group R-2 dwelling units. Is a NFPA13D system permitted in a Group R-2 with sleeping units? (Vote: 12-2)

E22-24

Individual Consideration Agenda

Comment 1:

Proponents: Jeff Grove, Chair, Building Code Action Committee (BCAC) (bcac@iccsafe.org) requests As Submitted

Reason: BCAC had 5 different proposals dealing with requirements for buildings where an NFPA13D sprinkler system is permitted. Proposal FS94-24, E16-24 and E95-24 were approved. We are asking for approval of code changes E22-24 and E93-24 for consistency within the code.

In these tables, by not listing and NFPA13D system, it could be interpreted that emergency escape windows are not required. Since emergency escape windows would be required for a building with an NFPA13 or NFPA13R system, this is not consistent and is a safety issue.

Much of the discussion with the committee was about where an NFPA13D system can be used. That is outside the scope of these proposals. However, Code change F100-24 was approved as modified to clarify where an NFPA13D system can be use. This is the approved text.

2024 International Fire/Building Code
Revise as follows:
903.2.8 Group R. An automatic sprinkler system installed in accordance with Section 903.3.1 shall be provided throughout all buildings with a Group R fire area.
Delete without substitution:
~~903.2.8.1 Group R-3. An automatic sprinkler system installed in accordance with Section 903.3.1.3 shall be permitted in Group R-3 occupancies.~~
~~903.2.8.2 Group R-4, Condition 1. An automatic sprinkler system installed in accordance with Section 903.3.1.3 shall be permitted in Group R-4, Condition 1 occupancies.~~
~~903.2.8.3 Care facilities. An automatic sprinkler system installed in accordance with Section 903.3.1.3 shall be permitted in care facilities~~

~~with five or fewer individuals in a single-family dwelling.~~

Revise as follows:

903.3.1.3 NFPA 13D sprinkler systems. Automatic sprinkler systems installed in one- and two-family dwellings and townhouses; Group R-3; and Group R-4~~, Condition 1; and townhouses~~ shall be permitted to be installed throughout in accordance with NFPA13D.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Proposed Change as Submitted

Proponents: Jeff Grove, Chair, Building Code Action Committee (BCAC) (bcac@iccsafe.org)

2024 International Building Code

1006.3.4 Single exits. A single *exit* or access to a single *exit* shall be permitted from any *story* or *occupiable roof* where one of the following conditions exists:

1. The *occupant load*, number of *dwelling units* and exit access travel distance do not exceed the values in Table 1006.3.4(1) or 1006.3.4(2).
2. Rooms, areas and spaces complying with Section 1006.2.1 with *exits* that discharge directly to the exterior at the *level of exit discharge*, are permitted to have one *exit* or access to a single *exit*.
3. Parking garages where vehicles are mechanically parked shall be permitted to have one *exit* or access to a single *exit*.
4. Group R-3 and R-4 occupancies shall be permitted to have one *exit* or access to a single *exit*.
5. Individual single-story or multistory *dwelling units* shall be permitted to have a single *exit* or access to a single *exit* from the *dwelling unit* provided that both of the following criteria are met:
   5.1. The *dwelling unit* complies with Section 1006.2.1 as a space with one *means of egress*.
   5.2. Either the exit from the *dwelling unit* discharges directly to the exterior at the *level of exit discharge*, or the *exit access* outside the *dwelling unit's* entrance door provides access to not less than two *approved* independent *exits*.

Revise as follows:

TABLE 1006.3.4(1) STORIES AND OCCUPIABLE ROOFS WITH ONE EXIT OR ACCESS TO ONE EXIT FOR R-2 OCCUPANCIES [a,b]

STORY OR OCCUPIABLE ROOF	OCCUPANCY	MAXIMUM NUMBER ~~OF DWELLING UNITS~~	MAXIMUM EXIT ACCESS TRAVEL DISTANCE
Basement, first, second or third story above grade plane and occupiable roofs over the first or second story above grade plane	R-2~~[a, b, c]~~ consisting of dwelling units	4 dwelling units	125 feet
	R-2 consisting of sleeping units	20 occupants	125 feet
Fourth story above grade plane and higher	NP	NA	NA

For SI: 1 foot = 304.8 mm.

NP = Not Permitted.

NA = Not Applicable.

a. Buildings classified as Group R-2 equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2 and provided with emergency escape and rescue openings in accordance with Section 1031.

~~b. This table is used for Group R-2 occupancies consisting of dwelling units. For Group R-2 occupancies consisting of sleeping units, use Table 1006.3.4(2).~~

~~c.~~ b. This table is for occupiable roofs accessed through and serving individual dwelling units or sleeping units in Group R-2 occupancies. For Group R-2 occupancies with occupiable roofs that are not accessed through and serving individual dwelling units or sleeping units, use Table 1006.3.4(2).

TABLE 1006.3.4(2) STORIES AND OCCUPIABLE ROOFS WITH ONE EXIT OR ACCESS TO ONE EXIT FOR OTHER OCCUPANCIES

STORY AND OCCUPIABLE ROOF	OCCUPANCY	MAXIMUM OCCUPANT LOAD PER STORY AND OCCUPIABLE ROOF	MAXIMUM EXIT ACCESS TRAVEL DISTANCE (feet)
First story above or below grade plane and occupiable roofs over the first story above grade plane	A, B~~[a][b]~~, E, F~~[a]~~, M, U	49	75
	H-2, H-3	3	25
	H-4, H-5, I, R-1~~, R-2[a, c]~~	10	75
	S~~[a][b, d]~~	29	75
Second story above grade plane	B, F, M, S~~[b][d]~~	29	75
Third story above grade plane and higher	NP	NA	NA

For SI: 1 foot = 304.8 mm.

NP = Not Permitted.

NA = Not Applicable.

~~a. Buildings classified as Group R-2 equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2 and provided with emergency escape and rescue openings in accordance with Section 1031.~~

~~b.~~ a. Group B, F and S occupancies in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or an occupiable roof of such buildings shall have a maximum exit access travel distance of 100 feet.

~~c. This table is used for Group R-2 occupancies consisting of sleeping units. For Group R-2 occupancies consisting of dwelling units, use Table 1006.3.4(1).~~

~~d.~~ b. The length of exit access travel distance in a Group S-2 open parking garage shall be not more than 100 feet.

1006.3.4.1 Mixed occupancies. Where one *exit*, or *exit access stairway* or *ramp* providing access to exits at other *stories*, is permitted to serve individual *stories*, mixed occupancies shall be permitted to be served by single *exits* provided that each individual occupancy complies with the applicable requirements of Table 1006.3.4(1) or 1006.3.4(2) for that occupancy. Where applicable, cumulative *occupant loads* from adjacent occupancies shall be considered to be in accordance with the provisions of Section 1004.1. In each *story* of a mixed occupancy *building*, the maximum number of occupants served by a single exit shall be such that the sum of the ratios of the calculated number of occupants of the space divided by the allowable number of occupants indicated in Table 1006.3.4(1) for Group R-2 sleeping units or Table 1006.3.4(2) for each occupancy does not exceed one. Where Group R-2 *dwelling units* are located on a story with other occupancies, the actual number of *dwelling units* divided by four plus the ratio from the other occupancy does not exceed one.

1031.2 Where required. In addition to the *means of egress* required by this chapter, *emergency escape and rescue openings* shall be provided in the following occupancies:

1. Group R-2 occupancies located in *stories* with only one *exit* or access to only one *exit* as permitted by ~~Tables~~ Table 1006.3.4(1) ~~and 1006.3.4(2)~~.
2. Group R-3 and R-4 occupancies.

Basements and sleeping rooms below the fourth *story above grade plane* shall have not fewer than one *emergency escape and rescue opening* in accordance with this section. Where *basements* contain one or more sleeping rooms, an *emergency escape and rescue opening* shall be required in each sleeping room, but shall not be required in adjoining areas of the *basement*. Such openings shall open directly into a *public way* or to a *yard* or *court* that opens to a *public way, or to an egress balcony that leads to a public way* .

Exceptions:

1. *Basements* with a ceiling height of less than 80 inches (2032 mm) shall not be required to have *emergency escape and rescue openings*.
2. *Emergency escape and rescue openings* are not required from *basements* or sleeping rooms that have an *exit* door or *exit access* door that opens directly into a *public way* or to a *yard*, *court* or exterior egress balcony that leads to a *public way*.

3. *Basements* without *habitable spaces* and having not more than 200 square feet (18.6 m^2) in floor area shall not be required to have *emergency escape and rescue openings*.
4. *Storm shelters* are not required to comply with this section where the shelter is constructed in accordance with ICC 500.
5. Within individual *dwelling* and *sleeping units* in Groups R-2 and R-3, where the *building* is equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1, 903.3.1.2 or 903.3.1.3, *sleeping rooms* in *basements* shall not be required to have *emergency escape and rescue openings* provided that the *basement* has one of the following:
   5.1. One *means of egress* and one *emergency escape and rescue opening*.
   5.2. Two *means of egress*.

2024 International Fire Code

[BE] 1006.3.4 Single exits. A single *exit* or access to a single *exit* shall be permitted from any story or *occupiable roof*, where one of the following conditions exists:

1. The *occupant load*, number of *dwelling units* and *exit access* travel distance do not exceed the values in Table 1006.3.4(1) or 1006.3.4(2).
2. Rooms, areas and spaces complying with Section 1006.2.1 with *exits* that discharge directly to the exterior at the *level of exit discharge*, are permitted to have one *exit* or access to a single *exit*.
3. Parking garages where vehicles are mechanically parked shall be permitted to have one *exit* or access to a single *exit*.
4. Group R-3 and R-4 occupancies shall be permitted to have one *exit* or access to a single *exit*.
5. Individual single-story or multistory *dwelling units* shall be permitted to have a single *exit* or access to a single *exit* from the *dwelling unit* provided that both of the following criteria are met:
   5.1. The *dwelling unit* complies with Section 1006.2.1 as a space with one means of egress.
   5.2. Either the *exit* from the *dwelling unit* discharges directly to the exterior at the *level of exit discharge*, or the *exit* access outside the *dwelling unit*'s entrance door provides access to not less than two *approved* independent *exits*.

Revise as follows:

[BE] TABLE 1006.3.4(1) STORIES AND OCCUPIABLE ROOFS WITH ONE EXIT OR ACCESS TO ONE EXIT FOR R-2 OCCUPANCIES a,b

STORY OR OCCUPIABLE ROOF	OCCUPANCY	MAXIMUM NUMBER ~~OF DWELLING UNITS~~	MAXIMUM EXIT ACCESS TRAVEL DISTANCE
Basement, first, second or third story above grade plane and occupiable roofs over the first or second story above grade plane	R-2~~a, b, c~~ consisting of dwellint units	4 dwelling units	125 feet
	R-2 consisting of sleeping units	20 occupants	125 feet
Fourth story above grade plane and higher	NP	NA	NA

For SI: 1 foot = 304.8 mm.

NP = Not Permitted.

NA = Not Applicable.

a. Buildings classified as Group R-2 equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2 and provided with emergency escape and rescue openings in accordance with Section 1031.

~~b. This table is used for Group R-2 occupancies consisting of dwelling units. For Group R-2 occupancies consisting of sleeping units, use Table 1006.3.4(2).~~

~~c.~~ b. This table is for occupiable roofs accessed through and serving individual dwelling units or sleeping units in Group R-2 occupancies. For Group R-2 occupancies with occupiable roofs that are not accessed through and serving individual dwelling or sleeping units, use Table 1006.3.4(2).

[BE] TABLE 1006.3.4(2) STORIES AND OCCUPIABLE ROOFS WITH ONE EXIT OR ACCESS TO ONE EXIT FOR OTHER OCCUPANCIES

STORY AND OCCUPIABLE ROOF	OCCUPANCY	MAXIMUM OCCUPANT LOAD PER STORY AND OCCUPIABLE ROOF	MAXIMUM EXIT ACCESS TRAVEL DISTANCE (feet)
First story above or below grade plane and occupiable roofs over the first story above grade plane	A, B~~[a,b]~~, E, F~~[a,b]~~, M, U	49	75
	H-2, H-3	3	25
	H-4, H-5, I, ~~R-1, R-2[a, c]~~	10	75
	S~~[a, b, d]~~	29	75
Second story above grade plane	B, F, M, S~~[b,d]~~	29	75
Third story above grade plane and higher	NP	NA	NA

For SI: 1 foot = 304.8 mm.

NP = Not Permitted.

NA = Not Applicable.

~~a. Buildings classified as Group R-2 equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2 and provided with emergency escape and rescue openings in accordance with Section 1031.~~

~~b.~~ a. Group B, F and S occupancies in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or an occupiable roof of such buildings shall have a maximum exit access travel distance of 100 feet.

~~c. This table is used for Group R-2 occupancies consisting of sleeping units. For Group R-2 occupancies consisting of dwelling units, use Table 1006.3.4(1).~~

~~d.~~ b. The length of exit access travel distance in a Group S-2 open parking garage shall be not more than 100 feet.

[BE] 1006.3.4.1 Mixed occupancies. Where one *exit*, or *exit access stairway* or *ramp* providing access to *exits* at other stories, is permitted to serve individual stories, mixed occupancies shall be permitted to be served by single *exits* provided that each individual occupancy complies with the applicable requirements of Table 1006.3.4(1) or 1006.3.4(2) for that occupancy. Where applicable, cumulative *occupant loads* from adjacent occupancies shall be considered to be in accordance with the provisions of Section 1004.1. In each story of a mixed occupancy building, the maximum number of occupants served by a single *exit* shall be such that the sum of the ratios of the calculated number of occupants ~~of the~~ indicated in Table 1006.3.4(1) for Group R-2 sleeping units or Table 1006.3.4(2) for each occupancy does not exceed one. Where *dwelling units* are located on a story with other occupancies, the actual number of Group R-2 *dwelling units* divided by four plus the ratio from the other occupancy does not exceed one.

[BE] 1031.2 Where required. In addition to the *means of egress* required by this chapter, *emergency escape and rescue openings* shall be provided in the following occupancies:

1. Group R-2 occupancies located in stories with only one *exit* or access to only one *exit* as permitted by ~~Tables~~ Table 1006.3.4(1) ~~and 1006.3.4(2)~~.
2. Group R-3 and R-4 occupancies.

Basements and sleeping rooms below the fourth *story above grade plane* shall have not fewer than one *emergency escape and rescue*

opening in accordance with this section. Where *basements* contain one or more sleeping rooms, an *emergency escape and rescue opening* shall be required in each sleeping room, but shall not be required in adjoining areas of the *basement*. Such openings shall open directly into a *public way* or to a *yard* or *court* that opens to a *public way* , or to an egress balcony that leads to a *public way* .

Exceptions:

1. *Basements* with a ceiling height of less than 80 inches (2032 mm) shall not be required to have *emergency escape and rescue openings*.
2. *Emergency escape and rescue openings* are not required from *basements* or sleeping rooms that have an *exit* door or *exit access* door that opens directly into a *public way* or to a *yard*, *court* or exterior egress balcony that leads to a *public way*.
3. *Basements* without *habitable spaces* and having not more than 200 square feet (18.6 m^2) in floor area shall not be required to have *emergency escape and rescue openings*.
4. *Storm shelters* are not required to comply with this section where the shelter is constructed in accordance with ICC 500.
5. Within individual *dwelling* and *sleeping units* in Groups R-2 and R-3, where the building is equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1, 903.3.1.2 or 903.3.1.3, sleeping rooms in *basements* shall not be required to have *emergency escape and rescue openings* provided that the *basement* has one of the following:

   5.1. One *means of egress* and one *emergency escape and rescue opening*.

   5.2. Two *means of egress*.

Reason: The purpose of this code change is to coordinate and consolidate requirements for R-2 units in Tables 1006.2.1 (single exit space), 1006.3.4(1) and 1006.3.4(2) (singe exit buildings).

Proposal E17-15 increased the maximum occupant load for R-2 Occupancies from 10 to 20 occupants for single exit spaces stating that it's appropriate since Group R-2 occupancies require sprinkler protection per Section 903.3.1.1 or 903.3.1.2. and that the exit access travel distance is 125' in both Table 1006.2.1 and 1006.3.4(1). There is no logic for a unit on the 1st floor of single exit building to have a lower occupant load or a shorter travel distance. In addition, if 4 single exit dwelling units are permitted on the 2nd and 3rd floor of a Group R-2 building, why is a single exit dwelling not permitted at the 2nd floor of a mixed-use building? Please note that emergency escape and rescue openings would be required in the single exit building.The change to Sections 1006.3.4.1 and 1031.2 are editorial to recognize that R-2 is only in one table.

This proposal is submitted by the ICC Building Code Action Committee (BCAC) .

BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 the BCAC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the BCAC website at BCAC webpage.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

$0 - This will eliminate the need for a 2nd exterior door, and will allow for more efficient floor plan design. The options in floor plans is so wide ranging, it is not possible to determine costs.

Estimated Immediate Cost Impact Justification (methodology and variables):

This will only affect dwelling units on the basement, 1st or 2nd floor of a mixed-use building. This will most likely be no change in units less than 2,000 sq. ft. This will allow for a single exit in some apartments between 2,000 and 4,000 sq. ft., provided they can meet the exit access travel distance and provide EEROs.

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: Combining the two tables appears to increase the number of sleeping units permitted to have a single exit. The revised table could be read to allow each of the sleeping units to have 20 occupants - there should be a unit count. The title on the third column of 'maximum number' is not clear. (Vote: 8-5)

Individual Consideration Agenda

Comment 1:

IBC: TABLE 1006.3.4(1); IFC: [BE] TABLE 1006.3.4(1)

Proponents: Jeff Grove, Chair, Building Code Action Committee (BCAC) (bcac@iccsafe.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

Revise as follows:

TABLE 1006.3.4(1) STORIES AND OCCUPIABLE ROOFS WITH ONE EXIT OR ACCESS TO ONE EXIT FOR R-2 OCCUPANCIES [a,b]

STORY OR OCCUPIABLE ROOF	OCCUPANCY	MAXIMUM NUMBER	MAXIMUM EXIT ACCESS TRAVEL DISTANCE
Basement, first, second or third story above grade plane and occupiable roofs over the first or second story above grade plane	R-2consisting of dwelling units	4 dwelling units per story	125 feet
	R-2 consisting of sleeping units	20 occupants per story	125 feet
Fourth story above grade plane and higher	NP	NA	NA

For SI: 1 foot = 304.8 mm.

NP = Not Permitted.

NA = Not Applicable.

a. Buildings classified as Group R-2 equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2 and provided with emergency escape and rescue openings in accordance with Section 1031.

b. This table is for occupiable roofs accessed through and serving individual dwelling units or sleeping units in Group R-2 occupancies. For Group R-2 occupancies with occupiable roofs that are not accessed through and serving individual dwelling units or sleeping units, use Table 1006.3.4(2).

2024 International Fire Code

Revise as follows:

[BE] TABLE 1006.3.4(1) STORIES AND OCCUPIABLE ROOFS WITH ONE EXIT OR ACCESS TO ONE EXIT FOR R-2 OCCUPANCIES a,b

STORY OR OCCUPIABLE ROOF	OCCUPANCY	MAXIMUM NUMBER	MAXIMUM EXIT ACCESS TRAVEL DISTANCE
Basement, first, second or third story above grade plane and occupiable roofs over the first or second story above grade plane	R-2consisting of dwellint units	4 dwelling units per story	125 feet
	R-2 consisting of sleeping units	20 occupants per story	125 feet
Fourth story above grade plane and higher	NP	NA	NA

For SI: 1 foot = 304.8 mm.

NP = Not Permitted.

NA = Not Applicable.

a. Buildings classified as Group R-2 equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2 and provided with emergency escape and rescue openings in accordance with Section 1031.

b. This table is for occupiable roofs accessed through and serving individual dwelling units or sleeping units in Group R-2 occupancies. For Group R-2 occupancies with occupiable roofs that are not accessed through and serving individual dwelling or sleeping units, use Table 1006.3.4(2).

Reason: From the report of committee actions- "Committee Reason: Combining the two tables appears to increase the number of sleeping units permitted to have a single exit. The revised table could be read to allow each of the sleeping units to have 20 occupants - there should be a unit count. The title on the third column of 'maximum number' is not clear. (Vote: 8-5)"

The purpose of this code change is to coordinate and consolidate requirements for R-2 units in Tables 1006.2.1 (single exit space), 1006.3.4(1) and 1006.3.4(2) (singe exit buildings).

Proposal E17-15 increased the maximum occupant load for R-2 Occupancies from 10 to 20 occupants for single exit spaces stating that it's appropriate since Group R-2 occupancies require sprinkler protection per Section 903.3.1.1 or 903.3.1.2. and that the exit access travel distance is 125' in both Table 1006.2.1 and 1006.3.4(1). There is no logic for a unit on the 1st floor of single exit building to have a lower occupant load or a shorter travel distance. Whether or not the spaces are dwelling or sleeping units shouldn't impact the allowable travel distance, because in both cases the residents are non-transient and equally familiar with their surroundings. The difference between the two is whether the spaces have both cooking and sanitation facilities, or only one of them. In addition, if 4 single exit dwelling units are permitted on the 2nd and 3rd floor of a Group R-2 building, why is a single exit dwelling not permitted at the 2nd floor of a mixed-use building? Please note that emergency escape and rescue openings would be required in the single exit building. The change to Sections 1006.3.4.1 and 1031.2 are editorial to recognize that R-2 is only in one table.

Regarding the committee's concern that the number of sleeping units should be limited to a certain number, rather than limiting only by number of occupants. Keep in mind that there are other factors that will also limit the overall story size. First, the occupant load calculation from Table 1004.5, where a residential occupancy is calculated at 200 sf per occupant, gross states to reach 20 occupants per story the building would be 4,000 sf in area, which could be 40'x100'; and maximum travel distance still needs to be met to a single exit. Table 1006.2.1 Spaces with One Exit or Exit Access Doorway uses 125-feet for the maximum R-2 travel distance, and that is the value used in the combined table.

This proposal is submitted by the ICC Building Code Action Committee (BCAC).

BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 the BCAC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the BCAC website at BCAC webpage.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

$0 - This will eliminate the need for a 2nd exterior door, and will allow for more efficient floor plan design. The options in floor plans is so wide ranging, it is not possible to determine costs.

Estimated Immediate Cost Impact Justification (methodology and variables):

This will only affect dwelling units on the basement, 1st or 2nd floor of a mixed-use building. This will most likely be no change in units less than 2,000 sq. ft. This will allow for a single exit in some apartments between 2,000 and 4,000 sq. ft., provided they can meet the exit access travel distance and provide EEROs.

2024 International Building Code

Revise as follows:

1006.3.4 Single exits. A single *exit* or access to a single *exit* shall be permitted from any *story* or *occupiable roof* where one of the following conditions exists:

1. The *occupant load*, number of *dwelling units* and exit access travel distance do not exceed the values in Table 1006.3.4(1) or 1006.3.4(2).

2. Group R-2 occupancies complying with Section 1006.3.5.

~~2~~ 3. Rooms, areas and spaces complying with Section 1006.2.1 with *exits* that discharge directly to the exterior at the *level of exit discharge*, are permitted to have one *exit* or access to a single *exit*.

~~3~~ 4. Parking garages where vehicles are mechanically parked shall be permitted to have one *exit* or access to a single *exit*.

~~4~~ 5. Group R-3 and R-4 occupancies shall be permitted to have one *exit* or access to a single *exit*.

~~5~~ 6. Individual single-story or multistory *dwelling units* shall be permitted to have a single *exit* or access to a single *exit* from the *dwelling unit* provided that both of the following criteria are met:

~~5.1~~ 6.1. The *dwelling unit* complies with Section 1006.2.1 as a space with one *means of egress*.

~~5.2~~ 6.2. Either the exit from the *dwelling unit* discharges directly to the exterior at the *level of exit discharge*, or the *exit access* outside the *dwelling unit's* entrance door provides access to not less than two *approved* independent *exits*.

TABLE 1006.3.4(1) STORIES AND OCCUPIABLE ROOFS WITH ONE EXIT OR ACCESS TO ONE EXIT FOR R-2 OCCUPANCIES

STORY	OCCUPANCY	MAXIMUM NUMBER OF DWELLING UNITS	MAXIMUM EXIT ACCESS TRAVEL DISTANCE
Basement, first, second or third story above grade plane and occupiable roofs over the first or second story above grade plane	R-2[a, b, c]	4 dwelling units	125 feet
Fourth story above grade plane and higher	NP	NA	NA

For SI: 1 foot = 304.8 mm.

NP = Not Permitted.

NA = Not Applicable.

a. Buildings classified as Group R-2 equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2 and provided with emergency escape and rescue openings in accordance with Section 1031.

b. This table is used for Group R-2 occupancies consisting of dwelling units. For Group R-2 occupancies consisting of sleeping units, use Table 1006.3.4(2).

c. This table is for occupiable roofs accessed through and serving individual dwelling units in Group R-2 occupancies. For Group R-2 occupancies with occupiable roofs that are not accessed through and serving individual units, use Table 1006.3.4(2).

TABLE 1006.3.4(2) STORIES AND OCCUPIABLE ROOFS WITH ONE EXIT OR ACCESS TO ONE EXIT FOR OTHER OCCUPANCIES

STORY AND OCCUPIABLE ROOF	OCCUPANCY	MAXIMUM OCCUPANT LOAD PER STORY AND OCCUPIABLE ROOF	MAXIMUM EXIT ACCESS TRAVEL DISTANCE (feet)
First story above or below grade plane and occupiable roofs over the first story above grade plane	A, B[b], E, F[b], M, U	49	75
	H-2, H-3	3	25
	H-4, H-5, I, R-1, R-2[a, c]	10	75
	S[b, d]	29	75
Second story above grade plane	B, F, M, S[d]	29	75
Third story above grade plane and higher	NP	NA	NA

For SI: 1 foot = 304.8 mm.

NP = Not Permitted.

NA = Not Applicable.

a. Buildings classified as Group R-2 equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2 and provided with emergency escape and rescue openings in accordance with Section 1031.

b. Group B, F and S occupancies in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or an occupiable roof of such buildings shall have a maximum exit access travel distance of 100 feet.

c. This table is used for Group R-2 occupancies consisting of sleeping units. For Group R-2 occupancies consisting of dwelling units, use Table 1006.3.4(1).

d. The length of exit access travel distance in a Group S-2 open parking garage shall be not more than 100 feet.

1006.3.4.1 Mixed occupancies. Where one *exit*, or *exit access stairway* or *ramp* providing access to exits at other *stories*, is permitted to serve individual *stories*, mixed occupancies shall be permitted to be served by single *exits* provided that each individual occupancy complies with the applicable requirements of Table 1006.3.4(1) or 1006.3.4(2) for that occupancy. Where applicable, cumulative *occupant loads* from adjacent occupancies shall be considered to be in accordance with the provisions of Section 1004.1. In each *story* of a mixed occupancy *building*, the maximum number of occupants served by a single exit shall be such that the sum of the ratios of the calculated number of occupants of the space divided by the allowable number of occupants indicated in Table 1006.3.4(2) for each occupancy does not exceed one. Where *dwelling units* are located on a story with other occupancies, the actual number of *dwelling units* divided by four plus the ratio from the other occupancy does not exceed one.

Add new text as follows:

1006.3.5 Group R-2 occupancies. In Group R-2 occupancies, a single exit shall be permitted from any story or occupiable roof where the number of dwelling units served per exit at each story comply with one of the following:

1. The basement and first through sixth story above grade plane with a maximum of 4 dwelling units served per exit on each story.
2. The basement and first through third story above grade plane with a maximum of 6 dwelling units served per exit on each story.

Such building shall comply with Sections 1006.3.5.1 through 1006.3.5.6.

1006.3.5.1 Construction type. The building is Type IA, IB, IIA, or IV construction.

1006.3.5.2 Corridors. Dwelling units that do not open directly into an exterior exit stairway shall exit directly to a corridor complying with Section 1020.

1006.3.5.3 Travel distance. Maximum exit access travel distance shall be not more than 125 feet (38.1 m). Travel distance from the exit access door of the unit to the exit door for the stairway shall be not more than 25 feet (7.62 m).

1006.3.5.4 Exit stairways. Means of egress shall be provided from each story above the level of exit discharge by an interior exit stairway or exterior exit stairway. Exit stairways shall be protected with 2-hour fire barriers in accordance with Section 707 or a 2-hour horizontal assemblies in accordance with Section 711. An interior exit stairway shall be a smokeproof enclosure in accordance with with Section 909.20.

1006.3.5.5 Emergency escape and rescue openings. Emergency escape and rescue openings shall be provided in accordance with Section 1031.

1006.3.5.6 Mixed occupancies. Mixed occupancies shall be permitted at and below the level of exit discharge. Other occupancies shall not have direct access to the Group R-2 occupancy portion of the building or to the exit stairway serving the Group R-2 occupancy.
Exception: Parking garages and occupied roofs that serve the Group R-2 occupancy shall be permitted to have direct access to the exit stairway.

Revise as follows:

1023.12 Smokeproof enclosures. Where required by Section 403.5.4, 405.7.2, ~~or~~ 412.2.2.1 or 1006.3.5.4, interior exit *stairways* and *ramps* shall be *smokeproof enclosures* in accordance with Section 909.20.

1031.2 Where required. In addition to the *means of egress* required by this chapter, *emergency escape and rescue openings* shall be provided in the following occupancies:

1. Group R-2 occupancies located in *stories* with only one *exit* or access to only one *exit* as permitted by Tables 1006.3.4(1) and 1006.3.4(2) and Section 1006.3.5.5.
2. Group R-3 and R-4 occupancies.

Basements and sleeping rooms below the fourth *story above grade plane* shall have not fewer than one *emergency escape and rescue opening* in accordance with this section. Where *basements* contain one or more sleeping rooms, an *emergency escape and rescue opening* shall be required in each sleeping room, but shall not be required in adjoining areas of the *basement*. Such openings shall open directly into a *public way* or to a *yard* or *court* that opens to a *public way, or to an egress balcony that leads to a public way*.

Exceptions:

1. *Basements* with a ceiling height of less than 80 inches (2032 mm) shall not be required to have *emergency escape and rescue openings*.
2. *Emergency escape and rescue openings* are not required from *basements* or sleeping rooms that have an *exit* door or *exit access* door that opens directly into a *public way* or to a *yard*, *court* or exterior egress balcony that leads to a *public way*.
3. *Basements* without *habitable spaces* and having not more than 200 square feet (18.6 m^2) in floor area shall not be required to have *emergency escape and rescue openings*.
4. *Storm shelters* are not required to comply with this section where the shelter is constructed in accordance with ICC 500.
5. Within individual *dwelling* and *sleeping units* in Groups R-2 and R-3, where the *building* is equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1, 903.3.1.2 or 903.3.1.3, *sleeping rooms* in *basements* shall not be required to have *emergency escape and rescue openings* provided that the *basement* has one of the following:
   5.1. One *means of egress* and one *emergency escape and rescue opening*.
   5.2. Two *means of egress*.

2024 International Fire Code

Revise as follows:

[BE] 1006.3.4 Single exits. A single *exit* or access to a single *exit* shall be permitted from any story or *occupiable roof*, where one of the following conditions exists:

1. The *occupant load*, number of *dwelling units* and exit access travel distance do not exceed the values in Table 1006.3.4(1) or 1006.3.4(2).

2. Group R-2 occupancies complying with Section 1006.3.5.

~~2~~ 3. Rooms, areas and spaces complying with Section 1006.2.1 with *exits* that discharge directly to the exterior at the *level of exit discharge*, are permitted to have one *exit* or access to a single *exit*.

~~3~~ 4. Parking garages where vehicles are mechanically parked shall be permitted to have one *exit* or access to a single *exit*.

~~4~~ 5. Group R-3 and R-4 occupancies shall be permitted to have one *exit* or access to a single *exit*.

~~5~~ 6. Individual single-story or multistory *dwelling units* shall be permitted to have a single *exit* or access to a single *exit* from the *dwelling unit* provided that both of the following criteria are met:

~~5.1~~ 6.1. The *dwelling unit* complies with Section 1006.2.1 as a space with one *means of egress*.

~~5.2~~ 6.2. Either the exit from the *dwelling unit* discharges directly to the exterior at the *level of exit discharge*, or the *exit access* outside the *dwelling unit's* entrance door provides access to not less than two *approved* independent *exits*.

[BE] TABLE 1006.3.4(1) STORIES AND OCCUPIABLE ROOFS WITH ONE EXIT OR ACCESS TO ONE EXIT FOR R-2 OCCUPANCIES

STORY	OCCUPANCY	MAXIMUM NUMBER OF DWELLING UNITS	MAXIMUM EXIT ACCESS TRAVEL DISTANCE
Basement, first, second or third story above grade plane and occupiable roofs over the first or second story above grade plane	R-2[a, b, c]	4 dwelling units	125 feet
Fourth story above grade plane and higher	NP	NA	NA

For SI: 1 foot = 304.8 mm.

NP = Not Permitted.

NA = Not Applicable.

a. Buildings classified as Group R-2 equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2 and provided with emergency escape and rescue openings in accordance with Section 1031.

b. This table is used for Group R-2 occupancies consisting of dwelling units. For Group R-2 occupancies consisting of sleeping units, use Table 1006.3.4(2).

c. This table is for occupiable roofs accessed through and serving individual dwelling units in Group R-2 occupancies. For Group R-2 occupancies with occupiable roofs that are not accessed through and serving individual units, use Table 1006.3.4(2).

[BE] TABLE 1006.3.4(2) STORIES AND OCCUPIABLE ROOFS WITH ONE EXIT OR ACCESS TO ONE EXIT FOR OTHER OCCUPANCIES

STORY AND OCCUPIABLE ROOF	OCCUPANCY	MAXIMUM OCCUPANT LOAD PER STORY AND OCCUPIABLE ROOF	MAXIMUM EXIT ACCESS TRAVEL DISTANCE (feet)
First story above or below grade plane and occupiable roofs over the first story above grade plane	A, B[b], E, F[b], M, U	49	75
	H-2, H-3	3	25
	H-4, H-5, I, R-1, R-2[a, c]	10	75
	S[b, d]	29	75

STORY AND OCCUPIABLE ROOF	OCCUPANCY	MAXIMUM OCCUPANT LOAD PER STORY AND OCCUPIABLE ROOF	MAXIMUM EXIT ACCESS TRAVEL DISTANCE (feet)
Second story above grade plane	B, F, M, S[d]	29	75
Third story above grade plane and higher	NP	NA	NA

For SI: 1 foot = 304.8 mm.

NP = Not Permitted.

NA = Not Applicable.

a. Buildings classified as Group R-2 equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2 and provided with emergency escape and rescue openings in accordance with Section 1031.

b. Group B, F and S occupancies in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or an occupiable roof of such buildings shall have a maximum exit access travel distance of 100 feet.

c. This table is used for Group R-2 occupancies consisting of sleeping units. For Group R-2 occupancies consisting of dwelling units, use Table 1006.3.4(1).

d. The length of exit access travel distance in a Group S-2 open parking garage shall be not more than 100 feet.

[BE] 1006.3.4.1 Mixed occupancies. Where one *exit*, or *exit access stairway* or *ramp* providing access to *exits* at other stories, is permitted to serve individual stories, mixed occupancies shall be permitted to be served by single *exits* provided that each individual occupancy complies with the applicable requirements of Table 1006.3.4(1) or 1006.3.4(2) for that occupancy. Where applicable, cumulative *occupant loads* from adjacent occupancies shall be considered to be in accordance with the provisions of Section 1004.1. In each story of a mixed occupancy building, the maximum number of occupants served by a single *exit* shall be such that the sum of the ratios of the calculated number of occupants of the space divided by the allowable number of occupants indicated in Table 1006.3.4(2) for each occupancy does not exceed one. Where *dwelling units* are located on a story with other occupancies, the actual number of *dwelling units* divided by four plus the ratio from the other occupancy does not exceed one.

Add new text as follows:

1006.3.5 Group R-2 occupancies. In Group R-2 occupancies, a single exit shall be permitted from any story or occupiable roof where the number of dwelling units served per exit at each story comply with one of the following:

1. The basement and first through sixth story above grade plane with a maximum of 4 dwelling units served per exit on each story.
2. The basement and first through third story above grade plane with a maximum of 6 dwelling units served per exit on each story.

Such building shall comply with Sections 1006.3.5.1 through 1006.3.5.6.

1006.3.5.1 Construction type. The building is Type IA, IB, IIA, or IV construction.

1006.3.5.2 Corridors. Dwelling units that do not open directly into an exterior exit stairway shall exit directly to a corridor complying with Section 1020.

1006.3.5.3 Travel distance. Maximum exit access travel distance shall be not more than 125 feet (38.1 m). Travel distance from the exit access door of the unit to the exit door for the stairway shall be not more than 25 feet (7.62 m).

1006.3.5.4 Exit stairways. Means of egress shall be provided from each story above the level of exit discharge by an interior exit stairway or exterior exit stairway. Exit stairways shall be protected with 2-hour fire barriers in accordance with Section 707 or a 2-hour horizontal assemblies in accordance with Section 711. An interior exit stairway shall be a smokeproof enclosure in accordance with with Section 909.20.

1006.3.5.5 Emergency escape and rescue openings. Emergency escape and rescue openings shall be provided in accordance with Section 1031.

1006.3.5.6 Mixed occupancies. Mixed occupancies shall be permitted in the building provided there are no exit access doors into the dwelling units or dwelling unit corridors directly from the other occupancies. Other occupancies shall not communicate with the Group R-2 occupancy portion of the building or with a single-exit stairway.**Exception:** Parking garages and occupied roofs that serve the Group R-2 occupancy shall be permitted to communicate with the exit stairway.

Revise as follows:

[BE] 1023.12 Smokeproof enclosures. Where required by Section 403.5.4, 405.7.2, ~~or~~ 412.2.2.1 or 1006.3.5.4, interior exit *stairways* and *ramps* shall be *smokeproof enclosures* in accordance with Section 909.20.

[BE] 1031.2 Where required. In addition to the *means of egress* required by this chapter, *emergency escape and rescue openings* shall be provided in the following occupancies:

1. Group R-2 occupancies located in *stories* with only one *exit* or access to only one *exit* as permitted by Tables 1006.3.4(1) and 1006.3.4(2) and Section 1006.3.5.5.
2. Group R-3 and R-4 occupancies.

Basements and sleeping rooms below the fourth *story above grade plane* shall have not fewer than one *emergency escape and rescue opening* in accordance with this section. Where *basements* contain one or more sleeping rooms, an *emergency escape and rescue opening* shall be required in each sleeping room, but shall not be required in adjoining areas of the *basement*. Such openings shall open directly into a *public way* or to a *yard* or *court* that opens to a *public way* , or to an egress balcony that leads to a *public way* .

Exceptions:

1. *Basements* with a ceiling height of less than 80 inches (2032 mm) shall not be required to have *emergency escape and rescue openings*.
2. *Emergency escape and rescue openings* are not required from *basements* or sleeping rooms that have an *exit* door or *exit access* door that opens directly into a *public way* or to a *yard*, *court* or exterior egress balcony that leads to a *public way*.
3. *Basements* without *habitable spaces* and having not more than 200 square feet (18.6 m^2) in floor area shall not be required to have *emergency escape and rescue openings*.
4. *Storm shelters* are not required to comply with this section where the shelter is constructed in accordance with ICC 500.
5. Within individual *dwelling* and *sleeping units* in Groups R-2 and R-3, where the building is equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1, 903.3.1.2 or 903.3.1.3, sleeping rooms in *basements* shall not be required to have *emergency escape and rescue openings* provided that the *basement* has one of the following:
   5.1. One *means of egress* and one *emergency escape and rescue opening*.
   5.2. Two *means of egress*.

Reason: Please refer to our attachment for an in-depth discussion of life safety and other issues.

The 2024 International Building Code allows buildings up to three stories of R-2 occupancy to have up to four dwelling units at each story served by a single exit. Our proposal acknowledges the rising demand for infill multifamily development and a growing movement across the United States to modify local building codes for this purpose. We recommend enabling a single exit to serve up to six stories of R-2 occupancy above the grade plane, or up to six units per floor in cases of at most three stories.

In return for the increased height or dwelling unit allowance, buildings would adhere to more stringent conditions than a traditional building. The building would be of Type IA, IB, IIA, or IV 1-hour fire resistant construction, dwelling units could not directly access the exit, active or passive smoke control systems would be required in the single exit, and there would be strict limits on travel distances and the

number of dwelling units per floor. The whole suite of ordinary fire safety measures contained in the IBC – access to the building by fire apparatus, fire sprinklers, etc. – would also still apply.

Our language is adapted from codes in Seattle, Honolulu, New York City, and Western European countries, collectively forming the most rigorous set of conditions for six-story buildings in the developed world. The limitations and requirements in our proposal match or exceed those in cities, suburbs, and rural areas around the developed world, where fire death rates are at or below the United States median. Within the U.S., Seattle, Honolulu, and New York City have allowed buildings with generally fewer restrictions, to no ill effect or local controversy, and no major fires that we are aware of.

Our proposal is intentionally cautious and may be subject to adjustment in future code cycles based on additional research and experience, expanding possibilities for such construction.

Bibliography: See attached.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

We believe the cost of constructing multifamily buildings on small lots will decrease by roughly 7 percent, in line with the reduction in circulation area required.

Estimated Immediate Cost Impact Justification (methodology and variables):

See attachment for details.

E24-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The cost to build the single exit building with all the added requirements would negate the savings for the area with the single stairway. There seems to be a disregard for the fire service operations and basic code concepts. How would the emergency escape and rescue openings work in this taller building. This needs to be coordinated with Table 504.4 for types of construction and height limitations. Many jurisdictions are not dealing with infill lots, so this is not justified for new construction with larger lot sizes. Egress stairways are also used for other purposes other than egress from fire, such as police or emergency service responses. This might be better as an appendix for adoption by jurisdictions that have have a need. There should also be a height limit since stories can have different heights and mezzanines in the space - so a six story building could very widely in height. There should be more industry reports showing how the 2nd stairway is actually the limiting factor - what is provided seems to be antidotal. The loss of the 2nd stairway greatly increases the risk for the occupants. (Vote: 14-0)

Individual Consideration Agenda

Comment 1:

IBC: 1006.3.4, 1006.3.5, 1006.3.5.1, 1006.3.5.2, 1006.3.5.3, 1006.3.5.4, 1006.3.5.5, 1006.3.5.6, 1006.3.5.7 (New), 1006.3.5.8 (New), 1006.3.5.8.1 (New), 1006.3.5.8.2 (New), 1006.3.5.8.3 (New), 1006.3.5.9 (New), 1023.12, 1031.2, 909.20; IFC: [BE] 1006.3.4, 1006.3.5, 1006.3.5.1, 1006.3.5.2, 1006.3.5.3, 1006.3.5.4, 1006.3.5.5 , 1006.3.5.6, 1006.3.5.7 (New), 1006.3.5.8 (New), 1006.3.5.8.1 (New), 1006.3.5.8.2 (New), 1006.3.5.8.3 (New), 1006.3.5.9 (New), [BE] 1023.12, [BE] 1031.2, [BF] 909.20

Proponents: Robert Marshall, San Mateo Consolidated Fire Department, Self (rmarshall@smcfire.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

1006.3.4 Single exits. A single *exit* or access to a single *exit* shall be permitted from any *story* or *occupiable roof* where one of the following conditions exists:

1. The *occupant load*, number of *dwelling units* and exit access travel distance do not exceed the values in Table 1006.3.4(1) or 1006.3.4(2).
2. Group R-2 occupancies complying with Section 1006.3.5.
3. Rooms, areas and spaces complying with Section 1006.2.1 with *exits* that discharge directly to the exterior at the *level of exit discharge*, are permitted to have one *exit* or access to a single *exit*.
4. Parking garages where vehicles are mechanically parked shall be permitted to have one *exit* or access to a single *exit*.
5. Group R-3 and R-4 occupancies shall be permitted to have one *exit* or access to a single *exit*.
6. Individual single-story or multistory *dwelling units* shall be permitted to have a single *exit* or access to a single *exit* from the *dwelling unit* provided that both of the following criteria are met:
   6.1. The *dwelling unit* complies with Section 1006.2.1 as a space with one *means of egress*.
   6.2. Either the exit from the *dwelling unit* discharges directly to the exterior at the *level of exit discharge*, or the *exit access* outside the *dwelling unit's* entrance door provides access to not less than two *approved* independent *exits*.

Revise as follows:

1006.3.5 Group R-2 occupancies. In Group R-2 occupancies, a single exit shall be permitted from any story or occupiable roof where the number of dwelling units served per exit at each story comply with one of the following:

1. The basement and first through sixth story above grade plane with a maximum of 4 dwelling units served per exit on each story.
2. The basement and first through third story above grade plane with a maximum of 6 dwelling units served per exit on each story.

Such building shall comply with Sections 1006.3.5.1 through ~~1006.3.5.6~~ 1006.3.5.9.

1006.3.5.1 Construction type. The building is Type IA, IB, or IIA~~, or IV~~ construction.

1006.3.5.2 Corridors. Dwelling units that do not open directly into an exterior exit stairway shall exit directly to a corridor complying with Section 1020.

1006.3.5.3 Travel distance. The maximum ~~Maximum~~ exit access travel distance shall be not more than 125 feet (38.1 m). Travel distance from the exit access door of the unit to the exit door for the stairway shall be not more than ~~25~~50 feet (~~7.62~~ 15.24 m).

1006.3.5.4 Exit stairways. Means of egress shall be provided from each story above the level of exit discharge by an interior ~~exit stairway or exterior~~ exit stairway enclosed in ~~Exit stairways shall be protected with 2-hour fire barriers in accordance with Section 707 or a 2-hour horizontal assemblies in accordance with Section 711. An interior exit stairway shall be a~~ a smokeproof enclosure in accordance with with Section 909.20.

Revise as follows:

1006.3.5.5 Emergency escape and rescue openings. Emergency escape and rescue openings shall be provided in accordance with Section 1031. Ladder pads shall be provided for each rescue opening. Ladder pads shall consist of a sidewalk running beneath all emergency escape or rescue openings, or an individual pad 24 inches by 24 inches (609 mm by 609 mm) minimum and shall be made of a material that allows a fire department ground ladder to be securely anchored to the pad without slipping. Pads shall be placed a distance from the building that allows for the ground ladder to be placed at a safe ladder angle appropriate for the ladders used by the responding fire department.

1006.3.5.6 Mixed occupancies. ~~Mixed occupancies shall be permitted at and below the level of exit discharge. Other occupancies shall not have direct access to the Group R-2 occupancy portion of the building or to the exit stairway serving the Group R-2 occupancy.~~ The single means of egress stair for a Group R-2 occupancy shall not be shared with other occupancies located in mixed use occupancy buildings.

Exception: Parking garages and occupied roofs that only serve the Group R-2 occupancy shall be permitted to have direct access to the exit stairway.

Add new text as follows:

1006.3.5.7 Elevators. Buildings four or more stories above grade plane shall be equipped with an elevator. The elevator shall comply with Sections 3002.4 and also Sections 3008.2 through 3008.5.

1006.3.5.8 Fire protection systems. Fire protection systems shall comply with Sections 1006.3.5.8.1 through 1006.3.5.8.3.

1006.3.5.8.1 Standpipes. In buildings 3 or more stories in height an automatic wet, Class I standpipe shall be installed in accordance with Section 905. Standpipe outlets shall be configured in such a way as to minimize conflicts with egress from doors to individual units. Outlets shall not be placed on intermediate landings.

1006.3.5.8.2 Fire alarm system. In buildings 3 or more stories in height shall install an automatic fire alarm system in accordance with Section 907 and an emergency voice/alarm communication system in accordance with Section 907.5.2.2.

1006.3.5.8.3 Automatic sprinkler system. An automatic sprinkler system, shall be installed in accordance with Section 903.3.1.1.

1006.3.5.9 Fire apparatus access. Where required by the fire code official, aerial fire apparatus access roads shall be provided in accordance with Appendix D, Section D105 of the International Fire Code.

1023.12 Smokeproof enclosures. Where required by Section 403.5.4, 405.7.2,412.2.2.1 or 1006.3.5.4, interior exit *stairways* and *ramps* shall be *smokeproof enclosures* in accordance with Section 909.20.

1031.2 Where required. In addition to the *means of egress* required by this chapter, *emergency escape and rescue openings* shall be provided in the following occupancies:

1. Group R-2 occupancies located in *stories* with only one *exit* or access to only one *exit* as permitted by Tables 1006.3.4(1) and 1006.3.4(2) ~~and~~ or Section 1006.3.5.5.
2. Group R-3 and R-4 occupancies.

Basements and sleeping rooms below the fourth *story above grade plane* shall have not fewer than one *emergency escape and rescue opening* in accordance with this section. Where *basements* contain one or more sleeping rooms, an *emergency escape and rescue*

opening shall be required in each sleeping room, but shall not be required in adjoining areas of the *basement*. Such openings shall open directly into a *public way* or to a *yard* or *court* that opens to a *public way, or to an egress balcony that leads to a public way*.

Exceptions:

1. *Basements* with a ceiling height of less than 80 inches (2032 mm) shall not be required to have *emergency escape and rescue openings*.
2. *Emergency escape and rescue openings* are not required from *basements* or sleeping rooms that have an *exit* door or *exit access* door that opens directly into a *public way* or to a *yard*, *court* or exterior egress balcony that leads to a *public way*.
3. *Basements* without *habitable spaces* and having not more than 200 square feet (18.6 m^2) in floor area shall not be required to have *emergency escape and rescue openings*.
4. *Storm shelters* are not required to comply with this section where the shelter is constructed in accordance with ICC 500.
5. Within individual *dwelling* and *sleeping units* in Groups R-2 and R-3, where the *building* is equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1, 903.3.1.2 or 903.3.1.3, *sleeping rooms* in *basements* shall not be required to have *emergency escape and rescue openings* provided that the *basement* has one of the following:
   5.1. One *means of egress* and one *emergency escape and rescue opening*.
   5.2. Two *means of egress*.

909.20 Smokeproof enclosures. Where required by ~~Section~~ Sections 1006.3.5.4 and 1023.12, a *smokeproof enclosure* shall be constructed in accordance with this section. A *smokeproof enclosure* shall consist of an *interior exit stairway* or *ramp* that is enclosed in accordance with the applicable provisions of Section 1023 and an open exterior balcony or pressurized *stair* and pressurized entrance vestibule meeting the requirements of this section. Where access to the roof is required by the *International Fire Code* , such access shall be from the *smokeproof enclosure* where a *smokeproof enclosure* is required.

2024 International Fire Code

[BE] 1006.3.4 Single exits. A single *exit* or access to a single *exit* shall be permitted from any story or *occupiable roof*, where one of the following conditions exists:

1. The *occupant load*, number of *dwelling units* and exit access travel distance do not exceed the values in Table 1006.3.4(1) or 1006.3.4(2).
2. Group R-2 occupancies complying with Section 1006.3.5.
3. Rooms, areas and spaces complying with Section 1006.2.1 with *exits* that discharge directly to the exterior at the *level of exit discharge*, are permitted to have one *exit* or access to a single *exit*.
4. Parking garages where vehicles are mechanically parked shall be permitted to have one *exit* or access to a single *exit*.
5. Group R-3 and R-4 occupancies shall be permitted to have one *exit* or access to a single *exit*.
6. Individual single-story or multistory *dwelling units* shall be permitted to have a single *exit* or access to a single *exit* from the *dwelling unit* provided that both of the following criteria are met:
   6.1. The *dwelling unit* complies with Section 1006.2.1 as a space with one *means of egress*.
   6.2. Either the exit from the *dwelling unit* discharges directly to the exterior at the *level of exit discharge*, or the *exit access* outside the *dwelling unit's* entrance door provides access to not less than two *approved* independent *exits*.

Revise as follows:

1006.3.5 Group R-2 occupancies. In Group R-2 occupancies, a single exit shall be permitted from any story or occupiable roof where the number of dwelling units served per exit at each story comply with one of the following:

1. The basement and first through sixth story above grade plane with a maximum of 4 dwelling units served per exit on each story.

2. The basement and first through third story above grade plane with a maximum of 6 dwelling units served per exit on each story.

Such building shall comply with Sections 1006.3.5.1 through ~~1006.3.5.6~~ 1006.3.5.9.

1006.3.5.1 Construction type. The building is Type IA, IB, or IIA~~, or IV~~ construction.

1006.3.5.2 Corridors. Dwelling units that do not open directly into an exterior exit stairway shall exit directly to a corridor complying with Section 1020.

1006.3.5.3 Travel distance. The maximum ~~Maximum~~ exit access travel distance shall be not more than 125 feet (38.1 m). Travel distance from the exit access door of the unit to the exit door for the stairway shall be not more than ~~25~~50 feet (~~7.62~~15.24 m).

Revise as follows:

1006.3.5.4 Exit stairways. Means of egress shall be provided from each story above the level of exit discharge by an interior ~~exit stairway or exterior~~ exit stairway enclosed in ~~Exit stairways shall be protected with 2-hour fire barriers in accordance with Section 707 or a 2-hour horizontal assemblies in accordance with Section 711. An interior exit stairway shall be~~ a smokeproof enclosure in accordance with with Section 909.20.

1006.3.5.5 Emergency escape and rescue openings. Emergency escape and rescue openings shall be provided in accordance with Section 1031. Ladder pads shall be provided for each rescue opening. Ladder pads shall consist of a sidewalk running beneath all emergency escape or rescue openings, or an individual pad 24 inches by 24 inches (609 mm by 609 mm) minimum and shall be made of a material that allows a fire department ground ladder to be securely anchored to the pad without slipping. Pads shall be placed a distance from the building that allows for the ground ladder to be placed at a safe ladder angle appropriate for the ladders used by the responding fire department.

1006.3.5.6 Mixed occupancies. ~~Mixed occupancies shall be permitted at and below the level of exit discharge. Other occupancies shall not have direct access to the Group R-2 occupancy portion of the building or to the exit stairway serving the Group R-2 occupancy.~~The single means of egress stair for a Group R-2 occupancy shall not be shared with other occupancies located in mixed use occupancy buildings.

Exception: Parking garages and occupied roofs that only serve the Group R-2 occupancy shall be permitted to communicate with the exit stairway.

Add new text as follows:

1006.3.5.7 Elevators. Buildings four or more stories above grade plane shall be equipped with an elevator. The elevator shall comply with Sections 3002.4 and also Sections 3008.2 through 3008.5.

1006.3.5.8 Fire protection systems. Fire protection systems shall comply with Sections 1006.3.5.8.1 through 1006.3.5.8.3.

1006.3.5.8.1 Standpipes. In buildings 3 or more stories in height an automatic wet, Class I standpipe shall be installed in accordance with section 905. Standpipe outlets shall be configured in such a way as to minimize conflicts with egress from doors to individual units. Outlets shall not be placed on intermediate landings.

1006.3.5.8.2 Fire alarm. In buildings 3 or more stories in height shall install an automatic fire alarm system in accordance with Section 907 and an emergency voice/alarm communication system in accordance with Section 907.5.2.2.

1006.3.5.8.3 Automatic sprinkler system. An automatic sprinkler system, shall be installed in accordance with Section 903.3.1.1.

1006.3.5.9 Fire apparatus access. Where required by the fire code official, aerial fire apparatus access roads shall be provided in

accordance with Appendix D, Section D105.

[BE] 1023.12 Smokeproof enclosures. Where required by Section 403.5.4, 405.7.2,412.2.2.1 or 1006.3.5.4, interior exit *stairways* and *ramps* shall be *smokeproof enclosures* in accordance with Section 909.20.

Revise as follows:

[BE] 1031.2 Where required. In addition to the *means of egress* required by this chapter, *emergency escape and rescue openings* shall be provided in the following occupancies:

1. Group R-2 occupancies located in *stories* with only one *exit* or access to only one *exit* as permitted by Tables 1006.3.4(1) and 1006.3.4(2) ~~and~~ or Section 1006.3.5.5.
2. Group R-3 and R-4 occupancies.

Basements and sleeping rooms below the fourth *story above grade plane* shall have not fewer than one *emergency escape and rescue opening* in accordance with this section. Where *basements* contain one or more sleeping rooms, an *emergency escape and rescue opening* shall be required in each sleeping room, but shall not be required in adjoining areas of the *basement*. Such openings shall open directly into a *public way* or to a *yard* or *court* that opens to a *public way* , or to an egress balcony that leads to a *public way* .

Exceptions:

1. *Basements* with a ceiling height of less than 80 inches (2032 mm) shall not be required to have *emergency escape and rescue openings*.
2. *Emergency escape and rescue openings* are not required from *basements* or sleeping rooms that have an *exit* door or *exit access* door that opens directly into a *public way* or to a *yard*, *court* or exterior egress balcony that leads to a *public way*.
3. *Basements* without *habitable spaces* and having not more than 200 square feet (18.6 m^2) in floor area shall not be required to have *emergency escape and rescue openings*.
4. *Storm shelters* are not required to comply with this section where the shelter is constructed in accordance with ICC 500.
5. Within individual *dwelling* and *sleeping units* in Groups R-2 and R-3, where the building is equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1, 903.3.1.2 or 903.3.1.3, sleeping rooms in *basements* shall not be required to have *emergency escape and rescue openings* provided that the *basement* has one of the following:
   5.1. One *means of egress* and one *emergency escape and rescue opening*.
   5.2. Two *means of egress*.

[BF] 909.20 Smokeproof enclosures. Where required by ~~Section~~ Sections 1006.3.5.4 and1023.12, a *smokeproof enclosure* shall be constructed in accordance with this section. A smokeproof enclosure shall consist of an *interior exit stairway* or *ramp* that is enclosed in accordance with the applicable provisions of Section 1023 and an open exterior balcony meeting the requirements of this section. Where access to the roof is required, such access shall be from the smokeproof enclosure where a *smokeproof enclosure* is required.

Reason: The original proponent of E24-24 submitted a proposal for allowance of a single egress stair in an R-2 occupancy, and as part of that submittal, it was mentioned that code professionals needed to work with proponents to make this kind of thing possible. The committee voted it down 14-0. The original proposal was severely lacking in appropriate safety, and this proposal aims to add in measures to make such a proposal safer for both occupants and all responders, not just fire departments. The changes detailed in this proposal are as follows (In both the Building and Fire Codes, both are identical):

1. If a single stair is proposed for a project, then NFPA 13R sprinkler systems are not appropriate. The system should be a full sprinkler NFPA 13 system in accordance with 903.3.1.1, and this change was made in 1006.3.5.8.3. Cities that allow single stairs like Seattle and New York have a robust response ability. These departments have higher staffing levels, better water supplies, more fire apparatus, better training and better apparatus access than many places in the US. To counter this disparity in order to make this appropriate in all places in the country, the fire sprinkler system should be as robust as it can be.

2. A change was made to the construction types in the original proposal. The original proposal allowed for all type IV construction to have a single stair. Since most type IV construction allows for exposed wood, it isn't appropriate to allow that because of additional smoke generated.

3. The travel distance was increased to 50 feet from 25 in the original proposal. This was done for two reasons. First is the inclusion of elevators later in this proposal. Second is to allow for more room to stage hoselines.

4. The original proposal had an awkwardly worded section on the use of smokeproof enclosures, and addition of 2 hour fire barriers. The section was reworded to just require that the single egress stair comply with section 909.20 which includes all the fire barriers and stairway smoke protection of the original proposal.

5. A provision was added by the original proponent to require emergency egress and rescue windows into all buildings with a single stair. This proposal adds the requirement for ladder pads from which to anchor ladder rescue operations for the use of ground ladders. This is not something usually needed in buildings of Type I or Type II construction, so it is included here so it doesn't get overlooked. Guidance is given as to how the pads should be configured.

6. A provision was reworded from the original proposal allowing for only the occupants of the R-2 occupancy to use the sole egress stair in a mixed use building.

7. A provision was added to require elevators in buildings 4 stories or more in height. There is also a requirement that makes that elevator comply with gurney requirements, as well as a requirement to comply with some Chapter 30 sections for occupant egress elevators, specifically with regards to elimination of shunt trips and hoistway enclosure protection. This requirement was placed in the proposal so that fire and EMS crews did not need to risk their personal safety on an elevator during a medical call by carrying patients down 4 or more flights of stairs.

8. Better provisions for fire protection systems were added as well. The original proposal only added the passive fire protection and smoke control elements, and did nothing for Standpipes or fire alarm notification. This proposal adds a requirement for a class one standpipe, and a fire alarm system that adds voice evacuation.

9. The proposal also adds a pointer to fire access in accordance with Appendix D of the Fire Code for ladder truck access if required by the Fire Code Official.

10. Language was cleaned up from the original proposal that would have required all buildings to potentially comply with the two tables and 1006.3.5 when it should be an "Or" for emergency escape and recue openings in 1031.

All of these changes are designed to try and work with the proponents of the original proposal to allow what they'd like while still providing a greater level of safety for all responders as well as the occupants. The proponents of the original change took great pains to paint this as a housing affordability issue. While we agree that affordability is a concern, housing affordability should never include a disservice to those who can least afford a lesser degree of safety.

Cost Impact: Increase

Estimated Immediate Cost Impact:

The addition of a fire alarm system, the elevators, and standpipes would increase the cost of construction over the increased cost impacts of the original proposal which also would have increased costs.
The rest of the requirements are generally editorial in nature over the cost impacts of the original proposal.

The cost would increase through maintenance of the required systems installed as a result of this proposal.

Estimated Immediate Cost Impact Justification (methodology and variables):

A Fire Alarm will increase the cost by a several thousand dollars if the system was not already required. (Depending on the size of the building a fire alarm may already be required, this would only add the differential of the voice evacuation piece.)

A Standpipe system would also increase the cost of construction by several thousand dollars if the building was not already required to have one.

Elevators would invrease the cost of the building by tens of thousands of dollars if the builder was not already planning on adding one. The provisions allowing for the reduction of fire sprinkler requirements and the elimination of the shunt trip would offset some of this cost by several thousand dollars.

Proponents: Stephen Smith, Center for Building in North America (stephen@centerforbuilding.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

Add new text as follows:

APPENDIX Q
SINGLE EXIT APARTMENT BUILDINGS

SECTION Q101
GENERAL

Q101.1 Scope. The scope of this appendix shall apply exclusively to Group R-2 apartment houses with access to a single exit. Such building shall be constructed in accordance with this appendix. **Exception:** Occupancies, other than Group H or I occupancies, are permitted only at the level of exit discharge and one story below the level of exit discharge.

SECTION Q102
APPLICATION

Q102.1 General. Stories within Group R-2 apartment houses served by a single exit shall comply with Sections Q102.2 through Q102.11.

Q102.2 Height. The height of the building shall comply with all of the following:

1. The building shall be six stories or less in height.
2. The building shall not be a high-rise building.

Exception: Occupiable roof areas shall be permitted where the area serves and is accessed through individual dwelling units.

Q102.3 Story size. The size of the stories shall comply with the following:

1. Each story shall have a maximum of four dwelling units.

2. The occupant load per story shall be 30 occupants maximum.

~~**1006.3.5 Group R-2 occupancies.** In Group R-2 occupancies, a single exit shall be permitted from any story or occupiable roof where the number of dwelling units served per exit at each story comply with one of the following:~~

~~1. The basement and first through sixth story above grade plane with a maximum of 4 dwelling units served per exit on each story.~~

~~2. The basement and first through third story above grade plane with a maximum of 6 dwelling units served per exit on each story.~~

~~Such building shall comply with Sections 1006.3.5.1 through 1006.3.5.6.~~

~~**1006.3.5.1**~~ **Q102.4 Construction type.** The building is Type IA, IB, IIA, IIIA, ~~or~~ IV or VA construction.

Add new text as follows:

Q102.5 Fire protection systems. Fire protection systems shall comply with Q102.5.1 through Q102.5.3.

Q102.5.1 Automatic sprinkler system. The building shall be equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1. Residential-type sprinklers shall be used in all habitable spaces in each dwelling unit.

Q102.5.2 Standpipes. Class I standpipe shall be provided in accordance with Section 905. Standpipe outlets shall be configured in such a way as to minimize the hose conflicting with egress from doors to individual dwelling units.

Q102.5.3 Fire Alarm System. A fire alarm system and smoke alarms shall be installed in accordance with Section 907.2.9.

~~**1006.3.5.2**~~ **Q102.6 Corridors.** Dwelling units that do not open directly into an exterior exit stairway shall exit directly to a corridor complying with Section 1020.

Add new text as follows:

Q102.6.1 Elevators. Elevator hoistway doors shall be protected in accordance with Section 3006.3.

~~**1006.3.5.3**~~ **Q102.7 Travel distance.** Maximum exit access travel distance shall be not more than 125 feet (38.1 m). Travel distance from the exit access door of the unit to the exit door for the stairway shall be not more than 25 feet (7.62 m).

~~**1006.3.5.4**~~ **Q102.8 Exit stairways.** Means of egress shall be provided from each story above the level of exit discharge by an interior exit stairway or exterior exit stairway. Exit stairways shall be protected with 2-hour fire barriers in accordance with Section 707 or a 2-hour horizontal assemblies in accordance with Section 711. An interior exit stairway shall be a smokeproof enclosure in accordance with with Section 909.20.

~~**1006.3.5.6**~~ **Q102.9 Mixed occupancies.** Mixed occupancies shall be permitted at and below the level of exit discharge. Other occupancies shall not have direct access to the Group R-2 occupancy portion of the building or to the exit stairway serving the Group R-2 occupancy.

~~**Exception:** Parking garages and occupied roofs that serve the Group R-2 occupancy shall be permitted to have direct access to the exit stairway.~~

Add new text as follows:

Q102.10 Egress courts. The single exit shall not terminate in an egress court where the court depth exceeds the court width unless

direct and unobstructed access to the public way through two or more independent paths is provided.

~~1006.3.5.5~~ Q102.11 **Emergency escape and rescue openings.** Emergency escape and rescue openings shall be provided in every sleeping room in accordance with ~~Section 1031~~ Sections 1031.2.1 through 1031.6.

1006.3.4 Single exits. A single *exit* or access to a single *exit* shall be permitted from any *story* or *occupiable roof* where one of the following conditions exists:

1. The *occupant load*, number of *dwelling units* and exit access travel distance do not exceed the values in Table 1006.3.4(1) or 1006.3.4(2).
2. ~~Group R-1 and R-2 occupancies complying with Section 1006.3.5.~~
3. ~~3.~~ 2. Rooms, areas and spaces complying with Section 1006.2.1 with *exits* that discharge directly to the exterior at the *level of exit discharge*, are permitted to have one *exit* or access to a single *exit*.
4. ~~4.~~ 3. Parking garages where vehicles are mechanically parked shall be permitted to have one *exit* or access to a single *exit*.
5. ~~5.~~ 4. Group R-3 and R-4 occupancies shall be permitted to have one *exit* or access to a single *exit*.
6. ~~6.~~ 5. Individual single-story or multistory *dwelling units* shall be permitted to have a single *exit* or access to a single *exit* from the *dwelling unit* provided that both of the following criteria are met:
   1. ~~6.1.~~ 5.1. The *dwelling unit* complies with Section 1006.2.1 as a space with one *means of egress*.
   2. ~~6.2.~~ 5.2. Either the exit from the *dwelling unit* discharges directly to the exterior at the *level of exit discharge*, or the *exit access* outside the *dwelling unit's* entrance door provides access to not less than two *approved* independent *exits*.

1023.12 Smokeproof enclosures. Where required by Section 403.5.4, 405.7.2, or 412.2.2.1 ~~or 1006.3.5.5~~, interior exit *stairways* and *ramps* shall be *smokeproof enclosures* in accordance with Section 909.20.

1031.2 Where required. In addition to the *means of egress* required by this chapter, *emergency escape and rescue openings* shall be provided in the following occupancies:

1. Group R-2 occupancies located in *stories* with only one *exit* or access to only one *exit* as permitted by Tables 1006.3.4(1) and 1006.3.4(2) ~~and Section 1006.3.5.5~~.
2. Group R-3 and R-4 occupancies.

Basements and sleeping rooms below the fourth *story above grade plane* shall have not fewer than one *emergency escape and rescue opening* in accordance with this section. Where *basements* contain one or more sleeping rooms, an *emergency escape and rescue opening* shall be required in each sleeping room, but shall not be required in adjoining areas of the *basement*. Such openings shall open directly into a *public way* or to a *yard* or *court* that opens to a *public way, or to an egress balcony that leads to a public way*.

Exceptions:

1. *Basements* with a ceiling height of less than 80 inches (2032 mm) shall not be required to have *emergency escape and rescue openings*.
2. *Emergency escape and rescue openings* are not required from *basements* or sleeping rooms that have an *exit* door or *exit access* door that opens directly into a *public way* or to a *yard*, *court* or exterior egress balcony that leads to a *public way*.
3. *Basements* without *habitable spaces* and having not more than 200 square feet (18.6 m^2) in floor area shall not be required to have *emergency escape and rescue openings*.
4. *Storm shelters* are not required to comply with this section where the shelter is constructed in accordance with ICC 500.

5. Within individual *dwelling* and *sleeping units* in Groups R-2 and R-3, where the *building* is equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1, 903.3.1.2 or 903.3.1.3, *sleeping rooms* in *basements* shall not be required to have *emergency escape and rescue openings* provided that the *basement* has one of the following:

   5.1. One *means of egress* and one *emergency escape and rescue opening*.

   5.2. Two *means of egress*.

Reason: Updated E24-24 single-exit proposal

Based on feedback from egress committee members and other code and fire officials and professionals, we have chosen to rewrite our single-exit apartment building proposal, using Seattle's current code section as a base but placing the entire section in an optional appendix.

In this new reason statement, we present extensive research from the Netherlands on fires in different types of multifamily buildings, supported by modeling and field experiments over the years. We also present preliminary findings on New York City's experience with its own single-exit buildings, supported by a novel fire loss history data set. We also summarize events in jurisdictions throughout the country that speak to the need for guidance from a model code. Finally, we address some frequently asked questions.

Code updates

The most consequential change to our proposal is the location: we have moved it out of Chapter 10, and into a newly created Appendix Q, which jurisdictions are free to adopt or ignore as they see fit. This is in response to the many commenters who have said that they feel the issue is best left to state and local jurisdictions (see the "Need" section of this statement for our explanation for why we still believe there is an ICC role here).

Beyond that, we have aligned our proposal more closely with Seattle's existing single-stair building code section. We have added a number of new requirements (mostly guardrail-type requirements), and removed one as well (some limitations on construction type).

Substantively, we have matched Seattle's existing requirement for NFPA 13 sprinklers regardless of height. In practice, this will add an NFPA 13 sprinkler requirement in four-story buildings that are otherwise allowed by the International Building Code to have NFPA 13R systems. This makes our sprinkler requirement more stringent than that of New York City's code (which allows NFPA 13R systems up to six stories, including in single-stair buildings), and more stringent than that of the main body of the IBC (which allows NFPA 13R systems in residential occupancies up to and including four stories). We have added restrictions on roof decks, added language that gives AHJs greater flexibility to determine standpipe locations, and have added a reminder that fire and smoke alarms must still be installed.

We have responded to concerns that developers may try to find loopholes around the six-story limit and travel distance and unit limits by placing additional limits on height and floor area. For height, we do not allow single-exit buildings to be classified as high-rises, limiting the distance from the level of firefighter vehicle access to the uppermost floor or occupied roof to 75 ft. For floor area, we have added a hard limit of 30 occupants – or 6,000 sq. ft. – per floor. While we do not anticipate this being achievable in normal circumstances given the travel distance limitations, we want to preempt unforeseen loopholes and make it clear to committee and voting members that these would be very small buildings, with individual floors that are a small fraction of the size of ordinary multifamily buildings meeting the requirements of the main body of the International Building Code, often having dozens of units arrayed off of an non-compartmentalized corridor, sharing just two stairs.

In this updated proposal we defer to Seattle's current requirements for one-hour construction, and, based on feedback from the spring, expand the construction types allowed to all that require a fire resistance rating of at least one hour for the primary structural frame, interior and exterior bearing walls, and roof and floor construction. This applies a more consistent standard than our original proposal, and also improves constructibility by allowing the use of the more common and affordable III-A and V-A construction types, while still disallowing the less protected II-B, III-B, and V-B types.

Research

Dutch research

The Netherlands has one of the lowest rates of fire death in the developed world, with a per-capita fatality rate that is just one-fifth of that

of the United States.[1] It has also the strictest rules on single-stair buildings in Europe.[2] The Nederlands Instituut Publieke Veiligheid (NIPV, or the Dutch Institute for Public Safety), the Instituut Fysieke Veiligheid at the Brandweeracademie (Institute for Physical Safety at the Fire Academy), and Nieman Raadgevende Ingenieurs (Nieman Consulting Engineers) have released a series of reports about safety in common Dutch multifamily typologies. These findings – which include statistical analyses of fire safety outcomes, smoke spread modeling, and field experiments, among other methodologies – speak to the improved safety of small, single-exit apartment buildings compared to larger, double-loaded corridor designs.

All reports are cited in the original Dutch, with a link to a version fully machine-translated into English in the bibliography. These documents are long, and the depth and rigor of the research far exceeds that of anything produced to justify basic, prescriptive multifamily codes in the United States, either by government agencies, standards development organizations, or academia. We highly recommend that the committee members read them.
The typical single stair building in the Netherlands, known as a portiekwoning, is made of non-combustible construction, and has a balcony where one can await rescue assistance. Portiekwoningen do not have fire sprinklers or active smoke control systems. Apartments usually open directly onto stairwells, and historically no self-closers were required on apartment doors. Rules have changed over the years, but fire apparatus access has not generally been required on all sides.[3]

Researchers at Nieman found that, according to government statistics from 2001 through 2008, fire fatalities in portiekwoningen occurred at roughly the same rate as the average dwelling in the country.[4] More recent data from NIPV again suggests the rate of fire fatalities in portiekwoningen is not notably different from that of the average Dutch dwelling. In the latest report, updated estimates of the number of single-stair buildings were not produced. However, based on the Netherlands' extremely low rate of fire fatality, it is safe to conclude that these buildings performed far better than the average US home. This report also found that a slightly lower share of fatal fire victims died in circulation areas (like stairs and corridors) in single-stair portiekwoningen than in larger two-stair buildings with interior corridors.[5]

While single-exit portiekwoningen are much safer than the average U.S. dwelling, data showed elevated rates of rescue compared to other building types in the Netherlands. Unlike other European governments, the Dutch government was uncomfortable with the dependence on fire service rescue. Because they did not want to ban the construction of these single-exit buildings for reasons of housing affordability, they commissioned another report by Nieman to determine what rules could be added to bring these buildings up to a higher level of self-reliant safety (that is, allowing more people to self-evacuate). The report applied NIST's Consolidated Fire and Smoke Transport (CFAST) zone model to determine the effects of a fire breaking out in a ground floor apartment in a five-story, 10-unit apartment building where units open directly into the exit. It concluded that the most cost-effective risk reduction can be achieved by requiring self-closers on apartment doors (which had not been previously required), cutting risk by up to 76 percent.[6]

Dutch researchers have also looked into the safety of buildings that more closely resemble standard IBC-compliant double-loaded corridor multifamily buildings. Researchers at the Instituut Fysieke Veiligheid conducted 19 field experiments in a double-loaded corridor multifamily building, to examine smoke propagation within the building. The building contained a segment of a corridor 19 meters (62 feet) in length with five apartments on either side (for a total of 10 units), with a synthetic couch containing flexible polyurethane foam set on fire inside of one of the apartments (and of course, no fire sprinklers). The report concluded that smoke propagates horizontally more than vertically, and that "almost immediately" after opening the door from the room of origin to the common corridor, "the possibility of escape for people in other residences [opening onto the corridor] is seriously impaired, since the corridor will fill up with smoke in a matter of seconds."[7] Subsequent computer modeling also showed that in cases where a sprinkler is not provided or effective, the double-loaded corridor building does not deliver a level of safety for vulnerable occupants that is acceptable by Dutch standards.[8]

Because the I-Codes do not establish an absolute level of life safety that must be achieved, proposals must be judged relative to currently allowed conditions, and therefore the safety of double-loaded corridor buildings is relevant to our proposal. While our proposal strictly limits the size of floors and corridors, the main body of the IBC allows much longer corridors – up to 500 occupants can share a floor with just two stairs, with exit access travel distances of up to 250 feet per Table 1017.2 for R-2 occupancies. Common paths of travel can be up to 125 feet in length. Compared to the main body of the current IBC, our proposal significantly limits the number of occupants that could be exposed to the hazardous exit access conditions described by Dutch researchers if, in the event of a fire sprinkler system failure, an apartment door is held open and smoke compromises a common corridor, either because of hose operations or the failure of a self-closing door.

New York City findings

This section is adapted from a forthcoming but as-of-yet unpublished report by the Pew Research Center, on single-exit apartment buildings.

New York City has a large stock of modern, sprinklered single-exit buildings of four to six stories in height, and the Pew Research Center is in the process of compiling and analyzing the fire loss history in these buildings. This research is based first on two fire fatality data sets: one pulled from the National Fire Incident Reporting System, and another one compiled manually through a search of news accounts, with the U.S. Fire Administration's "Home Fire Fatalities in the News" dataset serving as the base, and a smaller number of other fires reported in the media added as they were found.[9] We then joined the fire fatality data to the city's PLUTO data set, which has enough physical and regulatory variables that we can identify, with a high degree of certainty, which apartment buildings have a single exit.

The research is still ongoing, but as of now, we have manually identified 462 civilian fatalities associated with fires in residential structures (single- and multifamily) in New York City dating back to 2012, with better coverage of more recent years. We have also analyzed NFIRS data from 2012 (before this year, the data is heavily corrupted) through 2022 (the most recent year that has been published), identifying 240 fire fatalities over the period that match with a still-extant building (a significant number of buildings that experienced a fatal fire are later demolished and therefore no longer match to a current building, but these tend to be older, smaller, light wood-frame dwellings). (Reporting to NFIRS by FDNY has always been incomplete, as it is in many jurisdictions, but since the pandemic FDNY reporting has dropped off dramatically, creating the need for the manual collection method to supplement the NFIRS data.)

New York City has long allowed single-exit multifamily buildings up to six stories in height with at most 2,000 sq. ft. per floor – first in its 1968 building code, with the allowance copied over without substantial modification into the 2008, 2014, and 2022 codes.[10] New York City has long had other items within the same code section that allow single-stair multifamily buildings under different criteria, but item 7 under Section 1006.3.2, allowing six stories and 2,000 sq. ft. per floor, is by far the most commonly used item for new construction, and is therefore the focus of our study. The city began requiring fire sprinklers in all new multifamily buildings in 1999.[11] New York City allows NFPA 13R sprinklers into all residential buildings up to six stories in height, including in all new single-stair multifamily buildings (which, when sprinklered, we will refer to as "modern single-stair buildings").[12]

We have identified over 4,000 modern single-stair buildings above the IBC's three-story height limit across the city built since the sprinkler requirement was put into place. Taking into account when each unit was built and the number of residential units within it, New York City has over 300,000 apartment-years of experience with these four- through six-story modern single-stair buildings. New York City has an average of 2.43 residents per unit, suggesting around 750,000 resident-years of experience with such buildings.[13]We have identified two fatal fires in modern single-stair buildings, claiming the lives of three civilians and no firefighters. We have not identified any fire deaths in single-stair buildings (that is, those built since 1968, but excluding tenement-style and other multifamily buildings before this time with one interior stair and one or more fire escapes) built before the sprinkler requirement was imposed, although for reasons of difficult zoning and weak demand, there are not many single-stair buildings from this period.

Over the 10-year period from 2014 through 2023, New York City has averaged 0.85 fatalities per year per 100,000 residents, or more than twice the rate as we have identified in modern single-stair buildings.[14] None of the three modern single-stair deaths appear to have occurred outside of the unit of origin, and from the information we have available, neither incident involved smoke or fire penetrating the single exit. The facts suggest that a second stair would not have saved any lives in either of these two buildings, and that New York City's experience with taller single-stair buildings has been good. For the sake of completeness and to convey to committee members the depth of our research, the details of the two fatal fires are summarized below.

Fatal fire at 351 East 54th St., Manhattan (March 3, 2021)

In 2021, a private developer completed construction of a six-story, 12-unit multifamily building at 351 East 54th St., in the Midtown East section of Manhattan. The building contains two studio apartments on every floor, one facing the front of the building and the other facing the rear (with no fire department access to these rear units, as is allowed by New York City's building code). Each floor is served by a single stair in an enclosed shaft, and an elevator opening onto the common corridor (with no hoistway opening protection aside from the landing doors). The building is fully sprinklered, likely in accordance with NFPA 13R standards (New York City modifies the IBC to allow NFPA 13R sprinkler systems for multifamily buildings up to and including six stories in height).

Shortly after completion, the developer sold the building to a non-profit landlord called the Metropolitan Council on Jewish Poverty (known as the "Met Council"). The Met Council's website describes the building as serving "moderate-income senior citizens with incomes less than 80% of the area median income," with applicants required to be at least 62 years old.[15]

Police told reporters at at least two outlets that a 73-year-old woman was killed in a fire in a first-floor apartment that broke out around 4:30 p.m. on March 3, 2021, and was under control by 5:15 p.m. There is no mention of any other deaths or injuries in the building, or spread of the fire or smoke to other floors of the building (one outlet reported flames only on the first floor).[16] The incident was not recorded in NFIRS, and FDNY has not yet responded to our request for a redacted fire marshal report.

Fatal fire at 71-02 162nd St., Queens (December 15, 2021)A developer completed a four-story, three-unit apartment building at 71-02 162nd St. in 2007, in the Flushing section of Queens. As permitted, the building was sprinklered and contained a recreation space in the cellar, a garage and single two-room apartment on the ground floor, a single four-room apartment on the second floor, and a single bilevel apartment spanning the third and fourth floors, with a private terrace on the fourth floor.[17] The neighborhood is one of the major centers of New York City's Chinese immigrant community, and has a very wide range of incomes, with residents including many very low-income residents, ranging from new arrivals to the country to retirees, and many illegally converted dwelling units of all types.

According to four news accounts, a fire broke out on the fourth floor of the building in the early morning of December 15, 2021, killing a 75-year-old woman and her 81-year-old husband and injuring one other adult. Firefighters told the New York Post that they found the building in "an advanced fire condition," with a "heavy clutter condition."[18]

The full fire marshal report paints a picture of a deeply troubled building. The ostensibly three-unit building had been divided into five different apartments, with one illegal unit carved out of the cellar, and the top floor unit subdivided into two apartments, with one per floor. Neither of the illegal units had a smoke detector, and the building had problems with heating. One surviving witness who lived in the fourth-floor unit stated that the heat had been recently malfunctioning, and that somebody (whose name is redacted, but who appears to be one of the victims) had a space heater plugged into an extension cord near their bed, and had been sleeping with a lit tea candle next to it. A 20-lb. tank of propane was found in the fourth-floor stairwell.[19]

The fire marshal report states that the fire consumed multiple rooms of the apartment – the bedroom of origin, the living room, the kitchen, and the other bedroom. A surviving occupant said somebody ran downstairs to get a fire extinguisher and then back up to the apartment on fire, but could not stay because of the smoke and flames. Despite the high-risk conditions, the attempted reentry of one of the residents, and the advanced state of the fire by the time firefighters arrived, the NFIRS record shows that the fire did not damage any floor except the top one, and images from the scene back that up by showing intact windows on the third floor.

Need

Urban areas in the United States have experienced a worsening housing shortage over the past few decades, as demand has returned to American cities after years of decay and abandonment, while housing production has remained low. Starting around a decade ago, advocates and policymakers have looked to reform land use regulations to remove impediments to housing construction in U.S. cities and suburbs. But with construction costs for denser forms of housing remaining very high, there is concern that zoning reform alone will not be enough to make housing in American cities affordable again.
North America may be unique in the world in having construction costs that rise substantially as buildings grow denser. RSMeans Data, the most comprehensive database of construction costs
in the United States, shows that per-square-foot construction costs steadily rise as housing typologies grow in density – from $148 per square foot for a two-story single-family house to $190 per square foot for a three-story garden apartment complex to $227 (open shop) to $257 per square foot (union) for a six-story, reinforced concrete apartment building.[20] A cost guide for Canada, which has similar building codes to the United States, shows the same upward-sloping cost-density gradient, with freestanding single-family houses costing $210 (in Canadian dollars) per square foot to build in the Greater Toronto Area, wood-framed condos up to six stories costing $245 per square foot, and high-rises costing $285 to $365 per square foot, depending on height.[21]

Outside of North America, on the other hand, construction costs remain roughly the same across building types, sometimes even falling as construction grows from single- to multifamily. The German BKI Kostenplaner 2024, for example, shows that a one- or two-family house built to a mid-market standard costs on average €1,945 per square meter ($197 per square foot), a low-rise apartment building with up six units costs €1,770 per square meter ($179 per square foot), and a larger mid-rise apartment building costs around €1,700 per square meter ($172 per square foot).[22] Construction cost guides from Italy and Mexico show similar flat or even downward-sloping cost-density gradients.[23]

In the 1990s and 2000s, the United States real estate market overwhelmingly delivered new housing in the form of single-family houses. Since the 2007-2008 financial crisis, however, development has shifted to something closer to an even split between single- and multifamily homes. As should be expected as apartment construction grows, policymakers are becoming concerned about the hard costs

– not just zoning-driven land costs – of multifamily housing, with construction costs in coastal California markets, for example, rising to an average of around $500 for even subsidized "affordable" multifamily development.[24] Given the large amount of space occupied by exits on small lots, where cities and states with housing crises are trying to encourage infill development through zoning reform, the IBC's second exit requirement starting at a height that is unusually low for the developed world has emerged as a major area of concern.[25]Even prior to our single-exit proposal, New York, Seattle, and Honolulu already felt that the IBC's three-story single-exit multifamily height limit was overly restrictive, and developed code sections allowing single-exit multifamily buildings up to six stories. Vermont and Georgia allow single-exit apartment buildings to rise to four stories through adoption of NFPA 101's egress provisions in lieu of IBC Chapter 10, and anecdotal evidence suggests that a significant number of four-story, single-exit buildings have been built in and around Atlanta.[26]

More recently, legislation has been advanced (and in many cases passed) in California, Colorado, Connecticut, Minnesota, Nashville, New York City, New York State, Oregon, Pennsylvania, Tennessee, Virginia, and Washington State to study, adopt, or enable local adoption of amendments to the IBC to allow taller single-exit buildings.[27] We are aware of multiple other efforts that are not yet public. In some states, the debate over taller single-stair buildings has opened up wider discussion about buildings codes. In California, Gov. Gavin Newsom issued an executive order in August 2024 directing state agencies to "identify and explore opportunities to update the state Building Standards Code to lower the cost of, while increasing flexibility for, infill development" – a move that one publication characterized as the governor "tak[ing] aim" at the state's IBC-based building code.[28]

In the absence of guidance from the ICC on how to safely allow taller single-exit apartment buildings, jurisdictions will continue to move forward with their own amendments. A lack of any movement in the 2027 IBC on single-exit apartment buildings will inevitably raise questions in the minds of policymakers about the I-Codes' ability to adapt to new information, new technologies, and new economic circumstances, as it already has in California. This is not likely to stop at amendments to Section 10 of the IBC.

Frequently asked questions

Q: With all of these requirements (especially for stairway pressurization), are these buildings even economically viable?

A: Our proposal is based on language that has been refined over two generations in Seattle. Many four-, five-, and six-story single-exit apartment buildings – ranging from affordable walk-up rentals to luxury condos with elevators – have been built over a number of real estate cycles under the current language. Developers can – and often do – avoid the expense of mechanical pressurization systems by using an exterior stairway, which uses natural ventilation to keep the exit free of life-threatening amounts of smoke at lower cost. In any case, our appendix adds an additional compliance path to the main body of the code without removing any existing options, so it cannot harm the viability of any project.

Q: Some jurisdictions either have required or are considering requiring wider stairways.29 Why is that not part of your proposal? (Alternatively: How will firefighters adapt to not having the use of a dedicated attack stair?)

A: Many in the fire service have stated that multifamily buildings need two stairways because in a fire, responding firefighters designate one stairway to be used for firefighter attack and the other for egress, and therefore, a single stair, if allowed, should be wider to accommodate bidirectional flows. These statements ignore the fact that current fire service training does not fully rely on perfectly segregated attack and egress stairs, and that any such strategy would likely be deadly in a fire given current code limitations.

Regarding existing practice, in our original Group A CAH #1 reason statement we shared published excerpts from books written by firefighters that state that it is often not possible in practice to designate separate exits for occupant egress and firefighter attack in two-stair buildings. These back up statements made in private interviews by fire service officials: firefighters do not bar occupants trying to escape smoke-filled floors from using the nearest exit because they are using it to attack a fire, and segregating egress and attack is in practice, in the words of one fire service official, "a mess."

Beyond claims of impracticality from the fire service itself, the logic of the existing code does not support the idea of well segregated flows. Not only is there no requirement that stairs be positioned close to each other to allow firefighters to easily segregate flows, but Section 1007.1.1 ("Two exits or exit access doorways") now effectively forbids the practice. Table 1017.2 ("Exit access travel distance") sets 250 feet as the maximum travel distance within the exit access portion of the means of egress for residential occupancies. In a

typical two-stair, double-loaded corridor building, this means that while the nearest stair can be at most 250 feet away, the second-nearest stair can be even more distant from any apartment door. If firefighters tried to prevent occupants from using the nearest exit, occupants would have to potentially traverse distances in excess of 750 feet to reach an exit – up to 250 feet to the nearest stair (since there is no public address system required to tell them which stair to use), plus another 250 feet to return to their unit, plus over 250 feet to reach the second-nearest exit, in a likely unfamiliar location. This is clearly not a tenable practice, and therefore we must assume that occupants will often evacuate using the nearest exit even in apartment buildings with multiple exits.Given the impracticality of perfectly segregating flows, we must evaluate the numbers of occupants that may be trying to egress through a stair that firefighters would like to use for attack operations. Table 1006.3.3 (“Minimum number of exits or access to exits per story or occupiable roofs”) currently allows up to 500 occupants per floor with only two stairs, or up to around 250 occupants nearest to each exit. Our proposal limits each floor to just 30 occupants in total, or 150 for the upper levels of the entire building.

Q: Why is there a requirement for emergency escape and rescue openings (EEROs) if there is no additional requirement for fire service access to openings?

A: The EERO requirement is to give firefighters the certainty that if they see a window in a sleeping room (that is, a bedroom or living room) and believe they can reach it with a ladder or aerial apparatus, it will be sized and located in such a way that a rescue will be possible.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

We believe the cost of constructing multifamily buildings on small lots will decrease by roughly 7 percent, in line with the reduction in circulation area required.

Estimated Immediate Cost Impact Justification (methodology and variables):

See attachment to original proposal for details.

Proposed Change as Submitted

Proponents: Scott Brody, Self (sbrody96@gmail.com)

2024 International Building Code

Revise as follows:

1006.3.4 Single exits. A single *exit* or access to a single *exit* shall be permitted from any *story* or *occupiable roof* where one of the following conditions exists:

1. The *occupant load*, number of *dwelling units* and exit access travel distance do not exceed the values in Table 1006.3.4(1) or 1006.3.4(2).

2. Group R-1 and R-2 occupancies complying with Section 1006.3.5.

~~2~~ 3. Rooms, areas and spaces complying with Section 1006.2.1 with *exits* that discharge directly to the exterior at the *level of exit discharge*, are permitted to have one *exit* or access to a single *exit*.

~~3~~ 4. Parking garages where vehicles are mechanically parked shall be permitted to have one *exit* or access to a single *exit*.

~~4~~ 5. Group R-3 and R-4 occupancies shall be permitted to have one *exit* or access to a single *exit*.

~~5~~ 6. Individual single-story or multistory *dwelling units* shall be permitted to have a single *exit* or access to a single *exit* from the *dwelling unit* provided that both of the following criteria are met:

~~5.1~~ 6.1. The *dwelling unit* complies with Section 1006.2.1 as a space with one *means of egress*.

~~5.2~~ 6.2. Either the exit from the *dwelling unit* discharges directly to the exterior at the *level of exit discharge*, or the *exit access* outside the *dwelling unit's* entrance door provides access to not less than two *approved* independent *exits*.

TABLE 1006.3.4(1) STORIES AND OCCUPIABLE ROOFS WITH ONE EXIT OR ACCESS TO ONE EXIT FOR R-2 OCCUPANCIES

STORY	OCCUPANCY	MAXIMUM NUMBER OF DWELLING UNITS	MAXIMUM EXIT ACCESS TRAVEL DISTANCE
Basement, first, second or third story above grade plane and occupiable roofs over the first or second story above grade plane	R-2[a, b, c]	4 dwelling units	125 feet
Fourth story above grade plane and higher	NP	NA	NA

For SI: 1 foot = 304.8 mm.

NP = Not Permitted.

NA = Not Applicable.

a. Buildings classified as Group R-2 equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2 and provided with emergency escape and rescue openings in accordance with Section 1031.

b. This table is used for Group R-2 occupancies consisting of dwelling units. For Group R-2 occupancies consisting of sleeping units, use Table 1006.3.4(2).

c. This table is for occupiable roofs accessed through and serving individual dwelling units in Group R-2 occupancies. For Group R-2 occupancies with occupiable roofs that are not accessed through and serving individual units, use Table 1006.3.4(2).

TABLE 1006.3.4(2) STORIES AND OCCUPIABLE ROOFS WITH ONE EXIT OR ACCESS TO ONE EXIT FOR OTHER OCCUPANCIES

STORY AND OCCUPIABLE ROOF	OCCUPANCY	MAXIMUM OCCUPANT LOAD PER STORY AND OCCUPIABLE ROOF	MAXIMUM EXIT ACCESS TRAVEL DISTANCE (feet)
First story above or below grade plane and occupiable roofs over the first story above grade plane	A, B[b], E, F[b], M, U	49	75
	H-2, H-3	3	25
	H-4, H-5, I, R-1, R-2[a, c]	10	75
	S[b, d]	29	75
Second story above grade plane	B, F, M, S[d]	29	75
Third story above grade plane and higher	NP	NA	NA

For SI: 1 foot = 304.8 mm.

NP = Not Permitted.

NA = Not Applicable.

a. Buildings classified as Group R-2 equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2 and provided with emergency escape and rescue openings in accordance with Section 1031.

b. Group B, F and S occupancies in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or an occupiable roof of such buildings shall have a maximum exit access travel distance of 100 feet.

c. This table is used for Group R-2 occupancies consisting of sleeping units. For Group R-2 occupancies consisting of dwelling units, use Table 1006.3.4(1).

d. The length of exit access travel distance in a Group S-2 open parking garage shall be not more than 100 feet.

1006.3.4.1 Mixed occupancies. Where one *exit*, or *exit access stairway* or *ramp* providing access to exits at other *stories*, is permitted to serve individual *stories* , mixed occupancies shall be permitted to be served by single *exits* provided that each individual occupancy complies with the applicable requirements of Table 1006.3.4(1) or 1006.3.4(2) for that occupancy. Where applicable, cumulative *occupant loads* from adjacent occupancies shall be considered to be in accordance with the provisions of Section 1004.1. In each *story* of a mixed occupancy *building*, the maximum number of occupants served by a single exit shall be such that the sum of the ratios of the calculated number of occupants of the space divided by the allowable number of occupants indicated in Table 1006.3.4(2) for each occupancy does not exceed one. Where *dwelling units* are located on a story with other occupancies, the actual number of *dwelling units* divided by four plus the ratio from the other occupancy does not exceed one.

Add new text as follows:

1006.3.5 Group R-1 and R-2 occupancies. In Group R-1 and R-2 occupancies, a single exit shall be permitted from any story or occupiable roof where the number of dwelling units served per exit at each story comply with one of the following:

1. The basement and first through sixth story above grade plane with a maximum of 4 dwelling units or sleeping units per story.
2. The basement and first through third story above grade plane with a maximum of 6 dwelling units or sleeping units per story.

Such building shall comply with Sections 1006.3.5.1 through 1006.3.5.7.

1006.3.5.1 Construction type. The building is Type IA, IB, IIA, or IV construction.

1006.3.5.2 Automatic sprinkler system. An automatic sprinkler system shall be installed throughout in accordance with Section 903.3.1.1.

1006.3.5.3 Corridors. Dwelling units or sleeping units that do not open directly into an exterior exit stairway shall exit directly to a corridor complying with Section 1020.

1006.5.3.4 Travel distance. For Group R-1, the maximum exit access travel distance shall be not more than 75 feet (22.9 m). For Group R-2, the maximum exit access travel distance shall be not more than 125 feet (38.1 m). Travel distance from the exit access door of the unit to the exit door for the stairway shall be not more than 25 feet (7.62 m).

1006.3.5.5 Exit stairways. Means of egress shall be provided from each story above the level of exit discharge by an interior exit stairway or exterior exit stairway. Exit stairways shall be protected with 2-hour fire barriers in accordance with Section 707 or a 2-hour horizontal assemblies in accordance with Section 711. An interior exit stairway shall be a smokeproof enclosure in accordance with with Section 909.20.

1006.3.5.6 Emergency escape and rescue openings. Emergency escape and rescue openings shall be provided in accordance with Section 1031.

1006.3.5.7 Mixed occupancies. Mixed occupancies shall be permitted at and below the level of exit discharge. Other occupancies shall not have direct access to the Group R-1 and R-2 occupancy portion of the building or to the exit stairway serving the Group R-1 and R-2 occupancy. **Exception:** Parking garages and occupied roofs that serve the Group R-1 and R-2 occupancy shall be permitted to have direct access to the exit stairway.

Revise as follows:

1023.12 Smokeproof enclosures. Where required by Section 403.5.4, 405.7.2, ~~or~~ 412.2.2.1 or 1006.3.5.5, interior exit *stairways* and *ramps* shall be *smokeproof enclosures* in accordance with Section 909.20.

1031.2 Where required. In addition to the *means of egress* required by this chapter, *emergency escape and rescue openings* shall be provided in the following occupancies:

1. Group R-2 occupancies located in *stories* with only one *exit* or access to only one *exit* as permitted by Tables 1006.3.4(1) and 1006.3.4(2).
2. Group R-3 and R-4 occupancies.
3. Group R-1 and R-2 occupancies located in stories with one one exit as permitted by Section 1006.3.5.

Basements and sleeping rooms below the fourth *story above grade plane* shall have not fewer than one *emergency escape and rescue opening* in accordance with this section. Where *basements* contain one or more sleeping rooms, an *emergency escape and rescue opening* shall be required in each sleeping room, but shall not be required in adjoining areas of the *basement*. Such openings shall open directly into a *public way* or to a *yard* or *court* that opens to a *public way, or to an egress balcony that leads to a public way* .

Exceptions:

1. *Basements* with a ceiling height of less than 80 inches (2032 mm) shall not be required to have *emergency escape and rescue openings*.
2. *Emergency escape and rescue openings* are not required from *basements* or sleeping rooms that have an *exit* door or *exit access* door that opens directly into a *public way* or to a *yard*, *court* or exterior egress balcony that leads to a *public way*.
3. *Basements* without *habitable spaces* and having not more than 200 square feet (18.6 m^2) in floor area shall not be required to have *emergency escape and rescue openings*.
4. *Storm shelters* are not required to comply with this section where the shelter is constructed in accordance with ICC 500.

5. Within individual *dwelling* and *sleeping units* in Groups R-2 and R-3, where the *building* is equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1, 903.3.1.2 or 903.3.1.3, *sleeping rooms* in *basements* shall not be required to have *emergency escape and rescue openings* provided that the *basement* has one of the following:

   5.1. One *means of egress* and one *emergency escape and rescue opening*.

   5.2. Two *means of egress*.

2024 International Fire Code

Revise as follows:

[BE] 1006.3.4 Single exits. A single *exit* or access to a single *exit* shall be permitted from any story or *occupiable roof*, where one of the following conditions exists:

1. The *occupant load*, number of *dwelling units* and exit access travel distance do not exceed the values in Table 1006.3.4(1) or 1006.3.4(2).

2. Group R-1 and R-2 occupancies complying with Section 1006.3.5.

~~2~~ 3. Rooms, areas and spaces complying with Section 1006.2.1 with *exits* that discharge directly to the exterior at the *level of exit discharge*, are permitted to have one *exit* or access to a single *exit*.

~~3~~ 4. Parking garages where vehicles are mechanically parked shall be permitted to have one *exit* or access to a single *exit*.

~~4~~ 5. Group R-3 and R-4 occupancies shall be permitted to have one *exit* or access to a single *exit*.

~~5~~ 6. Individual single-story or multistory *dwelling units* shall be permitted to have a single *exit* or access to a single *exit* from the *dwelling unit* provided that both of the following criteria are met:

   ~~5.1~~ 6.1. The *dwelling unit* complies with Section 1006.2.1 as a space with one *means of egress*.

   ~~5.2~~ 6.2. Either the exit from the *dwelling unit* discharges directly to the exterior at the *level of exit discharge*, or the *exit access* outside the *dwelling unit's* entrance door provides access to not less than two *approved* independent *exits*.

[BE] TABLE 1006.3.4(1) STORIES AND OCCUPIABLE ROOFS WITH ONE EXIT OR ACCESS TO ONE EXIT FOR R-2 OCCUPANCIES

STORY	OCCUPANCY	MAXIMUM NUMBER OF DWELLING UNITS	MAXIMUM EXIT ACCESS TRAVEL DISTANCE
Basement, first, second or third story above grade plane and occupiable roofs over the first or second story above grade plane	R-2[a, b, c]	4 dwelling units	125 feet
Fourth story above grade plane and higher	NP	NA	NA

For SI: 1 foot = 304.8 mm.

NP = Not Permitted.

NA = Not Applicable.

a. Buildings classified as Group R-2 equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2 and provided with emergency escape and rescue openings in accordance with Section 1031.

b. This table is used for Group R-2 occupancies consisting of dwelling units. For Group R-2 occupancies consisting of sleeping units, use Table 1006.3.4(2).

c. This table is for occupiable roofs accessed through and serving individual dwelling units in Group R-2 occupancies. For Group R-2 occupancies with occupiable roofs that are not accessed through and serving individual units, use Table 1006.3.4(2).

[BE] TABLE 1006.3.4(2) STORIES AND OCCUPIABLE ROOFS WITH ONE EXIT OR ACCESS TO ONE EXIT FOR OTHER OCCUPANCIES

STORY AND OCCUPIABLE ROOF	OCCUPANCY	MAXIMUM OCCUPANT LOAD PER STORY AND OCCUPIABLE ROOF	MAXIMUM EXIT ACCESS TRAVEL DISTANCE (feet)
First story above or below grade plane and occupiable roofs over the first story above grade plane	A, B[b], E, F[b], M, U	49	75
	H-2, H-3	3	25
	H-4, H-5, I, R-1, R-2[a, c]	10	75
	S[b, d]	29	75
Second story above grade plane	B, F, M, S[d]	29	75
Third story above grade plane and higher	NP	NA	NA

For SI: 1 foot = 304.8 mm.

NP = Not Permitted.

NA = Not Applicable.

a. Buildings classified as Group R-2 equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2 and provided with emergency escape and rescue openings in accordance with Section 1031.

b. Group B, F and S occupancies in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or an occupiable roof of such buildings shall have a maximum exit access travel distance of 100 feet.

c. This table is used for Group R-2 occupancies consisting of sleeping units. For Group R-2 occupancies consisting of dwelling units, use Table 1006.3.4(1).

d. The length of exit access travel distance in a Group S-2 open parking garage shall be not more than 100 feet.

[BE] 1006.3.4.1 Mixed occupancies. Where one *exit*, or *exit access stairway* or *ramp* providing access to *exits* at other stories, is permitted to serve individual stories, mixed occupancies shall be permitted to be served by single *exits* provided that each individual occupancy complies with the applicable requirements of Table 1006.3.4(1) or 1006.3.4(2) for that occupancy. Where applicable, cumulative *occupant loads* from adjacent occupancies shall be considered to be in accordance with the provisions of Section 1004.1. In each story of a mixed occupancy building, the maximum number of occupants served by a single *exit* shall be such that the sum of the ratios of the calculated number of occupants of the space divided by the allowable number of occupants indicated in Table 1006.3.4(2) for each occupancy does not exceed one. Where *dwelling units* are located on a story with other occupancies, the actual number of *dwelling units* divided by four plus the ratio from the other occupancy does not exceed one.

Add new text as follows:

1006.3.5 Group R-1 and R-2 occupancies. In Group R-1 and R-2 occupancies, a single exit shall be permitted from any story or occupiable roof where the number of dwelling units served per exit at each story comply with one of the following:

1. The basement and first through sixth story above grade plane with a maximum of 4 dwelling units or sleeping units per story.
2. The basement and first through third story above grade plane with a maximum of 6 dwelling units or sleeping units per story.

Such building shall comply with Sections 1006.3.5.1 through 1006.3.5.7.

1006.3.5.1 Construction type. The building is Type IA, IB, IIA, or IV construction.

1006.3.5.2 Automatic sprinkler system. An automatic sprinkler system shall be installed throughout in accordance with Section 903.3.1.1.

1006.3.5.3 Corridors. Dwelling units or sleeping units that do not open directly into an exterior exit stairway shall exit directly to a corridor

complying with Section 1020.

1006.5.3.4 Travel distance. For Group R-1, the maximum exit access travel distance shall be not more than 75 feet (22.9 m). For Group R-2, the maximum exit access travel distance shall be not more than 125 feet (38.1 m). Travel distance from the exit access door of the unit to the exit door for the stairway shall be not more than 25 feet (7.62 m).

1006.3.5.5 Exit stairways. Means of egress shall be provided from each story above the level of exit discharge by an interior exit stairway or exterior exit stairway. Exit stairways shall be protected with 2-hour fire barriers in accordance with Section 707 or a 2-hour horizontal assemblies in accordance with Section 711. An interior exit stairway shall be a smokeproof enclosure in accordance with with Section 909.20.

1006.3.5.6 Emergency escape and rescue openings. Emergency escape and rescue openings shall be provided in accordance with Section 1031.

1006.3.5.7 Mixed occupancies. Mixed occupancies shall be permitted at and below the level of exit discharge. Other occupancies shall not have direct access to the Group R-1 and R-2 occupancy portion of the building or to the exit stairway serving the Group R-1 and R-2 occupancy. **Exception:** Parking garages and occupied roofs that serve the Group R-1 and R-2 occupancy shall be permitted to have direct access to the exit stairway.

Revise as follows:

[BE] 1023.12 Smokeproof enclosures. Where required by Section 403.5.4, 405.7.2, ~~or~~ 412.2.2.1 or 1006.3.5.5, interior exit *stairways* and *ramps* shall be *smokeproof enclosures* in accordance with Section 909.20.

[BE] 1031.2 Where required. In addition to the *means of egress* required by this chapter, *emergency escape and rescue openings* shall be provided in the following occupancies:

1. Group R-2 occupancies located in stories with only one *exit* or access to only one *exit* as permitted by Tables 1006.3.4(1) and 1006.3.4(2).
2. Group R-3 and R-4 occupancies.
3. Group R-1 and R-2 occupancies located in stories with one one exit as permitted by Section 1006.3.5.

Basements and sleeping rooms below the fourth *story above grade plane* shall have not fewer than one *emergency escape and rescue opening* in accordance with this section. Where *basements* contain one or more sleeping rooms, an *emergency escape and rescue opening* shall be required in each sleeping room, but shall not be required in adjoining areas of the *basement*. Such openings shall open directly into a *public way* or to a *yard* or *court* that opens to a *public way* , or to an egress balcony that leads to a *public way* .

Exceptions:

1. *Basements* with a ceiling height of less than 80 inches (2032 mm) shall not be required to have *emergency escape and rescue openings*.
2. *Emergency escape and rescue openings* are not required from *basements* or sleeping rooms that have an *exit* door or *exit access* door that opens directly into a *public way* or to a *yard*, *court* or exterior egress balcony that leads to a *public way*.
3. *Basements* without *habitable spaces* and having not more than 200 square feet (18.6 m^2) in floor area shall not be required to have *emergency escape and rescue openings*.
4. *Storm shelters* are not required to comply with this section where the shelter is constructed in accordance with ICC 500.

5. Within individual *dwelling* and *sleeping units* in Groups R-2 and R-3, where the building is equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1, 903.3.1.2 or 903.3.1.3, sleeping rooms in *basements* shall not be required to have *emergency escape and rescue openings* provided that the *basement* has one of the following:

   5.1. One *means of egress* and one *emergency escape and rescue opening*.

   5.2. Two *means of egress*.

Reason: Many years ago, fire officials drafted codes based on their intuition of what's safest. These codes saved lives, but not all rules remain consistent with evidence. Hundreds of thousands of fires occur annually, resulting in several thousand deaths a year. There is further a huge amount of evidence internationally. Therefore, even if past performance cannot predict every single possibility, there is enough data to say past performance closely reflects the level of risk. Old assumptions from before the Internet age, and before the advent of more modern fire-safety technologies, warrant fresh reexamination. I am accordingly proposing a new code section, because the existing requirements appear based on the following erroneous assumptions:

1) Bigger buildings with more staircases are safer than smaller buildings with fewer staircases.

2) Redundant staircases are so beneficial that it is safer to provide two nearby staircases without smoke control than a single staircase which resists smoke contamination via elements such as being open air, having a smoke-resistant vestibule with automatic opening windows, or being protected with a pressurization system.

3) Transient occupancies like hotels are more dangerous than ordinary dwellings, even when accounting for the additional protective features this construction type is typically required to follow.

All these assumptions are challenged by data. Therefore, it is imperative that the code be updated to provide fair treatment based on risk.

Previously, I assisted two other individuals to support a code change proposal in R-2 (non-transient) single exit cases. That proposal (10412) contains a reason statement, based on citations, that explains why small single exit buildings with enhanced protectives experience satisfactory safety performance. Please accept that proposal's reason statement here as well. Please additionally accept the following reasoning in support of extending allowances to hotels:

Per NFPA's latest Home Structure Fires Report, 49% of fires involve cooking. Cooking is much less likely to occur in hotel/motel occupancies because many rooms don't include kitchens. Even a room does include a kitchen or kitchenette, it may be less utilized if the hotel offers breakfast, people receive other meals at events like conferences or weddings, or they choose to use limited vacation time to go to restaurants vs shopping for ingredients and cooking themselves.

The second highest fatality generator is heating equipment, such as space heaters. These fires cause 13% of deaths. I don't have data on this, but reasonably believe people don't commonly travel to hotels with space heaters. If they come on an airplane, carrying heaters would waste baggage space and consume unnecessary weight allowance.

The final point on the NFPA list I will note is smoking materials. These are the 5th largest cause of fatal fires, generating 5% of deaths. Since many hotels are smoke-free, this is also less of a risk in this case.

In all, since potentially close to 2/3rds of the fire causes are eliminated, it is unjust for hotels to face stricter stairway requirements than similarly sized non-transient occupancies.

This risk argument is further supported by the 2010 US Fire Administration report on hotel fires. This shows hotels/motels experience less than half the number of fatalities per 1000 fires. Though injuries are slightly higher, since this is from 2005-2007 data, I wouldn't be surprised if the injury rate is now also lower in hotels, considering the proportion of new hotels fitted with sprinklers vs new single-family homes. On the subject of exit knowledge, since we are talking such small corridors, the hazard of people getting lost is extremely low. Further, research has linked central stair placement with huge increases in utilization of the stairs vs elevator. We can therefore expect more people to be familiar with the stair location in a small single stairway case vs the other scenario. If we are still concerned about wayfinding, this proposal could be amended to require low level egress path markers compliant with UL 1994, to reinforce the exit location.

Across the US and world, there are many small-scale hotels centered around an ornate central staircase. Some operate as bed and breakfasts. In the US, these buildings are often allowed due to their historic nature or are illegal conversions rented online. Given the demand for home-like transient buildings, the fire code should provide more options for this. Doing so will encourage more people to act under the purview of regulators, vs under-the-table operations.

As a final note, if the code committee is not comfortable going up to 6 stories single stair in this case, I believe they should at least raise the R1 single stair allowance to 3 or 4 stories. This would better reflect the level of risk in R1 vs R2 cases.

SEE ADDITIONAL SOURCES IN Proposal 10412

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

Since this allows for a new type of construction not currently allowed, there are no immediate cost impacts.

Compared with an existing allowed building, we expect a 7% new construction cost decrease. This is based on additional floor area not consumed by stairwells and inefficient corridors. The actual usable area would increase closer to 9%, but we assume some savings would be offset by investments in more advanced protectives such as smoke control systems. Thus, for a $2,000,000 small hotel, the costs would fall by $14,000.

Estimated Immediate Cost Impact Justification (methodology and variables):

See Proposal 10412 attachment for additional cost details.

Estimated Life Cycle Cost Impact:

Estimated to be similar to the initial cost savings (7%), mainly due to lower HVAC costs, less maintenance of materials, and more leasable area.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

See Proposal 10412 attachment for additional cost details.

E25-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The disapproval is consistent with the committee action on E24-24. The transient nature of the occupants decreases the familiarity of the occupants with the building, so this single exit building should not be permitted for Group R-1 occupancies. (Vote: 14-0)

E25-24

Individual Consideration Agenda

Comment 1:

IBC: APPENDIX Q (New), SECTION Q101 (New), Q101.1 (New), SECTION Q102 (New), Q102.1 (New), Q102.2 (New), Q102.3 (New), 1006.3.5, 1006.3.5.1, Q102.5 (New), 1006.3.5.2, Q102.5.2 (New), Q102.5.3 (New), 1006.3.5.3, Q102.6.1 (New), 1006.5.3.4, 1006.3.5.5, 1006.3.5.7, Q102.10 (New), 1006.3.5.6, 1006.3.4, 1023.12, 1031.2

Proponents: Scott Brody, Self (sbrody96@gmail.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

Add new text as follows:

APPENDIX Q
SINGLE EXIT RESIDENTIAL BUILDINGS

SECTION Q101
GENERAL

Q101.1 Scope. The scope of this appendix shall apply exclusively to Group R-1 and R-2 occupancies with access to a single exit. Such building shall be constructed in accordance with this appendix. **Exception:** Occupancies, other than Group H or I occupancies, are permitted only at the level of exit discharge and one story below the level of exit discharge.

SECTION Q102
APPLICATION

Q102.1 General. Stories within Group R-1 and R-2 occupancies served by a single exit shall comply with Sections Q102.2 through Q102.11.

Q102.2 Height. The height of the building shall comply with all of the following:

1. The building shall be six stories or less in height.
2. The building shall not be a high-rise building.

Exception: Occupiable roof areas shall be permitted where the area serves and is accessed through individual dwelling units or sleeping units.

Q102.3 Story size. The size of the stories shall comply with the following:

1. Each story shall have a maximum of four dwelling units or sleeping units.
2. The occupant load per story shall be 30 occupants maximum.

Revise as follows:

~~**1006.3.5 Group R-1 and R-2 occupancies.** In Group R-1 and R-2 occupancies, a single exit shall be permitted from any story or occupiable roof where the number of dwelling units served per exit at each story comply with one of the following:~~

1. ~~The basement and first through sixth story above grade plane with a maximum of 4 dwelling units or sleeping units per story.~~
2. ~~The basement and first through third story above grade plane with a maximum of 6 dwelling units or sleeping units per story.~~

~~Such building shall comply with Sections 1006.3.5.1 through 1006.3.5.7.~~

~~**1006.3.5.1**~~ **Q102.4 Construction type.** The building is Type IA, IB, IIA, IIIA, ~~or~~ IV or VA construction.

Add new text as follows:

Q102.5 Fire protection systems. Fire protection systems shall comply with Q102.5.1 through Q102.5.3.

~~**1006.3.5.2**~~ **Q102.5.1 Automatic sprinkler system.** The building shall be equipped throughout with an ~~An~~ automatic sprinkler system ~~shall be installed throughout~~ in accordance with Section 903.3.1.1.
Residential-type sprinklers shall be used in all habitable spaces in each dwelling unit or sleeping unit.

Add new text as follows:

Q102.5.2 Standpipes. Class I standpipe shall be provided in accordance with Section 905. Standpipe outlets shall be configured in such a way as to minimize the hose conflicting with egress from doors to individual dwelling units.

Q102.5.3 Fire Alarm System. A fire alarm system and smoke alarms shall be installed in accordance with Section 907.2.9.

~~**1006.3.5.3**~~ **Q102.6 Corridors.** Dwelling units or sleeping units that do not open directly into an exterior exit stairway shall exit directly to a corridor complying with Section 1020.

Add new text as follows:

Q102.6.1 Elevators. Elevator hoistway doors shall be protected in accordance with Section 3006.3.

~~**1006.5.3.4**~~ **Q102.7 Travel distance.** For Group R-1, the maximum exit access travel distance shall be not more than 75 feet (22.9 m). For Group R-2, the maximum exit access travel distance shall be not more than 125 feet (38.1 m). Travel distance from the exit access door of the unit to the exit door for the stairway shall be not more than 25 feet (7.62 m).

~~**1006.3.5.5**~~ **Q102.8 Exit stairways.** Means of egress shall be provided from each story above the level of exit discharge by an interior exit stairway or exterior exit stairway. Exit stairways shall be protected with 2-hour fire barriers in accordance with Section 707 or a 2-hour horizontal assemblies in accordance with Section 711. An interior exit stairway shall be a smokeproof enclosure in accordance with with Section 909.20.

~~**1006.3.5.7**~~ **Q102.9 Mixed occupancies.** Mixed occupancies shall be permitted at and below the level of exit discharge. Other

occupancies shall not have direct access to the Group R-1 and R-2 occupancy portion of the building or to the exit stairway serving the Group R-1 and R-2 occupancy.

~~**Exception:** Parking garages and occupied roofs that serve the Group R-1 and R-2 occupancy shall be permitted to have direct access to the exit stairway.~~

Add new text as follows:

Q102.10 Egress courts. The single exit shall not terminate in an egress court where the court depth exceeds the court width unless direct and unobstructed access to the public way through two or more independent paths is provided.

~~**1006.3.5.6**~~ **Q102.11 Emergency escape and rescue openings.** Emergency escape and rescue openings shall be provided in every sleeping room in accordance with ~~Section 1031~~ Sections 1031.2.1 through 1031.6.

1006.3.4 Single exits. A single *exit* or access to a single *exit* shall be permitted from any *story* or *occupiable roof* where one of the following conditions exists:

1. The *occupant load*, number of *dwelling units* and exit access travel distance do not exceed the values in Table 1006.3.4(1) or 1006.3.4(2).

~~2. Group R-1 and R-2 occupancies complying with Section 1006.3.5.~~

~~3.~~ 2. Rooms, areas and spaces complying with Section 1006.2.1 with *exits* that discharge directly to the exterior at the *level of exit discharge*, are permitted to have one *exit* or access to a single *exit*.

~~4.~~ 3. Parking garages where vehicles are mechanically parked shall be permitted to have one *exit* or access to a single *exit*.

~~5.~~ 4. Group R-3 and R-4 occupancies shall be permitted to have one *exit* or access to a single *exit*.

~~6.~~ 5. Individual single-story or multistory *dwelling units* shall be permitted to have a single *exit* or access to a single *exit* from the *dwelling unit* provided that both of the following criteria are met:

~~6.1.~~ 5.1. The *dwelling unit* complies with Section 1006.2.1 as a space with one *means of egress*.

~~6.2.~~ 5.2. Either the exit from the *dwelling unit* discharges directly to the exterior at the *level of exit discharge*, or the *exit access* outside the *dwelling unit's* entrance door provides access to not less than two *approved* independent *exits*.

1023.12 Smokeproof enclosures. Where required by Section 403.5.4, 405.7.2, or 412.2.2.1 ~~or 1006.3.5.5~~, interior exit *stairways* and *ramps* shall be *smokeproof enclosures* in accordance with Section 909.20.

1031.2 Where required. In addition to the *means of egress* required by this chapter, *emergency escape and rescue openings* shall be provided in the following occupancies:

1. Group R-2 occupancies located in *stories* with only one *exit* or access to only one *exit* as permitted by Tables 1006.3.4(1) and 1006.3.4(2).
2. Group R-3 and R-4 occupancies.
3. ~~Group R-1 and R-2 occupancies located in stories with one one exit as permitted by Section 1006.3.5.~~

Basements and sleeping rooms below the fourth *story above grade plane* shall have not fewer than one *emergency escape and rescue opening* in accordance with this section. Where *basements* contain one or more sleeping rooms, an *emergency escape and rescue opening* shall be required in each sleeping room, but shall not be required in adjoining areas of the *basement*. Such openings shall open directly into a *public way* or to a *yard* or *court* that opens to a *public way, or to an egress balcony that leads to a public way* .

Exceptions:

1. *Basements* with a ceiling height of less than 80 inches (2032 mm) shall not be required to have *emergency escape and rescue openings*.

2. *Emergency escape and rescue openings* are not required from *basements* or sleeping rooms that have an *exit* door or *exit access* door that opens directly into a *public way* or to a *yard*, *court* or exterior egress balcony that leads to a *public way*.
3. *Basements* without *habitable spaces* and having not more than 200 square feet (18.6 m^2) in floor area shall not be required to have *emergency escape and rescue openings*.
4. *Storm shelters* are not required to comply with this section where the shelter is constructed in accordance with ICC 500.
5. Within individual *dwelling* and *sleeping units* in Groups R-2 and R-3, where the *building* is equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1, 903.3.1.2 or 903.3.1.3, *sleeping rooms* in *basements* shall not be required to have *emergency escape and rescue openings* provided that the *basement* has one of the following:
   5.1. One *means of egress* and one *emergency escape and rescue opening*.
   5.2. Two *means of egress*.

Reason: *CLAIM: The disapproval is consistent with the committee action on E24-24. The transient nature of the occupants decreases the familiarity of the occupants with the building, so this single exit building should not be permitted for Group R-1 occupancies.*

RESPONSE:
Committee's implied claim: Buildings allowed by the IBC to be larger and have no smoke control are safer than our proposed single stair building.
My apologies for not including this research previously… your claim is challenged by modeling from the Netherlands. The corridor building will not deliver safe sight lines, a key performance indicator of smoke and hot gas spread, if the fire is uncontrolled by a sprinkler. This was proven in burn tests with smoke measurement, and again by modeling, for both situations. As you can see in the below figure, concentration of smoke and harmful gasses in the corridor do not provide acceptable evacuation conditions in the typical case where the door to the unit sometimes opens for firefighting operations.

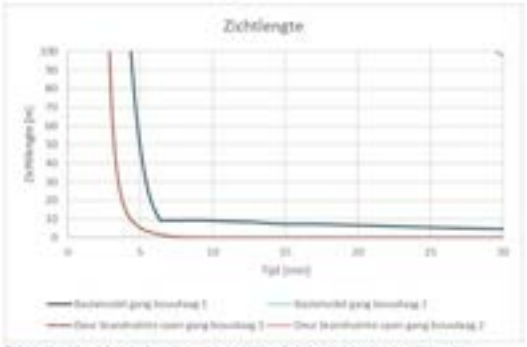

Figure 4.4 Line of sight length in the corridors for the residential building with corridor access at fire room door open/closed

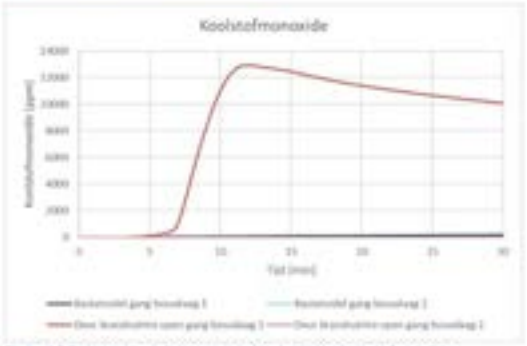

Figure 4.5 Concentration of carbon monoxide in the corridors in front of the residential building with corridor access with fire room door open/closed

Figure: Line of sight and carbon monoxide concentration graph for double loaded corridor building sofa fire. (Source: NIPV 2022, Smoke dispersion and

personal safety Facilities for escape safety and stay-in-place / Original in Dutch: Rookverspreiding en persoonlijke veiligheid:Voorzieningen voor vluchtveiligheid en stay-in-place. / see R2 proposal for translation) The fact that the corridor will not deliver safe conditions was also shown via burn tests in NIPVs Oudewater smoke propagation

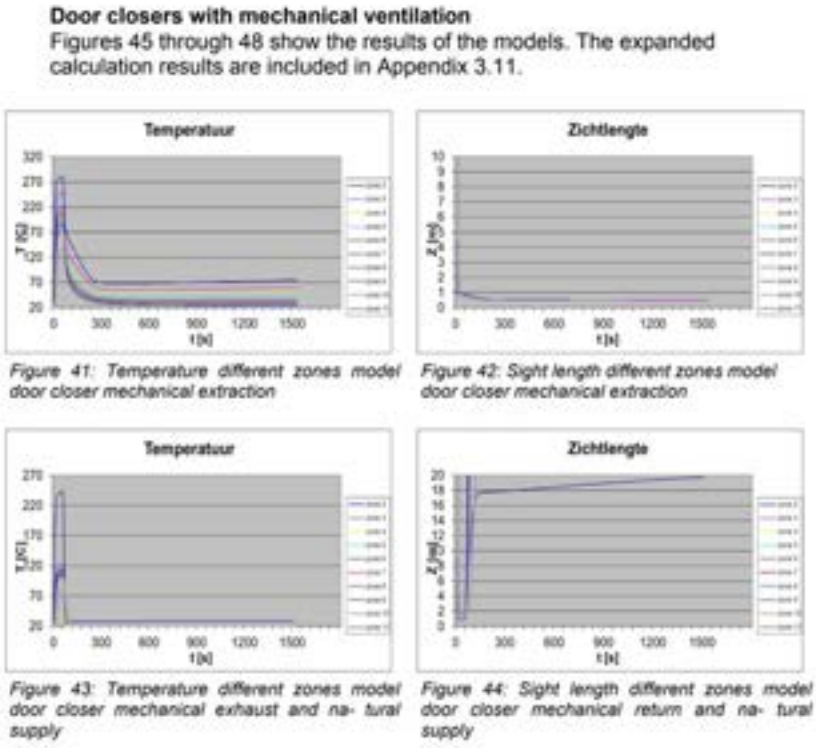

Figure: Key performance metrics for single exit building, determined in previous report by Nieman 2011. (See Research Smoke Control Porch Solutions / Witte, H.L. de, and R.A.P. van Herpen. Original in Dutch: Onderzoek Rookbeheersing Portiekoplossingen. Nieman Adviesburo B.V., September 2011/ see R2 proposal for translated copy) The fact that mechanical ventilation can deliver safe results was also proven in full scale burn testing conducted by the Colt Company in the UK.

On the other hand, the SIGHT LENGTH IS MUCH BETTER IN THE CASE OF THE SMALL SINGLE STAIR BUILDING with mechanical ventilation and self-closers. OTHER VARIABLES SIMILARLY SUGGEST THE VENTILATED SINGLE STAIR BUILDING WILL GENERALLY DELIVER SAFE CONDITIONS, WHILE THE CORRIDOR BUILDING WILL NOT. The finding that a mechanical smoke shaft can deliver safe conditions, but the unventilated corridor will not, is supported by both the above models, and full scale burn tests for each scenario. Other testing has shown natural ventilation can also work. Therefore, the current I-codes are inconsistent with research.

Our related R2 proposal provides more information on this claim. See there for full bibliography.

Occupant Familiarity – Committee Claim Challenged by Human Factors Studies

If occupant unfamiliarity is your reason for limiting single stair hotels even below 2 stories, it is illogical for code to mandate a layout that is proven to cause less occupant familiarity with the emergency exits.

According to the study Spatial Measures Associated with Stair Use, published in the American Journal of Health Prevention, “spatial qualities that optimize the convenience and legibility of stairs may have the most influence on stair use in buildings.”[1] Similarly, another study found shifting stair location from the ends to the center is associated with an increase in stair vs elevator use 8-10X%.[2] While our staircase being behind fire protectives would likely not lead to as high a utilization jump as the latter, basic human behavior tendencies still strongly imply moving the stair to the middle of the building would increase overall utilization. Therefore, the occupant familiarity argument is dubious.

Overall Hazard of R1 vs R2 – Committee Claim Discredited by Fire Data

The code committee is obligated to give due process to substantive comments. I will repeat what was stated previously. R1 OCCUPANCIES ARE MUCH LOWER FIRE RISK THAN R2. THEREFORE, YOUR CHOICE TO PLACE MUCH MORE ONEROUS RULES ON R1 IS AN ARBITRARY AND CAPRICIOUS AND COULD MAKE THE I-CODES SUCEPTIBLE TO COURT CHALLANGES.

Per NFPA's latest Home Structure Fires Report[3], 49% of fires involve cooking. Cooking is much less likely to occur in hotel/motel occupancies because many rooms don't include kitchens. Even if a room does include a kitchen or kitchenette, it may be less utilized if the hotel offers breakfast, people receive other meals at events like conferences or weddings, or they choose to use limited vacation time to go to restaurants vs cooking and cleaning dishes.

The second highest fatality generator is heating equipment, such as space heaters. These fires cause 13% of deaths. I don't have data on this but know people don't commonly travel to hotels with space heaters.

The final point of note on the NFPA list is smoking materials. These are the 5th largest cause of fatal fires, generating 5% of deaths. Since many hotels are smoke-free, this is also less of a risk in this case.

In all, since potentially CLOSE TO 2/3RDS OF THE FIRE CAUSES ARE ELIMINATED, it is ARBITRARY AND CAPRICIOUS for hotels to face stricter stairway requirements than similarly sized non-transient occupancies.

This risk argument is further supported by the 2010 US Fire Administration report on hotel fires. This shows HOTELS/MOTELS EXPERIENCE A MUCH LOWER NUMBER OF FATALITIES PER 1000 FIRES. Further, they had a low overall number of deaths. Though property damage was somewhat elevated, this is likely impacted by automatic extinguishing systems causing water damage.

Table 2. Loss measures for hotel and motel fires (three-year average, 2014-2016)

Measure	Hotel and motel fires	Confined hotel and motel fires	Nonconfined hotel and motel fires	Residential building fires (excluding hotel and motel fires)
Average loss:				
Fatalities/1,000 fires	3.2	0.0	7.1	5.8
Injuries/1,000 fires	24.0	4.6	48.2	25.6
Dollar loss/fire	$25,090	$250	$56,070	$17,420

Figure 1: Hotel vs Residential Building Fire deaths highlighted from USFA Report. [4]

The I-codes targeting of hotels and motels for more onerous exit rules is therefore unsubstantiated by evidence. Rather than trust assumptions by groups of people ages ago, folks who lacked computers, the I-codes should be listening to data and treating occupancies fairly based on their actual performance, which roughly equals risk when you have thousands of data points.

I-codes failure to provide 2 means of egress from hotel rooms places occupants in more danger than lack of two stairways

Because of how the IBC rules impact architecture, units tend to be abnormally long vs square. This commonly results in the layout where the kitchen is along the route of egress. In a hotel, if someone is heating food while working at the computer, their only egress from the room will be blocked by the fire. On the other hand, in my proposal, it would be easier to survive a fire in the room of fire origin because there is a second egress.

Figure 2: Small single stair building with egress balconies (Image own work)

Figure 3: Typical N American hotel with non-openable windows. (Image credit: Michael Rivera reuse permitted per CC BY SA 4.0, image adapted to remove hotel branding.)

Figure 4: Example of a hotel room where occupant trapped by fire. No way to escape, unlike the illegal single staircase building with secondary egress balcony (in Figure 2).

The committee appears to justify its approach in the idea that the stairway is the most hazardous location for occupants, but data on the size of fire spread shows 93.1% of hotel fires do not extend to multiple floors.[5] Therefore, the focus on having multiple staircases vs multiple ways out of the room is misguided.

Increasing Hazard by Pushing People to Unregulated Structures

By banning even 2-story single staircase transient occupancies, the committee ignores the elephant in the room – services like Air B&B. The very onerous IBC rules simply drive much of the population to rent dwellings unofficially, rather than through regulated channels. People also turn to historic bed and breakfasts for the old style, rather than stay in new single stair buildings that maintain the classic smaller proportions, but with better fire safety measures. It is similar to the problem of marijuana dispensary fires. For many years, fire

officials acted like marijuana is a fire hazard. Yet, in states where the substance was later legalized, it turned out cannabis growing did not really result in much hazard. Rather, it was overregulation which pushed activities under the table that actually contributed to dangerous situations. The I-code committee now has a chance avoid repeating this mistake with hotels.

Code must be changed because it is preempted by the Code of Federal Regulations (Federal Administrative Law), and ICC bylaw CP49-21 prohibits conflicts with US Federal Law

The Secretary of the Interior has issued regulations for preservation, rehabilitation, restoration or reconstruction of historic properties under the authority of Section 106 of the National Historic Preservation Act[6]. 36 CFR § 800.6 (b)(1)(i) requires government officials "seek ways to avoid, minimize or mitigate … adverse effects" on historic properties.[7]

IBC Inconsistent with Interior Secretary's Standards for Preserving "Size", "Scale", "Proportion" and other "Spatial Relationships" in Historic Districts

Per 36 CFR § 800.5 , adverse historic effects are defined to include work "that is not consistent with the Secretary's standards for the treatment of historic properties (36 CFR part 68) and applicable guidelines;"
Per the Secretary's standards at 36 CFR § 68.3 (b)(9):[9]
New additions, exterior alterations or related **new construction will not destroy historic** materials, features and **spatial relationships** that characterize the property… The **new work will be … compatible with the historic** materials, features, **size, scale and proportion,** and massing to protect the integrity of the property and its environment.

In cases of restoration, it is stated that:
A property will be used as it was historically or be given a new use that interprets the property and its restoration period…. **alteration of features, spaces and spatial relationships that characterize the period will not be undertaken.**

Within 36 CFR § 68.3, similar requirements can be found for reconstruction and rehabilitation projects.

As defined in the National Historic Preservation Act, [54 U.S.C. § 300308]:

the term ''**historic property" means any** prehistoric or **historic district**, site, building, structure, or object included on, or eligible for inclusion on, the National Register [10]

While the I-codes allow reconstructions of historic buildings, the latest historic preservation regulations also require new buildings in historic districts to match the features and proportions of the district's historic period. Since the double exit rule effectively blocks construction of small buildings of varying heights, the historic proportions are impermissibly degraded. This breach of federal regulations is further unnecessary because higher levels of safety have been shown to be achievable in single stair buildings using methods similar to what we are proposing.

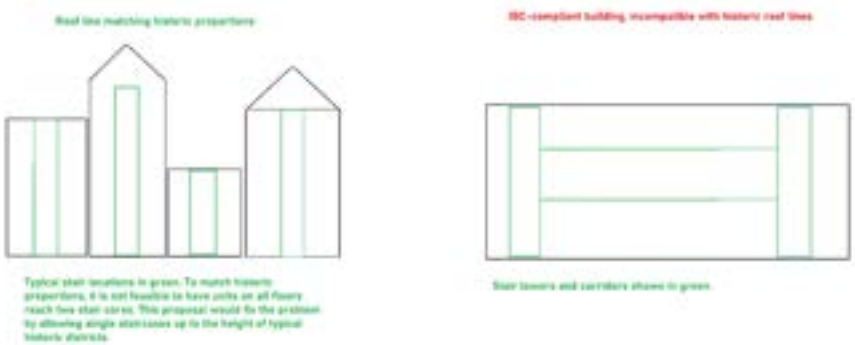

Figure: Shows how historic roofline typology is not able to be maintained with IBC rules.

Should your committee fail to take meaningful action, there is the possibility of preemption challenges being launched.

Old San Juan National Historic District. Photo own work.

Failure to include proven single stair safety previsions in the I-codes is also a tragedy for fire safety. Historic buildings often will never be renovated to have two stairs; therefore, the I-codes should provide better guidance on how to achieve safety alternatively for the many structures that are this way.

Thank you for your consideration.

Bibliography: See attachment.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

Will allow more buildings to be built on constrained lots, therefore inherent land development value which didn't exist before. See original proposal for additional details.

Estimated Immediate Cost Impact Justification (methodology and variables):

Varies based on jurisdiction. See original proposal for additional details. See original proposal for additional details.

Estimated Life Cycle Cost Impact:

Building will not be especially costly to maintain if provided with natural vent systems. Probably in the range of several thousand dollars.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

Please find a costs table at the following link:

Comment (CAH2)# 799

E28-24

IBC: 1008.2.1, 1011.3, 1011.6, 1011.7.1, 1011.13, 1023.9, 1027.5, 2406.4.6; IFC: [BE] 1008.2.1, [BE] 1011.3, [BE] 1011.6, [BE] 1011.7.1, [BE] 1011.13, [BE] 1023.9, [BE] 1027.5

Proposed Change as Submitted

Proponents: David Cooper, Stair Manufacturing and Design Consultants, Stairbuilders and Manufacturers Association, SMA (coderep@stairways.org)

2024 International Building Code

Revise as follows:

1008.2.1 Illumination level under normal power. The *means of egress* illumination level shall be not less than 1 footcandle (11 lux) at the walking surface. Along *exit access stairways*, and exit stairways ~~and at their required landings~~, the illumination level shall not be less than 10 footcandles (108 lux) at the walking surface when the *stairway* is in use. **Exception:** For auditoriums, theaters, concert or opera halls and similar assembly occupancies, the illumination at the walking surface is permitted to be reduced during performances by one of the following methods provided that the required illumination is automatically restored upon activation of a premises' *fire alarm system*:

1. Externally illuminated walking surfaces shall be permitted to be illuminated to not less than 0.2 footcandle (2.15 lux).
2. Steps, landings and the sides of *ramps* shall be permitted to be marked with *self-luminous* materials in accordance with Sections 1025.2.1, 1025.2.2 and 1025.2.4 by systems *listed* in accordance with UL 1994.

1011.3 Headroom. *Stairways* shall have a headroom clearance of not less than 80 inches (2032 mm) measured vertically from a line connecting the *nosings*. Such headroom shall be continuous above the *stairway* to the point where the line intersects the landing below, one tread depth beyond the bottom riser. The minimum clearance shall be maintained the full width of the *stairway* ~~and landing~~ . **Exceptions:**

1. *Spiral stairways* complying with Section 1011.10 are permitted a 78-inch (1981 mm) headroom clearance.
2. In Group R-3 occupancies; within *dwelling units* in Group R-2 occupancies; and in Group U occupancies that are accessory to a Group R-3 occupancy or accessory to individual *dwelling units* in Group R-2 occupancies; where the *nosings* of treads at the side of a *flight* extend under the edge of a floor opening through which the *stair* passes, the floor opening shall be allowed to project horizontally into the required headroom not more than $4\frac{3}{4}$ inches (121 mm).

1011.6 Stairway landings. There shall be a floor or landing at the top and bottom of each ~~*stairway*~~ *flight*. The width of landings, measured perpendicularly to the direction of travel, shall be not less than the width of *stairways* served. Every landing shall have a minimum depth, measured parallel to the direction of travel, equal to the width of the *stairway* or 48 inches (1219 mm), whichever is less. Doors opening onto a landing shall not reduce the landing to less than one-half the required width. When fully open, the door shall not project more than 7 inches (178 mm) into the required width of a landing. Where *wheelchair spaces* are required on the *stairway* landing in accordance with Section 1009.6.3, the *wheelchair space* shall not be located in the required width of the landing and doors shall not swing over the *wheelchair spaces*. **Exceptions:**

1. Where *stairways* connect stepped *aisles* to cross *aisles* or concourses, *stairway* landings are not required at the transition between *stairways* and stepped *aisles* constructed in accordance with Section 1030.
2. Where curved *stairways* of constant radius have intermediate landings, the landing depth shall be measured horizontally between the intersection of the walkline of the lower *flight* at the landing *nosing* and the intersection of the walkline of the upper *flight* at the *nosing* of the lowest tread of the upper *flight*.
3. Where a landing turns 90 degrees (1.57 rad) or more, the minimum landing depth in accordance with this section shall not be required where the landing provided is not less than that described by an arc with a radius equal to the width of the *flight* served.

1011.7.1 Stairway walking surface. The walking surfaces ~~surface of treads and landings~~ of a *stairway* shall not be sloped steeper than one unit vertical in 48 units horizontal (2-percent slope) in any direction. *Stairway* treads and landings shall have a solid surface. Finish floor surfaces shall be securely attached.

Exceptions:

1. Openings in *stair* walking surfaces shall be a size that does not permit the passage of $^1/_2$-inch-diameter (12.7 mm) sphere. Elongated openings shall be placed so that the long dimension is perpendicular to the direction of travel.
2. In Group F, H and S occupancies, other than areas of parking *structures* accessible to the public, openings in treads and landings shall not be prohibited provided that a sphere with a diameter of $1^1/_8$ inches (29 mm) cannot pass through the opening.

1011.13 Guards. *Guards* shall be provided along *stairways* ~~and landings~~ where required by Section 1015 and shall be constructed in accordance with Section 1015. Where the roof hatch opening providing the required access is located within 10 feet (3049 mm) of the roof edge, such roof access or roof edge shall be protected by *guards* installed in accordance with Section 1015.

1023.9 Stairway identification signs. A sign shall be provided at each floor level landing in an *interior exit stairway* and *ramp* connecting more than three *stories* designating the floor level, the terminus of the top and bottom of the *interior exit stairway* and *ramp* and the identification of the *stairway* or *ramp.* The signage shall state the story of and direction to the *exit discharge,* and the availability of roof access from the *interior exit stairway* and *ramp* for the fire department. The bottom of the sign shall be located not less than 5 feet (1524 mm) above the floor level landing in a position that is readily visible when the doors are in the open and closed positions.

1027.5 Location. *Exterior exit stairways* and *ramps* shall have a minimum *fire separation distance* of 10 feet (3048 mm) measured at right angles from the exterior edge of the *stairway* or *ramp* ~~*ramps*~~, including the ramp landing ~~landings~~, to:

1. Adjacent *lot lines*.
2. Other portions of the *building*.
3. Other buildings on the same lot unless the adjacent building *exterior walls* and openings are protected in accordance with Section 705 based on *fire separation distance*.

For the purposes of this section, other portions of the building shall be treated as separate *buildings*.

Exception: *Exterior exit stairways* and *ramps* serving individual *dwelling units* of Group R-3 shall have a minimum *fire separation distance* of 5 feet (1525 mm).

2406.4.6 Glazing adjacent to stairways and ramps. Glazing where the bottom exposed edge of the glazing is less than 60 inches (1524 mm) above the plane of the adjacent walking surface of *stairways*, ~~landings between *flights* of *stairs* and~~ *ramps* and ramp landings shall be considered to be a hazardous location. **Exceptions:**

1. The side of a *stairway*, ~~landing~~ ramp or *ramp* landing that has a *guard* complying with the provisions of Sections 1015 and 1607.9, and the plane of the glass is greater than 18 inches (457 mm) from the railing.
2. Glazing 36 inches (914 mm) or more measured horizontally from the walking surface.

2024 International Fire Code

Revise as follows:

[BE] 1008.2.1 Illumination level under normal power. The *means of egress* illumination level shall be not less than 1 footcandle (11 lux) at the walking surface. Along *exit access stairways*, and exit stairways ~~and at their required landings~~, the illumination level shall not be less than 10 footcandles (108 lux) at the walking surface when the *stairway* is in use.

Exception: For auditoriums, theaters, concert or opera halls and similar assembly occupancies, the illumination at the walking surface is permitted to be reduced during performances by one of the following methods provided that the required illumination is automatically restored upon activation of a premises' *fire alarm system*:

1. Externally illuminated walking surfaces shall be permitted to be illuminated to not less than 0.2 footcandle (2.15 lux).

2. Steps, landings and the sides of *ramps* shall be permitted to be marked with self-luminous materials in accordance with Sections 1025.2.1, 1025.2.2 and 1025.2.4 by systems *listed* in accordance with UL 1994.

[BE] 1011.3 Headroom. *Stairways* shall have a headroom clearance of not less than 80 inches (2032 mm) measured vertically from a line connecting the *nosings*. Such headroom shall be continuous above the *stairway* to the point where the line intersects the landing below, one tread depth beyond the bottom riser. The minimum clearance shall be maintained the full width of the *stairway* ~~and landing~~.

Exceptions:

1. *Spiral stairways* complying with Section 1011.10 are permitted a 78-inch (1981 mm) headroom clearance.
2. In Group R-3 occupancies; within *dwelling units* in Group R-2 occupancies; and in Group U occupancies that are accessory to a Group R-3 occupancy or accessory to individual *dwelling units* in Group R-2 occupancies; where the *nosings* of treads at the side of a *flight* extend under the edge of a floor opening through which the *stair* passes, the floor opening shall be allowed to project horizontally into the required headroom not more than $4^{3}/_{4}$ inches (121 mm).

[BE] 1011.6 Stairway landings. There shall be a floor or landing at the top and bottom of each ~~*stairway*~~ *flight*. The width of landings, measured perpendicularly to the direction of travel, shall be not less than the width of *stairways* served. Every landing shall have a minimum depth, measured parallel to the direction of travel, equal to the width of the *stairway* or 48 inches (1219 mm), whichever is less. Doors opening onto a landing shall not reduce the landing to less than one-half the required width. When fully open, the door shall not project more than 7 inches (178 mm) into the required width of a landing. Where wheelchair spaces are required on the stairway landing in accordance with Section 1009.6.3, the wheelchair space shall not be located in the required width of the landing and doors shall not swing over the wheelchair spaces. **Exceptions:**

1. Where *stairways* connect stepped *aisles* to cross *aisles* or concourses, *stairway* landings are not required at the transition between *stairways* and stepped *aisles* constructed in accordance with Section 1030.
2. Where curved *stairways* of constant radius have intermediate landings, the landing depth shall be measured horizontally between the intersection of the walkline of the lower *flight* at the landing *nosing*and the intersection of the walkline of the upper *flight* at the *nosing*of the lowest tread of the upper *flight*.
3. Where a landing turns 90 degrees (1.57 rad) or more, the minimum landing depth in accordance with this section shall not be required where the landing provided is not less than that described by an arc with a radius equal to the width of the *flight* served.

[BE] 1011.7.1 Stairway walking surface. The walking surfaces ~~surface of treads and landings~~ of a *stairway* shall not be sloped steeper than one unit vertical in 48 units horizontal (2-percent slope) in any direction. *Stairway* treads and landings shall have a solid surface. Finish floor surfaces shall be securely attached.

Exceptions:

1. Openings in *stair* walking surfaces shall be a size that does not permit the passage of $^{1}/_{2}$-inch-diameter (12.7 mm) sphere. Elongated openings shall be placed so that the long dimension is perpendicular to the direction of travel.
2. In Group F, H and S occupancies, other than areas of parking structures accessible to the public, openings in treads and landings shall not be prohibited provided that a sphere with a diameter of $1^{1}/_{8}$ inches (29 mm) cannot pass through the opening.

[BE] 1011.13 Guards. *Guards* shall be provided along *stairways* ~~and landings~~ where required by Section 1015 and shall be constructed in accordance with Section 1015. Where the roof hatch opening providing the required access is located within 10 feet (3049 mm) of the roof edge, such roof access or roof edge shall be protected by *guards* installed in accordance with Section 1015.

[BE] 1023.9 Stairway identification signs. A sign shall be provided at each floor level landing in an *interior exit stairway* and *ramp* connecting more than three stories designating the floor level, the terminus of the top and bottom of the *interior exit stairway* and *ramp* and the identification of the *stairway* or *ramp*. The signage shall state the story of, and the direction to, the *exit discharge* and the

availability of roof access from the *interior exit stairway* and *ramp* for the fire department. The bottom of the sign shall be located not less than 5 feet (1524 mm) above the floor level landing in a position that is readily visible when the doors are in the open and closed positions.

[BE] 1027.5 Location. *Exterior exit stairways* and *ramps* shall have a minimum *fire separation distance* of 10 feet (3048 mm) measured at right angles from the exterior edge of the *stairway* or *ramps*, including landings, to:

1. Adjacent lot lines.
2. Other portions of the building.
3. Other buildings on the same lot unless the adjacent building *exterior walls* and openings are protected in accordance with Section 705 of the International Building Code based on *fire separation distance*.

For the purposes of this section, other portions of the building shall be treated as separate buildings.

Exception: *Exterior exit stairways* and *ramps* serving individual *dwelling units* of Group R-3 shall have a *fire separation distance* of not less than 5 feet (1524 mm).

Reason: Stairway is a defined term and as such stairways have two basic components landings and flights. Flight is also a defined term and as such do not include landings. The same definitions appear in both the IBC and IRC is:

Stairway. One or more flights of stairs, either exterior or interior, **with the necessary landings** and platforms connecting them, to form a continuous and uninterrupted passage from one level to another.

Flight. A continuous run of rectangular treads, winders or combination thereof from one landing to another.

Landings are currently only required at the top and bottom of stairways. Landings and flights of stairs are the elements of a stairway. The current text is incorrect because landings are used between flights within a stairway to change direction or stride or to offer a rest not just at the top and bottom of a stairway. To correct this, we have deleted “stairway” and substituted “flight” in **1011.6 Stairway landings** and searched the code for further necessary changes related to the term landing.

In **1011.3 Headroom** and **1011.3 Guards**, we have deleted "and landings" because a stairway includes the landings by definition.

In **1011.7.1 Stairway walking surface**, we have deleted "treads and landings" as these terms are superfluous and understood as the defined components of the stairway.

In **1023.9 Stairway identification signs**, we have inserted "level" in two locations to more specifically describe that the landings where the required signs are to be located are at the floor levels.

In **1027.5 Location** we corrected the plurality of stairway and inserted "ramp" before landing because landings are part of a stairway but are not part of a ramp. We made similar changes in **2406.4.6 Glazing adjacent to stairways and ramps** and in **1008.2.1 Illumination level under normal power,** and also deleted "landings between flights of stairs and", "and at their required landings" respectively. The text was deleted because landings are defined as part of a stairway and the language is redundant.These corrections assure that landings are required at between flights of stairs as well as at the the top and bottom of stairways and provide for the correct use of the term stairway as defined in the code. Comprehensive changes have been made in each of the related IBC requirements relating to landings for both stairways and ramps to assure consistency throughout the code.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The changes in the text provide for clarification and consistent use of terms defined in the code and have no effect upon the cost of construction.

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: While this proposal eliminates redundant language and focuses on defined terms, Section 1008.2.1 will be misread without 'landings'. (Vote: 10-4)

E28-24

Individual Consideration Agenda

Comment 1:

IBC: 1008.2.1, 1011.6, 1027.5; IFC: [BE] 1008.2.1, [BE] 1011.6, [BE] 1027.5

Proponents: David Cooper, Stair Manufacturing and Design Consultants, Stairbuilders and Manufacturers Association, SMA (coderep@stairways.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

1008.2.1 Illumination level under normal power. The *means of egress* illumination level shall be not less than 1 footcandle (11 lux) at the walking surface. Along *exit access stairways*, ~~and~~ exit stairways and at their required landings, the illumination level shall not be less than 10 footcandles (108 lux) at the walking surface when the *stairway* is in use. **Exception:** For auditoriums, theaters, concert or opera halls and similar assembly occupancies, the illumination at the walking surface is permitted to be reduced during performances by one of the following methods provided that the required illumination is automatically restored upon activation of a premises' *fire alarm system*:

1. Externally illuminated walking surfaces shall be permitted to be illuminated to not less than 0.2 footcandle (2.15 lux).
2. Steps, landings and the sides of *ramps* shall be permitted to be marked with *self-luminous* materials in accordance with Sections 1025.2.1, 1025.2.2 and 1025.2.4 by systems *listed* in accordance with UL 1994.

1011.6 Stairway landings. There shall be a floor or landing at the top and bottom of each *flight* of stairs. The width of landings, measured perpendicularly to the direction of travel, shall be not less than the width of *stairways* served. Every landing shall have a minimum depth, measured parallel to the direction of travel, equal to the width of the *stairway* or 48 inches (1219 mm), whichever is less. Doors opening onto a landing shall not reduce the landing to less than one-half the required width. When fully open, the door shall not project more than 7 inches (178 mm) into the required width of a landing. Where *wheelchair spaces* are required on the *stairway* landing in accordance with Section 1009.6.3, the *wheelchair space* shall not be located in the required width of the landing and doors shall not swing over the *wheelchair spaces*. **Exceptions:**

1. Where *stairways* connect stepped *aisles* to cross *aisles* or concourses, *stairway* landings are not required at the transition between *stairways* and stepped *aisles* constructed in accordance with Section 1030.
2. Where curved *stairways* of constant radius have intermediate landings, the landing depth shall be measured horizontally between the intersection of the walkline of the lower *flight* at the landing *nosing* and the intersection of the walkline of the upper *flight* at the *nosing* of the lowest tread of the upper *flight*.

3. Where a landing turns 90 degrees (1.57 rad) or more, the minimum landing depth in accordance with this section shall not be required where the landing provided is not less than that described by an arc with a radius equal to the width of the *flight* served.

1027.5 Location. *Exterior exit stairways* and *ramps* shall have a minimum *fire separation distance* of 10 feet (3048 mm) measured at right angles from the exterior edge of the *stairway* or ~~ramp~~ *ramps*, including ~~the ramp landing~~ landings, to:

1. Adjacent *lot lines*.
2. Other portions of the *building*.
3. Other buildings on the same lot unless the adjacent building *exterior walls* and openings are protected in accordance with Section 705 based on *fire separation distance*.

For the purposes of this section, other portions of the building shall be treated as separate *buildings*.

Exception: *Exterior exit stairways* and *ramps* serving individual *dwelling units* of Group R-3 shall have a minimum *fire separation distance* of 5 feet (1525 mm).

2024 International Fire Code

[BE] 1008.2.1 Illumination level under normal power. The *means of egress* illumination level shall be not less than 1 footcandle (11 lux) at the walking surface. Along *exit access stairways*, ~~and~~ exit stairways and at their required landings, the illumination level shall not be less than 10 footcandles (108 lux) at the walking surface when the *stairway* is in use.

Exception: For auditoriums, theaters, concert or opera halls and similar assembly occupancies, the illumination at the walking surface is permitted to be reduced during performances by one of the following methods provided that the required illumination is automatically restored upon activation of a premises' *fire alarm system*:

1. Externally illuminated walking surfaces shall be permitted to be illuminated to not less than 0.2 footcandle (2.15 lux).
2. Steps, landings and the sides of *ramps* shall be permitted to be marked with self-luminous materials in accordance with Sections 1025.2.1, 1025.2.2 and 1025.2.4 by systems *listed* in accordance with UL 1994.

[BE] 1011.6 Stairway landings. There shall be a floor or landing at the top and bottom of each *flight* of stairs. The width of landings, measured perpendicularly to the direction of travel, shall be not less than the width of *stairways* served. Every landing shall have a minimum depth, measured parallel to the direction of travel, equal to the width of the *stairway* or 48 inches (1219 mm), whichever is less. Doors opening onto a landing shall not reduce the landing to less than one-half the required width. When fully open, the door shall not project more than 7 inches (178 mm) into the required width of a landing. Where wheelchair spaces are required on the stairway landing in accordance with Section 1009.6.3, the wheelchair space shall not be located in the required width of the landing and doors shall not swing over the wheelchair spaces. **Exceptions:**

1. Where *stairways* connect stepped *aisles* to cross *aisles* or concourses, *stairway* landings are not required at the transition between *stairways* and stepped *aisles* constructed in accordance with Section 1030.
2. Where curved *stairways* of constant radius have intermediate landings, the landing depth shall be measured horizontally between the intersection of the walkline of the lower *flight* at the landing *nosing* and the intersection of the walkline of the upper *flight* at the *nosing* of the lowest tread of the upper *flight*.
3. Where a landing turns 90 degrees (1.57 rad) or more, the minimum landing depth in accordance with this section shall not be required where the landing provided is not less than that described by an arc with a radius equal to the width of the *flight* served.

[BE] 1027.5 Location. *Exterior exit stairways* and *ramps* shall have a minimum *fire separation distance* of 10 feet (3048 mm) measured at right angles from the exterior edge of the *stairway* or ~~ramp~~ *ramps*, including ~~the ramp landing~~ landings, to:

1. Adjacent lot lines.
2. Other portions of the building.

3. Other buildings on the same lot unless the adjacent building *exterior walls* and openings are protected in accordance with Section 705 of the International Building Code based on *fire separation distance*.

For the purposes of this section, other portions of the building shall be treated as separate buildings.

Exception: *Exterior exit stairways* and *ramps* serving individual *dwelling units* of Group R-3 shall have a *fire separation distance* of not less than 5 feet (1524 mm).

Reason: In accordance with the committee's reason for disapproval and testimony related to 1027.5, the changes made in the original proposal to Sections 1008.2.1 and 1027.5 have been removed leaving them unchanged. However the intent of the original proposal is maintained, eliminating redundant text and promoting consistent interpretation through the correct use of terms as they are defined in the code. In 1011.6 Stairway landings we have "of stairs" following flight to match the language approved in E69 "...flight of stairs." Approval as modified by this comment addresses the committees reason for disapproval and proponents intent to clarify the code.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The changes in the text provide for clarification and consistent use of terms defined in the code and have no effect upon the cost of construction.

2024 International Building Code

Revise as follows:

1008.2.1 Illumination level under normal power. The *means of egress* illumination level shall be not less than 1 footcandle (11 lux) at the walking surface. Along *exit access stairways*, exit stairways and at their required landings, the illumination level shall not be less than 10 footcandles (108 lux) at the walking surface when the *stairway* is in use. Illumination levels on *stairways* shall be measured at the *nosing* of each landing and tread at a horizontal distance 12 inches (305 mm) to 14 inches (356 mm) from the stair side of each *handrail.*

Exception: For auditoriums, theaters, concert or opera halls and similar assembly occupancies, the illumination at the walking surface is permitted to be reduced during performances by one of the following methods provided that the required illumination is automatically restored upon activation of a premises' *fire alarm system*:

1. Externally illuminated walking surfaces shall be permitted to be illuminated to not less than 0.2 footcandle (2.15 lux).
2. Steps, landings and the sides of *ramps* shall be permitted to be marked with *self-luminous* materials in accordance with Sections 1025.2.1, 1025.2.2 and 1025.2.4 by systems *listed* in accordance with UL 1994.

2024 International Fire Code

Revise as follows:

[BE] 1008.2.1 Illumination level under normal power. The *means of egress* illumination level shall be not less than 1 footcandle (11 lux) at the walking surface. Along *exit access stairways*, exit *stairways* and at their required landings, the illumination level shall be not less than 10 footcandles (108 lux) at the walking surface when the *stairway* is in use. Illumination levels on *stairways* shall be measured at the *nosing* of each landing and tread at a horizontal distance 12 inches (305 mm) to 14 inches (356 mm) from the stair side of each *handrail.*

Exception: For auditoriums, theaters, concert or opera halls and similar assembly occupancies, the illumination at the walking surface is permitted to be reduced during performances by one of the following methods provided that the required illumination is automatically restored upon activation of a premises' *fire alarm system*:

1. Externally illuminated walking surfaces shall be permitted to be illuminated to not less than 0.2 footcandle (2.15 lux).
2. Steps, landings and the sides of *ramps* shall be permitted to be marked with self-luminous materials in accordance with Sections 1025.2.1, 1025.2.2 and 1025.2.4 by systems *listed* in accordance with UL 1994.

Reason: 1. To enhance safety by improving the visibility of stairs. Visibility is improved when there is visual contrast between the nosing and the portion of the tread near the riser. With overhead lighting, this contrast is created by (a) contrasting materials, and (b) the shadow created by the riser. If the 10fc minimum is interpreted to be measured in the shadow adjacent to the riser, then lighting will be designed to minimize this shadow and reduce contrast and hence reduce visibility.

2. To provide for greater consistency in application and enforcement of the code by specifying where readings are to be taken. There is a fair amount of disagreement about how far into the darkest corner a light meter should be placed when searching for the point with minimum illuminance.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal could be interpreted to reduce overall light level requirements in stairs, which would reduce costs. This impact is likely minimal. There is no plausible scenario where this would increase costs.

E31-24

Public Hearing Results (CAH1)

Committee Action: **As Submitted**

Committee Reason: This gives a measurement point to determine averages for officials and designers. The proposal puts the lighting levels on the walkline within reach of the handrail - this is where the lighting is most needed. (AS 11-3)

E31-24

Individual Consideration Agenda

Comment 1:

IBC: 1008.2.1; IFC: [BE] 1008.2.1

Proponents: Jack Bailey, One Lux Studio LLC, International Association of Lighting Designers (jbailey@oneluxstudio.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

1008.2.1 Illumination level under normal power. The *means of egress* illumination level shall be not less than 1 footcandle (11 lux) at the walking surface. Along *exit access stairways*, exit stairways and at their required landings, the illumination level shall not be less than 10 footcandles (108 lux) at the walking surface when the *stairway* is in use. Illumination levels on *stairways* shall be measured at the *nosing* of each landing, at the lowest *nosing* in each *flight*, and at one *nosing* in the middle of each *flight*, ~~and tread~~ at a horizontal distance 12 inches (305 mm) to 14 inches (356 mm) from the stair side of each *handrail*.

Exception: For auditoriums, theaters, concert or opera halls and similar assembly occupancies, the illumination at the walking surface is permitted to be reduced during performances by one of the following methods provided that the required illumination is automatically restored upon activation of a premises' *fire alarm system*:

1. Externally illuminated walking surfaces shall be permitted to be illuminated to not less than 0.2 footcandle (2.15 lux).
2. Steps, landings and the sides of *ramps* shall be permitted to be marked with *self-luminous* materials in accordance with Sections 1025.2.1, 1025.2.2 and 1025.2.4 by systems *listed* in accordance with UL 1994.

[BE] 1008.2.1 Illumination level under normal power. The *means of egress* illumination level shall be not less than 1 footcandle (11 lux) at the walking surface. Along *exit access stairways*, exit *stairways* and at their required landings, the illumination level shall be not less than 10 footcandles (108 lux) at the walking surface when the *stairway* is in use. Illumination levels on *stairways* shall be measured at the *nosing* of each landing, at the lowest *nosing* in each *flight*, and at one *nosing* in the middle of each *flight*, ~~and tread~~ at a horizontal distance 12 inches (305 mm) to 14 inches (356 mm) from the stair side of each *handrail*.

Exception: For auditoriums, theaters, concert or opera halls and similar assembly occupancies, the illumination at the walking surface is permitted to be reduced during performances by one of the following methods provided that the required illumination is automatically restored upon activation of a premises' *fire alarm system*:

1. Externally illuminated walking surfaces shall be permitted to be illuminated to not less than 0.2 footcandle (2.15 lux).
2. Steps, landings and the sides of *ramps* shall be permitted to be marked with self-luminous materials in accordance with Sections 1025.2.1, 1025.2.2 and 1025.2.4 by systems *listed* in accordance with UL 1994.

Reason: The proponents of E31 got feedback from several interested parties who were concerned that requiring measurements at every nosing would make inspection difficult.

From a practical standpoint, we believe that measuring at three nosings on each flight (top, middle, and bottom) will achieve substantially the same result as measuring at every nosing.

From a safety standpoint, we are most concerned about lighting the transitions from flight to landing, so we have required measurement points there. And with a light at each landing (most often the case), the darkest point will be in the middle of the flight, so we have required a measurement point there.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

By reducing the number of measurement points this proposal may make inspection and enforcement easier.

Comment (CAH2)# 348

E32-24

IBC: SECTION 202 (New), 1008.2.1; IFC: SECTION 202 (New), [BE] 1008.2.1

Proposed Change as Submitted

2024 International Building Code

Add new definition as follows:

OCCUPANT SENSOR CONTROL. An automatic control device or system that detects the presence or absence of people within an area and causes lighting, equipment, or appliances to be regulated accordingly.

Revise as follows:

1008.2.1 Illumination level under normal power. The *means of egress* illumination level shall be not less than 1 footcandle (11 lux) at the walking surface. Along *exit access stairways*, exit stairways and at their required landings, the illumination level shall not be less than 10 footcandles (108 lux) at the walking surface when the *stairway* is in use. ~~**Exception**~~ **Exceptions:**

1. *Occupant sensor controls* shall be permitted to reduce illumination levels along the *means of egress* serving occupied rooms and spaces where the following conditions are met:
   1.1. When no occupants are present, the illumination level shall not be less than an average of 1 footcandle (11 lux) and a minimum at any point of 0.1 footcandle (1 lux) measured along the path of egress at the walking surface. A maximum-to-minimum illumination uniformity ratio of 40 to 1 shall not be exceeded.
   1.2. Along *stairways*, when an occupant is present on a *landing*, the illumination level shall be automatically restored on that landing and on all *flights* adjacent to that *landing*.
   1.3. Along *stairways*, when an occupant is present on a *flight*, the illumination level shall be automatically restored on that *flight* and on both *landings* adjacent to that *flight*.
   1.4. Along the *means of egress* in rooms and spaces other than *stairways*, the illumination level shall be automatically restored in each *occupant sensor* control zone when occupants are present.
   1.5. After the occupants leave each *occupant sensor* control zone, the illumination level shall be maintained for no less than 15 minutes.
   1.6. In *interior exit stairways*, *interior exit ramps*, and *exit passageways* in buildings with fire alarm systems, the illumination level shall be automatically restored upon activation of the premises' fire alarm system.
2. For auditoriums, theaters, concert or opera halls and similar assembly occupancies, the illumination at the walking surface is permitted to be reduced during performances by one of the following methods provided that the required illumination is automatically restored upon activation of a premises' *fire alarm system*:
   2.1. Externally illuminated walking surfaces shall be permitted to be illuminated to not less than 0.2 footcandle (2.15 lux).
   2.2 Steps, landings and the sides of *ramps* shall be permitted to be marked with *self-luminous* materials in accordance with Sections 1025.2.1, 1025.2.2 and 1025.2.4 by systems *listed* in accordance with UL 1994.

2024 International Fire Code

Add new definition as follows:

OCCUPANT SENSOR CONTROL. An automatic control device or system that detects the presence or absence of people within an area and causes lighting, equipment, or appliances to be regulated accordingly.

Revise as follows:

[BE] 1008.2.1 Illumination level under normal power. The *means of egress* illumination level shall be not less than 1 footcandle (11 lux) at the walking surface. Along *exit access stairways*, exit *stairways* and at their required landings, the illumination level shall be not less than 10 footcandles (108 lux) at the walking surface when the *stairway* is in use. **~~Exception~~ Exceptions:**

1. *Occupant sensor controls* shall be permitted to reduce illumination levels along the *means of egress* serving occupied rooms and spaces where the following conditions are met:
   1.1. When no occupants are present, the illumination level shall not be less than an average of 1 footcandle (11 lux) and a minimum at any point of 0.1 footcandle (1 lux) measured along the path of egress at the walking surface. A maximum-to-minimum illumination uniformity ratio of 40 to 1 shall not be exceeded.
   1.2. Along *stairways*, when an occupant is present on a *landing*, the illumination level shall be automatically restored on that landing and on all *flights* adjacent to that *landing*.
   1.3. Along *stairways*, when an occupant is present on a *flight*, the illumination level shall be automatically restored on that *flight* and on both *landings* adjacent to that *flight*.
   1.4. Along the *means of egress* in rooms and spaces other than *stairways*, the illumination level shall be automatically restored in each *occupant sensor* control zone when occupants are present.
   1.5. After the occupants leave each *occupant sensor* control zone, the illumination level shall be maintained for no less than 15 minutes.
   1.6. In *interior exit stairways*, *interior exit ramps*, and *exit passageways* in buildings with fire alarm systems, the illumination level shall be automatically restored upon activation of the premises' fire alarm system.

2. For auditoriums, theaters, concert or opera halls and similar assembly occupancies, the illumination at the walking surface is permitted to be reduced during performances by one of the following methods provided that the required illumination is automatically restored upon activation of a premises' *fire alarm system*:
   2.1. Externally illuminated walking surfaces shall be permitted to be illuminated to not less than 0.2 footcandle (2.15 lux).
   2.2 Steps, landings and the sides of *ramps* shall be permitted to be marked with *self-luminous* materials in accordance with Sections 1025.2.1, 1025.2.2 and 1025.2.4 by systems *listed* in accordance with UL 1994.

Reason: To provide necessary clarity for the safe installation of occupant sensors to conserve energy in unoccupied means of egress.

A lot of energy is wasted operating lights in unoccupied spaces. The IBC currently requires that light levels be maintained at 1 footcandle minimum in many types of unoccupied spaces, provided that those spaces serve other spaces which may be occupied. First, please consider that a 1 footcandle minimum implies an average of 2-5 footcandes with typical uniformity ratios. Second, please consider that there is often no practical way to determine if the "spaces served" are occupied (e.g. a corridor in a residential building serving multiple dwelling units is always assumed to be serving occupied spaces), so the 2-5 footcandle average illumination is maintained 24 hours/day, 365 days/year even with occupant sensors controlling the lights.

This proposal would allow a reduction of light levels to 1 footcandle average in unoccupied means of egress serving occupied spaces. The specified illuminance levels for the unoccupied condition (Exception 1.1) are identical to the illuminance level required while occupied under emergency power (1008.3.2). So these spaces are always maintained at a light level which has been deemed to be safe under all versions of the IBC dating back to 2000, even if the occupant sensors were to fail to raise light levels when an occupant entered.

Energy savings would be quite significant where occupant sensor controls are provided in spaces like corridors, warehouses, and open office areas, where anywhere from 50% to 80% less energy would be required to light unoccupied spaces.

To ensure that safety is not compromised, and to ensure consistent application and enforcement of the code, this proposal adds six requirements for the safe installation and operation of occupant sensors.

1.1 Specifies the illumination level for unoccupied means of egress (as explained above).

1.2 and 1.3 Allow for the most common lighting control strategy in stairways (occupant sensors integrated into fixtures) to be employed, provided that the sensors can detect motion for the full flight leading to each landing. This way occupants are never walking into darkness.

1.4 Requires that sensors automatically raise light levels when an occupant enters (i.e. manual-on "vacancy sensors" are not permitted).

1.5 Requires that occupant sensors keep lights at the occupied level 15 minutes after the last occupant leaves the control zone, to avoid "false offs" (i.e. where illumination levels are reduced while the space is still occupied).

1.6 Requires that critical spaces in the exit automatically rise their occupied level when the fire alarm system is triggered, because occupant sensors are not tested in smoke.

None of these safety requirements are included in the IECC.

Please note that ICC A117.1 includes language permitting the use of occupant sensors which are "equipped for fail-safe operation and evaluated for this purpose" along stairways. But controls manufacturers do not do this, and similar language was removed from NFPA101 in 2015.

Bibliography: ANSI/ICC 117.1 *Accessible and Usable Buildings and Facilities* 2017 – 4th Version: Sept 2022 International Code Council. Washington, DC

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal does not requireusers of the code to do anything. It allowsthem to install occupant sensing lighting controls to save energy.

E32-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: There needs to be greater than just emergency lighting levels when an occupant sensor fails - there needs to be a failsafe level set. There needs to be additional clarification for what happens as a person moves up or down the stairway. (Vote: 8-6)

E32-24

Modify as follows:

2024 International Building Code

OCCUPANT SENSOR CONTROL. An automatic control device or system that detects the presence or absence of people within an area and causes lighting, equipment, or appliances to be regulated accordingly.

Add new definition as follows:

OCCUPANT SENSOR CONTROL ZONE. An area served by one or more light sources simultaneously controlled by one or more occupant sensors.

1008.2.1 Illumination level under normal power. The *means of egress* illumination level shall be not less than 1 footcandle (11 lux) at the walking surface. Along *exit access stairways*, exit stairways and at their required landings, the illumination level shall not be less than 10 footcandles (108 lux) at the walking surface when the *stairway* is in use. **Exceptions:**

1. *Occupant sensor controls* shall be permitted to reduce illumination levels along the *means of egress* serving occupied rooms and spaces where the following conditions are met:
   1.1. When no occupants are present, the illumination level shall not be less than an average of 1 footcandle (11 lux) and a minimum at any point of 0.1 footcandle (1 lux) measured along the path of egress at the walking surface. A maximum-to-minimum illumination uniformity ratio of 40 to 1 shall not be exceeded.
   1.2. Along *stairways*, when an occupant is present on a *landing*, the illumination level shall be automatically restored on that landing and on all *flights* ~~adjacent to~~ immediately above and below that *landing*.
   1.3. Along *stairways*, when an occupant is present on a *flight*, the illumination level shall be automatically restored on that *flight* and on the ~~both~~ *landings* ~~adjacent to~~ immediately above and below that *flight*.
   1.4. Along the *means of egress* in rooms and spaces other than *stairways*, the illumination level shall be automatically restored in each *occupant sensor* control zone when occupants are present.
   1.5. After the occupants leave each *occupant sensor* control zone, the illumination level shall be maintained for no less than 15 minutes.
   1.6. In *interior exit stairways, interior exit ramps*, and *exit passageways* in buildings with fire alarm systems, the illumination level shall be automatically restored upon activation of the premises' fire alarm system.
2. For auditoriums, theaters, concert or opera halls and similar assembly occupancies, the illumination at the walking surface is permitted to be reduced during performances by one of the following methods provided that the required illumination is automatically restored upon activation of a premises' *fire alarm system*:
   2.1. Externally illuminated walking surfaces shall be permitted to be illuminated to not less than 0.2 footcandle (2.15 lux).
   2.2 Steps, landings and the sides of *ramps* shall be permitted to be marked with *self-luminous* materials in accordance with Sections 1025.2.1, 1025.2.2 and 1025.2.4 by systems *listed* in accordance with UL 1994.

2024 International Fire Code

OCCUPANT SENSOR CONTROL. An automatic control device or system that detects the presence or absence of people within an area

and causes lighting, equipment, or appliances to be regulated accordingly.

Add new definition as follows:

OCCUPANT SENSOR CONTROL ZONE. An area served by one or more light sources simultaneously controlled by one or more occupant sensors.

[BE] 1008.2.1 Illumination level under normal power. The *means of egress* illumination level shall be not less than 1 footcandle (11 lux) at the walking surface. Along *exit access stairways*, exit *stairways* and at their required landings, the illumination level shall be not less than 10 footcandles (108 lux) at the walking surface when the *stairway* is in use. **Exceptions:**

1. *Occupant sensor controls* shall be permitted to reduce illumination levels along the *means of egress* serving occupied rooms and spaces where the following conditions are met:
   1.1. When no occupants are present, the illumination level shall not be less than an average of 1 footcandle (11 lux) and a minimum at any point of 0.1 footcandle (1 lux) measured along the path of egress at the walking surface. A maximum-to-minimum illumination uniformity ratio of 40 to 1 shall not be exceeded.
   1.2. Along *stairways*, when an occupant is present on a *landing*, the illumination level shall be automatically restored on that landing and on all *flights* ~~adjacent to~~ immediately above and below that *landing.*
   1.3. Along *stairways*, when an occupant is present on a *flight*, the illumination level shall be automatically restored on that *flight* and on the ~~both~~ *landings* ~~adjacent to~~ immediately above and below that *flight*.
   1.4. Along the *means of egress* in rooms and spaces other than *stairways*, the illumination level shall be automatically restored in each *occupant sensor* control zone when occupants are present.
   1.5. After the occupants leave each *occupant sensor* control zone, the illumination level shall be maintained for no less than 15 minutes.
   1.6. In *interior exit stairways, interior exit ramps*, and *exit passageways* in buildings with fire alarm systems, the illumination level shall be automatically restored upon activation of the premises' fire alarm system.

2. For auditoriums, theaters, concert or opera halls and similar assembly occupancies, the illumination at the walking surface is permitted to be reduced during performances by one of the following methods provided that the required illumination is automatically restored upon activation of a premises' *fire alarm system*:
   2.1. Externally illuminated walking surfaces shall be permitted to be illuminated to not less than 0.2 footcandle (2.15 lux).
   2.2 Steps, landings and the sides of *ramps* shall be permitted to be marked with *self-luminous* materials in accordance with Sections 1025.2.1, 1025.2.2 and 1025.2.4 by systems *listed* in accordance with UL 1994.

Reason: This revised language was suggested by a committee member during the CAH hearing in Orlando. We believe it helps clarify that light levels need to be increased both above and below an occupant in a stairwell, since people do walk up and down stairs.

This comment also includes the floor modification Bailey-1, adding a definition for OCCUPANT SENSOR CONTROL ZONE, which received strong support from the committee.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is a clarification of language, not a new requirement.

Comment (CAH2)# 347

Comment 2:

IBC: SECTION 202, SECTION 202 (New), 1008.2.1; IFC: SECTION 202, SECTION 202 (New), [BE] 1008.2.1

Proponents: Jonathan McHugh, McHugh Energy Consultants Inc., California Investor Owned Utilities (jon@mchughenergy.com); Koni Sims, ACB Board of Director, American Council of the Blind (ACB), Visually Impaired/Low Vision (koni.l.sims@gmail.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

OCCUPANT SENSOR CONTROL. An automatic control device or system that detects the presence or absence of people within an area and causes lighting, equipment, or appliances to be regulated accordingly.

Add new definition as follows:

OCCUPANT SENSOR CONTROL ZONE. . An area served by one or more light sources simultaneously controlled by one or more occupant sensors.

1008.2.1 Illumination level under normal power. The *means of egress* illumination level shall be not less than 1 footcandle (11 lux) at the walking surface. Along *exit access stairways*, *exit stairways* and at their required landings, the illumination level shall not be less than 10 footcandles (108 lux) at the walking surface when the *stairway* is in use.

Exceptions:

1. *Occupant sensor controls* shall be permitted to reduce illumination levels along the *means of egress* serving occupied rooms and spaces where the following conditions are met:
   - 1.1. When no occupants are present on *interior exit stairways*, the illumination level shall be not less than 1 footcandle (11 lux).
   - ~~1.1.~~ 1.2. When no occupants are present, in portions of the *means of egress* other than *interior exit stairways* and where an emergency electrical system is required, the illumination level shall not be less than ~~an average of 1 footcandle (11 lux) and a minimum at any point of 0.1 footcandle (1 lux) measured along the path of egress at the walking surface. A maximum-to-minimum illumination uniformity ratio of 40-to-1 shall not be exceeded.~~ the intial illumination level required in Section 1008.3.2.
   - ~~1.2.~~ 1.3. Along *stairways*, when an occupant is present on a *landing*, the illumination level shall be automatically restored on that landing and on all *flights* ~~adjacent to~~ immediately above and below that *landing.*
   - ~~1.3.~~ 1.4. Along *stairways*, when an occupant is present on a *flight*, the illumination level shall be automatically restored on that *flight* and on ~~both~~ *landings* ~~adjacent to~~ immediately above and below that *flight*.
   - ~~1.4.~~ 1.5. Along the *means of egress* in rooms and spaces other than *stairways*, the illumination level shall be automatically restored in each *occupant sensor* control zone when occupants are present.
   - ~~1.5.~~ 1.6. After the occupants leave each *occupant sensor* control zone, the illumination level shall be maintained for no less than 15 minutes.
   - ~~1.6.~~ 1.7 In *interior exit stairways, interior exit ramps*, and *exit passageways* in buildings with fire alarm systems, the illumination level shall be automatically restored upon activation of the premises' fire alarm system.

2. For auditoriums, theaters, concert or opera halls and similar assembly occupancies, the illumination at the walking surface is permitted to be reduced during performances by one of the following methods provided that the required illumination is automatically restored upon activation of a premises' *fire alarm system*:

   2.1. Externally illuminated walking surfaces shall be permitted to be illuminated to not less than 0.2 footcandle (2.15 lux).

   2.2 Steps, landings and the sides of *ramps* shall be permitted to be marked with *self-luminous* materials in accordance with Sections 1025.2.1, 1025.2.2 and 1025.2.4 by systems *listed* in accordance with UL 1994.

2024 International Fire Code

OCCUPANT SENSOR CONTROL. An automatic control device or system that detects the presence or absence of people within an area and causes lighting, equipment, or appliances to be regulated accordingly.

Add new definition as follows:

OCCUPANT SENSOR CONTROL ZONE. . An area served by one or more light sources simultaneously controlled by one or more occupant sensors.

[BE] 1008.2.1 Illumination level under normal power. The *means of egress* illumination level shall be not less than 1 footcandle (11 lux) at the walking surface. Along *exit access stairways*, *exit stairways* and at their required landings, the illumination level shall be not less than 10 footcandles (108 lux) at the walking surface when the *stairway* is in use.

Exceptions:

1. *Occupant sensor controls* shall be permitted to reduce illumination levels along the *means of egress* serving occupied rooms and spaces where the following conditions are met:

   1.1. When no occupants are present on *interior exit stairways*, the illumination level shall be not less than 1 footcandle (11 lux).

   ~~1.4.~~ 1.5 Along the *means of egress* in rooms and spaces other than *stairways*, the illumination level shall be automatically restored in each *occupant sensor* control zone when occupants are present.

   ~~1.5.~~ 1.6 After the occupants leave each *occupant sensor* control zone, the illumination level shall be maintained for no less than 15 minutes.

   ~~1.6.~~ 1.7 In *interior exit stairways, interior exit ramps*, and *exit passageways* in buildings with fire alarm systems, the illumination level shall be automatically restored upon activation of the premises' fire alarm system.

2. For auditoriums, theaters, concert or opera halls and similar assembly occupancies, the illumination at the walking surface is permitted to be reduced during performances by one of the following methods provided that the required illumination is automatically restored upon activation of a premises' *fire alarm system*:

   2.1. Externally illuminated walking surfaces shall be permitted to be illuminated to not less than 0.2 footcandle (2.15 lux).

   2.2 Steps, landings and the sides of *ramps* shall be permitted to be marked with *self-luminous* materials in accordance with Sections 1025.2.1, 1025.2.2 and 1025.2.4 by systems *listed* in accordance with UL 1994.

Reason: This proposal modifies the original egress lighting controls proposal E32-24, based on comments from the committee or other commenters and research from other sources.

Incorporating approved changes

Definition of occupant sensor control zone. This definition was added as part of floor modification E32-24-Bailey-MP1 and was non-controversial (no one spoke in opposition to this definition).

Incorporating comments from the committee or commenters

Committee member Fattah suggested using language of "landings immediately above and below that flight" and "flights immediately above and below a landing." This text is editorial in nature and others also thought this was more clear, so this change was incorporated.Commissioners Campbell and Fattah were concerned about stairs having a minimum of 0.1 fc in the stairs when the occupant sensor fails. The low illuminance setting can be considered to be the "fail-safe" illuminance during sensor failure. To address the special concern of light levels in interior exit stairways, this proposal increases by a factor of 10 the minimum unoccupied light levels from 0.1 fc minimum to 1.0 footcandles minimum when no occupants are sensed. 1.0 fc minimum was considered sufficient for stair safety in every version of the IBC prior to 2021, and is also the minimum illuminance which is usually required to charge photoluminescent tape.

Other commenters were concerned about applying the emergency illumination requirements to portions of the means of egress not required to have emergency lighting during occupied periods when no occupancy is detected; in that they expressed concerns about the complexity of calculating the maximum to minimum ratio of 40:1. Currently this calculation of minium to maximum ratios are not required unless the application is required to have emergency power back-up for lighting. This proposal is modified so these unoccupied light levels including maximum to minimum ratios are required only where the emergency lighting is required. Rather than repeating the emergency power initial illumination requirements from Section 1008.3.5, the section is referenced. These minimum light levels provide an additional level of security associated with the operation of the occupancy sensor. Even if the occupancy sensor failed by not detecting occupants, there would still be enough light for egress during normal operation (i.e. utility electrical power is still powering all lighting circuits) comparable to the intial (fully charged) lighting levels provided by the emergency lighting system.

Research from other sources When combined with the other proposals approved by the committee, this proposal aligns the stairway illuminance requirements in IBC Section 1008.2.1 with those in ANSI/ICC 117.1 accessibility standard in Section 504.9.1 "Illumination Level" and in IES-RP-28-20 Recommended Practice: Lighting and the Visual Environment for Older Adults and the Visually Impaired.

ICC 117.1 also allows 1 fc minimum illumination when the stair is not in use. Similarly in IES RP-28-20, in Table A-1 "Recommended Illuminance Criteria for Spaces Specific to Lighting for Older Adults or Those with Impaired Vision" the table indicates that for exit stairways and landings, the recommended average illuminance value is 10 footcandles and has a footnote with the following instruction: "Measured at the center of the step (If local code permits, stairwell lighting can be reduced when stairwell is unoccupied)."

Research conducted by the Virgina Transportation Technology Institute (Bhagavathula & Gibbons, 2020) evaluated illuminance levels necessary for visibility in parking lots and parking garages. This research informed the recommended illuminance levels in the Illuminating Engineering Society Standard ANSI/IES RP8-22 Recommended Practice: Lighting Roadway and Parking Facilities. In Table 17-3.

Recommended Maintained Illuminance for Parking Garages of IES-RP-8, recommended minimum illuminance in "Dedicated Corners, Ramps; Drive Aisles, Parking Areas" is 0.9 footcandle when active (motion sensed) and 0.2 footcandle when inactive (no motion detected). .The vast majority of outdoor lighting applications are in lighting zones 2 and 3. IES RP 43-22 has recommended upper and lower average recommended maintained illuminance targets in Table A-3. Recommended Illuminance Criteria for People in Outdoor Environments. For Walking Surfaces (general circulation and egress) in lighting zone 2 this range is 1 to 2 fc and in lighting zone 3 this range is 2 to 4 fc. For Stairs and Ramps in lighting zone 2 this range is 2 to 3 fc and in lighting zone 3 this range is 3 to 4 fc. Applying a lower limits of 10 fc average to these outdoor stairs would result in a code minimum that would be higher than the maximum average illumination recommendation from the Illuminating Engineering Society.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

No cost impact. Controlling lights with occupancy sensors increases the first cost. However this proposal does not require that occupancy sensors shall be installed. This proposal describes that if one does control lights with occupancy sensors how much the lighting level is allowed to drop.

2024 International Building Code

Revise as follows:

1008.2.1 Illumination level under normal power. The interior *means of egress* illumination level shall be not less than 1 footcandle (11 lux) at the walking surface. Along *exit access stairways*, exit stairways and at their required landings, the illumination level shall not be less than 10 footcandles (108 lux) at the walking surface when the *stairway* is in use.

Exception: For auditoriums, theaters, concert or opera halls and similar assembly occupancies, the illumination at the walking surface is permitted to be reduced during performances by one of the following methods provided that the required illumination is automatically restored upon activation of a premises' *fire alarm system*:

1. Externally illuminated walking surfaces shall be permitted to be illuminated to not less than 0.2 footcandle (2.15 lux).
2. Steps, landings and the sides of *ramps* shall be permitted to be marked with *self-luminous* materials in accordance with Sections 1025.2.1, 1025.2.2 and 1025.2.4 by systems *listed* in accordance with UL 1994.

1008.2.3 Exit discharge. Illumination shall be provided along the path of travel for the *exit discharge* from each exit to the *public way*. Illumination levels shall not be less than an average of 1 footcandle (11 lux) and a minimum at any point of 0.1 footcandle (1 lux) measured along the path of egress at the walking surface. A maximum-to-minimum illumination uniformity ratio of 40 to 1 shall not be exceeded.

Exception: Illumination shall not be required where the path of the *exit discharge* meets both of the following requirements:

1. The path of *exit discharge* is illuminated from the exit to a safe dispersal area complying with Section 1028.5.
2. A dispersal area shall be illuminated to a level not less than 1 footcandle (11 lux) at the walking surface.

2024 International Fire Code

Revise as follows:

[BE] 1008.2.1 Illumination level under normal power. The interior *means of egress* illumination level shall be not less than 1 footcandle (11 lux) at the walking surface. Along *exit access stairways*, exit stairways and at their required landings, the illumination level shall not be less than 10 footcandles (108 lux) at the walking surface when the *stairway* is in use.

Exception: For auditoriums, theaters, concert or opera halls and similar assembly occupancies, the illumination at the walking surface is permitted to be reduced during performances by one of the following methods provided that the required illumination is automatically restored upon activation of a premises' *fire alarm system*:

1. Externally illuminated walking surfaces shall be permitted to be illuminated to not less than 0.2 footcandle (2.15 lux).
2. Steps, landings and the sides of *ramps* shall be permitted to be marked with self-luminous materials in accordance with Sections 1025.2.1, 1025.2.2 and 1025.2.4 by systems *listed* in accordance with UL 1994.

[BE] 1008.2.3 Exit discharge. Illumination shall be provided along the path of travel for the *exit discharge* from each exit to the *public way*. Illumination levels shall not be less than an average of 1 footcandle (11 lux) and a minimum at any point of 0.1 footcandle (1 lux) measured along the path of egress at the walking surface. A maximum-to-minimum illumination uniformity ratio of 40 to 1 shall not be exceeded. **Exception:** Illumination shall not be required where the path of the *exit discharge* meets both of the following requirements:

1. The path of *exit discharge* is illuminated from the exit to a safe dispersal area complying with Section 1028.5.
2. A dispersal area shall be illuminated to a level not less than 1 footcandle (11 lux) at the walking surface.

Reason: To reduce the significant environmental impact that results when exterior spaces are over-lighted. Exterior spaces are rarely illuminated to a minimum of 1 footcandle, and exterior exit discharges lighted to meet current requirements in the IBC are unusually bright. This proposal would ensure that light levels which are currently considered sufficient for emergency conditions (refer to Section 1008.3.2) are maintained at all times, which will reduce energy costs and reduce light pollution.

Exterior occupancy sensors are not available for most pedestrian-scale lighting, which means that exit discharge lights will usually burn all night long.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

By reducing light level requirements this proposal will result in a reduction in construction costs for many projects as fixtures can be spaced further apart. Construction costs will not be increased for any projects.

E33-24

Public Hearing Results (CAH1)

Committee Action: **As Modified by Committee (AMC1)**

Committee Modification:

2024 International Building Code

1008.2.1 Illumination level under normal power. The ~~interior~~ *means of egress* illumination level shall be not less than 1 footcandle (11 lux) at the walking surface. Along *exit access stairways*, exit stairways and at their required landings, the illumination level shall not be less than 10 footcandles (108 lux) at the walking surface when the *stairway* is in use.

Exception: For auditoriums, theaters, concert or opera halls and similar assembly occupancies, the illumination at the walking surface is permitted to be reduced during performances by one of the following methods provided that the required illumination is automatically restored upon activation of a premises' *fire alarm system*:

1. Externally illuminated walking surfaces shall be permitted to be illuminated to not less than 0.2 footcandle (2.15 lux).
2. Steps, landings and the sides of *ramps* shall be permitted to be marked with *self-luminous* materials in accordance with Sections 1025.2.1, 1025.2.2 and 1025.2.4 by systems *listed* in accordance with UL 1994.

2024 International Fire Code

[BE] 1008.2.1 Illumination level under normal power. The ~~interior~~ *means of egress* illumination level shall be not less than 1 footcandle (11 lux) at the walking surface. Along *exit access stairways*, exit stairways and at their required landings, the illumination level shall not be less than 10 footcandles (108 lux) at the walking surface when the *stairway* is in use.

Exception: For auditoriums, theaters, concert or opera halls and similar assembly occupancies, the illumination at the walking surface is permitted to be reduced during performances by one of the following methods provided that the required illumination is

automatically restored upon activation of a premises' *fire alarm system*:

1. Externally illuminated walking surfaces shall be permitted to be illuminated to not less than 0.2 footcandle (2.15 lux).
2. Steps, landings and the sides of *ramps* shall be permitted to be marked with self-luminous materials in accordance with Sections 1025.2.1, 1025.2.2 and 1025.2.4 by systems *listed* in accordance with UL 1994.

Committee Reason: The modification is to delete 'interior' from Section 1008.2.1 was approved so that lighting will still be required on exterior exit stairways or egress balconies. The proposal will clarify requirements for illumination of the path of exit discharge. This is consistent with emergency lighting level. (Vote: 14-0)

E33-24

Individual Consideration Agenda

Comment 1:

IBC: 1008.2.3; IFC: [BE] 1008.2.3

Proponents: Jeffrey Munsterteiger, National Association of Home Builders, National Association of Home Builders (jmunsterteiger@nahb.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

Revise as follows:

1008.2.3 Exit discharge. Illumination shall be provided along the path of travel for the *exit discharge* from each exit to the *public way*. Illumination levels shall not be less than an average of 1 footcandle (11 lux) and a minimum at any point of 0.1 footcandle (1 lux) measured along the path of egress at the walking surface. ~~A maximum-to-minimum illumination uniformity ratio of 40-to-1 shall not be exceeded.~~

Exception: Illumination shall not be required where the path of the *exit discharge* meets both of the following requirements:

1. The path of *exit discharge* is illuminated from the exit to a safe dispersal area complying with Section 1028.5.
2. A dispersal area shall be illuminated to a level not less than 1 footcandle (11 lux) at the walking surface.

2024 International Fire Code

Revise as follows:

[BE] 1008.2.3 Exit discharge. Illumination shall be provided along the path of travel for the *exit discharge* from each exit to the *public way*. Illumination levels shall not be less than an average of 1 footcandle (11 lux) and a minimum at any point of 0.1 footcandle (1 lux) measured along the path of egress at the walking surface. ~~A maximum-to-minimum illumination uniformity ratio of 40-to-1 shall not be exceeded.~~ **Exception:** Illumination shall not be required where the path of the *exit discharge* meets both of the following requirements:

1. The path of *exit discharge* is illuminated from the exit to a safe dispersal area complying with Section 1028.5.
2. A dispersal area shall be illuminated to a level not less than 1 footcandle (11 lux) at the walking surface.

Reason: The purpose of this committee comment is to strike the uniformity ratio added to the exit discharge requirements by the original

proposal. The proponent's reason statement characterized the change as editorial; however, it is adding new technical requirements to the section, including the calculation of a uniformity ratio, and should have been disapproved on that basis.

While it's true that the uniformity ratio is already in the code, it applies only to the illumination level under emergency power. In this context it is a basic calculation, it's the ratio of when the lights are on versus on only under emergency power. Most of the lighting requiring emergency power is within the building and therefore entirely under the building owner's control.

But adding it to Section 1008.2.3 brings in many variables not within the control of the building's owner and leaves more questions. First is the question of how lighting on neighboring properties or other exterior sources impacts the ratio. The ratio across the exit discharge will be influenced by lighting on neighboring properties, lighting in the public way as well as other environmental factors. This cannot be left open to interpretation at the time of enforcement. The committee disapproved item E34, which was adding ratings for glare across the exit discharge, for this same reason; that it didn't consider light from other external sources.

Another question is the distance across where the ratio of lighting is measured. An exit discharge is not limited in length and can be dozens or even hundreds of yards long. How many points of measurement are taken in that distance to determine the correct ratio? Is it only across the distance of a few feet or across its entire length and width? How does it account for the changing landscape, such as trees with or without leaves blocking overhead lighting? This also cannot be left open to interpretation at the time of enforcement.

It is for these reasons that the ratio in the original proposal should be stricken.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

By removing the ratio calculation this proposal will have little cost impact. With it in place the costs could be incalculable as a permit holder attempts to comply and pass inspections.

Comment (CAH2)# 275

E35-24

IBC: 1008.3; IFC: [BE] 1008.3

Proposed Change as Submitted

Proponents: Lucas Pump, City of Cedar Rapids, Self (l.pump@cedar-rapids.org)

2024 International Building Code

Revise as follows:

1008.3 Illumination required by an emergency electrical system. An emergency electrical system shall be provided to automatically illuminate the following areas in the event of a power supply failure:

1. In rooms or spaces that require two or more exits or access to exits:
   1.1. *Aisles*.
   1.2. *Corridors*.
   1.3. *Exit access stairways* and *ramps*.
2. In *buildings* that require two or more exits or access to exits:
   2.1. Interior *exit access stairways* and *ramps*.
   2.2. Interior and *exterior exit stairways* and *ramps*.
   2.3. Exit passageways.
   2.4. Vestibules and areas on the level of discharge used for *exit discharge* in accordance with Section 1028.2.
   2.5. Exterior landings as required by Section 1010.1.5 for exit doorways that lead directly to the *exit discharge*.
3. In other rooms and spaces:
   3.1. Electrical equipment rooms.
   3.2. *Fire command centers*.
   3.3. Fire pump rooms.
   3.4. Generator rooms.
   3.5. Public restrooms ~~with and area greater then 300 square feet (27.87 m^2).~~

2024 International Fire Code

Revise as follows:

[BE] 1008.3 Illumination required by an emergency electrical system. An emergency electrical system shall be provided to automatically illuminate the following areas in the event of a power supply failure:

1. In rooms or spaces that require two or more *exits* or access to *exits*:
   1.1. *Aisles*.
   1.2. *Corridors*.
   1.3. *Exit access stairways* and *ramps*.

2. In buildings that require two or more *exits* or access to *exits*:
   2.1. *Interior exit access stairways* and *ramps*.
   2.2. *Interior* and *exterior exit stairways* and *ramps*.
   2.3. *Exit passageways*.
   2.4. Vestibules and areas on the level of discharge used for *exit discharge* in accordance with Section 1028.2.
   2.5. Exterior landings as required by Section 1010.1.5 for exit doorways that lead directly to the *exit discharge*.
3. In other rooms and spaces:
   3.1. Electrical equipment rooms.
   3.2. Fire command centers.
   3.3. Fire pump rooms.
   3.4. Generator rooms.
   3.5. Public restrooms ~~with an area greater than 300 square feet (27.87 m^2).~~

Reason: The deleting of this text of the square footage would require emergency lighting in all public restrooms. Public restrooms typically do not contain natural lighting, and when the electrical power goes out, these restrooms become completely black. Furthermore, a public restroom is usually not a familiar place, therefore safely exiting these spaces can be very difficult in an emergency situation.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

The cost increase would be negligible because the average emergency light cost is between $20-$60 USD.

Estimated Immediate Cost Impact Justification (methodology and variables):

This would increase the cost of construction as emergency lighting would be required in all public restrooms, although the cost increase would be negligible because the average emergency light cost is between $20-$60 USD.

Estimated Life Cycle Cost Impact:

$20-$60 USD per new public restroom

Estimated Life Cycle Cost Impact Justification (methodology and variables):

Safety of occupants of the building

E35-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The original requirement was for multi-stall toilet rooms. Why is emergency lighting required in single occupant restroom where there might not be emergency lighting required in the space the toilet room was located in? As written this would require emergency lighting on individual stalls where the compartments extended floor to ceiling - that is a very high cost with minimal gain. (Vote: 11-3)

Individual Consideration Agenda

Comment 1:

IBC: 1008.3; IFC: [BE] 1008.3

Proponents: Lucas Pump, City of Cedar Rapids, Self (l.pump@cedar-rapids.org) requests As Modified by Committee (AMC2)

Replace as follows:

2024 International Building Code

1008.3 Illumination required by an emergency electrical system. An emergency electrical system shall be provided to automatically illuminate the following areas in the event of a power supply failure:

1. In rooms or spaces that require two or more exits or access to exits:
   1.1. *Aisles*.
   1.2. *Corridors*.
   1.3. *Exit access stairways* and *ramps*.
2. In *buildings* that require two or more exits or access to exits:
   2.1. Interior *exit access stairways* and *ramps*.
   2.2. Interior and *exterior exit stairways* and *ramps*.
   2.3. Exit passageways.
   2.4. Vestibules and areas on the level of discharge used for *exit discharge* in accordance with Section 1028.2.
   2.5. Exterior landings as required by Section 1010.1.5 for exit doorways that lead directly to the *exit discharge*.
3. In other rooms and spaces:
   3.1. Electrical equipment rooms.
   3.2. *Fire command centers*.
   3.3. Fire pump rooms.
   3.4. Generator rooms.
   3.5. ~~Public restrooms with an area greater than 300 square feet (27.87 m^2)~~ Common areas of multi-stall toilet and bathing rooms.

2024 International Fire Code

[BE] 1008.3 Illumination required by an emergency electrical system. An emergency electrical system shall be provided to automatically illuminate the following areas in the event of a power supply failure:

1. In rooms or spaces that require two or more *exits* or access to *exits*:
   1.1. *Aisles*.
   1.2. *Corridors*.
   1.3. *Exit access stairways* and *ramps*.
2. In buildings that require two or more *exits* or access to *exits*:
   2.1. *Interior exit access stairways* and *ramps*.
   2.2. *Interior* and *exterior exit stairways* and *ramps*.
   2.3. *Exit passageways*.
   2.4. Vestibules and areas on the level of discharge used for *exit discharge* in accordance with Section 1028.2.
   2.5. Exterior landings as required by Section 1010.1.5 for exit doorways that lead directly to the *exit discharge*.
3. In other rooms and spaces:
   3.1. Electrical equipment rooms.
   3.2. Fire command centers.
   3.3. Fire pump rooms.
   3.4. Generator rooms.
   3.5. ~~Public restrooms with an area greater than 300 square feet (27.87 m^2)~~ Common areas of multi-stall toilet and bathing rooms.

Reason: The feedback at the Committee Action Hearings was that a single user restroom shouldn't be required to provide emergency lighting as the original intent of the code was for multi-user restroom where you might have several occupants that need to safely egress. Further testimony at the Hearings indicated that as written in the original proposal, a Building Official may interpret that every stall of a single user gender neutral restroom would need an emergency lighting because the stall partitions are floor to ceiling. This code change eliminates the arbitrary size of 300 sq. ft., which is not referenced anywhere else in the code. Public restrooms typically do not contain natural lighting, and when the electrical power goes out, these restrooms become completely black. Furthermore, a public restroom is usually not a familiar place, therefore safely exiting these spaces can be very difficult in an emergency situation. This comment fixes the concerns of the committee as well as the testimony in opposition.

Cost Impact: Increase

Estimated Immediate Cost Impact:

The cost increase would be negligible because the average emergency light cost is between $20-$60 USD, and would only now require emergency lighting on a small percentage of new restrooms.

Estimated Immediate Cost Impact Justification (methodology and variables):

Safety of occupants of the occupants in public restroom.

Estimated Life Cycle Cost Impact:

There would be a slight increase due to maintain of the lighting as well as replacement of the back-up battery.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

Safety of occupants of the building

Comment (CAH2)# 33

E38-24

IBC: 1009.2, 1009.7; IFC: [BE] 1009.2, [BE] 1009.7

Proposed Change as Submitted

Proponents: David Renn, PE, SE, City and County of Denver, Colorado Chapter Code Development Committee (david.renn@denvergov.org)

2024 International Building Code

Revise as follows:

1009.2 Continuity and components. Each required *accessible means of egress* shall be continuous to a *public way* and shall consist of one or more of the following components:

1. *Accessible routes* complying with Section 1104.
2. *Interior exit stairways* complying with Sections 1009.3 and 1023.
3. *Exit access stairways* complying with Sections 1009.3 and 1019.3 or 1019.4.
4. *Exterior exit stairways* complying with Sections 1009.3 and 1027 and serving levels other than the *level of exit discharge*.
5. Elevators complying with Section 1009.4.
6. Platform lifts complying with Section 1009.5.
7. *Horizontal exits* complying with Section 1026.
8. *Ramps* complying with Section 1012.
9. *Areas of refuge* complying with Section 1009.6.
10. Exterior areas for assisted rescue complying with Section 1009.7 serving *exits* at the *level of exit discharge*.

Exception: An *accessible means of egress* that ends at one of the following components is not required to be continuous to a *public way*:

1. *Area of refuge* complying with Section 1009.6 at the *level of exit discharge* that provides direct access to an exterior *exit* door.
2. Exterior area for assisted rescue complying with Section 1009.7 serving an *exit* at the *level of exit discharge*.

1009.7 Exterior areas for assisted rescue. Exterior areas for assisted rescue shall be accessed by an *accessible route* from the area served, shall be located on the exterior landing adjacent to an *exit*, and shall comply with Sections 1009.7.1 through 1009.7.4. ~~.Where the *exit discharge* does not include an *accessible route* from an exit located on the *level of exit discharge* to a *public way*, an exterior area of assisted rescue shall be provided on the exterior landing in accordance with Sections 1009.7.1 through 1009.7.4.~~

2024 International Fire Code

Revise as follows:

[BE] 1009.2 Continuity and components. Each required *accessible means of egress* shall be continuous to a *public way* and shall consist of one or more of the following components:

1. *Accessible routes* complying with Section 1104 of the International Building Code.
2. *Interior exit stairways* complying with Sections 1009.3 and 1023.
3. *Exit access stairways* complying with Sections 1009.3 and 1019.3 or 1019.4.

4. *Exterior exit stairways* complying with Sections 1009.3 and 1027 and serving levels other than the *level of exit discharge*.
5. Elevators complying with Section 1009.4.
6. Platform lifts complying with Section 1009.5.
7. *Horizontal exits* complying with Section 1026.
8. *Ramps* complying with Section 1012.
9. *Areas of refuge* complying with Section 1009.6.
10. Exterior areas for assisted rescue complying with Section 1009.7 serving *exits* at the *level of exit discharge*.

Exception: An *accessible means of egress* that ends at one of the following components is not required to be continuous to a *public way*:

1. *Area of refuge* complying with Section 1009.6 at the *level of exit discharge* that provides direct access to an exterior *exit* door.
2. Exterior area for assisted rescue complying with Section 1009.7 serving an *exit* at the *level of exit discharge*.

[BE] 1009.7 Exterior areas for assisted rescue. Exterior areas for assisted rescue shall be accessed by an *accessible route* from the area served, shall be located on the exterior landing adjacent to an *exit*, and shall comply with Sections 1009.7.1 through 1009.7.4. ~~.Where the *exit discharge* does not include an *accessible route* from an *exit* located on the *level of exit discharge* to a *public way*, an exterior area of assisted rescue shall be provided on the exterior landing in accordance with Sections 1009.7.1 through 1009.7.4.~~

Reason: Section 1009.7 currently requires an exterior area for assisted rescue where the exit discharge does not include an accessible route from the exit to a public way. This requirement is essentially an exception to 1009.2 that requires an accessible means of egress (AMOE) to be continuous to the public way. Also, the exception to Section 1009.6.2 was added to allow an interior area of refuge at the level of exit discharge to act the same as an exterior area of rescue assistance - both provide a protected space where persons with physical disabilities can wait for an assisted rescue by an emergency responder. The exception to 1009.6.2 doesn't specifically say the AMOE does not need an accessible route to the public way, but that is clearly the intent since there would be no other reason to provide such an area of refuge. Also, the commentary to Section 1009.7 discusses both an exterior area for assisted rescue and an interior area of refuge and indicates they both are an option to not providing an AMOE that is continuous to the public way.

To clarify the continuity requirements for an exterior area for assisted rescue and an interior area of refuge at the level of exit discharge, this proposal adds an exception to the continuity requirement in 1009.2 and deletes the implied exception in 1009.7 since it would be redundant.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal clarifies the intent of the code with regard to continuity requirements for assisted rescue components of the accessible means of egress, so there will be no cost impact.

E38-24

Public Hearing Results (CAH1)

Committee Action: **As Submitted**

Committee Reason: The continuity requirements are moved from Section 1009.7 and allows for an exception for an accessible route to the public way from both options at the level of exit discharge where an accessible route is not available to the public way. This proposal is preferred over E37-24. (Vote: 14-0)

Individual Consideration Agenda

Comment 1:

IBC: 1009.2; IFC: [BE] 1009.2

Proponents: Gene Boecker, CCI, self (geneb@codeconsultants.com) requests As Modified by Committee (AMC2)

Further modify as follows:

2024 International Building Code

1009.2 Continuity and components. Each required *accessible means of egress* shall be continuous to a *public way* and shall consist of one or more of the following components:

1. *Accessible routes* complying with Section 1104.
2. *Interior exit stairways* complying with Sections 1009.3 and 1023.
3. *Exit access stairways* complying with Sections 1009.3 and 1019.3 or 1019.4.
4. *Exterior exit stairways* complying with Sections 1009.3 and 1027 and serving levels other than the *level of exit discharge*.
5. Elevators complying with Section 1009.4.
6. Platform lifts complying with Section 1009.5.
7. *Horizontal exits* complying with Section 1026.
8. *Ramps* complying with Section 1012.
9. *Areas of refuge* complying with Section 1009.6.
10. Exterior areas for assisted rescue complying with Section 1009.7 serving *exits* at the *level of exit discharge*.

Exception: An *accessible means of egress* that ends at one of the following components is not required to be continuous to a *public way*:

1. *Area of refuge* complying with Section 1009.6 at the *level of exit discharge* that provides direct access to an exterior *exit* door.
2. Exterior area for assisted rescue complying with Section 1009.7 serving an *exit* at the *level of exit discharge*.
3. Interior exit stairways complying with Sections 1009.3 and 1023.
4. Exit access stairways complying with Sections 1009.3 and 1019.3 or 1019.4.
5. Exterior exit stairways complying with Section 1009.4.

2024 International Fire Code

[BE] 1009.2 Continuity and components. Each required *accessible means of egress* shall be continuous to a *public way* and shall consist of one or more of the following components:

1. *Accessible routes* complying with Section 1104 of the International Building Code.
2. *Interior exit stairways* complying with Sections 1009.3 and 1023.
3. *Exit access stairways* complying with Sections 1009.3 and 1019.3 or 1019.4.

4. *Exterior exit stairways* complying with Sections 1009.3 and 1027 and serving levels other than the *level of exit discharge*.
5. Elevators complying with Section 1009.4.
6. Platform lifts complying with Section 1009.5.
7. *Horizontal exits* complying with Section 1026.
8. *Ramps* complying with Section 1012.
9. *Areas of refuge* complying with Section 1009.6.
10. Exterior areas for assisted rescue complying with Section 1009.7 serving *exits* at the *level of exit discharge*.

Exception: An *accessible means of egress* that ends at one of the following components is not required to be continuous to a *public way*:

1. *Area of refuge* complying with Section 1009.6 at the *level of exit discharge* that provides direct access to an exterior *exit* door.
2. Exterior area for assisted rescue complying with Section 1009.7 serving an *exit* at the *level of exit discharge*.
3. Interior exit stairways complying with Sections 1009.3 and 1023.
4. Exit access stairways complying with Sections 1009.3 and 1019.3 or 1019.4.
5. Exterior exit stairways complying with Section 1009.4.

Reason: The committee preferred the wording and format for E38 over E37. However, E38 did not go far enough. While it includes two of the obvious elements where the continuity of accessible egress can be stopped, it did not include stairways, and obvious obstruction and impediment to free accessible egress. While E37 was attempting to do other things as well as this, the opportunity to include these elements in the exception should be taken. It is clear that the accessible route from stairways stops at the stairway, whether they have areas of refuge of not within them.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The question of where to end the accessible means of egress were the path is not continuous to the public way needs clarity. The original proposal and this modification seek to accomplish that clarification. As such, there is no associated cost.

Comment (CAH2)# 689

E41-24

IBC: 1009.2.1; IFC: [BE] 1009.2.1

Proposed Change as Submitted

Proponents: Jeff Grove, Chair, Building Code Action Committee (BCAC) (bcac@iccsafe.org)

2024 International Building Code

Revise as follows:

1009.2.1 Elevators required. In *buildings* where a required *accessible* floor is four or more *stories* above or below a *level of exit discharge* or where an accessible *occupiable roof* is above a *story* that is three or more *stories* above the *level of exit discharge* , not less than one required *accessible means of egress* shall include an elevator complying with Section 1009.4. **Exceptions:**

1. ~~In *buildings* equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1 or 903.3.1.2, the~~ The elevator shall not be required as part of the *accessible means of egress* ~~on floors provided with a *horizontal exit* and located at or above the *levels of exit discharge*.~~ where the building complies with all of the following:
   1.1. The building is equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.
   1.2. All floors above the level of exit discharge are provided with a horizontal exit.
   1.3. Where there is an occupiable roof, the means of egress serving the occupiable roof is provided by interior exit stairways or ramps complying with Section 1023.
2. In *buildings* equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1 or 903.3.1.2, the elevator shall not be required as part of the *accessible means of egress* on floors or *occupiable roofs* provided with a ramp conforming to the provisions of Section 1012.

2024 International Fire Code

Revise as follows:

[BE] 1009.2.1 Elevators required. In buildings where a required accessible floor is four or more stories above or below a *level of exit discharge* or where an accessible *occupiable roof* is above a story that is three or more stories above the *level of exit discharge* , not less than one required *accessible means of egress* shall include an elevator complying with Section 1009.4. **Exceptions:**

1. ~~In buildings equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1 or 903.3.1.2, the~~ The elevator shall not be required as part of the *accessible means of egress* ~~on floors provided with a *horizontal exit* and located at or above the *levels of exit discharge*.~~ where the building complies with all of the following:
   1.1. The building is equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.
   1.2. All floors above the level of exit discharge are provided with a horizontal exit.
   1.3. Where there is an occupiable roof, the means of egress serving the occupiable roof is provided by interior exit stairways or ramps complying with Section 1023.
2. In buildings equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1 or 903.3.1.2, the elevator shall not be required as part of the *accessible means of egress* on floors or *occupiable roofs* provided with a *ramp* conforming to the provisions of Section 1012.

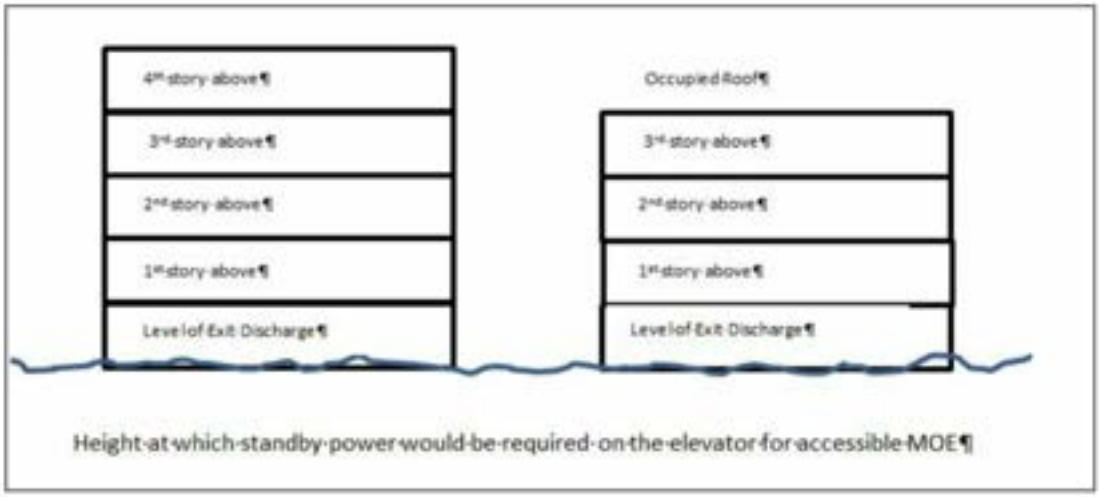
Reason: The intent of this proposal is to address buildings that have an occupiable roof and to allow for those buildings to use the option

of elevators with standby power (required in Section 1009.4) or to allow the use of horizontal exits. The reformatting is for ease of use and clarity. The new requirement for occupiable roofs is addressed in 1.3.

Horizontal exits on floors provide protected areas for people to wait for fire department assisted rescue if they need it.

With the addition of 1.3, people on the occupied roofs would be protected from smoke and fumes by being open to the air. If the people enter directly into enclosed exit stairways, they are protected to the level of exit discharge. These are sprinklered buildings, so no interior areas of refuge are required. The horizontal exits below allow for slower evacuation time, so the fire department can have additional time to assist anyone on the roof. Section 1006.3 considers occupiable roofs as a story for means of egress, so there will always be at least two ways off.

The Egress committee (E31-21) raised some concerns last cycle which this proposal addresses . The concern as to the location of the horizontal exit on the level below the occupied roof is immaterial because the occupants will already be within a protected exit enclosure. Following, there is not a concern of an occupant traveling down to the fire side of a horizontal exit on the floor below with the use of an exit access stairway or ramp.



This proposal is submitted by the ICC Building Code Action Committee (BCAC).

BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 the BCAC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the BCAC website at BCAC webpage.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Occupiable roofs were added to Section 1009.2 by E30-18. This clarifies an option for accessible means of egress for building with occupiable roofs.

E41-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: This clarification is needed to address occupied roofs. However, the exception does not address what happens in

the basement levels - either address these or limit the exception to above grade. (Vote: 14-0)

E41-24

Individual Consideration Agenda

Comment 1:

IBC: 1009.2.1; IFC: [BE] 1009.2.1

Proponents: Jeff Grove, Chair, Building Code Action Committee (BCAC) (bcac@iccsafe.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

1009.2.1 Elevators required. In *buildings* where a required *accessible* floor is four or more *stories* above or below a *level of exit discharge* or where an accessible *occupiable roof* is above a *story* that is three or more *stories* above the *level of exit discharge* , not less than one required *accessible means of egress* shall include an elevator complying with Section 1009.4. **Exceptions:**

1. The elevator shall not be required as part of the *accessible means of egress* where the building complies with all of the following:
   1.1. The building is equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.
   1.2. All floors above or below the level of exit discharge are provided with a horizontal exit.
   1.3. Where there is an occupiable roof, the means of egress serving the occupiable roof is provided by interior exit stairways or ramps complying with Section 1023.
2. In *buildings* equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1 or 903.3.1.2, the elevator shall not be required as part of the *accessible means of egress* on floors or *occupiable roofs* provided with a ramp conforming to the provisions of Section 1012.

2024 International Fire Code

[BE] 1009.2.1 Elevators required. In buildings where a required accessible floor is four or more stories above or below a *level of exit discharge* or where an accessible *occupiable roof* is above a story that is three or more stories above the *level of exit discharge* , not less than one required *accessible means of egress* shall include an elevator complying with Section 1009.4. **Exceptions:**

1. The elevator shall not be required as part of the *accessible means of egress* where the building complies with all of the following:
   1.1. The building is equipped throughout with an automatic sprinkler system installed in accordance with Section 903.3.1.1 or 903.3.1.2.
   1.2. All floors above or below the level of exit discharge are provided with a horizontal exit.
   1.3. Where there is an occupiable roof, the means of egress serving the occupiable roof is provided by interior exit stairways or ramps complying with Section 1023.
2. In buildings equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1 or 903.3.1.2, the elevator shall not be required as part of the *accessible means of egress* on floors or *occupiable roofs* provided with a *ramp* conforming to the provisions of Section 1012.

Reason: The revision to the proposal is to address a concern brought up during the testimony at the spring hearings. "Or below" was pointed out as a miss and has been corrected.

Please see the reason for the original proposal.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Occupiable roofs were added to Section 1009.2 by E30-18. This clarifies an option for accessible means of egress for building with occupiable roofs.

Comment (CAH2)# 220

E44-24

IBC: 1009.3; IFC: [BE] 1009.3

Proposed Change as Submitted

Proponents: Gene Boecker, CCI, self (geneb@codeconsultants.com); Matt Lescher, CCI, self (mattl@codeconsultants.com); Marsha Mazz, United Spinal Association, United Spinal Association (mmazz@accessibility-services.com)

2024 International Building Code

Revise as follows:

1009.3 Stairways. In order to be considered part of an *accessible means of egress*, a *stairway* between *stories* shall comply with ICC A117.1 and Sections 1009.3.1 through 1009.3.3. **Exception:** Stairways within dwelling units or sleeping units, other than Accessible dwelling or sleeping unit, shall not be required to comply with ICC A117.1.

2024 International Fire Code

Revise as follows:

[BE] 1009.3 Stairways. In order to be considered part of an *accessible means of egress*, a *stairway* between *stories* shall comply with ICC A117.1 and Sections 1009.3.1 through 1009.3.3. **Exception:** Stairways within dwelling units or sleeping units, other than Accessible dwelling or sleeping unit, shall not be required to comply with ICC A117.1.

Reason: While many of the accessibility related provisions of the A117.1 and ADA Standards have been mainstreamed into the IBC, some have not. The IBC includes provisions for stairs assuming the broad population as a whole. The A117.1 looks at these elements for their unique qualities as they relate to people with limited mobility and limited vision capabilities. The A117.1 standards are based on review of ergonomic data and actual fall and accident events as well as a comparison to other accessibility standards around the world. The A117.1 standard is better equipped to address the needs and concerns for people with disabilities.

As most of the requirements are the same and IBC Section 102.4 states that where conflicts exist between the code and a standard, the code shall prevail, the impact will be largely for the visual contrast at stair nosings. Visual contrast is especially important for people with limited vision and for people who are not functioning to their highest mental capability due to medication, intoxication or medical cognition.

The exception acknowledges the fact that the IBC contains a number of exceptions for stairs within dwelling units; and, that many people will not desire some of the A117.1 requirements for stairs within Type A and Type B units, as well as those not required to be Type A or Type B, since the A117.1 includes requirements for handrail extensions, and contrasting stripes. Since Type A and Type B units are adaptable, it seems reasonable that these elements could be added at a time when the occupant requires such features.

When evaluating the differences between the IBC requirements for stairways and the A117.1 requirements, the following table identifies the similarities and differences. Below each item is a notation about which is more restrictive or contains more criteria for compliance.

AMOE Stairways.

Requirement	IBC	A117.1
Riser Height (same)	4" min – 7" max	4" min – 7" max
Tread depth (same)	11" min	11" min
Open Risers (same)	Not required where stair is part of accessible means of egress.	Not Permitted
Tread surface (same)	Max opening of ½", securely attached, with slope not steeper than 1:48.	Max opening of 1/2", firm, stable, slip resistant and slope not steeper than 1:48
Tread and Riser uniformity (IBC)	Very Specific criteria for how uniformity is measured to adjacent steps and overall	All must be "uniform"
Nosing profile (A117.1)	9/16" max radius, underside at 30 degrees (no language about beveled nosings)	½" radius, ½" bevel, underside at 30 degrees max to vertical
Nosing depth (IBC)	1-1/4" max	1-1/2" max
Landings (IBC)	Specific criteria	No criteria
Visual contrast (A117.1)	Luminescent marking for high-rise buildings.	One of the following: 1. The leading 1 to 2 inches (25 to 51 mm) of every tread and landing, measured horizontally from the leading edge of the nosing, shall consist of a solid color having visual contrast of dark-on-light or light-on-dark from the remainder of the tread. The contrasting marking shall be durable and shall extend from one side of each tread to the other side of each tread. 2. Durable distinctive warning markings required by the adopted building code or ANSI safety standard.
Handrails (A117.1)	Required on both sides with some exceptions for short stairs and inside dwelling units.	Required on both sides, except for dwelling units NOT required to be Accessible.
Wet conditions (same)	Designed not to allow water accumulation.	Designed not to allow water accumulation.
Maxi. rise between landings (IBC)	12 feet vertical	Not addressed

Requirement	IBC	A117.1
Lighting (IBC)	The means of egress illumination level shall be not less than 1 footcandle (11 lux) at the walking surface. Along exit access stairways, exit stairways and at their required landings, the illumination level shall not be less than 10 footcandles (108 lux) at the walking surface when the stairway is in use.	1. A 1-foot-candle (10.8 lux) minimum illumination at times other than conditions of stair use 2. A 10-foot-candle (108 lux) minimum illumination during conditions of stair use 3. The transition from 1 foot candle (10.8 lux) to 10 foot candle (108 lux) under conditions of stair use shall be permitted to be achieved by automatic, motion sensor-type lighting switches provided the switch controllers comply with all of the following: 3.1 The switch controllers are equipped for fail-safe operation and evaluated for this purpose 3.2 The motion sensor is activated by occupant movement on the stair or stair landings 3.3 The illumination timers are set for a minimum 15-minute duration.
Signage within Stair enclosure (A117.1)	"1023.11 Tactile floor-level signs. Where floor level signs are provided in interior exit stairways and ramps, a floor-level sign identifying the floor level in visual characters, raised characters and braille complying with ICC A117.1 shall be located at each floor-level landing adjacent to the door leading from the interior exit stairway and ramp into the corridor."	"Stair level identification signs in raised characters and braille complying with [A117.1] Sections 703.3 and 703.4 shall be located at each floor level landing in all enclosed stairways adjacent to the door leading from the stairwell into the corridor to identify the floor level. The exit door discharging to the outside or to the level of exit discharge shall have a sign with raised characters and braille stating "EXIT.""
Signage at exits (IBC – includes horizontal exits)	"Where exit signs are provided at an area of refuge with direct access to a stairway, an exterior area for assisted rescue, an exit stairway or ramp, an exit passageway, a horizontal exit and	"A sign stating EXIT in raised characters and Braille and complying with [A117.1] Sections 703.3 and 703.4 shall be provided adjacent to each door to an area of refuge

Requirement	IBC	A117.1
	the exit discharge, a sign stating "EXIT" in visual characters, raised characters and braille and complying with ICC A117.1 shall be provided."	providing direct access to a stairway, an exterior area for assisted rescue, an exit stairway, an exit ramp, an exit passageway and the exit discharge."

Bibliography: IBC - 2024

ICC A117.1 - 2017, Supplement

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

The additional material cost to adding a stripe to the tread can be as little as $0.02 is it involves paint or $0.70 per tread for adhesive-type anti-slip tape applications. For a 4 story building with two exit stairways, the anti-slip application would increase the material cost by less than $100 for the entire project.

Estimated Immediate Cost Impact Justification (methodology and variables):

The cost would be minimal. Most of the differences are in the details which would not affect cost. The only item which would be a cost

increase is the visual contrast marking. In many facilities, this is already installed for general safety reasons and is therefore no cost at all.

Estimated Life Cycle Cost Impact:

Depending on the material used the life cycle costs could be $0 or an estimated $100 every 6-10 years.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

Variables include the type of materials originally used for contrast and the types of materials used for maintaining the contrasting stripes as well as teh frequency of maintenance - also dependent on the materials selected.

E44-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: Contrast on stairways should be addressed directly in the code. A reference to ICC A117.1 for this would cause confusion. (Vote: 14-0)

E44-24

Individual Consideration Agenda

Comment 1:

IBC: 1009.3, 1009.3.3 (New); IFC: [BE] 1009.3, [BE] 1009.3.3 (New)

Proponents: David Cooper, Stair Manufacturing and Design Consultants, Stairbuilders and Manufacturers Association, SMA (coderep@stairways.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

1009.3 Stairways. In order to be considered part of an *accessible means of egress*, a *stairway* between *stories* shall comply with ~~ICC A117.1 and~~ Sections 1009.3.1 through 1009.3.~~3~~4. **~~Exception:~~** ~~Stairways within dwelling units or sleeping units, other than Accessible dwelling or sleeping unit, shall not be required to comply with ICC A117.1.~~

Add new text as follows:

1009.3.3 Visual contrast markings. Visual contrast markings shall comply with either 1 or 2:

1. The leading 1 to 2 inches (25 to 51 mm) of every tread and landing, measured horizontally from the leading edge of the nosing, shall consist of a solid color having visual contrast of dark-on-light or light-on-dark from the remainder of the tread. The contrasting marking shall be durable and shall extend from one side of each tread to the other side of each tread.
2. Required distinctive warning and photoluminescent markings.

[BE] 1009.3 Stairways. In order to be considered part of an *accessible means of egress*, a *stairway* between *stories* shall comply with ~~ICC A117.1 and~~ Sections 1009.3.1 through 1009.3.~~3~~4. **~~Exception:~~** ~~Stairways within dwelling units or sleeping units, other than Accessible dwelling or sleeping unit, shall not be required to comply with ICC A117.1.~~

Add new text as follows:

[BE] 1009.3.3 Visual contrast markings. Visual contrast markings shall comply with either 1 or 2:

1. The leading 1 to 2 inches (25 to 51 mm) of every tread and landing, measured horizontally from the leading edge of the nosing, shall consist of a solid color having visual contrast of dark-on-light or light-on-dark from the remainder of the tread. The contrasting marking shall be durable and shall extend from one side of each tread to the other side of each tread.
2. Required distinctive warning and photoluminescent markings.

Reason: The stated reason of the original proposal was to add the visual contrast requirements for stairs from the A117.1 standard to the IBC. The simple reference to the A117.1 standard invoked conflicting requirements within chapter 10 Means of Egress as well as chapter 11 of the IBC where accessibility is scoped. The referenced standard has been delteted.

This comment simply incorporates the language of the current A117.1 standard regarding contrast markings at stairs.

This comment is one of several dealing with the need for contrast markings on stairways and resolves the intent of the original proposal as the committee suggested without unnecessary or controversial reference to the A117.1 standard.

Cost Impact: Increase

Estimated Immediate Cost Impact:

Labor and materials to apply the contrast strip will vary greatly depending on the durability desired any where from $10 to $100 + per stripe. The less expensive options of paint or tape will wear and need to be maintained on not less than an annual basis for all but the lesser used stairways.

Estimated Immediate Cost Impact Justification (methodology and variables):

Less durable must be maintained or replaced annually- Paint or tape $1 - $5 material, Labor $5 - $10 per stripe

Most durable typically permanent - Mechanically fastened or inlaid stripe $20 -$30+, Labor $25 - $75 per stripe

Estimated Life Cycle Cost Impact:

Stairs are typically rarely replaced in a building. The life cycle of a stair is that of the building where it is located.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

Less Durable - $10 x 16 stripes per stair x 50 years = $8000 per stair/50year (inflation not factored)

More to Most Durable - $100 x 16 stripes per stair = $1600 per stair one time expense

Comment (CAH2)# 57

Comment 2:

IBC: 1009.3, 1009.3.3 (New); IFC: [BE] 1009.3, [BE] 1009.3.3 (New)

Proponents: Ashley Goodin, Technical Services, Stairbuilders and Manufacturers Association (ashley.goodin@stairways.org); David Cooper, Stair Manufacturing and Design Consultants, Stairbuilders and Manufacturers Association, SMA (coderep@stairways.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

1009.3 Stairways. In order to be considered part of an *accessible means of egress*, a *stairway* between *stories* shall comply with ~~ICC A117.1 and~~ Sections 1009.3.1 through 1009.3.~~3~~4. ~~**Exception:** Stairways within dwelling units or sleeping units, other than Accessible dwelling or sleeping unit, shall not be required to comply with ICC A117.1.~~

Add new text as follows:

1009.3.3 Contrast marking stripe. A contrast marking stripe shall be provided on each tread and landing *nosing* such that the location of each tread is readily apparent when viewed in descent. Such stripe shall be not less than 1 inch (25 mm) and not more than 2 inches (51 mm) wide. **Exception:** The contrasting marking stripe is permitted to be omitted where tread surfaces are such that the location of each tread is readily apparent when viewed in descent.

2024 International Fire Code

[BE] 1009.3 Stairways. In order to be considered part of an *accessible means of egress*, a *stairway* between *stories* shall comply with ~~ICC A117.1 and~~ Sections 1009.3.1 through 1009.3.~~3~~4. ~~**Exception:** Stairways within dwelling units or sleeping units, other than Accessible dwelling or sleeping unit, shall not be required to comply with ICC A117.1.~~

Add new text as follows:

[BE] 1009.3.3 Contrast marking stripe. A contrast marking stripe shall be provided on each tread and landing *nosing* such that the location of each tread is readily apparent when viewed in descent. Such stripe shall be not less than 1 inch (25 mm) and not more than 2 inches (51 mm) wide. **Exception:** The contrasting marking stripe is permitted to be omitted where tread surfaces are such that the location of each tread is readily apparent when viewed in descent.

Reason: The stated reason of the original proposal was to add the visual contrast requirements for stairs from the A117.1 standard to the IBC. The simple reference to the A117.1 standard invoked conflicting requirements within chapter 10 Means of Egress as well as chapter 11 of the IBC where accessibility is scoped.

This comment is one of several dealing with the need for contrast markings on stairways and resolves the intent of the original proposal as the committee suggested without unnecessary or controversial reference to the A117.1 standard by simply incorporating existing text from Section 1030 Assembly as shown below.

> **1030.14.2.3 Tread contrasting marking stripe.** A contrasting marking stripe shall be provided on each tread at the *nosing* or leading edge such that the location of each tread is readily apparent when viewed in descent. Such stripe shall be not less than 1 inch (25 mm) and not more than 2 inches (51 mm) wide.
>
> **Exception:**The contrasting marking stripe is permitted to be omitted where tread surfaces are such that the location of each tread is readily apparent when viewed in descent.

The text was modified slightly in this comment to include the marking of landing nosings as well as tread nosings. Approval of this change would incorporate a requirement that has proven to be consistently enforceable in similar application.

Cost Impact: Increase

Estimated Immediate Cost Impact:

Labor and materials to apply the contrast strip will vary greatly depending on the durability desired any where from $10 to $100 + per stripe. The less expensive options of paint or tape will wear and need to be maintained on not less than an annual basis for all but the lesser used stairways.

Estimated Immediate Cost Impact Justification (methodology and variables):

Less durable must be maintained or replaced annually- Paint or tape $1 - $5 material, Labor $5 - $10 per stripe
Most durable typically permanent - Mechanically fastened or inlaid stripe $20 -$30+, Labor $25 - $75 per stripe

Estimated Life Cycle Cost Impact:

Stairs are typically rarely replaced in a building. The life cycle of a stair is that of the building where it is located.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

Less Durable - $10 x 16 stripes per stair x 50 years = $8000 per stair/50year (inflation not factored)
More to Most Durable - $100 x 16 stripes per stair = $1600 per stair one time expense

Comment (CAH2)# 59

Comment 3:

IBC: 1009.3, 1009.3.3 (New); IFC: [BE] 1009.3, [BE] 1009.3.3 (New)

Proponents: David Cooper, Stair Manufacturing and Design Consultants, Stairbuilders and Manufacturers Association, SMA (coderep@stairways.org); Paul Wishnoff, United Rockland Stairs, Self (pwishnoff@unitedrocklandstairs.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

1009.3 Stairways. In order to be considered part of an *accessible means of egress*, a *stairway* between *stories* shall comply with ~~ICC A117.1 and~~ Sections 1009.3.1 through 1009.3.~~3~~4. ~~**Exception:** Stairways within dwelling units or sleeping units, other than Accessible dwelling or sleeping unit, shall not be required to comply with ICC A117.1.~~

Add new text as follows:

1009.3.3 Visual contrast markings. Visual contrast markings shall comply with either 1 or 2:

1. The leading 1 to 2 inches (25 to 51 mm) of every tread and landing nosing shall include a solid color marking stripe having visual contrast of dark-on-light or light-on-dark from the background. The contrasting marking shall be uniform, located not more than 1/2 inch from the leading edge, and extend the full width of the stair.
2. Required distinctive warning and photoluminescent markings.

2024 International Fire Code

[BE] 1009.3 Stairways. In order to be considered part of an *accessible means of egress*, a *stairway* between *stories* shall comply with ~~ICC A117.1 and~~ Sections 1009.3.1 through 1009.3.~~3~~4. ~~**Exception:** Stairways within dwelling units or sleeping units, other than Accessible dwelling or sleeping unit, shall not be required to comply with ICC A117.1.~~

Add new text as follows:

[BE] 1009.3.3 Visual contrast markings. Visual contrast markings shall comply with either 1 or 2:

1. The leading 1 to 2 inches (25 to 51 mm) of every tread and landing nosing shall include a solid color marking stripe having visual contrast of dark-on-light or light-on-dark from the background. The contrasting marking shall be uniform, located not more than 1/2 inch from the leading edge, and extend the full width of the stair.
2. Required distinctive warning and photoluminescent markings.

Reason: The stated reason of the original proposal was to add the visual contrast requirements for stairs from the A117.1 standard to the IBC. The simple reference to the A117.1 standard invoked conflicting requirements within chapter 10 Means of Egress as well as chapter 11 of the IBC where accessibility is scoped. The referenced standard has been delteted.

This comment is a composite of current A117.1, E73, and New version of the A117.1 as currently being developed without a contrast formula.

This comment is one of several dealing with the need for contrast markings on stairways and resolves the intent of the original proposal as the committee suggested without unnecessary or controversial reference to the A117.1 standard.

Cost Impact: Increase

Estimated Immediate Cost Impact:

Labor and materials to apply the contrast strip will vary greatly depending on the durability desired any where from $10 to $100 + per stripe. The less expensive options of paint or tape will wear and need to be maintained on not less than an annual basis for all but the lesser used stairways.

Estimated Immediate Cost Impact Justification (methodology and variables):

Less durable must be maintained or replaced annually- Paint or tape $1 - $5 material, Labor $5 - $10 per stripe
Most durable typically permanent - Mechanically fastened or inlaid stripe $20 -$30+, Labor $25 - $75 per stripe

Estimated Life Cycle Cost Impact:

Stairs are typically rarely replaced in a building. The life cycle of a stair is that of the building where it is located.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

Proposed Change as Submitted

Proponents: David Cooper, Stair Manufacturing and Design Consultants, Stairbuilders and Manufacturers Association, SMA (coderep@stairways.org)

2024 International Building Code

Add new definition as follows:

LANDING. The portion of a walking surface required for direct access to or from an adjacent, door, stair, flight of stairs, ramp run, or elevator.

Revise as follows:

1010.1.4 Floor elevation. There shall be a ~~floor or~~ landing on each side of a door. Such ~~floor or~~ landing shall be at the same elevation on each side of the door. Landings shall be level except for exterior landings, which are permitted to have a slope not to exceed 0.25 unit vertical in 12 units horizontal (2-percent slope). **Exceptions:**

1. At doors serving individual *dwelling units* or *sleeping units* in Groups R-2 and R-3, a door is permitted to open at the top step of an interior *flight* of stairs, provided that the door does not swing over the top step.
2. At exterior doors serving Groups F, H, R-2 and S and where such doors are not part of an *accessible route*, the landing at an exterior door shall not be more than 7 inches (178 mm) below the landing on the egress side of the door, provided that the door, other than an exterior storm or screen door, does not swing over the landing.
3. At exterior doors serving Group U and individual *dwelling units* and *sleeping units* in Groups R-2 and R-3, and where such units are not required to be *Accessible units*, *Type A units* or *Type B units*, the landing at an exterior doorway shall be not more than $7\,^3/_4$ inches (197 mm) below the landing on the egress side of the door. Such doors, including storm or screen doors, shall be permitted to swing over either landing.
4. Variations in elevation due to differences in finish materials, but not more than $^1/_2$ inch (12.7 mm).
5. Exterior decks, patios or balconies that are part of Type B *dwelling units* or *sleeping units*, that have impervious surfaces and that are not more than 4 inches (102 mm) below the finished floor level of the adjacent interior space of the *dwelling unit* or *sleeping unit*.
6. Doors serving equipment spaces not required to be *accessible* in accordance with Section 1103.2.9 and serving an *occupant load* of five or less shall be permitted to have a landing on one side to be not more than 7 inches (178 mm) above or below the landing on the egress side of the door.

1010.1.6 Thresholds. Thresholds at doorways shall not exceed $^3/_4$ inch (19.1 mm) in height above the ~~finished floor or~~ landing for sliding doors serving *dwelling units* or $^1/_2$ inch (12.7 mm) above the ~~finished floor or~~ landing for other doors. Raised thresholds and ~~floor level~~ changes of level greater than $^1/_4$ inch (6.4 mm) at doorways shall be beveled with a slope not greater than one unit vertical in two units horizontal (50-percent slope). **Exceptions:**

1. In occupancy Group R-2 or R-3, threshold heights for sliding and side-hinged exterior doors shall be permitted to be up to $7^{3}/_{4}$ inches (197 mm) in height if all of the following apply:

   1.1. The door is not part of the required *means of egress*.

   1.2. The door is not part of an *accessible route* as required by Chapter 11.

   1.3. The door is not part of an *Accessible unit*, *Type A unit* or *Type B unit*.

2. In *Type B units*, where Exception 5 to Section 1010.1.4 permits a 4-inch (102 mm) elevation change at the door, the threshold height on the exterior side of the door shall not exceed $4^{3}/_{4}$ inches (120 mm) in height above the exterior deck, patio or balcony for sliding doors or $4^{1}/_{2}$ inches (114 mm) above the exterior deck, patio or balcony for other doors.

1011.5.5.2 Nosing projection uniformity. Nosing projections shall be of uniform size, including the projection~~s~~ of the *nosing~~s~~* of the ~~floor or~~ landing at the top of a *flight*.

1011.6 Stairway landings. There shall be a ~~floor or~~ landing at the top and bottom of each *stairway*. The width of landings, measured perpendicularly to the direction of travel, shall be not less than the width of *stairways* served. Every landing shall have a minimum depth, measured parallel to the direction of travel, equal to the width of the *stairway* or 48 inches (1219 mm), whichever is less. Doors opening onto a landing shall not reduce the landing to less than one-half the required width. When fully open, the door shall not project more than 7 inches (178 mm) into the required width of a landing. Where *wheelchair spaces* are required on the *stairway* landing in accordance with Section 1009.6.3, the *wheelchair space* shall not be located in the required width of the landing and doors shall not swing over the *wheelchair spaces*. **Exceptions:**

1. Where *stairways* connect stepped *aisles* to cross *aisles* or concourses, *stairway* landings are not required at the transition between *stairways* and stepped *aisles* constructed in accordance with Section 1030.
2. Where curved *stairways* of constant radius have intermediate landings, the landing depth shall be measured horizontally between the intersection of the walkline of the lower *flight* at the landing *nosing* and the intersection of the walkline of the upper *flight* at the *nosing* of the lowest tread of the upper *flight*.
3. Where a landing turns 90 degrees (1.57 rad) or more, the minimum landing depth in accordance with this section shall not be required where the landing provided is not less than that described by an arc with a radius equal to the width of the *flight* served.

1011.8 Vertical rise. A *flight* of *stairs* shall not have a vertical rise greater than 12 feet (3658 mm) between ~~floor levels or~~ landings.

Exception: *Spiral stairways* used as a *means of egress* from *technical production areas*.

1011.14 Alternating tread devices. *Alternating tread devices* are limited to an element of a *means of egress* in *buildings* of Groups F, H and S from a *mezzanine* not more than 250 square feet (23 m^2) in area and that serves not more than five occupants; in *buildings* of Group I-3 from a guard tower, observation station or control room not more than 250 square feet (23 m^2) in area and for access to unoccupiable roofs. *Alternating tread devices* used as a *means of egress* shall not have a rise greater than 20 feet (6096 mm) between ~~floor levels or~~ landings.

1027.3 Open side. *Exterior exit stairways* and *ramps* serving as an element of a required *means of egress* shall be open on not less than one side, except for required structural columns, beams, *handrails* and *guards*. An open side shall have not less than 35 square feet (3.3 m^2) of aggregate open area adjacent to ~~each floor level and~~ the level of each ~~intermediate~~ landing. The required open area shall be located not less than 42 inches (1067 mm) above the adjacent floor or landing level.

2024 International Fire Code

Add new definition as follows:

LANDING. The portion of a walking surface required for direct access to or from an adjacent, door, stair, flight of stairs, ramp run, or elevator.

Revise as follows:

[BE] 1010.1.4 Floor elevation. There shall be a ~~floor or~~ landing on each side of a door. Such ~~floor or~~ landing shall be at the same elevation on each side of the door. Landings shall be level except for exterior landings, which are permitted to have a slope not to exceed 0.25 unit vertical in 12 units horizontal (2-percent slope). **Exceptions:**

1. At doors serving individual *dwelling units* or *sleeping units* in Groups R-2 and R-3, a door is permitted to open at the top step of an interior *flight* of stairs, provided that the door does not swing over the top step.
2. At exterior doors serving Groups F, H, R-2 and S and where such doors are not part of an *accessible route*, the landing at an exterior door shall be not more than 7 inches (178 mm) below the landing on the egress side of the door, provided that the door, other than an exterior storm or screen door, does not swing over the landing.
3. At exterior doors serving Group U and individual *dwelling units* and *sleeping units* in Groups R-2 and R-3, and where such units are not required to be Accessible units, Type A units or Type B units, the landing at an exterior doorway shall be not more than $7\frac{3}{4}$ inches (197 mm) below the landing on the egress side of the door. Such doors, including storm or screen doors, shall be permitted to swing over either landing.
4. Variations in elevation due to differences in finish materials, but not more than $\frac{1}{2}$ inch (12.7 mm).
5. Exterior decks, patios or balconies that are part of Type B *dwelling units* or *sleeping units*, that have impervious surfaces and that are not more than 4 inches (102 mm) below the finished floor level of the adjacent interior space of the *dwelling unit* or *sleeping unit*.
6. Doors serving equipment spaces not required to be accessible in accordance with Section 1103.2.9 of the International Building Code and serving an *occupant load* of five or less shall be permitted to have a landing on one side to be not more than 7 inches (178 mm) above or below the landing on the egress side of the door.

[BE] 1010.1.6 Thresholds. Thresholds at doorways shall not exceed $\frac{3}{4}$ inch (19.1 mm) in height above the ~~finished floor or~~ landing for sliding doors serving *dwelling units* or $\frac{1}{2}$ inch (12.7 mm) above the ~~finished floor or~~ landing for other doors. Raised thresholds and ~~floor level~~ changes <u>of level</u> greater than $\frac{1}{4}$ inch (6.4 mm) at doorways shall be beveled with a slope not greater than 1 unit vertical in 2 units horizontal (50-percent slope). **Exceptions:**

1. In occupancy Group R-2 or R-3, threshold heights for sliding and side-hinged exterior doors shall be permitted to be up to $7\frac{3}{4}$ inches (197 mm) in height if all of the following apply:
   1.1. The door is not part of the required *means of egress*.
   1.2. The door is not part of an *accessible route* as required by Chapter 11 of the International Building Code.
   1.3. The door is not part of an accessible unit, Type A unit or Type B unit.
2. In Type B units, where Exception 5 to Section 1010.1.4 permits a 4-inch (102 mm) elevation change at the door, the threshold height on the exterior side of the door shall not exceed $4\frac{3}{4}$ inches (120 mm) in height above the exterior deck, patio or balcony for sliding doors or $4\frac{1}{2}$ inches (114 mm) above the exterior deck, patio or balcony for other doors.

[BE] 1011.5.5.2 Nosing projection uniformity. Nosing projections shall be of uniform size, including the projections of the *nosings* of the ~~floor or~~ landing at the top of a *flight*.

[BE] 1011.6 Stairway landings. There shall be a ~~floor or~~ landing at the top and bottom of each *stairway*. The width of landings, measured perpendicularly to the direction of travel, shall be not less than the width of *stairways* served. Every landing shall have a minimum depth, measured parallel to the direction of travel, equal to the width of the *stairway* or 48 inches (1219 mm), whichever is less. Doors opening onto a landing shall not reduce the landing to less than one-half the required width. When fully open, the door shall not project more than 7 inches (178 mm) into the required width of a landing. Where wheelchair spaces are required on the stairway landing in accordance with Section 1009.6.3, the wheelchair space shall not be located in the required width of the landing and doors shall not swing over the wheelchair spaces. **Exceptions:**

1. Where *stairways* connect stepped *aisles* to cross *aisles* or concourses, *stairway* landings are not required at the transition between *stairways* and stepped *aisles* constructed in accordance with Section 1030.

2. Where curved *stairways* of constant radius have intermediate landings, the landing depth shall be measured horizontally between the intersection of the walkline of the lower *flight* at the landing *nosing*and the intersection of the walkline of the upper *flight* at the *nosing*of the lowest tread of the upper *flight*.
3. Where a landing turns 90 degrees (1.57 rad) or more, the minimum landing depth in accordance with this section shall not be required where the landing provided is not less than that described by an arc with a radius equal to the width of the *flight* served.

[BE] 1011.8 Vertical rise. A *flight* of *stairs* shall not have a vertical rise greater than 12 feet (3658 mm) between ~~floor levels or~~ landings.

Exception: *Spiral stairways* used as a *means of egress* from technical production areas.

[BE] 1011.14 Alternating tread devices. *Alternating tread devices* are limited to an element of a *means of egress* in buildings of Groups F, H and S from a *mezzanine* not more than 250 square feet (23 m^2) in area and that serves not more than five occupants; in buildings of Group I-3 from a guard tower, observation station or control room not more than 250 square feet (23 m^2) in area and for access to unoccupiable roofs. *Alternating tread devices* used as a *means of egress* shall not have a rise greater than 20 feet (6096 mm) between ~~floor levels or~~ landings.

[BE] 1027.3 Open side. *Exterior exit stairways* and *ramps* serving as an element of a required *means of egress* shall be open on not less than one side, except for required structural columns, beams, *handrails* and guards. An open side shall have not less than 35 square feet (3.3 m^2) of aggregate open area adjacent to ~~each floor level and~~ the level of each ~~intermediate~~ landing. The required open area shall be located not less than 42 inches (1067 mm) above the adjacent floor or landing level.

Reason: What is the difference between a landing and a floor? There is clearly a difference that is not understood. An entire floor is not a landing, but the code uses the term “floor-or-landing” as if they are the same. In other instances, such as in **1027.3 Open side**, the two terms used confusingly allow the required open side to be located anywhere on the floor level as opposed to at the landing, as if they might be considered to be uniquely different locations. The confused use of the terms interchangeably is due to the lack of a definition for either floor or landing.

Is it a "landing", a "floor", or is it a "floor-or-landing"?

A landing is but a portion of a floor. The attribute of size is not addressed in dictionaries and this alone is justification for a unique definition in the code. A landing may not be a floor at all if it is not at a floor level but only located between flights or at a mezzanine. If it is a landing, the current code does not require it between flights. Landings are only required at the top and bottom of stairways. But that is an issue we will discuss in a separate code change related to the definition of stairway.

If it is a deck or patio connected to the structure, is it a floor or landing? Clearly only enough area is needed to safely access or depart from the door or flight of stairs. The code, however, provides an option for a floor of indefinite size though only a landing is needed. An entire floor is not necessary to enter or exit a stairway. If a floor is provided instead of a landing, is it limited to the size of a landing or what portion of the floor is the landing? This same circular rhetoric could be applied to landings at elevators as well.

How big is a floor or should I ask is there a need to describe the limits of a floor's size? If you could define "floor", it would likely not be in terms of its size? A landing is much different. The code specifies landing sizes throughout the code, albeit, sometimes indirectly as related to egress capacity. This alone makes a landing uniquely different from a floor.

The limit of a landing’s size is what defines where the stairway ends and where a floor begins. This is important because the width, depth, and headroom of landings are uniquely regulated within **1011 Stairways**. The suggested definition clearly identifies the unique quality of landing size as *"The portion of a walking surface required..."* and quantifies the landing as the amount of space needed to perform the functions of a landing, e.g., change in direction, change in stride, rest, or simply provide the area required to enter or exit a doorway, stair, ramp or elevator.

In addition to the definition, we have included comprehensive changes to all the requirements with instances of confusing reference to the terms floor or landing based upon a search of the IBC. Each has been corrected by deleting floor where "floor or landing" has been used and any related contextual changes necessary. Each of these necessary changes to the code are very clear examples of how the suggested definition for landing can simplify code language and provide for consistent interpretation.

In an effort to correlate with the A117.1 standard the proposed definition has been submitted and approved in the proceedings of the

A117.1 committee for inclusion in the final ballot of the ICC A117.1 Standard expected in 2024. The text is the same except that "door" is deleted as landings at doors are not mentioned in A117.1.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is a new definition and editorial changed needed to correlate with other ICC defined terminology. The changes have no material affect upon the cost of construction.

E48-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The proposal was disapproved. This is not an issue - changing this will cause confusion. Removing "floor" would add confusion for threshold measurements in Section 1010.1.6. Landings are part of a floor, so they can be the same location. There are not boundary explanation on where a landing ends and a floor would start. (Vote: 13-1)

E48-24

Individual Consideration Agenda

Comment 1:

IBC: SECTION 202, 1010.1.4, 1010.1.6, 1011.5.5.2, 1011.6, 1011.8, 1011.14, 1027.3; IFC: SECTION 202, [BE] 1010.1.4, [BE] 1010.1.6, [BE] 1011.5.5.2, [BE] 1011.6, [BE] 1011.8, [BE] 1011.14, [BE] 1027.3

Proponents: David Cooper, Stair Manufacturing and Design Consultants, Stairbuilders and Manufacturers Association, SMA (coderep@stairways.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

LANDING. The portion of a walking surface required for direct access to or from an adjacent, door, stair, flight of stairs, ramp run, or elevator.

1010.1.4 Floor elevation. There shall be a floor or landing on each side of a door. Such floor or landing shall be at the same elevation on each side of the door. Landings shall be level except for exterior landings, which are permitted to have a slope not to exceed 0.25 unit vertical in 12 units horizontal (2-percent slope). **Exceptions:**

1. At doors serving individual *dwelling units* or *sleeping units* in Groups R-2 and R-3, a door is permitted to open at the top step of an interior *flight* of stairs, provided that the door does not swing over the top step.
2. At exterior doors serving Groups F, H, R-2 and S and where such doors are not part of an *accessible route*, the landing at an exterior door shall not be more than 7 inches (178 mm) below the landing on the egress side of the door, provided that the door, other than an exterior storm or screen door, does not swing over the landing.

3. At exterior doors serving Group U and individual *dwelling units* and *sleeping units* in Groups R-2 and R-3, and where such units are not required to be *Accessible units*, *Type A units* or *Type B units*, the landing at an exterior doorway shall be not more than $7^3/_4$ inches (197 mm) below the landing on the egress side of the door. Such doors, including storm or screen doors, shall be permitted to swing over either landing.
4. Variations in elevation due to differences in finish materials, but not more than $^1/_2$ inch (12.7 mm).
5. Exterior decks, patios or balconies that are part of Type B *dwelling units* or *sleeping units*, that have impervious surfaces and that are not more than 4 inches (102 mm) below the finished floor level of the adjacent interior space of the *dwelling unit* or *sleeping unit*.
6. Doors serving equipment spaces not required to be *accessible* in accordance with Section 1103.2.9 and serving an *occupant load* of five or less shall be permitted to have a landing on one side to be not more than 7 inches (178 mm) above or below the landing on the egress side of the door.

1010.1.6 Thresholds. Thresholds at doorways shall not exceed $^3/_4$ inch (19.1 mm) in height above the finished floor or landing for sliding doors serving *dwelling units* or $^1/_2$ inch (12.7 mm) above the finished floor or landing for other doors. Raised thresholds and floor level changes ~~of level~~ greater than $^1/_4$ inch (6.4 mm) at doorways shall be beveled with a slope not greater than one unit vertical in two units horizontal (50-percent slope). **Exceptions:**

1. In occupancy Group R-2 or R-3, threshold heights for sliding and side-hinged exterior doors shall be permitted to be up to $7^3/_4$ inches (197 mm) in height if all of the following apply:
   1.1.The door is not part of the required *means of egress*.1.2.The door is not part of an *accessible route* as required by Chapter 11.1.3.The door is not part of an *Accessible unit*, *Type A unit* or *Type B unit*.
2. In *Type B units*, where Exception 5 to Section 1010.1.4 permits a 4-inch (102 mm) elevation change at the door, the threshold height on the exterior side of the door shall not exceed $4^3/_4$ inches (120 mm) in height above the exterior deck, patio or balcony for sliding doors or $4^1/_2$ inches (114 mm) above the exterior deck, patio or balcony for other doors.

1011.5.5.2 Nosing projection uniformity. Nosing projections shall be of uniform size, including the projection of the *nosing* of the landing at the top of a *flight*.

1011.6 Stairway landings. There shall be a landing at the top and bottom of each ~~*stairway*~~ *flight* of stairs. The width of landings, measured perpendicularly to the direction of travel, shall be not less than the width of *stairways* served. Every landing shall have a minimum depth, measured parallel to the direction of travel, equal to the width of the *stairway* or 48 inches (1219 mm), whichever is less. Doors opening onto a landing shall not reduce the landing to less than one-half the required width. When fully open, the door shall not project more than 7 inches (178 mm) into the required width of a landing. Where *wheelchair spaces* are required on the *stairway* landing in accordance with Section 1009.6.3, the *wheelchair space* shall not be located in the required width of the landing and doors shall not swing over the *wheelchair spaces*. **Exceptions:**

1. Where *stairways* connect stepped *aisles* to cross *aisles* or concourses, *stairway* landings are not required at the transition between *stairways* and stepped *aisles* constructed in accordance with Section 1030.
2. Where curved *stairways* of constant radius have intermediate landings, the landing depth shall be measured horizontally between the intersection of the walkline of the lower *flight* at the landing *nosing* and the intersection of the walkline of the upper *flight* at the *nosing* of the lowest tread of the upper *flight*.
3. Where a landing turns 90 degrees (1.57 rad) or more, the minimum landing depth in accordance with this section shall not be required where the landing provided is not less than that described by an arc with a radius equal to the width of the *flight* served.

1011.8 Vertical rise. A *flight* of *stairs* shall not have a vertical rise greater than 12 feet (3658 mm) between landings.

Exception: *Spiral stairways* used as a *means of egress* from *technical production areas*.

1011.14 Alternating tread devices. *Alternating tread devices* are limited to an element of a *means of egress* in *buildings* of Groups F, H and S from a *mezzanine* not more than 250 square feet (23 m^2) in area and that serves not more than five occupants; in *buildings* of

Group I-3 from a guard tower, observation station or control room not more than 250 square feet (23 m^2) in area and for access to unoccupiable roofs. *Alternating tread devices* used as a *means of egress* shall not have a rise greater than 20 feet (6096 mm) between landings.

1027.3 Open side. *Exterior exit stairways* and *ramps* serving as an element of a required *means of egress* shall be open on not less than one side, except for required structural columns, beams, *handrails* and *guards*. An open side shall have not less than 35 square feet (3.3 m^2) of aggregate open area adjacent to each floor level and the level of each intermediate landing. The required open area shall be located not less than 42 inches (1067 mm) above the adjacent floor or landing level.

2024 International Fire Code

LANDING. The portion of a walking surface required for direct access to or from an adjacent, door, stair, flight of stairs, ramp run, or elevator.

[BE] 1010.1.4 Floor elevation. There shall be a floor or landing on each side of a door. Such floor or landing shall be at the same elevation on each side of the door. Landings shall be level except for exterior landings, which are permitted to have a slope not to exceed 0.25 unit vertical in 12 units horizontal (2-percent slope). **Exceptions:**

1. At doors serving individual *dwelling units* or *sleeping units* in Groups R-2 and R-3, a door is permitted to open at the top step of an interior *flight* of stairs, provided that the door does not swing over the top step.
2. At exterior doors serving Groups F, H, R-2 and S and where such doors are not part of an *accessible route*, the landing at an exterior door shall be not more than 7 inches (178 mm) below the landing on the egress side of the door, provided that the door, other than an exterior storm or screen door, does not swing over the landing.
3. At exterior doors serving Group U and individual *dwelling units* and *sleeping units* in Groups R-2 and R-3, and where such units are not required to be Accessible units, Type A units or Type B units, the landing at an exterior doorway shall be not more than $7\,^3/_4$ inches (197 mm) below the landing on the egress side of the door. Such doors, including storm or screen doors, shall be permitted to swing over either landing.
4. Variations in elevation due to differences in finish materials, but not more than $^1/_2$ inch (12.7 mm).
5. Exterior decks, patios or balconies that are part of Type B *dwelling units* or *sleeping units*, that have impervious surfaces and that are not more than 4 inches (102 mm) below the finished floor level of the adjacent interior space of the *dwelling unit* or *sleeping unit*.
6. Doors serving equipment spaces not required to be accessible in accordance with Section 1103.2.9 of the International Building Code and serving an *occupant load* of five or less shall be permitted to have a landing on one side to be not more than 7 inches (178 mm) above or below the landing on the egress side of the door.

[BE] 1010.1.6 Thresholds. Thresholds at doorways shall not exceed $^3/_4$ inch (19.1 mm) in height above the finished floor or landing for sliding doors serving *dwelling units* or $^1/_2$ inch (12.7 mm) above the finished floor or landing for other doors. Raised thresholds and floor level changes ~~of level~~ greater than $^1/_4$ inch (6.4 mm) at doorways shall be beveled with a slope not greater than one unit vertical in two units horizontal (50-percent slope).

Exceptions:

1. In occupancy Group R-2 or R-3, threshold heights for sliding and side-hinged exterior doors shall be permitted to be up to $7\,^3/_4$ inches (197 mm) in height if all of the following apply:
   1.1. The door is not part of the required *means of egress*.
   1.2. The door is not part of an *accessible route* as required by Chapter 11 of the International Building Code.
   1.3. The door is not part of an accessible unit, Type A unit or Type B unit.

2. In Type B units, where Exception 5 to Section 1010.1.4 permits a 4-inch (102 mm) elevation change at the door, the threshold height on the exterior side of the door shall not exceed $4^{3}/_{4}$ inches (120 mm) in height above the exterior deck, patio or balcony for sliding doors or $4^{1}/_{2}$ inches (114 mm) above the exterior deck, patio or balcony for other doors.

[BE] 1011.5.5.2 Nosing projection uniformity. Nosing projections shall be of uniform size, including the projections of the *nosings* of the landing at the top of a *flight*.

[BE] 1011.6 Stairway landings. There shall be a landing at the top and bottom of each ~~*stairway*~~ *flight* of stairs. The width of landings, measured perpendicularly to the direction of travel, shall be not less than the width of *stairways* served. Every landing shall have a minimum depth, measured parallel to the direction of travel, equal to the width of the *stairway* or 48 inches (1219 mm), whichever is less. Doors opening onto a landing shall not reduce the landing to less than one-half the required width. When fully open, the door shall not project more than 7 inches (178 mm) into the required width of a landing. Where *wheelchair spaces* are required on the *stairway* landing in accordance with Section 1009.6.3, the *wheelchair space* shall not be located in the required width of the landing and doors shall not swing over the *wheelchair spaces*. **Exceptions:**

1. Where *stairways* connect stepped *aisles* to cross *aisles* or concourses, *stairway* landings are not required at the transition between *stairways* and stepped *aisles* constructed in accordance with Section 1030.
2. Where curved *stairways* of constant radius have intermediate landings, the landing depth shall be measured horizontally between the intersection of the walkline of the lower *flight* at the landing *nosing* and the intersection of the walkline of the upper *flight* at the *nosing* of the lowest tread of the upper *flight*.
3. Where a landing turns 90 degrees (1.57 rad) or more, the minimum landing depth in accordance with this section shall not be required where the landing provided is not less than that described by an arc with a radius equal to the width of the *flight* served.

[BE] 1011.8 Vertical rise. A *flight* of *stairs* shall not have a vertical rise greater than 12 feet (3658 mm) between landings.

Exception: *Spiral stairways* used as a *means of egress* from technical production areas.

[BE] 1011.14 Alternating tread devices. *Alternating tread devices* are limited to an element of a *means of egress* in buildings of Groups F, H and S from a *mezzanine* not more than 250 square feet (23 m^2) in area and that serves not more than five occupants; in buildings of Group I-3 from a guard tower, observation station or control room not more than 250 square feet (23 m^2) in area and for access to unoccupiable roofs. *Alternating tread devices* used as a *means of egress* shall not have a rise greater than 20 feet (6096 mm) between landings.

[BE] 1027.3 Open side. *Exterior exit stairways* and *ramps* serving as an element of a required *means of egress* shall be open on not less than one side, except for required structural columns, beams, *handrails* and *guards*. An open side shall have not less than 35 square feet (3.3 m^2) of aggregate open area adjacent to each floor level and the level of each intermediate landing. The required open area shall be located not less than 42 inches (1067 mm) above the adjacent floor or landing level.

Reason: Where the committee felt that the text deleted in sections 1010.4, 1010.6 and 1027.3 aided understanding this comment modifies the original proposal and returns the text maintaining these sections unchanged.

In accordance with the committees approval of E69-24 stairway has been replaced with "flight of stairs" and "floor or" remains deleted at 1011.6 Stairway landing and 1011.5.5.2 Nosing projection uniformity. In these locations a landing of specific size is required by the code. The code prescribes a specific area described by the width and depth requirements in 1011.6 that must meet other requirements such as headroom, slope, illumination. The landings and flights required from one level to another are defined as the components of a stairway with unique requirements that do not apply to floors. A floor has no limits of size nor is the slope of the walking surface regulated as is a landing. Allowing a floor to be substituted for the required landing offers a loophole to compliance, and confuses interpretation. Clearly distinguishing the landing from the remaining walking surface at a floor level will be of considerable consequence in relation to the illumination proposals approved at CAH1.

Also 1011.6 Stairway landings provides the specific requirements for the size of all stairway landings whether between flights within a stairway or at a floor level. E69-24 as approved at CAH1 is shown below:

1011.6 Stairway landings. There shall be a landing at the top and bottom of each flight of stairs. The **width of landings**, measured perpendicularly to the direction of travel of the flight served , shall be not less than the width of the flight served. Where there is a change in direction of the stairway at the landing, **the landing depth** shall be not less than the smallest width of the flights served. Where there is no change in direction of the stairway at the landing, the landing depth shall be 48 inches (1219 mm) minimum. Doors opening onto a landing shall not reduce the landing to less than one-half the required width. When fully open, the door shall not project more than 7 inches (178 mm) into the required width of a landing. Where wheelchair spaces are required on the stairway landing in accordance with Section 1009.6.3, the wheelchair space shall not be located in the required width of the landing and doors shall not swing over the wheelchair spaces. **<emphasis added>**

Clearly the problem is further exacerbated without a definition of landing as a portion of a walking surface. The landing must be understood to be a portion of the walking surface which may or may not be a floor at all as in the case of a sidewalk, driveway, etc. The definition of landing as a portion of the walking surface is essential to provide for consistent enforcement and interpretation of those requirements that are uniquely different from floors.
This comment addresses the committee's request for us to bring the definition back and retain the references to floor and finished floor where it had been deleted in sections related to doors. Please approve as modified by this comment.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is a new definition and editorial changed needed to correlate with other ICC defined terminology. The changes have no material affect upon the cost of construction.

Comment (CAH2)# 86

IBC: 1010.1.4, 1010.1.6; IFC: [BE] 1010.1.4, [BE] 1010.1.6

Proposed Change as Submitted

Proponents: Jennifer Hatfield, J. Hatfield & Associates, Fenestration & Glazing Industry Alliance (formerly AAMA) (jen@jhatfieldandassociates.com)

2024 International Building Code

Revise as follows:

1010.1.4 Floor elevation. There shall be a floor or landing on each side of a door. Such floor or landing shall be at the same elevation on each side of the door. Landings shall be level except for exterior landings, which are permitted to have a slope not to exceed 0.25 unit vertical in 12 units horizontal (2-percent slope). **Exceptions:**

1. At doors serving individual *dwelling units* or *sleeping units* in Groups R-2 and R-3, a door is permitted to open at the top step of an interior *flight* of stairs, provided that the door does not swing over the top step.
2. At exterior doors serving Groups F, H, R-2 and S and where such doors are not part of an *accessible route*, the landing at an exterior door shall not be more than 7 inches (178 mm) below the landing on the egress side of the door, provided that the door, other than an exterior storm or screen door, does not swing over the landing.
3. At exterior doors serving Group U and individual *dwelling units* and *sleeping units* in Groups R-2 and R-3, and where such units are not required to be *Accessible units*, *Type A units* or *Type B units*, the landing at an exterior doorway shall be not more than $7^3/_4$ inches (197 mm) below the landing on the egress side of the door. Such doors, including storm or screen doors, shall be permitted to swing over either landing.
4. Variations in elevation due to differences in finish materials, but not more than $^1/_2$ inch (12.7 mm).
5. Exterior decks, patios or balconies that are part of Type B dwelling units or sleeping units, that have impervious surfaces shall be permitted for the exterior surface to be ~~and that are~~ not more than 4 inches (102 mm) below the finished floor level of the adjacent interior space of the dwelling unit or *sleeping unit*. or allowed at a height necessary to comply with the water resistance requirements of Section 1709.5, whichever is greater.
6. Doors serving equipment spaces not required to be *accessible* in accordance with Section 1103.2.9 and serving an *occupant load* of five or less shall be permitted to have a landing on one side to be not more than 7 inches (178 mm) above or below the landing on the egress side of the door.

1010.1.6 Thresholds. Thresholds at doorways shall not exceed $^3/_4$ inch (19.1 mm) in height above the finished floor or landing for sliding doors serving *dwelling units* or $^1/_2$ inch (12.7 mm) above the finished floor or landing for other doors. Raised thresholds and floor level changes greater than $^1/_4$ inch (6.4 mm) at doorways shall be beveled with a slope not greater than one unit vertical in two units horizontal (50-percent slope). **Exceptions:**

1. In occupancy Group R-2 or R-3, threshold heights for sliding and side-hinged exterior doors shall be permitted to be up to $7^3/_4$ inches (197 mm) in height if all of the following apply:
   1.1. The door is not part of the required *means of egress*.
   1.2. The door is not part of an *accessible route* as required by Chapter 11.
   1.3. The door is not part of an *Accessible unit*, *Type A unit* or *Type B unit*.
2. In *Type B units*, where Exception 5 to Section 1010.1.4 permits a 4-inch (102 mm) elevation change at the door, the threshold height on the exterior side of the door shall not exceed 43/4 inches (120 mm) in height above the exterior deck, patio or balcony for sliding doors or 41/2 inches (114 mm) above the exterior deck, patio or balcony for other doors or allowed at a height necessary to comply with the water resistance requirements of Section 1709.5, whichever is greater.

2024 International Fire Code

Revise as follows:

[BE] 1010.1.4 Floor elevation. There shall be a floor or landing on each side of a door. Such floor or landing shall be at the same elevation on each side of the door. Landings shall be level except for exterior landings, which are permitted to have a slope not to exceed 0.25 unit vertical in 12 units horizontal (2-percent slope). **Exceptions:**

1. At doors serving individual *dwelling units* or *sleeping units* in Groups R-2 and R-3, a door is permitted to open at the top step of an interior *flight* of stairs, provided that the door does not swing over the top step.
2. At exterior doors serving Groups F, H, R-2 and S and where such doors are not part of an *accessible route*, the landing at an exterior door shall be not more than 7 inches (178 mm) below the landing on the egress side of the door, provided that the door, other than an exterior storm or screen door, does not swing over the landing.
3. At exterior doors serving Group U and individual *dwelling units* and *sleeping units* in Groups R-2 and R-3, and where such units are not required to be Accessible units, Type A units or Type B units, the landing at an exterior doorway shall be not more than $7^3/_4$ inches (197 mm) below the landing on the egress side of the door. Such doors, including storm or screen doors, shall be permitted to swing over either landing.
4. Variations in elevation due to differences in finish materials, but not more than $^1/_2$ inch (12.7 mm).
5. Exterior decks, patios or balconies that are part of Type B dwelling units or sleeping units, that have impervious surfaces shall be permitted for the exterior surface to be ~~and that are~~ not more than 4 inches (102 mm) below the finished floor level of the adjacent interior space of the dwelling unit or *sleeping unit*. or allowed at a height necessary to comply with the water resistance requirements of Section 1709.5 of the *International Building Code*, whichever is greater.
6. Doors serving equipment spaces not required to be accessible in accordance with Section 1103.2.9 of the International Building Code and serving an *occupant load* of five or less shall be permitted to have a landing on one side to be not more than 7 inches (178 mm) above or below the landing on the egress side of the door.

[BE] 1010.1.6 Thresholds. Thresholds at doorways shall not exceed $^3/_4$ inch (19.1 mm) in height above the finished floor or landing for sliding doors serving *dwelling units* or $^1/_2$ inch (12.7 mm) above the finished floor or landing for other doors. Raised thresholds and floor level changes greater than $^1/_4$ inch (6.4 mm) at doorways shall be beveled with a slope not greater than 1 unit vertical in 2 units horizontal (50-percent slope). **Exceptions:**

1. In occupancy Group R-2 or R-3, threshold heights for sliding and side-hinged exterior doors shall be permitted to be up to $7^3/_4$ inches (197 mm) in height if all of the following apply:
   1.1. The door is not part of the required *means of egress*.
   1.2. The door is not part of an *accessible route* as required by Chapter 11 of the International Building Code.
   1.3. The door is not part of an accessible unit, Type A unit or Type B unit.
2. In *Type B units*, where Exception 5 to Section 1010.1.4 permits a 4-inch (102 mm) elevation change at the door, the threshold height on the exterior side of the door shall not exceed 43/4 inches (120 mm) in height above the exterior deck, patio or balcony for sliding doors or 41/2 inches (114 mm) above the exterior deck, patio or balcony for other doors or allowed at a height necessary to comply with the water resistance requirements of Section 1709.5 of the *International Building Code*, whichever is greater..

Reason: This proposal is intended to provide needed clarity in Section 1010.1.4 Exception 5 and Section 1010.1.6 Exception 2 for decks on Type B units, as it is confusing as currently written. The revised language simply clarifies that a higher door threshold may be allowed as required to meet the water testing requirements found in Section 1709.5 of the IBC.

This change is similar to the clarification made in the current Florida Building Code.

Bibliography: Section 1010.1.6 of the 2023 Florida Building Code, Building, Eighth Edition

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal is a clarification of allowances required for step downs and thresholds at decks when it comes to door thresholds and water testing requirements.

E49-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: This proposal was disapproved. It is not clear on what the maximum height would be under Section 1709.5. How would this be evaluated, inspected or reviewed? This could be a conflict with ICC A117.1 and Fair Housing requirements. Hurricane and wind storm requirements are not applicable for all areas of the country like it is in Florida. (Vote: 14-0)

E49-24

Individual Consideration Agenda

Comment 1:

Proponents: Jennifer Hatfield, J. Hatfield & Associates, Fenestration & Glazing Industry Alliance (formerly AAMA) (jen@jhatfieldandassociates.com) requests As Submitted

Reason: Section 1709.5 of the IBC provides for water testing requirements, requiring the design pressure rating of exterior windows and door assemblies (including sliding glass doors) to comply with either the AAMA/WDMA/CSA 101/I.S.2/A440 (NAFS) or the ASTM E330 standard. At the same time, Sections 1010.1.4 and 1010.1.6 of both the IBC and IFC provide for a maximum 4 inch threshold at doorways. Based on both these existing code provisions, this proposal is first and foremost intended to simply better coordinate the provisions. Second, it would allow for a threshold over 4 inches only if the water testing requirements of Section 1709.5 call for it, which could possibly occur in a unique building design.

It was brought up at the Committee Action Hearings in Orlando that making this clarification could conflict with the Americans with Disability Act (ADA), Fair Housing Act (FHA) and ICC A117.1 requirements. The code provisions being coordinated address Type B dwelling units. Whereas the ADA Standard for Accessible Design addresses accessible units and applies to public accommodations. The Type B units are coordinated with the FHA Accessibility Guidelines.

The 4 inch threshold found in the IBC and IFC comes from the FHA, which did not consider the need for more than 4 inches to address water resistance. The United States Department of Housing and Urban Development (HUD) came up with the 4 inches in the late 1980s, prior to the weather changes that have occurred over the last few decades. The strength of storms and wind driven rain have not only increased but have also become an issue for states that have not previously been in the path of these types of weather systems. This is not just a concern in hurricane prone states such as Florida, as storms increasingly go farther into the northeast.

These weather changes have resulted in the need to design products for higher rain and winds than what was done decades ago, and the current provisions in the IBC provide for those water testing requirements. In most cases, the threshold would never go over 4 inches, but in rare cases where it might be necessary, it is imperative the property be properly protected from water damage. Worst case scenario would be 7 3/4 inches below the top of the threshold, as allowed for in Section R318.3.1 of the IRC. The FHA Design and Construction Requirements adopts the IBC as a safe harbor under the FHA. If this proposal were to be adopted it would allow ICC staff to further

discuss with HUD the technical justification for why, in limited applications, the allowance for greater than a 4 inch threshold may sometimes be needed to protect the owners and residents from possible water damage.

Lastly, we recognize that the ICC A117.1 addresses all four levels of accessibility, including Type B units. However, it is our understanding that anytime there is a conflict with a standard and the building code, the code requirements rule. In the rare instance where an over 4 inch threshold may be necessary, the IBC requirements would override the ICC A117.1 requirement found in section 1104.4.2. Further, this conflict could also be addressed in the A117.1, as it is currently being updated.

In summary, this proposal is intended to provide needed clarity and ensure better coordination between two existing I-code requirements. The revised language simply clarifies that if the water testing requirements of Section 1709.5 find that in some conditions the water column may go beyond the 4 inches, in that limited circumstance a higher door threshold may be allowed.

Bibliography: IBC, Section 1709.5

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Comment (CAH2)# 213

E50-24

IBC: 1010.2.1, 1010.2.4; IFC: [BE] 1010.2.1, [BE] 1010.2.4

Proposed Change as Submitted

Proponents: John Woestman, Kellen Company, Builders Hardware Manufacturers Association (BHMA) (jwoestman@kellencompany.com)

2024 International Building Code

Revise as follows:

1010.2.1 Unlatching. The unlatching of any door or leaf for egress shall require not more than one motion in a single linear or rotational direction to release all latching and all locking devices. locking devices. *Manual bolts* are not permitted. **Exceptions:**

1. Places of detention or restraint in Group I-3 occupancies.
2. Doors with *manual bolts*, *automatic flush bolts* and *constant latching bolts* as permitted by Section 1010.2.4, Item 4.
3. Doors from individual *dwelling units* and *sleeping units* of Group R occupancies as permitted by Section 1010.2.4, Item 5.

1010.2.4 Locks and latches. Locks and latches shall be permitted to prevent operation of doors where any of the following exist:

1. Places of detention or restraint in Group I-3 occupancies.
2. In Group I-1, Condition 2 and Group I-2 occupancies where the clinical needs of *persons* receiving care require containment or where *persons* receiving care pose a security threat, provided that all clinical staff can readily unlock doors at all times, and all such locks are keyed to keys carried by all clinical staff at all times or all clinical staff have the codes or other means necessary to operate the locks at all times.
3. In *buildings* in occupancy Group A having an *occupant load* of 300 or less, Groups B, F, M and S, and in *places of religious worship*, the main door or doors are permitted to be equipped with key-operated locking devices from the egress side provided that:
   3.1. The doors are the main exterior doors to the *building*, or the doors are the main doors to the tenant space.
   3.2. The locking device is readily distinguishable as locked.
   3.3. A readily visible durable sign is posted on the egress side on or adjacent to the door stating: THIS DOOR TO REMAIN UNLOCKED WHEN THIS SPACE IS OCCUPIED. The sign shall be in letters 1 inch (25 mm) high on a contrasting background.
   3.4. The use of the key-operated locking device is revocable by the *building official* for due cause.
4. *Manual bolts*, automatic flush bolts and *constant latching bolts* on the inactive leaf of a pair of doors in accordance with Table 1010.2.4, provided that the inactive leaf does not have a doorknob, *panic hardware*, or similar operating hardware.
5. Single exit doors complying with Section 1006.2.1 or 1006.3.4 from individual *dwelling* or *sleeping units* of Group R occupancies and equipped with a night latch, *dead bolt* or security chain that requires a second releasing motion, provided that such devices are openable from the inside without the use of a key or tool.
6. *Fire doors* after the minimum elevated temperature has disabled the unlatching mechanism in accordance with *listed fire door* test procedures.
7. Doors serving roofs not intended to be occupied shall be permitted to be locked preventing entry to the *building* from the roof.

8. Other than egress *courts*, where occupants must egress from an exterior space through the *building* for *means of egress*, exit access doors shall be permitted to be equipped with an approved locking device where installed and operated in accordance with all of the following:

    8.1. The maximum *occupant load* shall be posted where required by Section 1004.9. Such signage shall be permanently affixed inside the building and shall be posted in a conspicuous space near all the *exit access doorways*.

    8.2. A weatherproof telephone or two-way communication system installed in accordance with Sections 1009.8.1 and 1009.8.2 shall be located adjacent to not less than one required exit access door on the exterior side.

    8.3. The egress door locking device is readily distinguishable as locked and shall be a key-operated locking device.

    8.4. A clear window or glazed door opening, not less than 5 square feet (0.46 m^2) in area, shall be provided at each exit access door to determine if there are occupants using the outdoor area.

    8.5. A readily visible, durable sign shall be posted on the interior side on or adjacent to each locked required exit access door serving the exterior area stating, "THIS DOOR TO REMAIN UNLOCKED WHEN THE OUTDOOR AREA IS OCCUPIED." The letters on the sign shall be not less than 1 inch (25.4 mm) high on a contrasting background.

    8.6. The *occupant load* of the occupied exterior area shall not exceed 300 occupants in accordance with Section 1004.

9. Locking devices are permitted on doors to balconies, decks or other exterior spaces serving individual *dwelling* or *sleeping units*.

10. Locking devices are permitted on doors to balconies, decks or other exterior spaces of 250 square feet (23.23 m^2) or less serving a private office space.

2024 International Fire Code

Revise as follows:

[BE] 1010.2.1 Unlatching. The unlatching of any door orleaf for egress shall require not more than one motion ina single linear or rotational direction to release all latching and all locking devices. locking devices. Manual bolts are not permitted. **Exceptions:**

1. Places of detention or restraint <u>in Group I-3 occupancies</u>.
2. Doors with manual bolts, automatic flush bolts and constant latching bolts as permitted by Section 1010.2.4, Item 4.
3. Doors from individual *dwelling units* and *sleeping units* of Group R occupancies as permitted by Section 1010.2.4, Item 5.

[BE] 1010.2.4 Locks and latches. Locks and latches shall be permitted to prevent operation of doors where any of the following exist:

1. Places of detention or restraint <u>in Group I-3 occupancies</u>.
2. In Group I-1, Condition 2 and Group I-2 occupancies where the clinical needs of persons receiving care require containment or where persons receiving care pose a security threat, provided that all clinical staff can readily unlock doors at all times, and all such locks are keyed to keys carried by all clinical staff at all times or all clinical staff have the codes or other means necessary to operate the locks at all times.

3. In buildings in occupancy Group A having an *occupant load* of 300 or less, Groups B, F, M and S, and in *places of religious worship*, the main door or doors are permitted to be equipped with key-operated locking devices from the egress side provided that:

   3.1. The doors are the main exterior doors to the building, or the doors are the main doors to the tenant space.

   3.2. The locking device is readily distinguishable as locked.

   3.3. A readily visible durable sign is posted on the egress side on or adjacent to the door stating: "THIS DOOR TO REMAIN UNLOCKED WHEN THIS SPACE IS OCCUPIED." The sign shall be in letters 1 inch (25 mm) high on a contrasting background.

   3.4. The use of the key-operated locking device is revocable by the *fire code official* for due cause.

4. Manual bolts, automatic flush bolts and constant latching bolts on the inactive leaf of a pair of doors in accordance with Table 1010.2.4, provided that the inactive leaf does not have a doorknob, panic hardware, or similar operating hardware.

5. Single exit doors complying with Section 1006.2.1 or 1006.3.4 from individual *dwelling* or sleeping units of Group R occupancies and equipped with a night latch, dead bolt or security chain that requires a second releasing motion, provided that such devices are openable from the inside without the use of a key or tool.

6. Fire doors after the minimum elevated temperature has disabled the unlatching mechanism in accordance with *listed* fire door test procedures.

7. Doors serving roofs not intended to be occupied shall be permitted to be locked, preventing entry to the building from the roof.

8. Other than *egress courts*, where occupants must egress from an exterior space through the building for *means of egress*, *exit access* doors shall be permitted to be equipped with an *approved* locking device where installed and operated in accordance with all of the following:

   8.1. The maximum *occupant load* shall be posted where required by Section 1004.9. Such sign shall be permanently affixed inside the building and shall be posted in a conspicuous space near all the *exit access doorways*.

   8.2. A weatherproof telephone or two-way communication system installed in accordance with Sections 1009.8.1 and 1009.8.2 shall be located adjacent to not less than one required *exit access* door on the exterior side.

   8.3. The egress door locking device is readily distinguishable as locked and shall be a key-operated locking device.

   8.4. A clear window or glazed door opening, not less than 5 square feet (0.46 m^2) in area, shall be provided at each *exit access* door to determine if there are occupants using the outdoor area.

   8.5. A readily visible durable sign shall be posted on the interior side on or adjacent to each locked required *exit access* door serving the exterior area stating: "THIS DOOR TO REMAIN UNLOCKED WHEN THE OUTDOOR AREA IS OCCUPIED." The letters on the sign shall be not less than 1 inch (25.4 mm) high on a contrasting background.

   8.6. The *occupant load* of the occupied exterior area shall not exceed 300 occupants in accordance with Section 1004.

9. Locking devices are permitted on doors to balconies, decks or other exterior spaces serving individual *dwelling*or *sleeping units*.

10. Locking devices are permitted on doors to balconies, decks or other exterior spaces of 250 square feet (23.23 m^2) or less, serving a private office space.

Reason: The revisions of this proposal are intended to be editorial and to better communicate the intent of the code.
Our understanding is Exception 1 is intended to apply to Occupancy Group I-3, where security measures are not under the occupants' control.
In Occupancy Group I-3, the unlatching of a door would be expected to require more than on motion.
These are the only locations in the IBC and IFC where the phrase "detention or restraint" is used.
The specific needs for Groups I-1 and I-2 for health care clinical needs of care recipients are addressed in 1010.2.4 Item 2 (locks and latches), 1010.2.13.1 Item 6 exception (delayed egress locking systems), and 1010.2.14 Item 8 exception 1 (controlled egress locking systems).

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Should not increase or decrease the cost of construction.
Code change proposal is editorial clarification of the intent of the code for places of detention and restraint.

E50-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: Places of detention or restraint are needed in many other occupancies other than just Group I-3. This includes police and courthouses with fewer than 6 occupants in the jail. Several other areas were identified in the testimony that should be allowed to use this section appropriately. This change does not address the issue of the schools misinterpreting this section for classrooms. (Vote: 14-0)

E50-24

Individual Consideration Agenda

Comment 1:

IBC: 1010.2.1, 1010.2.4; IFC: [BE] 1010.2.1, [BE] 1010.2.4

Proponents: John Woestman, Kellen Company, Builders Hardware Manufacturers Association (BHMA) (jwoestman@kellencompany.com) requests As Modified by Committee (AMC2)

Further modify as follows:

2024 International Building Code

Revise as follows:

1010.2.1 Unlatching. The unlatching of any door or leaf for egress shall require not more than one motion in a single linear or rotational direction to release all latching and all locking devices. locking devices. *Manual bolts* are not permitted. **Exceptions:**

1. Places ~~of~~ designed and designated for occupant detention, ~~or~~ restraint , or containment ~~in Group I-3 occupancies~~.
2. Doors with *manual bolts*, *automatic flush bolts* and *constant latching bolts* as permitted by Section 1010.2.4, Item 4.
3. Doors from individual *dwelling units* and *sleeping units* of Group R occupancies as permitted by Section 1010.2.4, Item 5.

1010.2.4 Locks and latches. Locks and latches shall be permitted to prevent operation of doors where any of the following exist:

1. Places ~~of~~ designed and designated for occupant detention, ~~or~~ restraint , or containment ~~in Group I-3 occupancies~~.

2. In Group I-1, Condition 2 and Group I-2 occupancies where the clinical needs of *persons* receiving care require containment or where *persons* receiving care pose a security threat, provided that all clinical staff can readily unlock doors at all times, and all such locks are keyed to keys carried by all clinical staff at all times or all clinical staff have the codes or other means necessary to operate the locks at all times.
3. In *buildings* in occupancy Group A having an *occupant load* of 300 or less, Groups B, F, M and S, and in *places of religious worship*, the main door or doors are permitted to be equipped with key-operated locking devices from the egress side provided that:
    3.1. The doors are the main exterior doors to the *building*, or the doors are the main doors to the tenant space.
    3.2. The locking device is readily distinguishable as locked.
    3.3. A readily visible durable sign is posted on the egress side on or adjacent to the door stating: THIS DOOR TO REMAIN UNLOCKED WHEN THIS SPACE IS OCCUPIED. The sign shall be in letters 1 inch (25 mm) high on a contrasting background.
    3.4. The use of the key-operated locking device is revocable by the *building official* for due cause.
4. *Manual bolts*, automatic flush bolts and *constant latching bolts* on the inactive leaf of a pair of doors in accordance with Table 1010.2.4, provided that the inactive leaf does not have a doorknob, *panic hardware*, or similar operating hardware.
5. Single exit doors complying with Section 1006.2.1 or 1006.3.4 from individual *dwelling* or *sleeping units* of Group R occupancies and equipped with a night latch, *dead bolt* or security chain that requires a second releasing motion, provided that such devices are openable from the inside without the use of a key or tool.
6. *Fire doors* after the minimum elevated temperature has disabled the unlatching mechanism in accordance with *listed fire door* test procedures.
7. Doors serving roofs not intended to be occupied shall be permitted to be locked preventing entry to the *building* from the roof.
8. Other than egress *courts*, where occupants must egress from an exterior space through the *building* for *means of egress*, exit access doors shall be permitted to be equipped with an approved locking device where installed and operated in accordance with all of the following:
    8.1. The maximum *occupant load* shall be posted where required by Section 1004.9. Such signage shall be permanently affixed inside the building and shall be posted in a conspicuous space near all the *exit access doorways*.
    8.2. A weatherproof telephone or two-way communication system installed in accordance with Sections 1009.8.1 and 1009.8.2 shall be located adjacent to not less than one required exit access door on the exterior side.
    8.3. The egress door locking device is readily distinguishable as locked and shall be a key-operated locking device.
    8.4. A clear window or glazed door opening, not less than 5 square feet (0.46 m^2) in area, shall be provided at each exit access door to determine if there are occupants using the outdoor area.
    8.5. A readily visible, durable sign shall be posted on the interior side on or adjacent to each locked required exit access door serving the exterior area stating, "THIS DOOR TO REMAIN UNLOCKED WHEN THE OUTDOOR AREA IS OCCUPIED." The letters on the sign shall be not less than 1 inch (25.4 mm) high on a contrasting background.
    8.6. The *occupant load* of the occupied exterior area shall not exceed 300 occupants in accordance with Section 1004.
9. Locking devices are permitted on doors to balconies, decks or other exterior spaces serving individual *dwelling* or *sleeping units*.
10. Locking devices are permitted on doors to balconies, decks or other exterior spaces of 250 square feet (23.23 m^2) or less serving a private office space.

2024 International Fire Code

Revise as follows:

[BE] 1010.2.1 Unlatching. The unlatching of any door orleaf for egress shall require not more than one motion ina single linear or rotational direction to release all latching and all locking devices. locking devices. Manual bolts are not permitted. **Exceptions:**

1. Places ~~of~~ designed and designated for occupant detention, ~~or~~ restraint , or containment ~~in Group I-3 occupancies~~.
2. Doors with manual bolts, automatic flush bolts and constant latching bolts as permitted by Section 1010.2.4, Item 4.
3. Doors from individual *dwelling units* and *sleeping units* of Group R occupancies as permitted by Section 1010.2.4, Item 5.

[BE] 1010.2.4 Locks and latches. Locks and latches shall be permitted to prevent operation of doors where any of the following exist:

1. Places ~~of~~ designed and designated for occupant detention, ~~or~~ restraint , or containment ~~in Group I-3 occupancies~~.
2. In Group I-1, Condition 2 and Group I-2 occupancies where the clinical needs of persons receiving care require containment or where persons receiving care pose a security threat, provided that all clinical staff can readily unlock doors at all times, and all such locks are keyed to keys carried by all clinical staff at all times or all clinical staff have the codes or other means necessary to operate the locks at all times.
3. In buildings in occupancy Group A having an *occupant load* of 300 or less, Groups B, F, M and S, and in *places of religious worship*, the main door or doors are permitted to be equipped with key-operated locking devices from the egress side provided that:
   3.1. The doors are the main exterior doors to the building, or the doors are the main doors to the tenant space.
   3.2. The locking device is readily distinguishable as locked.
   3.3. A readily visible durable sign is posted on the egress side on or adjacent to the door stating: “THIS DOOR TO REMAIN UNLOCKED WHEN THIS SPACE IS OCCUPIED.” The sign shall be in letters 1 inch (25 mm) high on a contrasting background.
   3.4. The use of the key-operated locking device is revocable by the *fire code official* for due cause.
4. Manual bolts, automatic flush bolts and constant latching bolts on the inactive leaf of a pair of doors in accordance with Table 1010.2.4, provided that the inactive leaf does not have a doorknob, panic hardware, or similar operating hardware.
5. Single exit doors complying with Section 1006.2.1 or 1006.3.4 from individual *dwelling* or sleeping units of Group R occupancies and equipped with a night latch, dead bolt or security chain that requires a second releasing motion, provided that such devices are openable from the inside without the use of a key or tool.
6. Fire doors after the minimum elevated temperature has disabled the unlatching mechanism in accordance with *listed* fire door test procedures.
7. Doors serving roofs not intended to be occupied shall be permitted to be locked, preventing entry to the building from the roof.

8. Other than *egress courts*, where occupants must egress from an exterior space through the building for *means of egress*, *exit access* doors shall be permitted to be equipped with an *approved* locking device where installed and operated in accordance with all of the following:

   8.1. The maximum *occupant load* shall be posted where required by Section 1004.9. Such sign shall be permanently affixed inside the building and shall be posted in a conspicuous space near all the *exit access doorways*.

   8.2. A weatherproof telephone or two-way communication system installed in accordance with Sections 1009.8.1 and 1009.8.2 shall be located adjacent to not less than one required *exit access* door on the exterior side.

   8.3. The egress door locking device is readily distinguishable as locked and shall be a key-operated locking device.

   8.4. A clear window or glazed door opening, not less than 5 square feet (0.46 m^2) in area, shall be provided at each *exit access* door to determine if there are occupants using the outdoor area.

   8.5. A readily visible durable sign shall be posted on the interior side on or adjacent to each locked required *exit access* door serving the exterior area stating: “THIS DOOR TO REMAIN UNLOCKED WHEN THE OUTDOOR AREA IS OCCUPIED.” The letters on the sign shall be not less than 1 inch (25.4 mm) high on a contrasting background.

   8.6. The *occupant load* of the occupied exterior area shall not exceed 300 occupants in accordance with Section 1004.

9. Locking devices are permitted on doors to balconies, decks or other exterior spaces serving individual *dwelling*or *sleeping units*.

10. Locking devices are permitted on doors to balconies, decks or other exterior spaces of 250 square feet (23.23 m^2) or less, serving a private office space.

Reason: During CAH #1, there was significant testimony in opposition to the original proposal. The revisions proposed here are intended to address the concerns raised during CAH #1, and to address the issue of schools misinterpreting this exception regarding classrooms.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Code change proposal is editorial clarification of the intent of the code.

Comment (CAH2)# 657

IBC: [BE] 403.5.3, [BE] 403.5.3.1, 1010.2.4, 1010.2.6; IFC: [BE] 1010.2.4, [BE] 1010.2.6

Proposed Change as Submitted

Proponents: John Woestman, Kellen Company, Builders Hardware Manufacturers Association (BHMA) (jwoestman@kellencompany.com)

2024 International Building Code

Revise as follows:

[BE] 403.5.3 Stairway door operation. *Stairway* doors ~~other than the exit discharge doors~~ shall be permitted to be locked to prevent passage from the *stairway* ~~side~~ into the building. *Stairway* doors that are locked to prevent passage from the *stairway* ~~side~~ into the building shall be capable of being unlocked without unlatching where any of the following conditions occur:

1. Individually or simultaneously upon a signal from the *fire command center*.
2. Simultaneously upon activation of a *fire alarm signal* in an area served by the *stairway*.
3. Upon failure of the power supply to the lock or the locking system.

[BE] 403.5.3.1 Stairway communication system. A telephone or other two-way communications system connected to an *approved constantly attended station* shall be provided at not less than every fifth floor in each *stairway* where the ~~doors to the~~ *stairway* doors are locked to prevent passage from the stairway into the building. Systems shall be *listed* in accordance with UL 2525 and installed in accordance with NFPA 72.

1010.2.4 Locks and latches. Locks and latches shall be permitted to prevent operation of doors where any of the following exist:

1. Places of detention or restraint.
2. In Group I-1, Condition 2 and Group I-2 occupancies where the clinical needs of *persons* receiving care require containment or where *persons* receiving care pose a security threat, provided that all clinical staff can readily unlock doors at all times, and all such locks are keyed to keys carried by all clinical staff at all times or all clinical staff have the codes or other means necessary to operate the locks at all times.
3. In *buildings* in occupancy Group A having an *occupant load* of 300 or less, Groups B, F, M and S, and in *places of religious worship*, the main door or doors are permitted to be equipped with key-operated locking devices ~~from the~~ which, when locked, prevent egress ~~side~~ provided that:
   3.1. The doors are the main exterior doors to the *building*, or the doors are the main doors to the tenant space.
   3.2. The locking device is readily distinguishable as locked.
   3.3. A readily visible durable sign is posted on the egress side on or adjacent to the door stating: THIS DOOR TO REMAIN UNLOCKED WHEN THIS SPACE IS OCCUPIED. The sign shall be in letters 1 inch (25 mm) high on a contrasting background.
   3.4. The use of the key-operated locking device is revocable by the *building official* for due cause.
4. *Manual bolts*, automatic flush bolts and *constant latching bolts* on the inactive leaf of a pair of doors in accordance with Table 1010.2.4, provided that the inactive leaf does not have a doorknob, *panic hardware*, or similar operating hardware.
5. Single exit doors complying with Section 1006.2.1 or 1006.3.4 from individual *dwelling* or *sleeping units* of Group R occupancies and equipped with a night latch, *dead bolt* or security chain that requires a second releasing motion, provided that such devices are openable from the inside without the use of a key or tool.

6. *Fire doors* after the minimum elevated temperature has disabled the unlatching mechanism in accordance with *listed fire door* test procedures.
7. Doors serving roofs not intended to be occupied shall be permitted to be locked preventing entry to the *building* from the roof.
8. Other than egress *courts*, where occupants must egress from an exterior space through the *building* for *means of egress*, exit access doors shall be permitted to be equipped with an approved locking device where installed and operated in accordance with all of the following:
   8.1. The maximum *occupant load* shall be posted where required by Section 1004.9. Such signage shall be permanently affixed inside the building and shall be posted in a conspicuous space near all the *exit access doorways*.
   8.2. A weatherproof telephone or two-way communication system installed in accordance with Sections 1009.8.1 and 1009.8.2 shall be located adjacent to not less than one required exit access door on the exterior side.
   8.3. The egress door locking device is readily distinguishable as locked and shall be a key-operated locking device.
   8.4. A clear window or glazed door opening, not less than 5 square feet (0.46 m^2) in area, shall be provided at each exit access door to determine if there are occupants using the outdoor area.
   8.5. A readily visible, durable sign shall be posted on the interior side on or adjacent to each locked required exit access door serving the exterior area stating, "THIS DOOR TO REMAIN UNLOCKED WHEN THE OUTDOOR AREA IS OCCUPIED." The letters on the sign shall be not less than 1 inch (25.4 mm) high on a contrasting background.
   8.6. The *occupant load* of the occupied exterior area shall not exceed 300 occupants in accordance with Section 1004.
9. Locking devices are permitted on doors to balconies, decks or other exterior spaces serving individual *dwelling* or *sleeping units*.
10. Locking devices are permitted on doors to balconies, decks or other exterior spaces of 250 square feet (23.23 m^2) or less serving a private office space.

1010.2.6 Stairway doors~~~~ operation. ~~Interior *stairway*~~ *Stairway* doors in the *means of egress* ~~doors~~ shall be openable from both sides without the use of a key or special knowledge or effort. **Exceptions:**

1. *Stairway* discharge doors shall be openable from the egress side and shall ~~only be locked from the opposite side~~ be permitted to be locked to prevent passage into the stairway through the stairway discharge door.
2. ~~This section shall not apply to~~ *Stairway* doors arranged in accordance with Section 403.5.3 shall be permitted to be locked to prevent passage from the stairway into the building.
3. *Stairway* ~~exit~~ doors shall not be locked ~~from the side opposite the egress side,~~ to prevent passage from the stairway into the building unless they are openable from the egress side and capable of being unlocked ~~simultaneously~~ without unlatching by any of the following methods:
   3.1. Shall be capable of being unlocked individually or simultaneously upon a signal from the *fire command center*, where present, or a signal by emergency personnel from a single location inside the main entrance to the *building*.
   3.2. Shall unlock simultaneously upon activation of a *fire alarm signal* when a fire alarm system is present in an area served by the stairway.
   3.3. Shall unlock upon failure of the power supply to the electric lock or the locking system.
4. *Stairway* ~~*exit*~~ doors shall be openable from the egress side and shall only be locked ~~from the opposite side~~ to prevent passage from the stairway into the building in Group B, F, M and S occupancies where the only interior access to the tenant space is from a single *exit stairway* where permitted in Section 1006.3.4.
5. *Stairway* ~~exit~~ doors shall be openable from the egress side and shall only be locked ~~from the opposite side~~ to prevent passage from the stairway into the building in Group R-2 occupancies where the only interior access to the *dwelling unit* is from a single exit *stairway* where permitted in Section 1006.3.4.

2024 International Fire Code

Revise as follows:

[BE] 1010.2.4 Locks and latches. Locks and latches shall be permitted to prevent operation of doors where any of the following exist:

1. Places of detention or restraint.
2. In Group I-1, Condition 2 and Group I-2 occupancies where the clinical needs of persons receiving care require containment or where persons receiving care pose a security threat, provided that all clinical staff can readily unlock doors at all times, and all such locks are keyed to keys carried by all clinical staff at all times or all clinical staff have the codes or other means necessary to operate the locks at all times.
3. In buildings in occupancy Group A having an *occupant load* of 300 or less, Groups B, F, M and S, and in *places of religious worship*, the main door or doors are permitted to be equipped with key-operated locking devices ~~from the~~ which, when locked, prevent egress ~~side~~ provided that:
   3.1. The doors are the main exterior doors to the building, or the doors are the main doors to the tenant space.
   3.2. The locking device is readily distinguishable as locked.
   3.3. A readily visible durable sign is posted on the egress side on or adjacent to the door stating: "THIS DOOR TO REMAIN UNLOCKED WHEN THIS SPACE IS OCCUPIED." The sign shall be in letters 1 inch (25 mm) high on a contrasting background.
   3.4. The use of the key-operated locking device is revocable by the *fire code official* for due cause.
4. Manual bolts, automatic flush bolts and constant latching bolts on the inactive leaf of a pair of doors in accordance with Table 1010.2.4, provided that the inactive leaf does not have a doorknob, panic hardware, or similar operating hardware.
5. Single exit doors complying with Section 1006.2.1 or 1006.3.4 from individual *dwelling* or sleeping units of Group R occupancies and equipped with a night latch, dead bolt or security chain that requires a second releasing motion, provided that such devices are openable from the inside without the use of a key or tool.
6. Fire doors after the minimum elevated temperature has disabled the unlatching mechanism in accordance with *listed* fire door test procedures.
7. Doors serving roofs not intended to be occupied shall be permitted to be locked, preventing entry to the building from the roof.
8. Other than *egress courts*, where occupants must egress from an exterior space through the building for *means of egress*, *exit access* doors shall be permitted to be equipped with an *approved* locking device where installed and operated in accordance with all of the following:
   8.1. The maximum *occupant load* shall be posted where required by Section 1004.9. Such sign shall be permanently affixed inside the building and shall be posted in a conspicuous space near all the *exit access doorways*.
   8.2. A weatherproof telephone or two-way communication system installed in accordance with Sections 1009.8.1 and 1009.8.2 shall be located adjacent to not less than one required *exit access* door on the exterior side.
   8.3. The egress door locking device is readily distinguishable as locked and shall be a key-operated locking device.
   8.4. A clear window or glazed door opening, not less than 5 square feet (0.46 m^2) in area, shall be provided at each *exit access* door to determine if there are occupants using the outdoor area.
   8.5. A readily visible durable sign shall be posted on the interior side on or adjacent to each locked required *exit access* door serving the exterior area stating: "THIS DOOR TO REMAIN UNLOCKED WHEN THE OUTDOOR AREA IS OCCUPIED." The letters on the sign shall be not less than 1 inch (25.4 mm) high on a contrasting background.
   8.6. The *occupant load* of the occupied exterior area shall not exceed 300 occupants in accordance with Section 1004.
9. Locking devices are permitted on doors to balconies, decks or other exterior spaces serving individual *dwelling* or *sleeping units*.

10. Locking devices are permitted on doors to balconies, decks or other exterior spaces of 250 square feet (23.23 m^2) or less, serving a private office space.

[BE] 1010.2.6 Stairway doors operation. ~~Interior *stairway*~~ *Stairway* doors in the *means of egress* ~~doors~~ shall be openable from both sides without the use of a key or special knowledge or effort. **Exceptions:**

1. *Stairway* discharge doors shall be openable from the egress side and shall ~~only be locked from the opposite side~~ be permitted to be locked to prevent passage into the stairway through the stairway discharge door.
2. ~~This section shall not apply to~~ *Stairway* doors arranged in accordance with Section 403.5.3 of the International Building Code shall be permitted to be locked to prevent passage from the stairway into the building.
3. *Stairway* ~~exit~~ doors shall not be locked ~~from the side opposite the egress side,~~ to prevent passage from the stairway into the building unless they are openable from the egress side and capable of being unlocked ~~simultaneously~~ without unlatching by any of the following methods:
   3.1. Shall be capable of being unlocked individually or simultaneously upon a signal from the *fire command center*, where present, or a signal by emergency personnel from a single location inside the main entrance to the building.
   3.2. Shall unlock simultaneously upon activation of a fire alarm signal when a *fire alarm system* is present in an area served by the stairway.
   3.3. Shall unlock upon failure of the power supply to the electric lock or the locking system.
4. *Stairway* ~~*exit*~~ doors shall be openable from the egress side and shall only be locked ~~from the opposite side~~ to prevent passage from the stairway into the building in Group B, F, M and S occupancies where the only interior access to the tenant space is from a single *exit stairway* where permitted in Section 1006.3.4.
5. *Stairway* ~~exit~~ doors shall be openable from the egress side and shall only be locked ~~from the opposite side~~ to prevent passage from the stairway into the building in Group R-2 occupancies where the only interior access to the *dwelling unit* is from a single exit stairway where permitted in Section 1006.3.4.

Reason: Reviewing these sections of the IBC with a critical eye identifies several opportunities for editorial improvements.

In several sections there's language that permits stairway doors, where they comply with specified conditions, to be locked preventing passage from the stairway into the building or structure. But, the language used in the code is less clear than the language used in the 1st sentence of this paragraph of this reason statement. Several edits reflect the language of the 1st sentence of this paragraph.

Section 403.5.3 is all about provisions permitting locking of stairway doors in high-rise buildings limiting passage from the stairway into the building. In these provisions, there's not a need to address stairway exit discharge doors as stairway exit discharge doors are addressed in 1010.2.6 Exception 1. Section 403.5.3 is edited appropriately.

In sections 403.5.2 and 1010.2.6, the terms "stairway doors" and "stairway exit doors" are used to describe the same doors. It appears that "stairway doors" may be the better term to use when the code is addressing doors to / from stairways where the doors are in the means of egress (if the stairway doors are not in the means of egress, the code provisions most likely would not apply). Also, these provisions regarding stairway doors should be applicable to doors in interior exit stairways and to doors in exterior exit stairways. Edits are made in 403.5.2 and 1010.2.6.

The language of Exception 1 and 2 to Section 1010.2.6, as currently in the IBC, essentially exempt stairway discharge doors (Exception 1) and stairway doors complying with 403.5.3 (Exception 2) from the requirements in 1010.2.6 to be openable without the use of a key, special knowledge, or effort. That's not the intent of the code. These two exceptions are edited to more accurately describe the intent and scope of the exceptions.

In Exception 3 of Section 1010.2.6, the word "simultaneously" is redundant with the requirements in Items 3.1 and 3.2, and not appropriate if applied to Item 3.3. Thus "simultaneously" is deleted in Item 3 of 1010.2.6.

Exceptions 4 and 5 of Section 1010.2.6 are editorially revised to more clearly describe the intent of the code.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposal is not expected to increase or decrease the cost of construction.

The revisions are intended to be editorial improvements to the existing requirements of the code for stairways where the door can be locked.

E53-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The concept is good, but there appears to be a conflict with the change in Section 403.5.3.1 with the exit discharge section in Section 1028. The proposed text could allow for the door at the stairway door discharging into the lobby to be locked. (Vote: 14-0)

Individual Consideration Agenda

Comment 1:

IBC: [BE] 403.5.3, 1010.2.6; IFC: [BE] 1010.2.6

Proponents: John Woestman, Kellen Company, Builders Hardware Manufacturers Association (BHMA) (jwoestman@kellencompany.com) requests As Modified by Committee (AMC2)

Further modify as follows:

2024 International Building Code

Revise as follows:

[BE] 403.5.3 Stairway door operation. *Stairway* doors, other than exit discharge doors, shall be permitted to be locked to prevent passage from the *stairway* into the building. *Stairway* doors that are locked to prevent passage from the *stairway* into the building shall be capable of being unlocked without unlatching where any of the following conditions occur:

1. Individually or simultaneously upon a signal from the *fire command center*.
2. Simultaneously upon activation of a *fire alarm signal* in an area served by the *stairway*.
3. Upon failure of the power supply to the lock or the locking system.

1010.2.6 Stairway door operation. *Stairway* doors in the *means of egress* shall be openable from both sides without the use of a key or special knowledge or effort. **Exceptions:**

1. *Stairway* discharge doors shall be openable from the egress side and shall be permitted to be locked to prevent passage into the stairway through the stairway discharge door.

2. *Stairway* doors arranged in accordance with Section 403.5.3, other than exit discharge doors, shall be permitted to be locked to prevent passage from the stairway into the building.
3. *Stairway* doors shall not be locked to prevent passage from the stairway into the building unless they are openable from the egress side and capable of being unlocked without unlatching by any of the following methods:
   3.1. Shall be capable of being unlocked individually or simultaneously upon a signal from the *fire command center*, where present, or a signal by emergency personnel from a single location inside the main entrance to the *building*.
   3.2. Shall unlock simultaneously upon activation of a *fire alarm signal* when a fire alarm system is present in an area served by the stairway.
   3.3. Shall unlock upon failure of the power supply to the electric lock or the locking system.
4. *Stairway* doors shall be openable from the egress side and shall only be locked to prevent passage from the stairway into the building in Group B, F, M and S occupancies where the only interior access to the tenant space is from a single *exit stairway* where permitted in Section 1006.3.4.
5. *Stairway* doors shall be openable from the egress side and shall only be locked to prevent passage from the stairway into the building in Group R-2 occupancies where the only interior access to the *dwelling unit* is from a single exit *stairway* where permitted in Section 1006.3.4.

2024 International Fire Code

Revise as follows:

[BE] 1010.2.6 Stairway door operation. *Stairway* doors in the *means of egress* shall be openable from both sides without the use of a key or special knowledge or effort. **Exceptions:**

1. *Stairway* discharge doors shall be openable from the egress side and shall be permitted to be locked to prevent passage into the stairway through the stairway discharge door.
2. *Stairway* doors arranged in accordance with Section 403.5.3 of the International Building Code, other than exit discharge doors, shall be permitted to be locked to prevent passage from the stairway into the building.
3. *Stairway* doors shall not be locked to prevent passage from the stairway into the building unless they are openable from the egress side and capable of being unlocked without unlatching by any of the following methods:
   3.1. Shall be capable of being unlocked individually or simultaneously upon a signal from the *fire command center*, where present, or a signal by emergency personnel from a single location inside the main entrance to the building.
   3.2. Shall unlock simultaneously upon activation of a fire alarm signal when a *fire alarm system* is present in an area served by the stairway.
   3.3. Shall unlock upon failure of the power supply to the electric lock or the locking system.
4. *Stairway* doors shall be openable from the egress side and shall only be locked to prevent passage from the stairway into the building in Group B, F, M and S occupancies where the only interior access to the tenant space is from a single *exit stairway* where permitted in Section 1006.3.4.
5. *Stairway* doors shall be openable from the egress side and shall only be locked to prevent passage from the stairway into the building in Group R-2 occupancies where the only interior access to the *dwelling unit* is from a single exit stairway where permitted in Section 1006.3.4.

Reason: The proposal, as submitted, inadvertently affected stairway exit discharge doors, as addressed by the provisions in Section 1028. This comment replaces language deleted in 403.5.3 (with minor edits), and inserts similar language in Exception 3 of 1010.2.6 for consistency with 403.5.3.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The revisions are intended to be editorial improvements to the existing requirements of the code.

Comment (CAH2)# 670

IBC: 1010.2.4; IFC: [BE] 1010.2.4

Proposed Change as Submitted

Proponents: John Woestman, Kellen Company, Builders Hardware Manufacturers Association (BHMA) (jwoestman@kellencompany.com)

2024 International Building Code

Revise as follows:

1010.2.4 Locks and latches. Locks and latches shall be permitted to prevent operation of doors where any of the following exist:

1. Places of detention or restraint.
2. In Group I-1, Condition 2 and Group I-2 occupancies where the clinical needs of *persons* receiving care require containment or where *persons* receiving care pose a security threat, provided that all clinical staff can readily unlock doors at all times, and all such locks are keyed to keys carried by all clinical staff at all times or all clinical staff have the codes or other means necessary to operate the locks at all times.
3. In *buildings* in occupancy Group A having an *occupant load* of 300 or less, Groups B, F, M and S, and in *places of religious worship*, the main door or doors are permitted to be equipped with key-operated locking devices from the egress side provided that:
   3.1. The doors are the main exterior doors to the *building*, or the doors are the main doors to the tenant space.
   3.2. The locking device is readily distinguishable as locked.
   3.3. A readily visible durable sign is posted on the egress side on or adjacent to the door stating: THIS DOOR TO REMAIN UNLOCKED WHEN THIS SPACE IS OCCUPIED. The sign shall be in letters 1 inch (25 mm) high on a contrasting background.
   3.4. The use of the key-operated locking device is revocable by the *building official* for due cause.
4. *Manual bolts*, automatic flush bolts and *constant latching bolts* on the inactive leaf of a pair of doors in accordance with Table 1010.2.4, provided that the inactive leaf does not have a doorknob, *panic hardware*, or similar operating hardware.
5. ~~Single exit doors complying with Section 1006.2.1 or 1006.3.4 from individual *dwelling* or *sleeping units* of Group R occupancies and~~ Doors complying with any of the following are permitted to be equipped with a night latch, *dead bolt* or security chain that requires a second releasing motion, provided that such devices are openable from the inside without the use of a key or tool.
   5.1. Doors from individual Group R *dwelling* or *sleeping units* where a single *exit* complies with Section 1006.2.1 or 1006.3.4.
   5.2 Doors from individual sleeping rooms within *sleeping units* of *congregate living facilities* of Group R-2 and Group R-3 occupancies.
   5.3 Doors from individual sleeping rooms of *dwelling units* of Group R-2 occupancies serving as college or university residence halls.
6. *Fire doors* after the minimum elevated temperature has disabled the unlatching mechanism in accordance with *listed fire door* test procedures.
7. Doors serving roofs not intended to be occupied shall be permitted to be locked preventing entry to the *building* from the roof.

8. Other than egress *courts*, where occupants must egress from an exterior space through the *building* for *means of egress*, exit access doors shall be permitted to be equipped with an approved locking device where installed and operated in accordance with all of the following:

   8.1. The maximum *occupant load* shall be posted where required by Section 1004.9. Such signage shall be permanently affixed inside the building and shall be posted in a conspicuous space near all the *exit access doorways*.

   8.2. A weatherproof telephone or two-way communication system installed in accordance with Sections 1009.8.1 and 1009.8.2 shall be located adjacent to not less than one required exit access door on the exterior side.

   8.3. The egress door locking device is readily distinguishable as locked and shall be a key-operated locking device.

   8.4. A clear window or glazed door opening, not less than 5 square feet (0.46 m^2) in area, shall be provided at each exit access door to determine if there are occupants using the outdoor area.

   8.5. A readily visible, durable sign shall be posted on the interior side on or adjacent to each locked required exit access door serving the exterior area stating, "THIS DOOR TO REMAIN UNLOCKED WHEN THE OUTDOOR AREA IS OCCUPIED." The letters on the sign shall be not less than 1 inch (25.4 mm) high on a contrasting background.

   8.6. The *occupant load* of the occupied exterior area shall not exceed 300 occupants in accordance with Section 1004.

9. Locking devices are permitted on doors to balconies, decks or other exterior spaces serving individual *dwelling* or *sleeping units*.

10. Locking devices are permitted on doors to balconies, decks or other exterior spaces of 250 square feet (23.23 m^2) or less serving a private office space.

2024 International Fire Code

Revise as follows:

[BE] 1010.2.4 Locks and latches. Locks and latches shall be permitted to prevent operation of doors where any of the following exist:

1. Places of detention or restraint.
2. In Group I-1, Condition 2 and Group I-2 occupancies where the clinical needs of persons receiving care require containment or where persons receiving care pose a security threat, provided that all clinical staff can readily unlock doors at all times, and all such locks are keyed to keys carried by all clinical staff at all times or all clinical staff have the codes or other means necessary to operate the locks at all times.
3. In buildings in occupancy Group A having an *occupant load* of 300 or less, Groups B, F, M and S, and in *places of religious worship*, the main door or doors are permitted to be equipped with key-operated locking devices from the egress side provided that:

   3.1. The doors are the main exterior doors to the building, or the doors are the main doors to the tenant space.

   3.2. The locking device is readily distinguishable as locked.

   3.3. A readily visible durable sign is posted on the egress side on or adjacent to the door stating: “THIS DOOR TO REMAIN UNLOCKED WHEN THIS SPACE IS OCCUPIED.” The sign shall be in letters 1 inch (25 mm) high on a contrasting background.

   3.4. The use of the key-operated locking device is revocable by the *fire code official* for due cause.

4. Manual bolts, automatic flush bolts and constant latching bolts on the inactive leaf of a pair of doors in accordance with Table 1010.2.4, provided that the inactive leaf does not have a doorknob, panic hardware, or similar operating hardware.

5. ~~Single exit doors complying with Section 1006.2.1 or 1006.3.4 from individual *dwelling* or sleeping units of Group R occupancies and~~ Doors complying with any of the following are permitted to be equipped with a night latch, dead bolt or security chain that requires a second releasing motion, provided that such devices are openable from the inside without the use of a key or tool.

   5.1. Doors from individual Group R *dwelling* or *sleeping units* where a single *exit* complies with Section 1006.2.1 or 1006.3.4.

   5.2 Doors from individual sleeping rooms within *sleeping units* of *congregate living facilities* of Group R-2 and Group R-3 occupancies.

   5.3 Doors from individual sleeping rooms of *dwelling units* of Group R-2 occupancies serving as college or university residence halls.

6. Fire doors after the minimum elevated temperature has disabled the unlatching mechanism in accordance with *listed* fire door test procedures.
7. Doors serving roofs not intended to be occupied shall be permitted to be locked, preventing entry to the building from the roof.
8. Other than *egress courts*, where occupants must egress from an exterior space through the building for *means of egress*, *exit access* doors shall be permitted to be equipped with an *approved* locking device where installed and operated in accordance with all of the following:

   8.1. The maximum *occupant load* shall be posted where required by Section 1004.9. Such sign shall be permanently affixed inside the building and shall be posted in a conspicuous space near all the *exit access doorways*.

   8.2. A weatherproof telephone or two-way communication system installed in accordance with Sections 1009.8.1 and 1009.8.2 shall be located adjacent to not less than one required *exit access* door on the exterior side.

   8.3. The egress door locking device is readily distinguishable as locked and shall be a key-operated locking device.

   8.4. A clear window or glazed door opening, not less than 5 square feet (0.46 m^2) in area, shall be provided at each *exit access* door to determine if there are occupants using the outdoor area.

   8.5. A readily visible durable sign shall be posted on the interior side on or adjacent to each locked required *exit access* door serving the exterior area stating: “THIS DOOR TO REMAIN UNLOCKED WHEN THE OUTDOOR AREA IS OCCUPIED.” The letters on the sign shall be not less than 1 inch (25.4 mm) high on a contrasting background.

   8.6. The *occupant load* of the occupied exterior area shall not exceed 300 occupants in accordance with Section 1004.

9. Locking devices are permitted on doors to balconies, decks or other exterior spaces serving individual *dwelling*or *sleeping units*.
10. Locking devices are permitted on doors to balconies, decks or other exterior spaces of 250 square feet (23.23 m^2) or less, serving a private office space.

Reason: This code proposal is about permitting locking of doors to individual sleeping rooms on Group R-2 occupancies similar to what’s permitted regarding locking of doors of hotel rooms (i.e. *sleeping units*) and college / university *dormitory* rooms (i.e. *sleeping units*).

Some college and university *dormitories* and residence halls are designed and constructed with suite-style layouts. The residence halls at Upstate University of South Carolina are one example: www.uscupstate.edu/campus-life/housing-and-dining/housing-floor-plans/.

Another example is Clarkson College residence hall: www.clarksoncollege.edu/student-life/residence-life/floor-plan-layout/index. But, do note the layout of the Clarkson College residence hall suites include permanent provisions for living, sleeping, eating, cooking, and sanitation, which means these suites would be considered *dwelling units,* per the IBC definition of *dwelling units*, and the buildings would be R-2 apartment houses. Thus, these suites would not be *congregate living facilities* (because *congregate living facilities* have *sleeping units*, but not *dwelling units*, per the IBC definition of *congregate living facilities*), and additionally, buildings containing these suites would not be a *dormitories* (because *dormitories* are a subset of *congregate living facilities*, per IBC Section 310.3).

The IBC currently permits dead bolts on the door into residence hall suites in the same manner as doors into *dwelling units* – see IBC Section 1010.2.4 Item 5. Considering the occupants of these residence hall suites are unlikely to be of the same family group (see the IBC definition of *dormitory*), there's a desire by the occupants to be able to enhance the security of their individual sleeping rooms. But, the IBC does not permit dead bolts on doors into each of the sleeping rooms of these residence hall suites.

This proposal was initially conceived as applicable only to Group R-2 *dormitories*; but perhaps the proposed revisions should be applicable to (permitted for) the individual sleeping rooms of all Group R-2 and Group R-3 *congregate living facilities* (as proposed here). *Congregate living facilities* include *boarding houses*, convents, *dormitories*, fraternities and sororities, and monasteries. In all of these uses, the occupants of the sleeping rooms would be primarily adults, are unlikely to be of the same family group, and the person that locks the door for security would be able to quickly unlock the door for egress.

Item 5.1 is moved from the Item 5 and editorially revised.

Item 5.2 applies to the individual sleeping rooms within the *sleeping units* of nontransient *congregate living facilities* of Group R-2, and applies to the sleeping units of nontransient and *transient congregate living facilities* of Group R-3.

Item 5.3 applies to the individual sleeping rooms of *dwelling units* in college and university residence halls.

2024 IBC Definitions (for information only):

[BG] BOARDING HOUSE. A building arranged or used for lodging for compensation, with or without meals, and not occupied as a single-family unit.

[BG] CONGREGATE LIVING FACILITIES. A building or part thereof that contains sleeping units where residents share bathroom or kitchen facilities, or both.

[BG] DORMITORY. A space in a building where group sleeping accommodations are provided in one room, or in a series of closely associated rooms, for persons not members of the same family group, under joint occupancy and single management, as in college dormitories or fraternity houses.

[A] DWELLING. A building that contains one or two dwelling units used, intended or designed to be used, rented, leased, let or hired out to be occupied for living purposes.

[A] DWELLING UNIT. A single unit providing complete, independent living facilities for one or more persons, including permanent provisions for living, sleeping, eating, cooking and sanitation.

[A] SLEEPING UNIT. A single unit that provides rooms or spaces for one or more persons, includes permanent provisions for sleeping and can include provisions for living, eating and either sanitation or kitchen facilities but not both. Such rooms and spaces that are also part of a dwelling unit are not sleeping units.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

No cost changes.
This proposal permits, but does not require, the use of locking devices in these Group R applications.

E54-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: You could do a single action lock set on the bedroom to get the security you needed. There is a concern if there could be one of these on the bedroom and a second set on the unit door - there should not be two in a row. (Vote: 12-2)

E54-24

Comment 1:

IBC: 1010.2.1, 1010.2.4; IFC: [BE] 1010.2.1, [BE] 1010.2.4

Proponents: John Woestman, Kellen Company, Builders Hardware Manufacturers Association (BHMA) (jwoestman@kellencompany.com) requests As Modified by Committee (AMC2)

Further modify as follows:

2024 International Building Code

Revise as follows:

1010.2.1 Unlatching. The unlatching of any door or leaf for egress shall require not more than one motion in a single linear or rotational direction to release all latching and all locking devices. locking devices. *Manual bolts* are not permitted. **Exceptions:**

1. Places of detention or restraint.
2. Doors with *manual bolts*, *automatic flush bolts* and *constant latching bolts* as permitted by Section 1010.2.4, Item 4.
3. Doors from individual *dwelling units*, ~~and~~ *sleeping units*, and sleeping rooms of Group R occupancies as permitted by Section 1010.2.4, Item 5.

1010.2.4 Locks and latches. Locks and latches shall be permitted to prevent operation of doors where any of the following exist:

1. Places of detention or restraint.
2. In Group I-1, Condition 2 and Group I-2 occupancies where the clinical needs of *persons* receiving care require containment or where *persons* receiving care pose a security threat, provided that all clinical staff can readily unlock doors at all times, and all such locks are keyed to keys carried by all clinical staff at all times or all clinical staff have the codes or other means necessary to operate the locks at all times.
3. In *buildings* in occupancy Group A having an *occupant load* of 300 or less, Groups B, F, M and S, and in *places of religious worship*, the main door or doors are permitted to be equipped with key-operated locking devices from the egress side provided that:
   3.1. The doors are the main exterior doors to the *building*, or the doors are the main doors to the tenant space.
   3.2. The locking device is readily distinguishable as locked.
   3.3. A readily visible durable sign is posted on the egress side on or adjacent to the door stating: THIS DOOR TO REMAIN UNLOCKED WHEN THIS SPACE IS OCCUPIED. The sign shall be in letters 1 inch (25 mm) high on a contrasting background.
   3.4. The use of the key-operated locking device is revocable by the *building official* for due cause.
4. *Manual bolts*, automatic flush bolts and *constant latching bolts* on the inactive leaf of a pair of doors in accordance with Table 1010.2.4, provided that the inactive leaf does not have a doorknob, *panic hardware*, or similar operating hardware.

5. Doors complying with any of the following are permitted to be equipped with a night latch, *dead bolt* or security chain that requires a second releasing motion, provided that such devices are openable from the inside without the use of a key or tool.

   5.1. Doors from individual Group R *dwelling* or *sleeping units* where a single *exit* complies with Section 1006.2.1 or 1006.3.4.

   5.2 Doors from individual sleeping rooms within *sleeping units* of *congregate living facilities* of Group R-2 and Group R-3 occupancies provided the doors from the *sleeping units* require not more than one motion for egress.

   5.3 Doors from individual sleeping rooms ~~of~~ within *dwelling units* of Group R-2 occupancies serving as college or university ~~residence halls~~ student housing provided the doors from the *dwelling units* require not more than one motion for egress.

6. *Fire doors* after the minimum elevated temperature has disabled the unlatching mechanism in accordance with *listed fire door* test procedures.
7. Doors serving roofs not intended to be occupied shall be permitted to be locked preventing entry to the *building* from the roof.
8. Other than egress *courts*, where occupants must egress from an exterior space through the *building* for *means of egress*, exit access doors shall be permitted to be equipped with an approved locking device where installed and operated in accordance with all of the following:

   8.1. The maximum *occupant load* shall be posted where required by Section 1004.9. Such signage shall be permanently affixed inside the building and shall be posted in a conspicuous space near all the *exit access doorways*.

   8.2. A weatherproof telephone or two-way communication system installed in accordance with Sections 1009.8.1 and 1009.8.2 shall be located adjacent to not less than one required exit access door on the exterior side.

   8.3. The egress door locking device is readily distinguishable as locked and shall be a key-operated locking device.

   8.4. A clear window or glazed door opening, not less than 5 square feet (0.46 m^2) in area, shall be provided at each exit access door to determine if there are occupants using the outdoor area.

   8.5. A readily visible, durable sign shall be posted on the interior side on or adjacent to each locked required exit access door serving the exterior area stating, "THIS DOOR TO REMAIN UNLOCKED WHEN THE OUTDOOR AREA IS OCCUPIED." The letters on the sign shall be not less than 1 inch (25.4 mm) high on a contrasting background.

   8.6. The *occupant load* of the occupied exterior area shall not exceed 300 occupants in accordance with Section 1004.

9. Locking devices are permitted on doors to balconies, decks or other exterior spaces serving individual *dwelling* or *sleeping units*.
10. Locking devices are permitted on doors to balconies, decks or other exterior spaces of 250 square feet (23.23 m^2) or less serving a private office space.

2024 International Fire Code

Revise as follows:

[BE] 1010.2.1 Unlatching. The unlatching of any door orleaf for egress shall require not more than one motion ina single linear or rotational direction to release all latching and all locking devices. locking devices. Manual bolts are not permitted. **Exceptions:**

1. Places of detention or restraint.
2. Doors with manual bolts, automatic flush bolts and constant latching bolts as permitted by Section 1010.2.4, Item 4.
3. Doors from individual *dwelling units*, ~~and~~ *sleeping units*, and sleeping rooms of Group R occupancies as permitted by Section 1010.2.4, Item 5.

[BE] 1010.2.4 Locks and latches. Locks and latches shall be permitted to prevent operation of doors where any of the following exist:

1. Places of detention or restraint.

2. In Group I-1, Condition 2 and Group I-2 occupancies where the clinical needs of persons receiving care require containment or where persons receiving care pose a security threat, provided that all clinical staff can readily unlock doors at all times, and all such locks are keyed to keys carried by all clinical staff at all times or all clinical staff have the codes or other means necessary to operate the locks at all times.

3. In buildings in occupancy Group A having an *occupant load* of 300 or less, Groups B, F, M and S, and in *places of religious worship*, the main door or doors are permitted to be equipped with key-operated locking devices from the egress side provided that:

   3.1. The doors are the main exterior doors to the building, or the doors are the main doors to the tenant space.

   3.2. The locking device is readily distinguishable as locked.

   3.3. A readily visible durable sign is posted on the egress side on or adjacent to the door stating: "THIS DOOR TO REMAIN UNLOCKED WHEN THIS SPACE IS OCCUPIED." The sign shall be in letters 1 inch (25 mm) high on a contrasting background.

   3.4. The use of the key-operated locking device is revocable by the *fire code official* for due cause.

4. Manual bolts, automatic flush bolts and constant latching bolts on the inactive leaf of a pair of doors in accordance with Table 1010.2.4, provided that the inactive leaf does not have a doorknob, panic hardware, or similar operating hardware.

5. Doors complying with any of the following are permitted to be equipped with a night latch, dead bolt or security chain that requires a second releasing motion, provided that such devices are openable from the inside without the use of a key or tool.

   5.1. Doors from individual Group R *dwelling* or *sleeping units* where a single *exit* complies with Section 1006.2.1 or 1006.3.4.

   5.2 Doors from individual sleeping rooms within *sleeping units* of *congregate living facilities* of Group R-2 and Group R-3 occupancies provided the doors from the *sleeping units* require not more than one motion for egress.

   5.3 Doors from individual sleeping rooms ~~of~~ within *dwelling units* of Group R-2 occupancies serving as college or university ~~residence halls~~ student housing provided the doors from the *dwelling units* require not more than one motion for egress.

6. Fire doors after the minimum elevated temperature has disabled the unlatching mechanism in accordance with *listed* fire door test procedures.

7. Doors serving roofs not intended to be occupied shall be permitted to be locked, preventing entry to the building from the roof.

8. Other than *egress courts*, where occupants must egress from an exterior space through the building for *means of egress*, *exit access* doors shall be permitted to be equipped with an *approved* locking device where installed and operated in accordance with all of the following:

   8.1. The maximum *occupant load* shall be posted where required by Section 1004.9. Such sign shall be permanently affixed inside the building and shall be posted in a conspicuous space near all the *exit access doorways*.

   8.2. A weatherproof telephone or two-way communication system installed in accordance with Sections 1009.8.1 and 1009.8.2 shall be located adjacent to not less than one required *exit access* door on the exterior side.

   8.3. The egress door locking device is readily distinguishable as locked and shall be a key-operated locking device.

   8.4. A clear window or glazed door opening, not less than 5 square feet (0.46 m^2) in area, shall be provided at each *exit access* door to determine if there are occupants using the outdoor area.

   8.5. A readily visible durable sign shall be posted on the interior side on or adjacent to each locked required *exit access* door serving the exterior area stating: "THIS DOOR TO REMAIN UNLOCKED WHEN THE OUTDOOR AREA IS OCCUPIED." The letters on the sign shall be not less than 1 inch (25.4 mm) high on a contrasting background.

   8.6. The *occupant load* of the occupied exterior area shall not exceed 300 occupants in accordance with Section 1004.

9. Locking devices are permitted on doors to balconies, decks or other exterior spaces serving individual *dwelling*or *sleeping units*.

10. Locking devices are permitted on doors to balconies, decks or other exterior spaces of 250 square feet (23.23 m^2) or less, serving a private office space.

Reason: The modifications are intended to address committee comments.

The revisions in 5.2 and 5.3 address the concern the original proposal would permit up to two doors in the means of egress with where each door would be permitted to have locking systems with two releasing motions for egress.

Also, Item 5.3 was revised to “student housing” to be inclusive of student housing in addition to residence halls (i.e. dormitories).

And, the revisions proposed in Exception 3 of 1010.2.1 are to synchronize this exception with the revisions proposed in Item 5 of 1010.2.4.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal permits, but does not require, the use of locking devices in these applications

Proposed Change as Submitted

Proponents: John Woestman, Kellen Company, Builders Hardware Manufacturers Association (BHMA) (jwoestman@kellencompany.com)

2024 International Building Code

Delete and substitute as follows:

~~**1010.2.8.2 Rooms with electrical equipment.** Exit or exit access doors serving transformer vaults, rooms designated for batteries or energy storage systems, or modular *data centers* shall be equipped with *panic hardware* or *fire exit hardware*. Rooms containing electrical equipment rated 800 amperes or more that contain overcurrent devices, switching devices or control devices and where the exit or exit access door is less than 25 feet (7620 mm) from the equipment working space as required by NFPA 70, such doors shall not be provided with a latch or lock other than *panic hardware* or *fire exit hardware*. The doors shall swing in the direction of egress travel.~~

1010.2.8.2 Rooms with electrical equipment. Where an electrical equipment room, enclosure, or vault meets one or more of the following criteria, exit doors or exit access doors shall comply with Section 1010.2.8.2.1.

1. Room, enclosure, or vault for electrical equipment of 1000 volts, nominal, or less and rated 800 amperes or more that contain overcurrent devices, switching devices, or control devices and where the exit door or exit access door is less than 25 feet (7620 mm) from the equipment working space as required by NFPA 70.
2. Vault for electrical equipment of over 1000 volts, nominal.
3. Room or enclosure for electrical equipment of over 1000 volts, nominal, and where the exit door or exit access door is less than 25 feet (7620 mm) from the equipment working space as required by NFPA 70.
4. Transformer vault.
5. Room, enclosure, or vault for batteries or energy storage systems having a capacity greater than 1 kWh (3.6MJ).
6. Modular data center.

Add new text as follows:

1010.2.8.2.1 Electrical equipment room doors. Exit doors and exit access doors of such electrical room, enclosure, or vault shall swing in the direction of egress travel, and locks and latches on the doors shall be provided with panic hardware or fire exit hardware.

2024 International Fire Code

Delete and substitute as follows:

~~**[BE] 1010.2.8.2 Rooms with electrical equipment .** *Exit* or *exit access* doors serving transformer vaults, rooms designated for batteries or energy storage systems, or modular *data centers* shall be equipped with *panic hardware* or *fire exit hardware*. Rooms containing electrical equipment rated 800 amperes or more that contain overcurrent devices, switching devices or control devices and where the *exit* or *exit access* door is less than 25 feet (7620 mm) from the equipment working space as required by NFPA 70, such doors shall not be provided with a latch or lock other than *panic hardware* or *fire exit hardware*. The doors shall swing in the direction of egress travel.~~

[BE] 1010.2.8.2 Rooms with electrical equipment . Where an electrical equipment room, enclosure, or vault meets one or more of the following criteria, exit doors or exit access doors shall comply with Section 1010.2.8.2.1.

1. Room, enclosure, or vault for electrical equipment of 1000 volts, nominal, or less and rated 800 amperes or more that contain overcurrent devices, switching devices, or control devices and where the exit door or exit access door is less than 25 feet (7620 mm) from the equipment working space as required by NFPA 70.
2. Vault for electrical equipment of over 1000 volts, nominal.
3. Room or enclosure for electrical equipment of over 1000 volts, nominal, and where the exit door or exit access door is less than 25 feet (7620 mm) from the equipment working space as required by NFPA 70.
4. Transformer vault.
5. Room, enclosure, or vault for batteries or energy storage systems having a capacity greater than 1 kWh (3.6MJ).
6. Modular data center.

Add new text as follows:

1010.2.8.2.1 Electrical equipment room doors. Exit doors and exit access doors of such electrical room, enclosure, or vault shall swing in the direction of egress travel, and locks and latches on the doors shall be provided with panic hardware or fire exit hardware.

Reason: This proposal is intended to be editorial and to more closely mesh with the requirements in NFPA 70 National Electrical Code. The IBC, in Chapter 27, requires compliance with NFPA 70. The current text in Section 1010.2.8.2 closely follows requirements in NFPA 70 regarding panic hardware and fire exit hardware, but the revised text more closely follows the requirements in NFPA 70, making it easier to understand what's required to comply with NFPA 70.

The charging language of 1010.2.8.2 is primarily the existing language in 1010.2.8.2 with editing to more closely mesh with terms used in NFPA 70. For example, electrical enclosures of wire fence-like material surrounding electrical equipment may not be considered an electrical equipment room – hence the proposed revisions to electrical equipment room, enclosure, or vault.

The criteria in Items 1 through 6 are from current requirements in 1010.2.8.2 and augmented by requirements in these sections of NFPA 70:

1. 110.26(C)(3) – electrical equipment rooms, enclosures, or vaults for 1000 volts or less
2. 110.31(A)(4) – electrical equipment vaults for more than 1000 volts
3. 110.33(A)(3) – electrical equipment rooms or enclosures for more than 1000 volts
4. 450.43(C) – transformer vaults
5. 480.1 and 480.10(E) – batteries and energy storage systems
6. 646.19 – modular data centers

Also, these six criteria were separated into items for easier correlation to NFPA 70 requirements.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal should result in no cost increase or decrease. The IBC requires compliance to the NEC, and the proposed revisions are intended for ease of understanding this aspect of NEC requirements.

E59-24

Public Hearing Results (CAH1)

Committee Action: **As Submitted**

Committee Reason: This clarifies the requirements for electrical equipment rooms and coordinates with NFPA 70. (Vote 14-0)

E59-24

Individual Consideration Agenda

Comment 1:

IBC: 1010.2.8.2.1; IFC: 1010.2.8.2.1

Proponents: Micah Chappell, Seattle Department of Construction and Inspections, Seattle Department of Construction and Inspections (micah.chappell@seattle.gov); Ken Brouillette, Seattle Fire Department, Seattle Fire Department (ken.brouillette@seattle.gov) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

Revise as follows:

1010.2.8.2.1 Electrical equipment room doors. Exit doors and exit access doors of such electrical room, enclosure, or vault shall swing in the direction of egress travel, and locks and latches on the doors shall be provided with panic hardware or fire exit hardware.

Exception: Room, enclosure, or vault in Group R-3 or R-4 occupancies containing ESS that comply with Section 1207.11 of the *International Fire Code*.

2024 International Fire Code

Revise as follows:

1010.2.8.2.1 Electrical equipment room doors. Exit doors and exit access doors of such electrical room, enclosure, or vault shall swing in the direction of egress travel, and locks and latches on the doors shall be provided with panic hardware or fire exit hardware.

Exception: Room, enclosure, or vault in Group R-3 or R-4 occupancies containing ESS that comply with Section 1207.11.

Reason: We believe this added exception captures the intent of the original proposal and IFC Section 1207.11 that guides the installation of ESS in Group R-3 and R-4 occupancies. This exception would specify that panic hardware would not be required for exit doors or exit access doors from areas of Group R-3 and R-4 occupancies that contain energy storage systems that comply with the appropriate section of the IFC.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This modification would clarify that panic hardware is not required for areas in R-3 and R-4 occupancies that have ESS installed in compliance with 1207.11 of the Fire Code.

Comment (CAH2)# 626

E60-24

IBC: 1010.2.12.1; IFC: [BE] 1010.2.12.1

Proposed Change as Submitted

Proponents: John Woestman, Kellen Company, Builders Hardware Manufacturers Association (BHMA) (jwoestman@kellencompany.com)

2024 International Building Code

Revise as follows:

1010.2.12.1 Delayed egress locking system. The delayed egress electrical locking system shall be installed and operated in accordance with all of the following:

1. The delay of the delayed egress electrical locking system shall deactivate upon actuation of the *automatic sprinkler system* or *automatic fire detection system*, allowing immediate free egress.
2. The delay of the delayed egress electrical locking system shall deactivate upon loss of power to the electrical locking system or electrical lock, allowing immediate free egress.
3. The delay of the delayed egress locking electrical system shall have the capability of being deactivated at the *fire command center* and other *approved* locations.
4. ~~An attempt to egress shall initiate an irreversible process that shall allow such egress in not more than 15 seconds when~~ When a physical effort to exit is applied to the egress side door hardware for not more than 3 seconds, an irreversible process shall be initiated that allows such egress in not more than 15 seconds. Initiation of the irreversible process shall activate an audible signal in the vicinity of the door. ~~Once the delay has been deactivated, rearming~~ Rearming the delay electronics shall be by manual means only. **Exception:** Where *approved*, a delay of not more than 30 seconds is permitted on a door with a delayed egress ~~door~~ locking system.
5. The egress path from any point shall not pass through more than one delayed egress locking system. **Exceptions:**
    1. In Group I-1, Condition 2, Group I-2 or I-3 occupancies, the egress path from any point in the *building* shall pass through not more than two delayed egress locking systems provided that the combined delay does not exceed 30 seconds.
    2. In Group I-1, Condition 1 or Group I-4 occupancies, the egress path from any point in the *building* shall pass through not more than two delayed egress locking systems provided the combined delay does not exceed 30 seconds and the *building* is equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1.
    3. The egress path from any point in the building shall be permitted to pass a second delayed egress locking systems where the irreversible process of the second delayed egress locking system is initiated concurrently with the irreversible process required by Item 4 of the first delayed egress locking system.

6. A sign shall be provided on the door and shall be located above and within 12 inches (305 mm) of the door exit hardware. **Exception:** Where *approved*, in Group I occupancies, the installation of a sign is not required where care recipients who because of clinical needs require restraint or containment as part of the function of the treatment area.
   6.1. For doors that swing in the direction of egress, the sign shall read, "PUSH UNTIL ALARM SOUNDS. DOOR CAN BE OPENED IN 15 [30] SECONDS."
   6.2. For doors that swing in the opposite direction of egress, the sign shall read, "PULL UNTIL ALARM SOUNDS. DOOR CAN BE OPENED IN 15 [30] SECONDS."
   6.3. The sign shall comply with the visual character requirements in ICC A117.1.

7. Emergency lighting shall be provided on the egress side of the door.
8. The electromechanical or electromagnetic locking device shall be *listed* in accordance with either UL 294 or UL 1034 .

2024 International Fire Code

Revise as follows:

[BE] 1010.2.12.1 Delayed egress locking system. The delayed egress electrical locking system shall be installed and operated in accordance with all of the following:

1. The delay of the delayed egress electrical locking system shall deactivate upon actuation of the *automatic sprinkler system* or automatic fire detection system, allowing immediate, free egress.
2. The delay of the delayed egress electrical locking system shall deactivate upon loss of power to the electrical locking system or electrical lock , allowing immediate free egress.
3. The delay of the delayed egress locking electrical system shall have the capability of being deactivated at the *fire command center* and other *approved* locations.
4. ~~An attempt to egress shall initiate an irreversible process that shall allow such egress in not more than 15 seconds when~~ When a physical effort to exit is applied to the egress side door hardware for not more than 3 seconds, an irreversible process shall be initiated that allows such egress in not more than 15 seconds. Initiation of the irreversible process shall activate an audible signal in the vicinity of the door. ~~Once the delay has been deactivated, rearming~~ Rearming the delay electronics shall be by manual means only. **Exception:** Where *approved*, a delay of not more than 30 seconds is permitted on a door with a delayed egress ~~door~~ locking system.
5. The egress path from any point shall not pass through more than one delayed egress locking system. **Exceptions:**
   1. In Group I-1, Condition 2, Group I-2 or I-3 occupancies, the egress path from any point in the building shall pass through not more than two delayed egress locking systems provided that the combined delay does not exceed 30 seconds.
   2. In Group I-1, Condition 1 or Group I-4 occupancies, the egress path from any point in the building shall pass through not more than two delayed egress locking systems provided that the combined delay does not exceed 30 seconds and the building is equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1.
   3. The egress path from any point in the building shall be permitted to pass a second delayed egress locking systems where the irreversible process of the second delayed egress locking system is initiated concurrently with the irreversible process required by Item 4 of the first delayed egress locking system.

6. A sign shall be provided on the door and shall be located above and within 12 inches (305 mm) of the door exit hardware: **Exception:** Where *approved*, in Group I occupancies, the installation of a sign is not required where care recipients who, because of clinical needs, require restraint or containment as part of the function of the treatment area.
   6.1. For doors that swing in the direction of egress, the sign shall read: "PUSH UNTIL ALARM SOUNDS. DOOR CAN BE OPENED IN 15 [30] SECONDS."
   6.2. For doors that swing in the opposite direction of egress, the sign shall read: "PULL UNTIL ALARM SOUNDS. DOOR CAN BE OPENED IN 15 [30] SECONDS."
   6.3. The sign shall comply with the visual character requirements in ICC A117.1.
7. Emergency lighting shall be provided on the egress side of the door.
8. The electromechanical or electromagnetic locking device shall be listed in accordance with either UL 294 or UL 1034.

Reason: In Item 4 and the exception to Item 4, the proposed revisions are primarily editorial. However, the revisions in the last sentence of Item 4 are technical, but are intended to clarify the intent of the code.

The last sentence of Item 4 is typically interpreted to require the delay electronics to be rearmed after the delay of the delayed egress locking system has completed. But, is that actually what this sentence requires? Copied here, for reference, is the existing last sentence of Item 4: "Once the delay electronics have been deactivated, rearming the delay electronics shall be by manual means only."

Examining the current language, it has explicit requirements for rearming the locking system once the delay has completed, but, this sentence doesn't explicitly permit, or prohibit, rearming the delay electronics while the delay is underway. From a code perspective, if it's not prohibited, it's permitted. If this last sentence of Item 4 is interpreted that the delay electronics are not prohibited from being rearmed while the delay is underway, then it could be further interpreted the rearming could be executed by other than manual means only.

Rearming the delayed egress locking system, after the delay has deactivated, by manual means only communicates the intent that an authorized person, typically an employee or staff person, is required to physically be at the door to investigate what triggered the activation of the delayed egress locking system and to ensure that it is safe to re-set the delay.

With these thoughts in mind, the perspective from which the revisions to the last sentence of Item 4 are written: With a person at the delayed egress door to rearm the locking system manually, and to ensure it's safe to do so, there's little, if any, difference if the delayed egress locking system is rearmed while the delay is underway, or the locking system is rearmed after the delay has completed. In other words, there's little, if any, benefit to be gained if the locking system may be rearmed only after the delay has completed, compared to permitting rearming the locking system at any time after the delay has been initiated, assuming the rearming is required to be by manual means only (a person physically is at the door).

Moving to Item 5, the proposed new exception to Item 5 is intended to address situations in other than I-1 or I-2 where more than one delayed egress locking systems are desired. Consider the situation where a delayed locking system is needed on the stairway door on the 7th floor, and the building owner desires or needs a delayed egress locking system on the ground floor stairway discharge door. This new exception is intended to address these situations.

This proposed additional exception to Item 5 is intended to permit a 2nd delayed egress locking system where the delay of the 2nd system is initiated simultaneously with the delay of the 1st system. The effect is there is no delay at the 2nd delayed egress door for the occupant that goes through the 1st delayed egress locked door.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal should not increase or decrease the cost of construction.

The proposed revisions in Section 1010.2.12.1, Item 4are intended to clarify the intent of the code.

The proposed new exception in Section 1010.2.12.1, Item 5 is an optional application of a second delayed egress locking system. Delayed egress locking systems are not required by the code.

E60-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The proposal was disapproved. Item 4 is a good clarification, however there was concerns about Exception 3 in Item 5. Where there are two doors in a series with delayed egress locks, should there be syncing of the doors; or is this all doors that could be reached? Exception 3 in item 5 is too difficult to program and test and should be addressed through alternative means on a case by case basis. (Vote: 11-2)

E60-24

Individual Consideration Agenda

Comment 1:

IBC: 1010.2.12.1; IFC: [BE] 1010.2.12.1

Proponents: John Woestman, Kellen Company, Builders Hardware Manufacturers Association (BHMA) (jwoestman@kellencompany.com) requests As Modified by Committee (AMC2)

Further modify as follows:

2024 International Building Code

Revise as follows:

1010.2.12.1 Delayed egress locking system. The delayed egress electrical locking system shall be installed and operated in accordance with all of the following:

1. The delay of the delayed egress electrical locking system shall deactivate upon actuation of the *automatic sprinkler system* or *automatic fire detection system*, allowing immediate free egress.
2. The delay of the delayed egress electrical locking system shall deactivate upon loss of power to the electrical locking system or electrical lock, allowing immediate free egress.
3. The delay of the delayed egress locking electrical system shall have the capability of being deactivated at the *fire command center* and other *approved* locations.
4. When a physical effort to exit is applied to the egress side door hardware for not more than 3 seconds, an irreversible process shall be initiated that allows such egress in not more than 15 seconds. Initiation of the irreversible process shall activate an audible signal in the vicinity of the door. Rearming the delay electronics shall be by manual means only. **Exception:** Where *approved*, a delay of not more than 30 seconds is permitted on a door with a delayed egress locking system.

5. The egress path from any point shall not pass through more than one delayed egress locking system. **Exceptions:**
    1. In Group I-1, Condition 2, Group I-2 or I-3 occupancies, the egress path from any point in the *building* shall pass through not more than two delayed egress locking systems provided that the combined delay does not exceed 30 seconds.
    2. In Group I-1, Condition 1 or Group I-4 occupancies, the egress path from any point in the *building* shall pass through not more than two delayed egress locking systems provided the combined delay does not exceed 30 seconds and the *building* is equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1.
    3. ~~The egress path from any point in the building shall be permitted to pass a second delayed egress locking systems where the irreversible process of the second delayed egress locking system is initiated concurrently with the irreversible process required by Item 4 of the first delayed egress locking system.~~

6. A sign shall be provided on the door and shall be located above and within 12 inches (305 mm) of the door exit hardware. **Exception:** Where *approved*, in Group I occupancies, the installation of a sign is not required where care recipients who because of clinical needs require restraint or containment as part of the function of the treatment area.
    6.1. For doors that swing in the direction of egress, the sign shall read, "PUSH UNTIL ALARM SOUNDS. DOOR CAN BE OPENED IN 15 [30] SECONDS."
    6.2. For doors that swing in the opposite direction of egress, the sign shall read, "PULL UNTIL ALARM SOUNDS. DOOR CAN BE OPENED IN 15 [30] SECONDS."
    6.3. The sign shall comply with the visual character requirements in ICC A117.1.
7. Emergency lighting shall be provided on the egress side of the door.
8. The electromechanical or electromagnetic locking device shall be *listed* in accordance with either UL 294 or UL 1034 .

2024 International Fire Code

Revise as follows:

[BE] 1010.2.12.1 Delayed egress locking system. The delayed egress electrical locking system shall be installed and operated in accordance with all of the following:

1. The delay of the delayed egress electrical locking system shall deactivate upon actuation of the *automatic sprinkler system* or automatic fire detection system, allowing immediate, free egress.
2. The delay of the delayed egress electrical locking system shall deactivate upon loss of power to the electrical locking system or electrical lock , allowing immediate free egress.
3. The delay of the delayed egress locking electrical system shall have the capability of being deactivated at the *fire command center* and other *approved* locations.
4. When a physical effort to exit is applied to the egress side door hardware for not more than 3 seconds, an irreversible process shall be initiated that allows such egress in not more than 15 seconds. Initiation of the irreversible process shall activate an audible signal in the vicinity of the door. Rearming the delay electronics shall be by manual means only. **Exception:** Where *approved*, a delay of not more than 30 seconds is permitted on a door with a delayed egress locking system.

5. The egress path from any point shall not pass through more than one delayed egress locking system. **Exceptions:**

    1. In Group I-1, Condition 2, Group I-2 or I-3 occupancies, the egress path from any point in the building shall pass through not more than two delayed egress locking systems provided that the combined delay does not exceed 30 seconds.
    2. In Group I-1, Condition 1 or Group I-4 occupancies, the egress path from any point in the building shall pass through not more than two delayed egress locking systems provided that the combined delay does not exceed 30 seconds and the building is equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1.
    3. ~~The egress path from any point in the building shall be permitted to pass a second delayed egress locking systems where the irreversible process of the second delayed egress locking system is initiated concurrently with the irreversible process required by Item 4 of the first delayed egress locking system.~~

6. A sign shall be provided on the door and shall be located above and within 12 inches (305 mm) of the door exit hardware: **Exception:** Where *approved*, in Group I occupancies, the installation of a sign is not required where care recipients who, because of clinical needs, require restraint or containment as part of the function of the treatment area.
    6.1. For doors that swing in the direction of egress, the sign shall read: "PUSH UNTIL ALARM SOUNDS. DOOR CAN BE OPENED IN 15 [30] SECONDS."
    6.2. For doors that swing in the opposite direction of egress, the sign shall read: "PULL UNTIL ALARM SOUNDS. DOOR CAN BE OPENED IN 15 [30] SECONDS."
    6.3. The sign shall comply with the visual character requirements in ICC A117.1.
7. Emergency lighting shall be provided on the egress side of the door.
8. The electromechanical or electromagnetic locking device shall be listed in accordance with either UL 294 or UL 1034.

Reason: The committee was concerned with proposed new Exception 3 of Item 5, and appeared to be supportive of the revisions of Item 4.

This comment removes (deletes) the proposed text of concern.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposed revisions in Section 1010.2.12.1, Item 4 are intended to clarify the intent of the code.

Comment (CAH2)# 681

E63-24

IBC: 1010.3.5 (New); IFC: 1010.3.5 (New)

Proposed Change as Submitted

Proponents: John Woestman, Kellen Company, Builders Hardware Manufacturers Association (BHMA) (jwoestman@kellencompany.com)

2024 International Building Code

Add new text as follows:

1010.3.5 Airport Terminal Exit Lanes. Airport terminal egress from the secured airside area to the nonsecured landside area shall be permitted to be through exit lane breach control systems which comply with all of the following:

1. The exit lane breach control system is installed in accordance with the manufacturer's instructions.
2. The exit lane breach control system is approved by the building official.
3. The exit lane breach control system is accepted by the U.S. Department of Homeland Security (DHS) Transportation Security Administration (TSA).
4. The operation of the exit lane breach control system is included in the TSA-required airport security program.

2024 International Fire Code

Add new text as follows:

1010.3.5 Airport Terminal Exit Lanes. Airport terminal egress from the secured airside area to the nonsecured landside area shall be permitted to be through exit lane breach control systems which comply with all of the following:

1. The exit lane breach control system is installed in accordance with the manufacturer's instructions.
2. The exit lane breach control system is approved by the building official.
3. The exit lane breach control system is accepted by the U.S. Department of Homeland Security (DHS) Transportation Security Administration (TSA).
4. The operation of the exit lane breach control system is included in the TSA-required airport security program.

Reason: Airport exit lane breach control systems facilitate passenger movement in the terminals from secure areas to non-secure areas. Airports are installing these automated systems to improve security and remove much of the human element where arriving passengers move from the secure area of the airport to the unsecured area. The IBC is currently silent regarding requirements for airport exit lane breach control systems.

Airport exit lane breach control systems are relatively sophisticated, and not all the details as to how they work are made public (for good reasons). These systems incorporate power-operated doors, sensors, cameras, alarms, and electronic and human monitoring, all designed to detect unauthorized intruders and unauthorized objects.

Portland, Oregon airport exit lane breach control system.

This four-minute video of one manufacturer's exit lane breach control systems provides a good illustration of the functions: https://www.youtube.com/watch?v=PxMQB4ykOeo

Additional information about exit lane breach control systems is available:

https://www.assaabloyentrance.com/global/en/solutions/products/security-entrance-control/exit-lanes
https://www.hortondoors.com/additional-products/exit-breach-control/secure-exit-lane/

The TSA requires the airport's security program to include operation procedures for exit lane breach control systems.

The TSA does not "approve" the method for controlling exit lanes they no longer staff in airports—they only accept or do not accept the solution. However, the TSA can levy penalties or open a Letter of Investigation for breaches and any incidents that occur. As a result, it is in the airport's best interest to work closely with local TSA during the design and procurement stages and to update the airport security plan as appropriate.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal does not increase or decrease the cost of construction.
Airports are not required by this proposal to install exit lane breach control systems. This proposal provides guidance and requirements for airport exit lane breach control systems, should they be installed.

E63-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: These types of doors should be included in the code, but the requirements need further work. Items 3 and 4 could not be verified by the code official since they would not have access to airport security items. Several of the new terms used in the proposal should be defined. Should there be a minimum depth between doors? Item 2 needs to provide guidance for the code official for

access controls, connection to alarm systems, limitations for the number of occupants, etc. similar to the other special locking arrangements. (Vote: 12-2)

E63-24

Individual Consideration Agenda

Comment 1:

IBC: SECTION 202 (New), 1010.3.5; IFC: SECTION 202 (New), 1010.3.5

Proponents: John Woestman, Kellen Company, Builders Hardware Manufacturers Association (BHMA) (jwoestman@kellencompany.com) requests As Modified by Committee (AMC2)

Further modify as follows:

2024 International Building Code

Add new definition as follows:

EXIT LANE BREACH CONTROL SYSTEM. In airports, a system of doors which facilitates occupant movement in the intended direction, and provides access control to prevent wrong way movement of unauthorized persons and objects.

SECURED AIRSIDE AREA. In airports, the spaces of airport terminal buildings where passengers and personnel are authorized after having passed security screening. Passengers board airplanes from these spaces, and disembark airplanes into these spaces.

NON-SECURED LANDSIDE AREA . In airports, the spaces of airport terminal buildings open to the public.

Revise as follows:

1010.3.5 Airport terminal exit lanes. Airport terminal ~~egress~~ occupant movement from the *secured airside area* to the *non-secured landside area* shall be permitted to be through *exit lane breach control systems* which comply with ~~all of~~ the following:

1. ~~The exit~~ *Exit lane breach control* ~~*system* is~~ *systems* shall be installed in accordance with the manufacturer's instructions.
2. ~~The exit~~ *Exit lane breach control* ~~*system* is approved~~ *systems* shall be subject to approval by the building official.
3. ~~The exit lane breach control system is accepted by the U.S. Department of Homeland Security (DHS) Transportation Security Administration (TSA).~~
4. ~~The operation of the exit lane breach control system is included in the TSA-required airport security program.~~

2024 International Fire Code

Add new definition as follows:

EXIT LANE BREACH CONTROL SYSTEM. In airports, a system of doors which facilitates occupant movement in the intended direction, and provides access control to prevent wrong way movement of unauthorized persons and objects.

SECURED AIRSIDE AREA. In airports, the spaces of airport terminal buildings where passengers and personnel are authorized after having passed security screening. Passengers board airplanes from these spaces, and disembark airplanes into these spaces.

NON-SECURED LANDSIDE AREA. In airports, the spaces of airport terminal buildings open to the public.

Revise as follows:

1010.3.5 Airport terminal exit lanes. Airport terminal ~~egress~~ occupant movement from the *secured airside area* to the *non-secured landside area* shall be permitted to be through *exit lane breach control systems* which comply with ~~all of~~ the following:

1. ~~The exit~~ *Exit lane breach control* ~~*system* is~~ *systems* shall be installed in accordance with the manufacturer's instructions.
2. ~~The exit~~ *Exit lane breach control* ~~*system* is approved~~ *systems* shall be subject to approval by the building official.
3. ~~The exit lane breach control system is accepted by the U.S. Department of Homeland Security (DHS) Transportation Security Administration (TSA).~~
4. ~~The operation of the exit lane breach control system is included in the TSA-required airport security program.~~

Reason: The committee suggested provisions for these types of door systems should be in the code. In addition, the committee provided suggestions for revisions to the proposal.

Before discussing the proposed revisions to this proposal, a bit more information about these exit lane breach control systems:

Airport exit lane breach control systems facilitate occupant movement in airport terminals from secure areas (the airside areas) to non-secure areas (the landside areas). Typically, the doors in exit lane breach control systems operate just like automatic doors – sensors detect approaching people and open the door(s) for unimpeded travel through the door(s) by one or multiple people. The video in this news article shows these systems in action (at 40 sec): https://www.newschannel5.com/news/new-security-efforts-underway-at-bna-to-protect-travelers. Most important, the primary reason for exit lane breach control systems is air travel safety. These door systems are designed to stop unauthorized persons from traveling the wrong way, and are designed to thwart thrown objects and to detect abandoned objects.

Airports are installing these automated systems to improve security and remove much of the human element where arriving passengers move from the secure area of the airport to the unsecured area. The IBC is currently silent regarding requirements for airport exit lane breach control systems.

Airport exit lane breach control systems are relatively sophisticated, and not all the details as to how they work are made public (for good reasons). These systems incorporate power-operated doors, sensors, cameras, sophisticated electronic monitoring, alarms, and human monitoring, all designed to detect unauthorized intruders and unauthorized objects. Should a person attempt wrong way travel in a lane in the exit lane breach control system, the door(s) in that lane in front of the wrong way person typically close preventing further wrong way travel. Typically, exit lane breach control systems are installed with multiple lanes, and a violation in one lane does not affect the functionality of the other parallel lanes. Exit lane breach control systems are installed in a manner that prevents objects from being thrown over the top while also facilitating fire sprinkler coverage inside the lanes.

Portland, OR airport exit lane breach control systems.

Anchorage, AK airport exit lane breach control systems.

What was Items 3 & 4 are deleted per the committee reasons.
Three definitions are proposed – the committee suggested several of the new terms should be defined.
Regarding the suggestion to provide guidance for code officials for additional topics . . . in airports, exit lane breach control systems are typically installed near where TSA security screening is located. The TSA is responsible for screening essentially all persons desiring to move from the non-secure landside space of the airport to the secure airside space. Occupant flow in the other direction – from the secure space to the non-secure space – is typically routed either through a staffed exit lane (where the staff is responsible to monitor and prevent wrong way travel in the exit lane) or through an exit lane breach control system which facilitates travel in the exit direction while also preventing and blocking travel in the wrong way direction. Exit lanes, staffed or with exit lane breach control systems, are designed and sized to accommodate all occupant traffic moving from the secured space to the non-secured space of the airport terminal building. Exit lane breach control systems are typically in one of the means of egress and are complemented by numerous other means of egress from the secured space of the airport terminal. In the event of fire or smoke, the exit lane breach control system typically would need to function much as it would during non-emergency use: facilitating people movement in the intended direction while also preventing wrong way movement.

And, exit lane breach control systems in the means of egress would be required to comply with all applicable egress provisions. Similarly, exit lane breach control systems on an accessible route would be required to comply with applicable provisions for accessibility.
This four-minute video of one manufacturer's exit lane breach control systems provides a good illustration of the functions: https://www.youtube.com/watch?v=PxMQB4ykOeo

Additional information about exit lane breach control systems is available:

https://www.assaabloyentrance.com/global/en/solutions/products/security-entrance-control/exit-lanes
https://www.hortondoors.com/additional-products/exit-breach-control/secure-exit-lane/

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Airports are not required by this proposal to install exit lane breach control systems. This proposal provides guidance and requirements for airport exit lane breach control systems, should they be installed.

Comment (CAH2)# 685

E65-24

IBC: 1010.5.1; IFC: [BE] 1010.5.1

Proposed Change as Submitted

Proponents: Daniel Nichols, MTA Construction and Development, MTA Construction and Development (dnichols@mnr.org)

2024 International Building Code

Revise as follows:

1010.5.1 Capacity. Each turnstile or similar device shall be credited with a capacity based on not more than a 50-*person occupant load* where all of the following provisions are met:

1. Each device shall turn free in the direction of egress travel when primary power is lost and on the manual release by ~~an employee in the area~~ a trained person in an approved method.
2. Such devices are not given credit for more than 50 percent of the required egress capacity or width.
3. Each device is not more than 39 inches (991 mm) high.
4. Each device has not less than $16^{1}/_{2}$ inches (419 mm) clear width at and below a height of 39 inches (991 mm) and not less than 22 inches (559 mm) clear width at heights above 39 inches (991 mm).

2024 International Fire Code

Revise as follows:

[BE] 1010.5.1 Capacity. Each turnstile or similar device shall be credited with a capacity based on not more than a 50-person *occupant load* where all of the following provisions are met:

1. Each device shall turn free in the direction of egress travel when primary power is lost and on the manual release by ~~an employee in the area~~ a trained person in an approved method.
2. Such devices are not given credit for more than 50 percent of the required egress capacity or width.
3. Each device is not more than 39 inches (991 mm) high.
4. Each device has not less than $16^{1}/_{2}$ inches (419 mm) clear width at and below a height of 39 inches (991 mm) and not less than 22 inches (559 mm) clear width at heights above 39 inches (991 mm).

Reason: The use of turnstiles occurs in many locations such as transportation facilities, lobby control in access-limited buildings, and amusement locations. The current language states that turnstiles need to have a manual release by an "employee in the area", but provides no reasoning for the limitation to an employee, nor to a physical dimension of "in the area".

The proposal moves towards the need for trained personnel to be able to react and have that methodology approved by the AHJ. This could be as simple as a security desk having CCTV observation ability and a remote release for a control point at a building entrance out-of-view, to a multi-lane point of entry into an amusement park with a coordinated command center. Further, the proposal does not remove or inhibit the current use of the "employee in the area" for jurisdictions that already successfully utilize the section.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This provides another option to provide manual release of turnstiles. Many turnstiles already free spin or operate in the direction of egress, so this would provide options due to changes in technology.

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: This proposal was disapproved. The committee felt that E64-24 was more comprehensive. The proposed language would be difficult to enforce. (Vote: 14-0)

E65-24

Individual Consideration Agenda

Comment 1:

IBC: 1010.5.1; IFC: [BE] 1010.5.1

Proponents: Daniel Nichols, MTA Construction and Development, MTA Construction and Development (dnichols@mnr.org) requests As Modified by Committee (AMC2)

Replace as follows:

2024 International Building Code

Revise as follows:

1010.5.1 Capacity. Each turnstile or similar device shall be credited with a capacity based on not more than a 50-*person occupant load* where all of the following provisions are met:

1. Each device shall turn free in the direction of egress travel when primary power is lost and on the manual release by a ~~n employee in the area~~ person that can monitor the location and is trained in accordance with Section 406 of the International Fire Code.
2. Such devices are not given credit for more than 50 percent of the required egress capacity or width.
3. Each device is not more than 39 inches (991 mm) high.
4. Each device has not less than $16^{1}/_{2}$ inches (419 mm) clear width at and below a height of 39 inches (991 mm) and not less than 22 inches (559 mm) clear width at heights above 39 inches (991 mm).

2024 International Fire Code

Revise as follows:

[BE] 1010.5.1 Capacity. Each turnstile or similar device shall be credited with a capacity based on not more than a 50-person *occupant load* where all of the following provisions are met:

1. Each device shall turn free in the direction of egress travel when primary power is lost and on the manual release by a~~n employee in the area~~ person that can monitor the location and is trained in accordance with Section 406.
2. Such devices are not given credit for more than 50 percent of the required egress capacity or width.
3. Each device is not more than 39 inches (991 mm) high.

4. Each device has not less than $16\frac{1}{2}$ inches (419 mm) clear width at and below a height of 39 inches (991 mm) and not less than 22 inches (559 mm) clear width at heights above 39 inches (991 mm).

Reason: This comment is to further define the operator of the manual release. The current language of "employee in the area" does not provide any actual qualifications of the person, limits the person to an employee, and gives the term "area" which has no performance requirements. The proposal adds a direct link to the education required by the actual operator of the applicable fire safety, evacuation, and lockdown plans.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is an operational change with no construction cost implications.

Comment (CAH2)# 439

E67-24

IBC: 1011.5.2; IFC: [BE] 1011.5.2

Proposed Change as Submitted

Proponents: Thomas Zuzik Jr, RailingCodes.com, National Ornamental & Miscellaneous Metals Association (NOMMA.org) (coderep@railingcodes.com)

2024 International Building Code

1011.5 Stair treads and risers. *Stair* treads and risers shall comply with Sections 1011.5.1 through 1011.5.5.3.

1011.5.1 Dimension reference surfaces. For the purpose of this section, all dimensions are exclusive of carpets, rugs or runners.

Revise as follows:

1011.5.2 Riser height and tread depth. *Stair* riser heights shall be 7 inches (178 mm) maximum and 4 inches (102 mm) minimum. The riser height shall be measured vertically between the *nosings* of adjacent treads, ~~or~~ between the nosing of the ~~*stairway*~~ upper landing and the adjacent lower tread, and between the nosing of the bottom tread and a projected point forward on the lower landing equal to the bottom tread's depth. Rectangular tread depths shall be 11 inches (279 mm) minimum measured horizontally between the vertical planes of the foremost projection of adjacent treads and at a right angle to the tread's *nosing*. *Winder* treads shall have a minimum tread depth of 11 inches (279 mm) between the vertical planes of the foremost projection of adjacent treads at the intersections with the walkline and a minimum tread depth of 10 inches (254 mm) within the clear width of the stair. **Exceptions:**

1. *Spiral stairways* in accordance with Section 1011.10.
2. *Stairways* connecting stepped *aisles* to cross *aisles* or concourses shall be permitted to use the riser/tread dimension in Section 1030.14.2.
3. In Group R-3 occupancies; within *dwelling units* in Group R-2 occupancies not required by Chapter 11 to be *Accessible* or Type A dwelling or *sleeping units* ; and in Group U occupancies that are accessory to a Group R-3 occupancy or accessory to individual *dwelling units* in Group R-2 occupancies; the maximum riser height shall be $7\,^{3}/_{4}$ inches (197 mm); the minimum tread depth shall be 10 inches (254 mm); the minimum *winder* tread depth at the walkline shall be 10 inches (254 mm); and the minimum *winder* tread depth shall be 6 inches (152 mm). A *nosing* projection not less than $^{3}/_{4}$ inch (19.1 mm) but not more than $1\,^{1}/_{4}$ inches (32 mm) shall be provided on *stairways* with solid risers where the tread depth is less than 11 inches (279 mm).
4. See Section 503.1 of the International Existing Building Code for the replacement of existing *stairways*.
5. In Group I-3 *facilities*, *stairways* providing access to guard towers, observation stations and control rooms, not more than 250 square feet (23 m^2) in area, shall be permitted to have a maximum riser height of 8 inches (203 mm) and a minimum tread depth of 9 inches (229 mm).
6. Where only a single riser is located between 2 landings, the riser height shall be measured between the upper landing's nosing and a projected point on the lower landing 11 inches (280 mm) forward of the upper landing's nosing.

2024 International Fire Code

[BE] 1011.5 Stair treads and risers. *Stair* treads and risers shall comply with Sections 1011.5.1 through 1011.5.5.3.

[BE] 1011.5.1 Dimension reference surfaces. For the purpose of this section, all dimensions are exclusive of carpets, rugs or runners.

Revise as follows:

[BE] 1011.5.2 Riser height and tread depth. *Stair* riser heights shall be 7 inches (178 mm) maximum and 4 inches (102 mm) minimum.

The riser height shall be measured vertically between the *nosings* of adjacent treads, ~~or~~ between the nosing of the ~~*stairway*~~ upper landing and the adjacent lower tread, and between the nosing of the bottom tread and a projected point forward on the lower landing equal to the bottom tread's depth. Rectangular tread depths shall be 11 inches (279 mm) minimum measured horizontally between the vertical planes of the foremost projection of adjacent treads and at a right angle to the tread's *nosing*. *Winder* treads shall have a minimum tread depth of 11 inches (279 mm) between the vertical planes of the foremost projection of adjacent treads at the intersections with the walkline and a minimum tread depth of 10 inches (254 mm) within the clear width of the stair. **Exceptions:**

1. *Spiral stairways* in accordance with Section 1011.10.
2. *Stairways* connecting stepped *aisles* to cross *aisles* or concourses shall be permitted to use the riser/tread dimension in Section 1030.14.2.
3. In Group R-3 occupancies; within *dwelling units* in Group R-2 occupancies not required by Chapter 11 to be *Accessible* or *Type A* dwelling or sleeping units; and in Group U occupancies that are accessory to a Group R-3 occupancy or accessory to individual *dwelling units* in Group R-2 occupancies; the maximum riser height shall be $7^3/_4$ inches (197 mm); the minimum tread depth shall be 10 inches (254 mm); the minimum *winder* tread depth at the walkline shall be 10 inches (254 mm); and the minimum *winder* tread depth shall be 6 inches (152 mm). A *nosing* projection not less than $^3/_4$ inch (19.1 mm) but not more than $1^1/_4$ inches (32 mm) shall be provided on *stairways* with solid risers where the tread depth is less than 11 inches (279 mm).
4. See Section 503.1 of the International Existing Building Code for the replacement of existing *stairways*.
5. In Group I-3 facilities, *stairways* providing access to guard towers, observation stations and control rooms, not more than 250 square feet (23 m^2) in area, shall be permitted to have a maximum riser height of 8 inches (203 mm) and a minimum tread depth of 9 inches (229 mm).
6. Where only a single riser is located between 2 landings, the riser height shall be measured between the upper landing's nosing and a projected point on the lower landing 11 inches (280 mm) forward of the upper landing's nosing.

Reason: This code change is centered on clarifying where a bottom riser's, height measurement, is to be taken in conjunction with the lower landing.

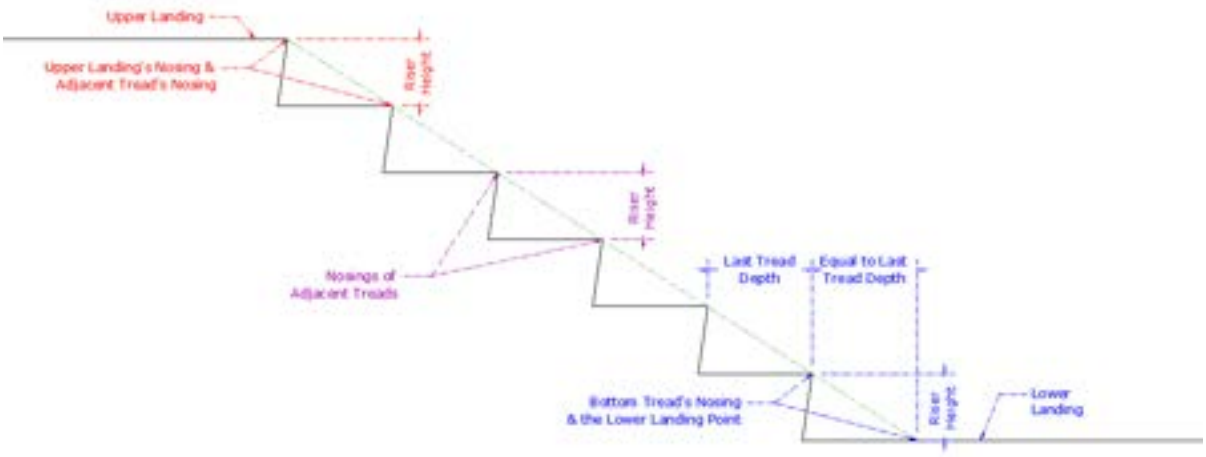
There are 3 distinct parts of a stair flight for when measuring riser heights.

1. The top landing's nosing, to the nosing of the first tread down, the adjacent tread.
2. The nosings of adjacent treads within the flight of stairs.
3. The bottom tread's nosing and the lower landing.

Currently the code is clear in that you are to measure from the upper landing's nosing to the adjacent lower tread's nosing, and to measure from the nosing of one tread to an adjacent tread within the flight, as they all have **nosings.** The confusion and or question comes in that the lower landing does not have a physical/traditional nosing point per say, as defined within the code, and as thus, many a times the bottom riser is measured directly at the bottom tread's riser and not at the same point in distance as every other riser within the flight of stairs, which are all measured to an **adjacent nosing**.

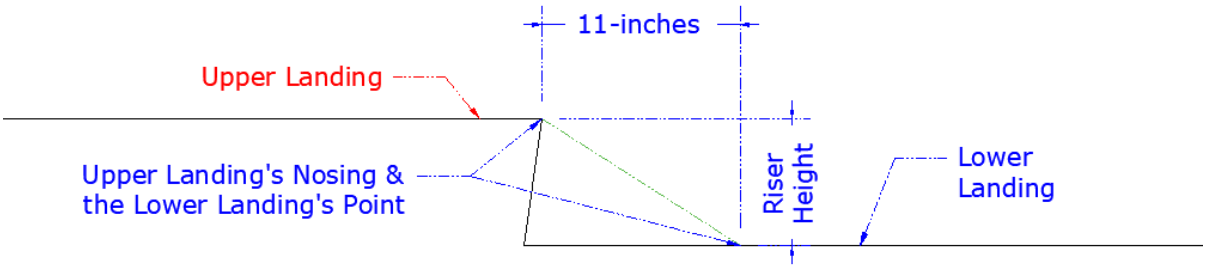
In Section 1014.7 Handrail extensions. The code requires that handrail extensions continue for one tread depth beyond the bottom tread's nosing, this is theorized to be for when descending or ascending the same area is used by the person on the stair flight. With this in our focus, this code change represents that the same theory and point justified and specified for the handrail extension, is to be used for the riser measurement on the lower landing, keeping in mind that this is the same measurement point used within the stair flight on all the other risers up to this point.

To help show a visual representation of the new text, sketch RC-01 included in this reason statement below shows the 3 distinct types of riser measurements within a flight of stairs, in conjunction with a superimposed nosing line as reference for a point of contact on the lower landing, proposed to being revised.



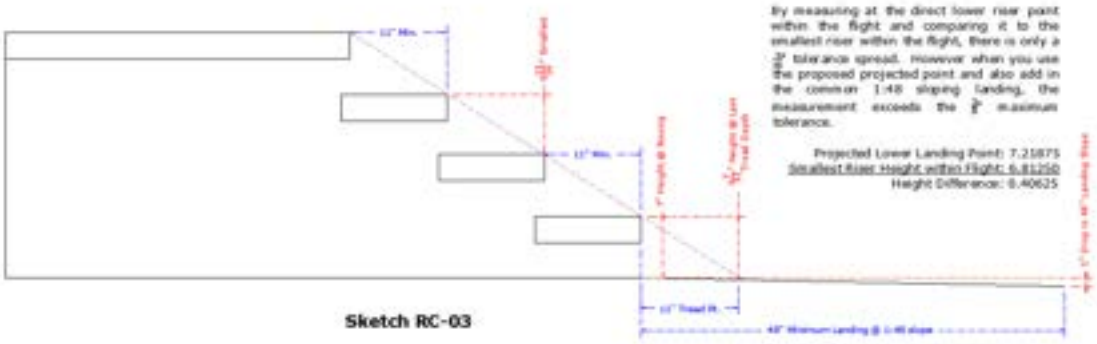
SKETCH RC-01

The second sketch RC-02 included in this reason statement is for the exception and explains the same point of measurement for when there is only one single riser between 2 landings and provides direction with the exception when there are no treads, by following the bottom tread requirement in a flight with the specified minimum tread depth of 11 inches for these specific single riser conditions.



SKETCH RC-02

Of note to keep in mind, If the smallest riser height within a flight is 6.8125", and the bottom riser height at the lower landing is 7", at the riser. And the lower landing slopes away at 1:48, 1/4" to the foot, then at the minimum 11" projected forward point you will be over the maximum 3/8" tolerance allowed per code, see sketch RC-03.



SKETCH RC-03

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

We believe that there are no cost increases or decrease with this code change, as it only further clarifies the measurement point of the required measurement for where the bottom riser height of a stair flight shall be taken.

E67-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: This proposal is overly complicated and confusing. (Vote: 9-5)

E67-24

Individual Consideration Agenda

Comment 1:

IBC: 1011.5, 1011.5.1, 1011.5.2; IFC: [BE] 1011.5, [BE] 1011.5.1, [BE] 1011.5.2

Proponents: Thomas Zuzik Jr, RailingCodes.com, National Ornamental & Miscellaneous Metals Association (NOMMA.org) (coderep@railingcodes.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

1011.5 Stair treads and risers. *Stair* treads and risers shall comply with Sections 1011.5.1 through 1011.5.5.3.

1011.5.1 Dimension reference surfaces. For the purpose of this section, all dimensions are exclusive of carpets, rugs or runners.

1011.5.2 Riser height and tread depth. *Stair* riser heights shall be 7 inches (178 mm) maximum and 4 inches (102 mm) minimum. The riser height shall be measured vertically between ~~the~~ adjacent *nosings* ~~of adjacent treads~~ within the flight, ~~between the nosing of the upper landing and the adjacent lower tread,~~ and between the ~~nosing of the~~ bottom nosing ~~tread~~ and a projected point forward on the lower landing equal to the bottom tread's depth. Rectangular tread depths shall be 11 inches (279 mm) minimum measured horizontally between the vertical planes of the foremost projection of adjacent treads and at a right angle to the tread's *nosing*. *Winder* treads shall have a minimum tread depth of 11 inches (279 mm) between the vertical planes of the foremost projection of adjacent treads at the intersections with the walkline and a minimum tread depth of 10 inches (254 mm) within the clear width of the stair. **Exceptions:**

1. *Spiral stairways* in accordance with Section 1011.10.
2. *Stairways* connecting stepped *aisles* to cross *aisles* or concourses shall be permitted to use the riser/tread dimension in Section 1030.14.2.
3. In Group R-3 occupancies; within *dwelling units* in Group R-2 occupancies not required by Chapter 11 to be *Accessible* or Type A dwelling or *sleeping units* ; and in Group U occupancies that are accessory to a Group R-3 occupancy or accessory to individual *dwelling units* in Group R-2 occupancies; the maximum riser height shall be $7^3/_4$ inches (197 mm); the minimum tread depth shall be 10 inches (254 mm); the minimum *winder* tread depth at the walkline shall be 10 inches (254 mm); and the minimum *winder* tread depth shall be 6 inches (152 mm). A *nosing* projection not less than $^3/_4$ inch (19.1 mm) but not more than $1^1/_4$ inches (32 mm) shall be provided on *stairways* with solid risers where the tread depth is less than 11 inches (279 mm).
4. See Section 503.1 of the International Existing Building Code for the replacement of existing *stairways*.
5. In Group I-3 *facilities*, *stairways* providing access to guard towers, observation stations and control rooms, not more than 250 square feet (23 m^2) in area, shall be permitted to have a maximum riser height of 8 inches (203 mm) and a minimum tread depth of 9 inches (229 mm).
6. Where ~~only~~ a single riser is located between 2 landings, the riser height shall be measured between the upper landing's nosing and a projected point on the lower landing 11 inches (280 mm) forward of the ~~upper landing's~~ nosing.

2024 International Fire Code

[BE] 1011.5 Stair treads and risers. *Stair* treads and risers shall comply with Sections 1011.5.1 through 1011.5.5.3.

[BE] 1011.5.1 Dimension reference surfaces. For the purpose of this section, all dimensions are exclusive of carpets, rugs or runners.

[BE] 1011.5.2 Riser height and tread depth. *Stair* riser heights shall be 7 inches (178 mm) maximum and 4 inches (102 mm) minimum. The riser height shall be measured vertically between ~~the~~ adjacent *nosings* ~~of adjacent treads~~ within the flight, ~~between the nosing of the upper landing and the adjacent lower tread,~~ and between the ~~nosing of the~~ bottom nosing ~~tread~~ and a projected point forward on the lower landing equal to the bottom tread's depth. Rectangular tread depths shall be 11 inches (279 mm) minimum measured horizontally between the vertical planes of the foremost projection of adjacent treads and at a right angle to the tread's *nosing*. *Winder* treads shall have a minimum tread depth of 11 inches (279 mm) between the vertical planes of the foremost projection of adjacent treads at the intersections with the walkline and a minimum tread depth of 10 inches (254 mm) within the clear width of the stair. **Exceptions:**

1. *Spiral stairways* in accordance with Section 1011.10.
2. *Stairways* connecting stepped *aisles* to cross *aisles* or concourses shall be permitted to use the riser/tread dimension in Section 1030.14.2.
3. In Group R-3 occupancies; within *dwelling units* in Group R-2 occupancies not required by Chapter 11 to be *Accessible* or *Type A* dwelling or sleeping units; and in Group U occupancies that are accessory to a Group R-3 occupancy or accessory to individual *dwelling units* in Group R-2 occupancies; the maximum riser height shall be $7^3/_4$ inches (197 mm); the minimum tread depth shall be 10 inches (254 mm); the minimum *winder* tread depth at the walkline shall be 10 inches (254 mm); and the minimum *winder* tread depth shall be 6 inches (152 mm). A *nosing* projection not less than $^3/_4$ inch (19.1 mm) but not more than $1^1/_4$ inches (32 mm) shall be provided on *stairways* with solid risers where the tread depth is less than 11 inches (279 mm).
4. See Section 503.1 of the International Existing Building Code for the replacement of existing *stairways*.
5. In Group I-3 facilities, *stairways* providing access to guard towers, observation stations and control rooms, not more than 250 square feet (23 m^2) in area, shall be permitted to have a maximum riser height of 8 inches (203 mm) and a minimum tread depth of 9 inches (229 mm).
6. Where ~~only~~ a single riser is located between 2 landings, the riser height shall be measured between the upper landing's nosing and a projected point on the lower landing 11 inches (280 mm) forward of the ~~upper landing's~~ nosing.

Reason: Please Review the original proposals reason statement in addition to these comments about the text modification.

- The model codes went from measuring riser heights at the risers to the now clarified point of the nosings.
  - With this productive change made by the SMA, there was one point over looked in that the lower landing never has a nosing, inline with the stair geometry.
  - As thus, there is no clarified point per code to measure the bottom nosing to the lower landing.
- This measurement issue has been tracked throughout the country by the NOMMA members reporting back to the volunteer committee that reviews and then submits code changes to clarify issues its membership sees in the field that are not on point and enforced uniformly across jurisdictions within a state, and from state to state.
- We understand that the original proposal was wording, as thus, the editing done within this proposal built on the advice of committee member comments at the CAH1 in Florida.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

We beleive that there are no cost increase with this code change, as it only further clarifies the measurement point of the required measurement for where the bottom riser height of a stair flight shall be taken.

Comment (CAH2)# 736

Comment 2:

IBC: 1011.5.2; IFC: [BE] 1011.5.2

Proponents: David Cooper, Stair Manufacturing and Design Consultants, Stairbuilders and Manufacturers Association, SMA (coderep@stairways.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

1011.5.2 Riser height and tread depth. *Stair* riser heights shall be 7 inches (178 mm) maximum and 4 inches (102 mm) minimum. The riser height shall be measured vertically between ~~the *nosings* of~~ adjacent ~~treads~~ nosings, the height of a single riser between landings or the lowest riser of the flight shall be measured vertically from the nosing to a point one tread depth on to the landing. ~~between the nosing of the upper landing and the adjacent lower tread, and between the nosing of the bottom tread and a projected point forward on the lower landing equal to the bottom tread's depth.~~Rectangular tread depths shall be 11 inches (279 mm) minimum measured horizontally between the vertical planes of the foremost projection of adjacent treads and at a right angle to the tread's *nosing*. *Winder* treads shall have a minimum tread depth of 11 inches (279 mm) between the vertical planes of the foremost projection of adjacent treads at the intersections with the walkline and a minimum tread depth of 10 inches (254 mm) within the clear width of the stair. **Exceptions:**

1. *Spiral stairways* in accordance with Section 1011.10.
2. *Stairways* connecting stepped *aisles* to cross *aisles* or concourses shall be permitted to use the riser/tread dimension in Section 1030.14.2.
3. In Group R-3 occupancies; within *dwelling units* in Group R-2 occupancies not required by Chapter 11 to be *Accessible* or Type A dwelling or *sleeping units* ; and in Group U occupancies that are accessory to a Group R-3 occupancy or accessory to individual *dwelling units* in Group R-2 occupancies; the maximum riser height shall be $7\frac{3}{4}$ inches (197 mm); the minimum tread depth shall be 10 inches (254 mm); the minimum *winder* tread depth at the walkline shall be 10 inches (254 mm); and the minimum *winder* tread depth shall be 6 inches (152 mm). A *nosing* projection not less than $\frac{3}{4}$ inch (19.1 mm) but not more than $1\frac{1}{4}$ inches (32 mm) shall be provided on *stairways* with solid risers where the tread depth is less than 11 inches (279 mm).
4. See Section 503.1 of the International Existing Building Code for the replacement of existing *stairways*.

5. In Group I-3 *facilities*, *stairways* providing access to guard towers, observation stations and control rooms, not more than 250 square feet (23 m^2) in area, shall be permitted to have a maximum riser height of 8 inches (203 mm) and a minimum tread depth of 9 inches (229 mm).
6. ~~Where only a single riser is located between 2 landings, the riser height shall be measured between the upper landing's nosing and a projected point on the lower landing 11 inches (280 mm) forward of the upper landing's nosing.~~

2024 International Fire Code

[BE] 1011.5.2 Riser height and tread depth. *Stair* riser heights shall be 7 inches (178 mm) maximum and 4 inches (102 mm) minimum. The riser height shall be measured vertically between ~~the *nosings* of~~ adjacent ~~treads~~ nosings, the height of a single riser between landings or the lowest riser of the flight shall be measured vertically from the nosing to a point one tread depth on to the landing. ~~between the nosing of the upper landing and the adjacent lower tread, and between the nosing of the bottom tread and a projected point forward on the lower landing equal to the bottom tread's depth.~~ Rectangular tread depths shall be 11 inches (279 mm) minimum measured horizontally between the vertical planes of the foremost projection of adjacent treads and at a right angle to the tread's *nosing*. *Winder* treads shall have a minimum tread depth of 11 inches (279 mm) between the vertical planes of the foremost projection of adjacent treads at the intersections with the walkline and a minimum tread depth of 10 inches (254 mm) within the clear width of the stair. **Exceptions:**

1. *Spiral stairways* in accordance with Section 1011.10.
2. *Stairways* connecting stepped *aisles* to cross *aisles* or concourses shall be permitted to use the riser/tread dimension in Section 1030.14.2.
3. In Group R-3 occupancies; within *dwelling units* in Group R-2 occupancies not required by Chapter 11 to be *Accessible* or *Type A* dwelling or sleeping units; and in Group U occupancies that are accessory to a Group R-3 occupancy or accessory to individual *dwelling units* in Group R-2 occupancies; the maximum riser height shall be $7\frac{3}{4}$ inches (197 mm); the minimum tread depth shall be 10 inches (254 mm); the minimum *winder* tread depth at the walkline shall be 10 inches (254 mm); and the minimum *winder* tread depth shall be 6 inches (152 mm). A *nosing* projection not less than $\frac{3}{4}$ inch (19.1 mm) but not more than $1\frac{1}{4}$ inches (32 mm) shall be provided on *stairways* with solid risers where the tread depth is less than 11 inches (279 mm).
4. See Section 503.1 of the International Existing Building Code for the replacement of existing *stairways*.
5. In Group I-3 facilities, *stairways* providing access to guard towers, observation stations and control rooms, not more than 250 square feet (23 m^2) in area, shall be permitted to have a maximum riser height of 8 inches (203 mm) and a minimum tread depth of 9 inches (229 mm).
6. ~~Where only a single riser is located between 2 landings, the riser height shall be measured between the upper landing's nosing and a projected point on the lower landing 11 inches (280 mm) forward of the upper landing's nosing.~~

Reason: This comment provides clear and concise language that meets the intent of the original proposal and assures compliant use of the code.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

We believe that there are no cost increases or decrease with this code change, as it only further clarifies the measurement point of the required measurement for where the bottom riser height of a stair flight shall be taken.

Comment (CAH2)# 216

E68-24

IBC: 1011.5.5.1, 1011.5.5.2; IFC: [BE] 1011.5.5.1, [BE] 1011.5.5.2

Proposed Change as Submitted

Proponents: David Cooper, Stair Manufacturing and Design Consultants, Stairbuilders and Manufacturers Association, SMA (coderep@stairways.org)

2024 International Building Code

Revise as follows:

1011.5.5.1 Nosing projection size. The nosings shall project not more than $1^{1}/_{4}$ inches (32 mm) ~~beyond~~ over the trailing edge of the tread below

Exception: When solid risers are not required, the nosing projection is permitted to exceed the maximum projection.

1011.5.5.2 Nosing projection uniformity. Nosing projections of treads within a flight of stairs and of the landing at the top of the flight shall be of uniform size~~, including the projections of the *nosings* of the floor or landing at the top of a *flight*~~.

2024 International Fire Code

Revise as follows:

[BE] 1011.5.5.1 Nosing projection size. The nosings shall project not more than $1^{1}/_{4}$ inches (32 mm) ~~beyond~~ over the trailing edge of the tread below.

Exception: When solid risers are not required, the nosing projection is permitted to exceed the maximum projection.

[BE] 1011.5.5.2 Nosing projection uniformity. Nosing projections of treads within a flight of stairs and of the landing at the top of the flight shall be of uniform size~~, including the projections of the *nosings* of the floor or landing at the top of a *flight*~~.

Reason: Nosing projection size.

Use of the preposition “over” is more accurate than “beyond”. Beyond is defined as indicating to the further side of. A tread’s nosing does not extend or project “to the further side of” the tread below but rather “over” just a small portion of the tread below. The term beyond as used here is inappropriate. Deleting beyond and adding “over the trailing edge” clarifies for enforcement the point on the tread below from which the nosing projection of the tread above can be measured.

Nosing projection uniformity.

The proposal further clarifies the requirement with more direct/concise sentence structure that will result in more consistent understanding and enforcement.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The language substitutions and changes in syntax add no technical requirements that are material to construction methodology and will neither increase or decrease the cost of construction.

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The intent of the language for the nosing projection measurements is an improvement, however, the revised text is confusing. (Vote: 8-6)

E68-24

Individual Consideration Agenda

Comment 1:

IBC: 1011.5.5.1, 1011.5.5.2; IFC: [BE] 1011.5.5.1, [BE] 1011.5.5.2

Proponents: Ashley Goodin, Technical Services, Stairbuilders and Manufacturers Association (ashley.goodin@stairways.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

1011.5.5.1 Nosing projection size. The nosings shall project not more than $1\frac{1}{4}$ inches (32 mm) ~~over the trailing edge of the tread below~~ . Nosing projection shall be measured horizontally between the vertical plane of the foremost projection of the nosing and the intersection of the riser and tread below.

Exception: When solid risers are not required, the nosing projection is permitted to exceed the maximum projection.

1011.5.5.2 Nosing projection uniformity. Nosing projections of treads within a flight of stairs and of the landing at the top of the flight shall be of uniform size.

2024 International Fire Code

[BE] 1011.5.5.1 Nosing projection size. The nosings shall project not more than $1\frac{1}{4}$ inches (32 mm) ~~over the trailing edge of the tread below~~. Nosing projection shall be measured horizontally between the vertical plane of the foremost projection of the nosing and the intersection of the riser and tread below.

Exception: When solid risers are not required, the nosing projection is permitted to exceed the maximum projection.

[BE] 1011.5.5.2 Nosing projection uniformity. Nosing projections of treads within a flight of stairs and of the landing at the top of the flight shall be of uniform size.

Reason: This comment clarifies the points of measurement based on feedback received from the committee during the CAH1 hearing and the proponents intent. The text describing the measurement of the the nosing projection parallels that of the tread depth requirement that has been well understood and enforced for years...

From **1011.5.2 Riser height and tread depth.**

> ...tread depths shall be...*measured horizontally between the vertical planes of the foremost projection*... <*emphasis added*>

Your approval of this comment will clarify the code and assure consistent determination of the nosing projection size.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The change proposal does not affect labor and materials, only clarifies a point of measurement for code compliance.

Comment (CAH2)# 146

E69-24

IBC: 1011.6; IFC: [BE] 1011.6

Proposed Change as Submitted

Proponents: David Cooper, Stair Manufacturing and Design Consultants, Stairbuilders and Manufacturers Association, SMA (coderep@stairways.org)

2024 International Building Code

Revise as follows:

1011.6 Stairway landings. There shall be a ~~floor or~~ landing at the top and bottom of each ~~*stairway*~~ *flight* of stairs. The width of landings, measured perpendicularly to the direction of travel of the flight served , shall be not less than the width of ~~*stairways*~~ the flight served. ~~Every landing shall have a minimum depth, measured parallel to the direction of travel, equal to the width of the *stairway* or 48 inches (1219 mm), whichever is less.~~ Where there is a change in direction of the stairway at the landing, the landing depth shall be not less than the smallest width of the flights served. Where there is no change in direction of the stairway at the landing, the landing depth shall be 48 inches (1219 mm) minimum. Doors opening onto a landing shall not reduce the landing to less than one-half the required width. When fully open, the door shall not project more than 7 inches (178 mm) into the required width of a landing. Where *wheelchair spaces* are required on the *stairway* landing in accordance with Section 1009.6.3, the *wheelchair space* shall not be located in the required width of the landing and doors shall not swing over the *wheelchair spaces*.

Exceptions:

~~2~~ 1. Where curved *stairways* of constant radius have intermediate landings, the landing depth shall be measured horizontally between the intersection of the walkline of the lower *flight* at the landing *nosing* and the intersection of the walkline of the upper *flight* at the *nosing* of the lowest tread of the upper *flight*.

~~3~~ 2. Where a landing turns 90 degrees (1.57 rad) or more, the minimum landing depth in accordance with this section shall not be required where the landing provided is not less than that described by an arc with a radius equal to the width of the *flight* served.

~~1~~ 3. Where *stairways* connect stepped *aisles* to cross *aisles* or concourses, *stairway* landings are not required at the transition between *stairways* and stepped *aisles* constructed in accordance with Section 1030.

2024 International Fire Code

Revise as follows:

[BE] 1011.6 Stairway landings. There shall be a ~~floor or~~ landing at the top and bottom of each ~~*stairway*~~ *flight* of stairs. The width of landings, measured perpendicularly to the direction of travel of the flight served , shall be not less than the width of ~~*stairways*~~ the flight served. ~~Every landing shall have a minimum depth, measured parallel to the direction of travel, equal to the width of the *stairway* or 48 inches (1219 mm), whichever is less.~~ Where there is a change in direction of the stairway at the landing, the landing depth shall be not less than the smallest width of the flights served. Where there is no change in direction of the stairway at the landing, the landing depth shall be 48 inches (1219 mm) minimum. Doors opening onto a landing shall not reduce the landing to less than one-half the required width. When fully open, the door shall not project more than 7 inches (178 mm) into the required width of a landing. Where *wheelchair spaces* are required on the *stairway* landing in accordance with Section 1009.6.3, the *wheelchair space* shall not be located in the required width of the landing and doors shall not swing over the *wheelchair spaces*.

Exceptions:

~~2~~ 1. Where curved *stairways* of constant radius have intermediate landings, the landing depth shall be measured horizontally between the intersection of the walkline of the lower *flight* at the landing *nosing* and the intersection of the walkline of the upper *flight* at the *nosing* of the lowest tread of the upper *flight*.

~~3~~ 2. Where a landing turns 90 degrees (1.57 rad) or more, the minimum landing depth in accordance with this section shall not be required where the landing provided is not less than that described by an arc with a radius equal to the width of the *flight* served.

~~1~~ 3. Where *stairways* connect stepped *aisles* to cross *aisles* or concourses, *stairway* landings are not required at the transition between *stairways* and stepped *aisles* constructed in accordance with Section 1030.

Reason: It is important to note here that by definition in the IBC a stairway includes the flights and landings. A landing may occur at the top or bottom of a flight or between flights of a stairway not only at the top and bottom of a stairway. Substituting *flight* for *stairway* offers the correct description using the terms as defined.

Stairway. One or more flights of stairs, either exterior or interior, with the necessary landings and platforms connecting them, to form a continuous and uninterrupted passage from one level to another.

Flight. A continuous run of rectangular treads, winders or combination thereof from one landing to another.

A stairway may turn at any of these landing locations. The current language refers to the direction of travel but fails to provide a reference location or perspective. Width and depth reverse with ascent and descent on a 90 degree, or quarter space landing. Is the direction of travel to be considered an arc through the turn on the landing or the direction of travel across a landing adjoining two flights at a 180 degree, or half space landing. What is width and what is depth? If there are multiple flights adjoining the landing determining the direction of travel and the width or depth is confusing at best. By referencing the direction of the flight served and the change of the direction of the stairway the depth and width are more clearly understood.

The current text by the most grievous interpretation might imply that the landing may be just 48 inches in depth in situations not intended. We have corrected this anomaly by clarifying that the 48" minimum only applies to stairways that do not change direction a the landing.

The proposed language eliminates trying to distinguish width and depth axes that can reverse with ascent and descent more clearly describes the intent of the width and depth requirements.

Exception 1 has been moved to exception 3 without change because it is likely less common in terms of general use and application when compared to the other exceptions.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The changes proposed serve to restructure and correct the technical requirements for landings to aid interpretation and enforcement without material change to the methods or costs of construction.

E69-24

Public Hearing Results (CAH1)

Errata: This proposal includes unpublished errata for IBC and IFC
The following language was shown as struck out in the 3rd sentence of the proposal. However, this language is not current text. This language will be removed from the proposal.

"~~depth of landings shall be measured in the direction of travel of the flight served and shall be not less than~~"

Committee Action: **As Submitted**

Committee Reason: This proposal clarifies the requirements for measurement of the landings. The committee was concerned that this proposal removed "floor or" that was disapproved by the committee in E48-24. (Vote: 12-2)

E69-24

Individual Consideration Agenda

Comment 1:

IBC: 1011.6; IFC: [BE] 1011.6

Proponents: David Cooper, Stair Manufacturing and Design Consultants, Stairbuilders and Manufacturers Association, SMA (coderep@stairways.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

1011.6 Stairway landings. There shall be a landing at the top and bottom of each *flight* of stairs. The width of landings, measured perpendicularly to the direction of travel of the *flight* served , shall be not less than the width of the flight served. Where there is a change in direction of the stairway at the landing, the landing depth shall be not less than the smallest width of the flights served. Exceptions:

Exceptions:

1. Where curved *stairways* of constant radius have intermediate landings, the landing depth shall be measured horizontally between the intersection of the walkline of the lower *flight* at the landing *nosing* and the intersection of the walkline of the upper *flight* at the *nosing* of the lowest tread of the upper *flight*.
2. Where a landing turns 90 degrees (1.57 rad) or more, the minimum landing depth in accordance with this section shall not be required where the landing provided is not less than that described by an arc with a radius equal to the width of the *flight* served.
3. Where *stairways* connect stepped *aisles* to cross *aisles* or concourses, *stairway* landings are not required at the transition between *stairways* and stepped *aisles* constructed in accordance with Section 1030.
4. Where a tread depth of less than 11 inches (279 mm) is permitted the landing depth shall be 36 inches (914 mm) minimum where there is no change in direction of the stairway at the landing.

Reason: Although this proposal was approved, the committee questioned an errata and implied that there was text struck out that was not part of the code. Staff has informed me that the errata in the original proposal, mentioned by the committee has been corrected as published here for comment.

It is important to point out that landing depth should best be understood as being on the same axis as tread depth. Landing width is on the same axis as the width of the stair or flight. That said it was pointed out at the hearing that an exception should be considered for stairs within residential applications and other locations where the tread depth and and resulting stride is shorter. The new exception 4 provides for the same 36 inch limit as is in the IRC and is recommended.Please approve as modified by this comment.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The changes proposed serve to restructure and correct the technical requirements for landings to aid interpretation and enforcement without material change to the methods or costs of construction.

E70-24

IBC: 1011.7.1 (New), 1012.7.1 (New); IFC: 1011.7.1 (New), 1012.7.1 (New)

Proposed Change as Submitted

Proponents: Jeffrey Grove, Coffman Engineers, Coffman Engineers (jeff.grove@coffman.com)

2024 International Building Code

Add new text as follows:

1011.7.1 Stairway Supporting Construction. *Stairway* supporting construction shall have a fire resistance rating equivalent to the rating of the enclosure or separation required by Sections 1023.2 and 1027.6. **Exception:** *Stairway* supporting construction located within the fire resistance rated enclosure or exterior to the building does not require a fire resistance rating.

1012.7.1 Ramp Supporting Construction. *Ramp* supporting construction shall have a fire resistance rating equivalent to the rating of the enclosure or separation required by Sections 1023.2 and 1027.6. **Exception:** *Ramp* supporting construction located within the fire resistance rated enclosure or exterior to the building does not require a fire resistance rating.

2024 International Fire Code

Add new text as follows:

1011.7.1 Stairway Supporting Construction. *Stairway* supporting construction shall have a fire resistance rating equivalent to the rating of the enclosure or separation required by Sections 1023.2 and 1027.6. **Exception:** *Stairway* supporting construction located within the fire resistance rated enclosure or exterior to the building does not require a fire resistance rating.

1012.7.1 Ramp Supporting Construction. *Ramp* supporting construction shall have a fire resistance rating equivalent to the rating of the enclosure or separation required by Sections 1023.2 and 1027.6. **Exception:** *Ramp* supporting construction located within the fire resistance rated enclosure or exterior to the building does not require a fire resistance rating.

Reason: NOTE: These two new sections are intended to be directly following the charging sections, 1011.7 and 1012.7, respectively. The following sections remain unchanged and should follow these new sections.

There is a requirement for stairway and ramp enclosures to be constructed with fire barriers in accordance with IBC Section 1023.2. This requires the supporting construction for the enclosure to be protected to afford the required fire resistance rating of the fire barrier supported in accordance with IBC Section 707.5.1.

Stair and ramp enclosures should be supported in accordance with the fire resistance rating of the enclosure to assist in the egress of occupants and response of first responders. However, this does not currently extend to the landings and stairway/ramp construction which may extend beyond the enclosure into the building. For example, a four-story exit enclosure in a Type II-B building would be provided with a 2-hour fire resistance rating and associated supporting construction. However, if the specific landing supports extend beyond the enclosure, the associated landing supports are not required to be protected. The intent is an exit enclosure to be provided with structural fire protection and reliability and it should extend to the elements which support occupants within that enclosure that are not protected by the enclosure.

The reasoning for locating the requirement in these sections is it would be applicable to stairway and ramp construction (both interior and exterior) that have supporting construction which extends into the building and may be unprotected.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

For a single 5-story stair utilizing this design strategy quotes were received for $15,000-$32,000 to provide fireproofing to these

supporting structural members. It should be reiterated that other structural design strategies are available which would not represent a cost increase for this scenario. The cost, if present, is immediate with no significant life-cycle cost anticipated.

Estimated Immediate Cost Impact Justification (methodology and variables):

This is not considered a cost increase for all stair/ramp enclosures where stairway/ramp construction are located within the exit enclosure or in circumstances where the enclosure supporting construction is shared with the stairway/ramp. The cost impact for providing fire resistance to supporting construction of stairways/ramps that extend beyond the enclosure is dependent upon numerous factors including number/size of supporting members, method of fire protection and required fire resistance rating.

A case study was developed which may represent a cost increase as a portion of the cost impact statement. Conservatively a 5 story Type II-B (non-rated non-combustible steel building) which could be found in a Group R-2 sprinklered occupancy type building was considered. This would require a 2-hour fire rated separation for the stairway and associated supporting construction which exited the stair enclosure as identified in this proposal. The proposal team worked with a structural engineer on a structural design which would be utilized to support the stairway construction and provided this information to spray-applied fireproofing contractors for pricing.

Additional supporting cost information can be found at the FTP below:

Password: G10G7Vw84rjq

E70-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: This proposal should be addressed in Section 1023 for the stairway enclosure, not the general stairway provisions. As written, it could be read to apply to exit access stairways. There should be a separate exception for an exterior wall. The exception needs to clarify if this is for stairways totally within the enclosure, or supporting elements that come through the enclosure walls. (Vote: 14-0)

E70-24

Individual Consideration Agenda

Comment 1:

IBC: 1023.2.1 (New); IFC: [BE] 1023.2.1 (New)

Proponents: Jeffrey Grove, Coffman Engineers, Coffman Engineers (jeff.grove@coffman.com) requests As Modified by Committee (AMC2)

Replace as follows:

2024 International Building Code

Add new text as follows:

1023.2.1 Supporting construction. Structural elements that support interior exit stairways and ramps and that penetrate, or are installed within the membrane of a required fire resistance rated assembly shall be provided with a fire resistance rating not less than the enclosure.

2024 International Fire Code

Add new text as follows:

[BE] 1023.2.1 Supporting construction. Structural elements that support interior exit stairways and ramps and that penetrate, or are installed within the membrane of a required fire resistance rated assembly shall be provided with a fire resistance rating not less than the enclosure.

Reason: The previous proposed code change was located in 1011.7 and 1012.7 to address stairs and ramps (including exterior) that require a rating. However, after committee feedback this is being relocated to 1023.2.1 explicitly and reworded.
This comes into align with NFPA 101 Section 7.1.3.2.1(5):

"Structural elements, or portions thereof, that support exit components and either penetrate into a fire-resistance-rated assembly or are installed within a fire-resistance-rated wall assembly shall be protected, as a minimum, to the fire resistance rating required by 7.1.3.2.1(1) or 7.1.3.2.1(3).

Annex: It is not the intent to require the structural elements supporting outside stairs, or structural elements that penetrate within exterior walls or any other wall not required to have a fire resistance rating, to be protected by fire-resistance-rated construction."

This change brings in line the intent between the two codes that these elements need to be protected when leaving fire resistance rated enclosures.

IBC: 1011.7.1; IFC: [BE] 1011.7.1

Proposed Change as Submitted

Proponents: David Cooper, Stair Manufacturing and Design Consultants, Stairbuilders and Manufacturers Association, SMA (coderep@stairways.org)

2024 International Building Code

Revise as follows:

1011.7.1 Stairway walking surface. The walking surface of treads and landings of a *stairway* shall not be sloped steeper than one unit vertical in 48 units horizontal (2-percent slope) in any direction. *Stairway* treads and landings shall have a solid surface. Finish floor surfaces shall be securely attached. **Exceptions:**

1. ~~Openings~~ Perforations in *stair* walking surfaces shall be a size that does not permit the passage of $^1/_2$-inch-diameter (12.7 mm) sphere. Elongated ~~openings~~ perforations shall be placed so that the long dimension is perpendicular to the direction of travel.
2. Where open risers are permitted the open ends of treads that do not extend to the face of the guard infill or wall shall extend to a point not more than 2 inches (51 mm) measured horizontally from the face of the guard infill or wall.
3. ~~2~~ In Group F, H and S occupancies, other than areas of parking *structures* accessible to the public, openings in treads and landings shall not be prohibited provided that a sphere with a diameter of $1^1/_8$ inches (29 mm) cannot pass through the opening.

2024 International Fire Code

Revise as follows:

[BE] 1011.7.1 Stairway walking surface. The walking surface of treads and landings of a *stairway* shall not be sloped steeper than 1 unit vertical in 48 units horizontal (2-percent slope) in any direction. *Stairway* treads and landings shall have a solid surface. Finish floor surfaces shall be securely attached. **Exceptions:**

1. ~~Openings~~ Perforations in *stair* walking surfaces shall be a size that does not permit the passage of $^1/_2$-inch-diameter (12.7 mm) sphere. Elongated ~~openings~~ perforations shall be placed so that the long dimension is perpendicular to the direction of travel.
2. Where open risers are permitted the open ends of treads that do not extend to the face of the guard infill or wall shall extend to a point not more than 2 inches (51 mm) measured horizontally from the face of the guard infill or wall.
3. ~~2~~ In Group F, H and S occupancies, other than areas of parking structures accessible to the public, openings in treads and landings shall not be prohibited provided that a sphere with a diameter of $1^1/_8$ inches (29 mm) cannot pass through the opening.

Reason: Although a tread has a solid surface the end of a tread often ends without actually abutting any surface. Such is the case on many open stairs or where open risers are allowed. Opening limitations in guards regulating the vertical plane are not applicable to the horizontal walking surface. This addition to the exception for openings in stair walking surfaces will provide much needed guidance for design and enforcement when the tread does not extend under the guard system or abut a wall, skirtboard, or other vertical surface. The 2 inch limit is reasoned as the maximum standoff used and is considerably smaller than the smallest of shoe sizes for children of 2 -6 months.

Common applications are pictured:

Illustration A: Glass panel is attached to the ends of treads with “standoff” hardware leaving a narrow gap between the glass

panel and the extreme end of the tread.

Illustration B: Shows the an open riser mono stringer stair with open ended treads.

In each case the exposed area is well out of the path of travel.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The change provides specific technical requirements that provide clarification for enforcement of a common and highly desired design aesthetic without change to methods of construction or related costs of construction of the stair.

E71-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: There was a discussion on if the edge of the tread would be considered a walking surface that was subject to the floor walking surface requirements or not. The committee had different opinions on if the gap at the side of a tread would be a hazard for persons on the stairway using a cane or crutches. Some members felt that if the gap was away from the walkline it would not be a safety hazard. The proposal should be brought back with some of the clarifications proposed in the floor modifications. (Vote: 8-4).

E71-24

Individual Consideration Agenda

Comment 1:

IBC: 1011.7.1; IFC: [BE] 1011.7.1

Proponents: Ashley Goodin, Technical Services, Stairbuilders and Manufacturers Association (ashley.goodin@stairways.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

1011.7.1 Stairway walking surface. The walking surface of treads and landings of a *stairway* shall not be sloped steeper than one unit vertical in 48 units horizontal (2-percent slope) in any direction. *Stairway* walking surfaces ~~treads and landings~~ shall have a solid surface. Finish floor surfaces shall be securely attached. **Exceptions:**

1. Perforations in ~~*stair*~~ stairway walking surfaces shall be a size that does not permit the passage of $^{1}/_{2}$-inch-diameter (12.7 mm) sphere. Elongated perforations shall be placed so that the long dimension is perpendicular to the direction of travel.
2. Where open risers are permitted, the open ends of stairway walking surfaces ~~treads that do not extend to the face of the guard infill or wall,~~ shall extend to a point not more than ~~2~~ 1-1/2 inches (~~51~~ 38 mm) measured horizontally from the face of the adjacent guard infill or wall.
3. In Group F, H and S occupancies, other than areas of parking *structures* accessible to the public, openings in treads and landings shall not be prohibited provided that a sphere with a diameter of $1^{1}/_{8}$ inches (29 mm) cannot pass through the opening.

2024 International Fire Code

[BE] 1011.7.1 Stairway walking surface. The walking surface of treads and landings of a *stairway* shall not be sloped steeper than 1 unit vertical in 48 units horizontal (2-percent slope) in any direction. *Stairway* walking surfaces ~~treads and landings~~ shall have a solid surface. Finish floor surfaces shall be securely attached. **Exceptions:**

1. Perforations in *stair* walking surfaces shall be a size that does not permit the passage of $^{1}/_{2}$-inch-diameter (12.7 mm) sphere. Elongated perforations shall be placed so that the long dimension is perpendicular to the direction of travel.
2. Where open risers are permitted, the stairway walking surfaces ~~open ends of treads that do not extend to the face of the guard infill or wall,~~ shall extend to a point not more than ~~2~~ 1-1/2 inches (~~51~~ 38 mm) measured horizontally from the face of the adjacent guard infill or wall.

3. In Group F, H and S occupancies, other than areas of parking structures accessible to the public, openings in treads and landings shall not be prohibited provided that a sphere with a diameter of $1\frac{1}{8}$ inches (29 mm) cannot pass through the opening.

Reason: The purpose of the original proposal and this comment is two-fold. The first is to clarify the orienation and size of perforations in stair tread surfaces. The second is to provide for consistent measurement and enforcement of openings as designed in "floating" tread configurations between stairways and adjacent guards.

In this conmment, feedback from the committe and others has benn considered and implemented through the following changes. The floor modifications Munsenteiger 1 has been integrated into this comment. Additionally, the floor modification Zuzik 1 has not been added, thus returning the intent and scope of the original proposal back to open riser stairs. This limits the areas where the proposed openings are allowed as open riser stairs are not allowed as an accessable means of egress. Further, comments from the committee regarding opening location and sizes relative to ambulatory aids and individuals with low vision have been taken into consideration and the opening size has been reduced to prevent accidental engagement of crutch and cane tips.

Currently, the code is silent on this measurement which leads to confusion as to whether the sphere measurement of 4" for guards from Section 1015.4 is being used. At open riser configurations such as are addressed in this comment, the 4" sphere rule also applies to the measurement between treads at the open riser. By implementing the measurement of 1-1//2" as proposed in this comment, both safety and clarity are added to the code in reducing the limitation from 4" to 1-1/2", thus reducing the opportunities for objects such as cane tips, crutches, or limbs to pass through the openings. Further, as the opening in question is located away from the walkline and below and away from the handrail further reduces the risk of accidental engagement of ambulatory aids or limbs in this space. As written, this proposed change increases safety for users and provides clarity for enforcement, therefore it should be considered for adoption within the code.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The change does not add any additional materials or labor to the cost of construction, only clarifies a tolerance for enforcement.

Comment (CAH2)# 430

Comment 2:

IBC: 1011.7.1; IFC: [BE] 1011.7.1

Proponents: Thomas Zuzik Jr, RailingCodes.com, National Ornamental & Miscellaneous Metals Association (NOMMA.org) (coderep@railingcodes.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

1011.7.1 Stairway walking surface. The walking surface of treads and landings of a *stairway* shall not be sloped steeper than one unit vertical in 48 units horizontal (2-percent slope) in any direction. *Stairway* treads and landings shall have a solid surface. Finish floor surfaces shall be securely attached. **Exceptions:**

1. Perforations in *stair* walking surfaces shall be a size that does not permit the passage of $\frac{1}{2}$-inch-diameter (12.7 mm) sphere. Elongated perforations shall be placed so that the long dimension is perpendicular to the direction of travel.
2. Where ~~open risers are permitted~~ the open ends of treads ~~that~~ do not extend to the face of the guard infill or wall .the tread shall extend to a point not more than 2 inches (51 mm) measured horizontally from the face of the guard infill or wall.

3. In Group F, H and S occupancies, other than areas of parking *structures* accessible to the public, openings in treads and landings shall not be prohibited provided that a sphere with a diameter of $1\,^{1}/_{8}$ inches (29 mm) cannot pass through the opening.

2024 International Fire Code

[BE] 1011.7.1 Stairway walking surface. The walking surface of treads and landings of a *stairway* shall not be sloped steeper than 1 unit vertical in 48 units horizontal (2-percent slope) in any direction. *Stairway* treads and landings shall have a solid surface. Finish floor surfaces shall be securely attached. **Exceptions:**

1. Perforations in *stair* walking surfaces shall be a size that does not permit the passage of $^{1}/_{2}$-inch-diameter (12.7 mm) sphere. Elongated perforations shall be placed so that the long dimension is perpendicular to the direction of travel.
2. Where ~~open risers are permitted~~ the open ends of treads ~~that~~ do not extend to the face of the guard infill or wall <u>,the tread</u> shall extend to a point not more than 2 inches (51 mm) measured horizontally from the face of the guard infill or wall.
3. In Group F, H and S occupancies, other than areas of parking structures accessible to the public, openings in treads and landings shall not be prohibited provided that a sphere with a diameter of $1\,^{1}/_{8}$ inches (29 mm) cannot pass through the opening.

Reason: One of the most miss interpreted enforcements in the field is when inspectors apply walking surface opening limits in place of the guard opening limits.

The edge of the walking surface is defined by were it stops. The protection for someone accidentally falling off an open sided walking surface is done by the requirement within the code with a guard.

The code does not require open sided walking surfaces to extend within a 1/2" of the guard infill or wall currently, as thus, when the 1/2" floor opening limit is applied by inspectors for were the code specifies the 4" sphere opening limit, it is over reaching and not the intent of the code.

The original proposal looked at addressing this by compromising with a 2" limit, however, the proposal was only for when the stair flight has open risers, but not for open sided treads? This comment brings to light to the committee that it should not matter if the stair flight has open risers or not, but rather if it has open sided treads for it's walking surface, and not enclosed by a stringer.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

There is already a guard or wall being constructed for these stair flights, as thus the cost is not seen for reducing the offset distance to the guard's infill or wall.

Comment (CAH2)# 746

2024 International Building Code

Add new text as follows:

1011.7.2 Markings on stairways. Egress path markings shall be provided on interior and exterior stairways in accordance with Sections 1011.7.2.1 and 1011.7.2.2. **Exceptions:**

1. Stairways within individual dwelling units.
2. Stairways with stripes complying with Section 1025.

1011.7.2.1 Steps. A solid and continuous stripe shall be applied to the horizontal leading edge of each step and shall extend for the full length of the step. Stripes shall be a solid color having a visual contrast of dark-on-light or light-on dark from the remainder of the tread or landing surface. Stripes have a minimum horizontal width of 1 inch (25 mm) and a maximum width of 3 inches (76 mm). The leading edge of the stripe shall be placed not more than ½ inch (12.7 mm) from the leading edge of the step and the stripe shall not overlap the leading edge of the step by not more than 1/2 inch (12.7 mm) down the vertical face of the step. The stripe shall be of material that is at least as slip resistant as the other tread surface.

1011.7.2.2 Landings. The leading edge of landings shall be marked with a stripe consistent with the dimensional requirements for steps.

2024 International Fire Code

Add new text as follows:

1011.7.2 Markings on stairways. Egress path markings shall be provided on interior and exterior stairways in accordance with Sections 1011.7.2.1 and1011.7.2.2. **Exceptions:**

1. Stairways within individual dwelling units.
2. Stairways with stripes complying with Section 1025.

1011.7.2.1 Steps. A solid and continuous stripe shall be applied to the horizontal leading edge of each step and shall extend for the full length of the step. Stripes shall be a solid color having a visual contrast of dark-on-light or light-on dark from the remainder of the tread or landing surface. Stripes have a minimum horizontal width of 1 inch (25 mm) and a maximum width of 3 inches (76 mm). The leading edge of the stripe shall be placed not more than ½ inch (12.7 mm) from the leading edge of the step and the stripe shall not overlap the leading edge of the step by not more than 1/2 inch (12.7 mm) down the vertical face of the step. The stripe shall be of material that is at least as slip resistant as the other tread surface.

1011.7.2.2 Landings. The leading edge of landings shall be marked with a stripe consistent with the dimensional requirements for steps.

Reason: From Cohen and Pauls (2006) they cite the following statistics about stair safety. *"According to the National Public Services Research Institute, in 1995, it was estimated that stair-related injuries in the United States were associated with comprehensive costs of $50 billion, including $4.7 billion in medical costs, $7.1 billion in productivity losses, and $38.1 billion in quality of life losses (T. Miller, Personal Communication. 1998). Even the smallest of these component costs is astonishing relative to annual stair construction costs in the United States; these are only approximately $5 billion. With the possible exception of products, such as handguns, tobacco and illegal drugs, this 10-to-l ratio of injury costs to product production costs is extraordinary."*

Cohen and Pauls also note that increasing quantity of lighting alone is not sufficient to incease the visibility of the edge of the stair tread. *"In addition to lighting, there are other important factors in visibility of steps, including careful choice of stairway covering materials to avoid patterns that tend to camouflage the step nosings and the critical leading edges of treads. and to use highly contrasting tread markings."*

The Illuminating Engineering Society's Recommended Practice for Lighting and the Visual Environment for Older Adults and the Visually Impaired (IES-RP-28-20) notes the following concerning the use of reflectance contrast for increasing visibility: *Value contrast should be a design consideration in the selection of finishes for corridors, stairs, lobbies and spaces that become part of the path of egress. Contrast helps to define the space and the elements within the space, e.g., doorways, changes of floor level or direction, and obstructions such as columns, to increase visibility and the occupant's confidence. Everyone's sight benefits from value contrast in low-light conditions, regardless of age or visual acuity.*

The IES also recommends that *"All stairs should have clearly marked edge strips, staircase borders, and handrails to meet the needs of older people and persons with low vision."*

Similar to what has been recommended by Cohen and Pauls and the Illuminating Engineering Society, this proposal would increase the safety of stairways by increasing the reflectance contrast (and thus the luminance contrast) by requiring colored stripes on the nosing or leading edges of stairs. The difference in reflectance between the edge stripe and the rest of the stair tread will to increase the visibility of the edge of the stair. These colored stripes would be one to two inches wide on the edge of nosing the stair. This proposal is written the same format as the requirement as IBC *Section 1011.5.4.1 Nonuniform height risers*. However the distinguishing difference between stripes on nonuniform height risers and those proposed for all other stairs is "nonuniform height risers shall have a distinctive marking stripe, different from any other nosing marking provided on the stair flight."

The description of the marking stripes are written to be in alignment with ANSI/ICC 117.1 Accessibility Standard Section 504.6 "Visual Contrast". Addtionally this proposal modifies both Section 1011.5.4.1 and 1011.7.1 on the geometrical description of the contrasting marking stripe. Originally the stripe is defined as being one to two inches wide, this proposal more clearly defines the stripes as being one to two inches in depth and having a width that extends the width of the stair tread.

Bibliography: ANSI/IES RP-28-20. *Recommended Practice: Lighting and the Visual Environment for Older Adults and the Visually Impaired.* Illuminating Engineering Society. New York.

Cohen, Harvey and Pauls, Jake. *Warnings and Markings for Stairs and Pedestrian Terrain*. **Handbook on Warnings.** In: Michael Wogalter (Ed.),Lawrence Erlbaum, Inc., 2006, pp. 711-722.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

The lowest cost method for adding a stripe to stairs is painting a stripe. However to provide conservatively high estimate we have used the cost of adding a metal nosing strip to the tread of each stair and on the nosing of the landing above a stair. From estimates of costs published on the internet the costs of aluminum stair nosing are $6 to $21 per linear foot. https://kofflersales.com/product/metal-stair-nosing Similar costs are found on Grainger's and Lowes websites.

Using a medium costs of $12.50/linear foot, the material cost of adding an aluminum nosing to a 4 foot wide tread is $50/stair. According

one home improvement website, “A beginner can install a nosing on a tread in 15 to 30 minutes.” https://www.thespruce.com/installing-a-stair-nosing-strip-1822570 According to the US Bureau of Labor Statistics, the Mean Labor wage for carpenter, US average May 2022 is $ 27.99/hr https://www.bls.gov/oes/current/oes472031.htm Thus the labor cost is $14 per step to install a $50 nosing strip for a total installed cost of $64/stair tread. With 50% overhead and profit for carpenters (2020 RS Means), total cost is $96 per installed 4 foot wide nosing. For a 12 foot tall story, with 6 inch risers per step, there are 24 nosings with an installed cost of 24 x $96 = $2,304 per story.

This cost for nosings is compared against the cost adding stairs per story. In the Economics of Egress Alternatives and Life-Safety Costs, NIST Special Publication 1109. September 2010. Gaithersburg, Maryland (https://nvlpubs.nist.gov/nistpubs/Legacy/SP/nistspecialpublication1109.pdf) describes the costs of adding an additional exit stair to a 13 story prototypical building as follows: “The baseline value for the life-cycle costs of installing an additional exit stair in Building 2 ranges from $1.5 million for the 44 in (112 cm) stair width to $2.4 million for the 66 in (168 cm) stair width.” The cost per story of this added exit stair is $1.5 Million/ 12 = $125,000 per story. The fractional cost of adding aluminum stair nosings strips is $2,300/$125,000 = 1.8

Estimated Immediate Cost Impact Justification (methodology and variables):

Adding striping to stairs increases the cost of stairs by 1.8%. However, this cost is offset by the societal savings associated with avoiding trip and fall hazards on stairways.

Estimated Life Cycle Cost Impact:

In Cohen and Pauls, Warnings and Markings for Stairs and Pedestrian Terrain (see bibliography), they estimate that the ratio of the cost of annual injuries on stairs to the annual cost of stair construction is 10 to one. The annual construction rate of nonresidential buildings is 1.3% (table B7 of the US EIA 2012 Commercial Buildings Energy Consumption Survey). Thus the annual value of injuries on stairs are 10 x 0.013 = 13% of the value of the stock of all stairs. Assuming that metal nosing lasts at least 10 years, the ratio of the value of injuries on stairs over 10 years to cost of the stairs is 10 x 13% = 130% of the value of the stairs. As described in the cost impact statement, a conservatively high estimate of the cost of stair striping is 1.8% of total stair cost. Thus, the ratio of the cost of stair striping to the cost of injuries on stairs is 1.8%/130% = 1.4%. If stair striping reduces injuries on stairs, by 1.4% this will pay for the added cost of striping stairs by adding an aluminum nosing that is conspicuously different than the reflectance of the rest of the stair tread. Given the mechanisms of how falls are induced on stairs, we expect that stair striping will reduce the percentage of falls significantly more than 1.4%.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

If the striping reduces falls in stairs by any amount greater than 1.4%, life cycle cost is decreased.

In Cohen and Pauls, Warnings and Markings for Stairs and Pedestrian Terrain, they identify three factors to stair safety.

1. visibility of the stair flight and its individual steps, especially when viewed in descent;

2. adequacy and uniformity of step dimensions in relation to human gait; and

3. availability of reachable, graspable handrails that also provide accurate visual cues about the presence and location of steps.

Items 2 is addressed by IBC Section 1011.5. Item 3 is addressed by IBC section 1011.11. Visibility is only partially addressed by illuminance requirements in IBC Section 1008. Critical to visibility of steps is the luminance contrast of the tread edge; luminance contrast is the ratio of reflected light from the stair edge as compared to other surfaces on the stair. When stairs are uniformly illuminated, luminance contrast is a function of reflectance contrast of the stair edge from the surrounding tread and riser. Increasing illuminance without adjusting the ratios of surface reflectances of stair edge from its surroundings does not increase luminance contrast because with increasing illuminance, the luminance of both the stair edge and its surroundings will both rise proportionately and thus the ratio of the stair edge to its surroundings have not changed. We expect that lack of reflectance contrast is a significant cause of falls on stairs and thus addressing this issue will result in substantially more savings associated with avoided injuries and deaths than its first cost. Reducing stairway falls by only 1.4% will pay for the cost of the stair striping. See the calculations below for the rationale.

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: While contrast on stairways is important, the proposed requirements are not clear. The committee felt that the language was not clear enough to apply consistently and correctly in the field. The terms 'steps' is not defined in the code - this should be 'treads'. The requirements for the treads and landings should be in Sections 1011.5 and 1011.6. The application of this to "interior and exterior stairways" would include to all convenience stairways (exit access), as well as stairways in the exit discharge - this is over reaching. Are there any studies that have taken into consideration stairway continuity and handrails to address the safety concerns brought up by the proponents? What would be an acceptable material for the stripes? How would you verify contrast on stairways that were not a solid color? See also E74-24. (Vote: 13-1)

E73-24

Individual Consideration Agenda

Comment 1:

IBC: 1011.5, 1011.5.4.1, 1011.7.2, 1011.7.2.1, 1011.7.2.2, 1011.6, 1011.6.1 (New); IFC: [BE] 1011.5, [BE] 1011.5.4.1, 1011.7.2, 1011.7.2.1, 1011.7.2.2, [BE] 1011.6, [BE] 1011.6.1 (New)

Proponents: Jonathan McHugh, McHugh Energy Consultants Inc., California Investor Owned Utilities (jon@mchughenergy.com); Eunice Noell-Waggoner, Center of Design for an Aging Society, IES Lighting for Seniors and the Visually Impaired Committee (eunice@centerofdesign.org); Koni Sims, ACB Board of Director, American Council of the Blind (ACB), Visually Impaired/Low Vision (koni.l.sims@gmail.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

1011.5 Stair treads and risers. *Stair* treads and risers shall comply with Sections 1011.5.1 through ~~1011.5.5.3~~ 1011.5.6.

1011.5.4.1 Nonuniform height risers. Where the bottom or top riser adjoins a sloping *public way*, walkway or driveway having an established grade and serving as a landing, the bottom or top riser is permitted to be reduced along the slope to less than 4 inches (102 mm) in height, with the variation in height of the bottom or top riser not to exceed one unit vertical in 12 units horizontal (8-percent slope) of *stair* width. The *nosings* at such nonuniform height risers shall have a distinctive marking stripe, different from any other *nosing* marking provided on the *stair flight*. The distinctive marking stripe shall be visible in descent of the *stair*. Marking stripes shall have a width of not less than 1 inch (25 mm) but not more than 2 inches (51 mm).

Revise as follows:

~~**1011.7.2 Markings on stairways .** Egress path markings shall be provided on interior and exterior stairways in accordance with Sections 1011.7.2.1 and 1011.7.2.2.~~

~~**Exceptions:**~~

1. ~~Stairways within individual dwelling units.~~

~~2. Stairways with stripes complying with Section 1025.~~

~~**1011.7.2.1**~~ **1105.6** ~~**Steps**~~ **Marking stripes on tread nosings.** For interior exit stairways and exterior exit stairways, the leading 1 to 2 inches (25 to 51 mm) of every tread nosing shall have a marking stripe of a solid color that is lighter or darker than the remainder of the tread. The marking stripe shall be durable and shall extend from one side of the tread to the other side of each tread.~~A solid and continuous stripe shall be applied to the horizontal leading edge of each step and shall extend for the full length of the step. Stripes shall be a solid color having a visual contrast of dark on light or light on dark from the remainder of the tread or landing surface. Stripes have a minimum horizontal width of 1 inch (25 mm) and a maximum width of 3 inches (76 mm). The leading edge of the stripe shall be placed not more than ½ inch (12.7 mm) from the leading edge of the step and the stripe shall not overlap the leading edge of the step by not more than 1/2 inch (12.7 mm) down the vertical face of the step. The stripe shall be of material that is at least as slip resistant as the other tread surface.~~

Exceptions:

1. Portions of treads with distinctive marking stripes complying with Section 1011.5.4.1.
2. Stairways with stripes complying with Section 1025.

Delete without substitution:

~~**1011.7.2.2 Landings.** The leading edge of landings shall be marked with a stripe consistent with the dimensional requirements for steps.~~

1011.6 Stairway landings. There shall be a floor or landing at the top and bottom of each *stairway*. The width of landings, measured perpendicularly to the direction of travel, shall be not less than the width of *stairways* served. Every landing shall have a minimum depth, measured parallel to the direction of travel, equal to the width of the *stairway* or 48 inches (1219 mm), whichever is less. Doors opening onto a landing shall not reduce the landing to less than one-half the required width. When fully open, the door shall not project more than 7 inches (178 mm) into the required width of a landing. Where *wheelchair spaces* are required on the *stairway* landing in accordance with Section 1009.6.3, the *wheelchair space* shall not be located in the required width of the landing and doors shall not swing over the *wheelchair spaces*. **Exceptions:**

1. Where *stairways* connect stepped *aisles* to cross *aisles* or concourses, *stairway* landings are not required at the transition between *stairways* and stepped *aisles* constructed in accordance with Section 1030.
2. Where curved *stairways* of constant radius have intermediate landings, the landing depth shall be measured horizontally between the intersection of the walkline of the lower *flight* at the landing *nosing* and the intersection of the walkline of the upper *flight* at the *nosing* of the lowest tread of the upper *flight*.
3. Where a landing turns 90 degrees (1.57 rad) or more, the minimum landing depth in accordance with this section shall not be required where the landing provided is not less than that described by an arc with a radius equal to the width of the *flight* served.

1011.6.1 Marking stripes on landing nosings. For *interior exit stairways* and *exterior exit stairways*, the nosing of all landings shall have a marking stripe complying with Section 1011.5.6.

2024 International Fire Code

[BE] 1011.5 Stair treads and risers. *Stair* treads and risers shall comply with Sections 1011.5.1 through ~~1011.5.5.3~~ 1011.5.6.

[BE] 1011.5.4.1 Nonuniform height risers. Where the bottom or top riser adjoins a sloping *public way*, walkway or driveway having an established grade and serving as a landing, the bottom or top riser is permitted to be reduced along the slope to less than 4 inches (102 mm) in height, with the variation in height of the bottom or top riser not to exceed 1 unit vertical in 12 units horizontal (8-percent slope) of *stair* width. The nosings at such nonuniform height risers shall have a distinctive marking stripe, different from any other *nosing* marking provided on the *stair flight*. The distinctive marking stripe shall be visible in descent of the *stair*. Marking stripes shall have a width of not less than 1 inch (25 mm) but not more than 2 inches (51 mm).

~~**1011.7.2 Markings on stairways .** Egress path markings shall be provided on interior and exterior stairways in accordance with Sections 1011.7.2.1 and1011.7.2.2.~~

~~**Exceptions:**~~

1. ~~Stairways within individual dwelling units.~~
2. ~~Stairways with stripes complying with Section 1025.~~

Revise as follows:

[BE] ~~**1011.7.2.1**~~ **1011.5.6** ~~**Steps**~~ **Marking stripes on tread nosings.** For interior exit stairways and exterior exit stairways, the leading 1 to 2 inches (25 to 51 mm) of every tread nosing shall have a marking stripe of a solid color that is lighter or darker color than the remainder of the tread. The marking stripe shall be durable and shall extend from one side of the tread to the other side of each tread.~~A solid and continuous stripe shall be applied to the horizontal leading edge of each step and shall extend for the full length of the step. Stripes shall be a solid color having a visual contrast of dark on light or light on dark from the remainder of the tread or landing surface. Stripes have a minimum horizontal width of 1 inch (25 mm) and a maximum width of 3 inches (76 mm). The leading edge of the stripe shall be placed not more than ½ inch (12.7 mm) from the leading edge of the step and the stripe shall not overlap the leading edge of the step by not more than 1/2 inch (12.7 mm) down the vertical face of the step. The stripe shall be of material that is at least as slip resistant as the other tread surface~~.

Exceptions:

1. Portions of treads with distinctive marking stripes complying with Section 1011.5.4.1.
2. Stairways with stripes complying with Section 1025.

Delete without substitution:

~~**1011.7.2.2 Landings.** The leading edge of landings shall be marked with a stripe consistent with the dimensional requirements for steps.~~

[BE] 1011.6 Stairway landings. There shall be a floor or landing at the top and bottom of each *stairway*. The width of landings, measured perpendicularly to the direction of travel, shall be not less than the width of *stairways* served. Every landing shall have a minimum depth, measured parallel to the direction of travel, equal to the width of the *stairway* or 48 inches (1219 mm), whichever is less. Doors opening onto a landing shall not reduce the landing to less than one-half the required width. When fully open, the door shall not project more than 7 inches (178 mm) into the required width of a landing. Where wheelchair spaces are required on the stairway landing in accordance with Section 1009.6.3, the wheelchair space shall not be located in the required width of the landing and doors shall not swing over the wheelchair spaces. **Exceptions:**

1. Where *stairways* connect stepped *aisles* to cross *aisles* or concourses, *stairway* landings are not required at the transition between *stairways* and stepped *aisles* constructed in accordance with Section 1030.
2. Where curved *stairways* of constant radius have intermediate landings, the landing depth shall be measured horizontally between the intersection of the walkline of the lower *flight* at the landing *nosing* and the intersection of the walkline of the upper *flight* at the *nosing* of the lowest tread of the upper *flight*.
3. Where a landing turns 90 degrees (1.57 rad) or more, the minimum landing depth in accordance with this section shall not be required where the landing provided is not less than that described by an arc with a radius equal to the width of the *flight* served.

[BE] 1011.6.1 Marking stripes on landing nosings. For *interior exit stairways* and *exterior exit stairways*, the nosing of all landings shall have a marking stripe complying with Section 1011.5.6.

Reason: This modified proposal attempts to include a fundamental safety feature into stairways, striping that delineates the edge of the nosing of the landing and the nosing of the stair tread. This is an extremely inexpensive features that is valuable for people with excellent vision but especially important for the visually impaired -- something that occurs to almost all with age. Many people wear bifocals designed for reading. This same feature creates a blurred view of edge of the tread or landing, whereas a contrasting marking is still visible and is not distorted. (See Reference for Herren et al. 2009).

The committee's comments were extremely helpful and the following responses describe how this revised proposal addressed these comments:

Comment: More clarity desired The terms 'steps' is not defined in the code - this should be 'treads'. The requirements for the treads and landings should be in Sections 1011.5 and 1011.6.

Response: This recommendation was followed by moving the requirements to Section 1011.5.6 "Marking stripes on tread nosings" and Section 1011.6.1 "Marking stripes on landing nosings."

Comment: The application of this to "interior and exterior stairways" would include to all convenience stairways (exit access), as well as stairways in the exit discharge - this is over reaching.

Response: As an initial proposal that addresses visibility of stairs we agree that this proposal should be limited to the areas with the greatest potential for significant injury. As a result, this modification to the proposal would limit the requirement for stripes on the nosing of treads and landings to interior exit stairways and exterior exit stairways. This scope is relatively easy to enforce as the building official can readily identify what ways are protected and does not have to parse whether the stairway is designated as accessible or not. In addition to protecting the visually impaired, this proposal is protective of the general population who also fall on stairs. With this reduced scope less exceptions are necessary.

Comment: What would be an acceptable material for the stripes? How would you verify contrast on stairways that were not a solid color? See also E74-24.

Response: This proposal asks that the stripe be durable and qualitatively have a contrast of light-on- dark or dark-on- light without a quantitative criteria. This qualitative light-on- dark or dark-on- light visual contrast criteria is the same as what is in Section 504.6 "Visual Contrast" in ICC A117.1-2017. The modified proposal to E74-24 discusses quantitative reflectance ratios that result in visual contrast that would also comply with the updates approved by the accessibility committee for ICC A117.1-2025.

Comment: Are there any studies that have taken into consideration stairway continuity and handrails to address the safety concerns brought up by the proponents? What would be an acceptable material for the stripes?

Response: The safety system for stairs is to have enough luminance contrast to detect the edge of the stair and also to have a handrail to catch oneself. Stair striping is like having good brakes before relying on the airbag of a car or the handrail to break one's fall. The original proposal provided a number of research studies on contrast and visibility and falls. A more recent study is from 2011 "Stepping characteristics and Centre of Mass control during stair descent: Effects of age, fall risk and visual factors," they concluded that "high stair edge contrast has a beneficial effect on balance control in older adults." **Comment:** How would you verify contrast on stairways that were not a solid color?

Response: Proposal 73 only asks for light on dark contrast without a specifying criteria. Though this criteria is qualitative, a building official can easily make the judgement call if there is no marking stripe at all. Installing white or yellow stripes on stairs are a pretty safe selection for most stairs even those that have patterned treads. Note that change in scope to interior exit stairways and exterior exit stairways reduces the likelihood that the stairs will be patterned.

Cost Impact: Increase

Estimated Immediate Cost Impact:

See original cost estimate from original proposal, approximately $2,300 per story or approximately 1.8% of the cost of the stair.

Estimated Immediate Cost Impact Justification (methodology and variables):

See original cost justification from original proposal. Estimate is that injuries have a value of 13% of the cost of the stair per year. Breakeven cost is if striping reduces injuries by 1.4%

Estimated Life Cycle Cost Impact:

See original cost-effectiveness justification from original proposal. Breakeven cost is if striping reduces injuries by 1.4%

Estimated Life Cycle Cost Impact Justification (methodology and variables):

See original cost-effectiveness justification from original proposal.

2024 International Building Code

Add new text as follows:

1011.7.2 Markings on stairways. Egress path markings shall be provided on interior and exterior stairways in accordance with Sections 1011.7.2.1 through 1011.7.2.3. **Exceptions:**

1. Stairways within individual dwelling units.
2. Stairways with stripes complying with Section 1025.

1011.7.2.1 Steps. A solid and continuous stripe shall be applied to the horizontal leading edge of each step and shall extend for the full length of the step. Stripes shall be a solid color having a visual contrast of dark-on-light or light-on dark from the remainder of the tread or landing surface. Stripes have a minimum horizontal width of 1 inch (25 mm) and a maximum width of 3 inches (76 mm). The leading edge of the stripe shall be placed not more than ½ inch (12.7 mm) from the leading edge of the step and the stripe shall not overlap the leading edge of the step by not more than 1/2 inch (12.7 mm) down the vertical face of the step. The stripe shall be of material that is at least as slip resistant as the other tread surface.

1011.7.2.2 Landings. The leading edge of landings shall be marked with a stripe consistent with the dimensional requirements for steps.

1011.7.2.3 Light reflectance. The stripe light reflectance value (LRV) and the tread surface LRV shall be determined in accordance with ASTM E1331. The stripe LRV shall comply with one of the following:

1. Stripe LRV shall be no less than stair tread LRV plus 65.
2. Stripe LRV shall be no greater than stair tread LRV minus 65.

Add new standard(s) as follows:

E 1331-15	ASTM E1331-15 (2019) Standard Test Method for Reflectance Factor and Color by Spectrophotometry Using Hemispherical Geometry

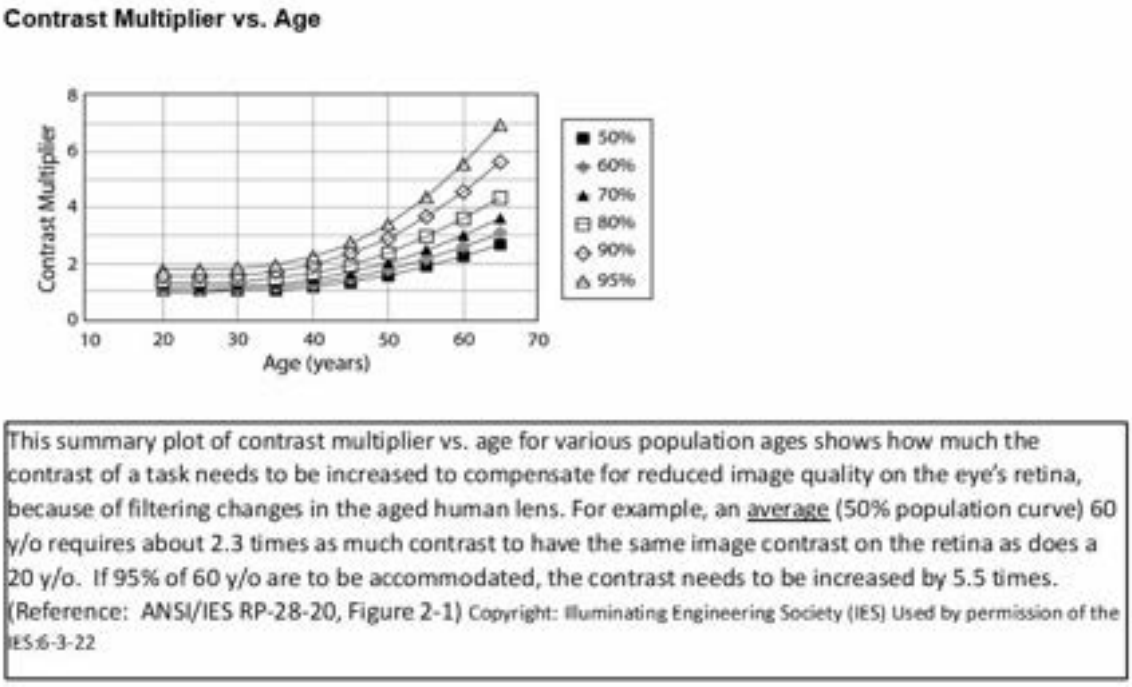
Reason: The Importance of Contrast on Stairs

Expanding Baby Boom Cohort: (Official Website of the U.S. Government, Report No. P25-1141)

- By 2029 20% of the US population will be over age 65.
- By 2056 the US population 65+will be larger than the population under 18 years.
- Why aren't building codes keeping pace with the requirement for our aging population?

Age-Related Vision Changes: Sensory loss is the most common aspect of aging; however, perception problems (e.g. vision and hearing) are not easily recognized by others or addressed in the built environment.

- **Low Vision is prevalent in the older population** and increases dramatically at the age of 70. Defined as 20/60 in the better seeing eye, and cannot be corrected with glasses, contact lenses, medicine, or surgery. (National Eye Institute, Low Vision 2010)
- **We see by visual contrast** and as people age, they experience a loss of contrast sensitivity.
- **Contrast sensitivity, not visual acuity, is associated with gait and fall related risk factors in older adults.** Research article: Duggan et al (2017) Time to refocus assessment of vision in older adults? Contrast sensitivity, but not visual acuity is associated with the gait of older adults. Journal of Gerontology :Medical Sciences doi: 10.1093/geona/glx21



This summary plot of contrast multiplier vs. age for various population ages shows how much the contrast of a task needs to be increased to compensate for reduced image quality on the eye's retina, because of filtering changes in the aged human lens. For example, an average (50% population curve) 60 y/o requires about 2.3 times as much contrast to have the same image contrast on the retina as does a 20 y/o. If 95% of 60 y/o are to be accommodated, the contrast needs to be increased by 5.5 times. (Reference: ANSI/IES RP-28-20, Figure 2-1)

Falls and stair negotiation in older people and their relationship with vision The prevalence and morbidity of falls (NIH National Library of Medicine, National Center for Biotechnology Information). Falls are a common and very serious problem for older adults, with approximately one-third of community-dwelling, healthy adults aged 65 years and over falling at least once per year, and with up to half of these people experiencing multiple falls. Annual falls rates increase to about 50% in people aged 85 years and over. Approximately 25% of falls result in an injury ranging from minor bruising to hip fracture. Hip fractures are a particularly severe consequence of falling, with the 1-year mortality rate following hip fracture being about 25%. In addition, 80% of surveyed older women suggested that they would rather be dead than experience the loss of independence and quality of life that results from a hip fracture and subsequent admission to a nursing home. Falls and hip fractures are mentioned as a contributing factor in 40% of admissions to long-term nursing and residential home care. Furthermore, even non-injurious falls have significant consequences, as they can lead to a fear of falling, which, in turn, results in a self-imposed restriction of functional activity, decreased mobility and independence, social isolation, deteriorating health, depression and reduced quality of life. **Incidences of falling in older people have been consistently linked to problems with step or stair negotiation.** Changes in visual acuity may be more associated with falls than the actual level of visual acuity, and other aspects of vision (such as visual field assessments, contrast sensitivity and stereoacuity are likely to be more important risk factors than visual acuity for falls.

According to CDC data, 38.6% of senior falls occur on level ground, but a significant 5.5% of all senior falls occur on stairs or steps.

Falls in Older Adults - Older People's Health Issues Merck Manuals https://www.merckmanuals.com › home › falls-in-older-...After a fall, injuries are common and tend to be more severe as people age. Over half of all falls result in at least a slight injury, such as a bruise, sprained ligament, or strained muscle. More serious injuries include broken bones, torn ligaments, deep cuts, and damage to organs such as the kidney or the liver.

The information cited in Cohen and Pauls (2006) is still valuable. The information provided above is focus on age-related changes to vision and the risk factor for falls on stairs due to these changes.

Contrast at the edge of stair treads defines where to safely step and helps prevent falls. Cohen and Paul also note that increasing quantity of lighting alone is not sufficient to increase the visibility of the edge of the stair tread. "In addition to lighting, there are other important factors in visibility of steps, including careful choice of stairway covering materials to avoid patterns that tend to camouflage the step nosings and the critical leading edges of treads. **and to use highly contrasting tread markings.**"

The Illuminating Engineering Society's Recommended Practice for Lighting and the Visual Environment for Older Adults and the Visually Impaired (IES-RP-28-20) notes the following concerning the use of reflectance contrast for increasing visibility: Value contrast should be

a design consideration in the selection of finishes for corridors, stairs, lobbies and spaces that become part of the path of egress. Contrast helps to define the space and the elements within the space, e.g., doorways, changes of floor level or direction, and obstructions such as columns, to increase visibility and the occupant's confidence. Everyone's sight benefits from value contrast in low-light conditions, regardless of age or visual acuity.The

IES also recommends that "*All stairs should have clearly marked edge strips, staircase borders, and handrails to meet the needs of older people and persons with low vision*."

Similar to what has been recommended by Cohen and Pauls and the Illuminating Engineering Society, this proposal would increase the safety of stairways by increasing the visual contrast (and thus the luminance contrast) by requiring contrast stripes on the nosing or leading edges of stairs. The difference in reflectance between the edge stripe and the rest of the stair tread will increase the visibility of the edge of the stair. These contrasting stripes would be one to two inches wide on the edge of nosing the stair but would allow 3" wide nosing on concrete stairs to provide adequate attachment to the tread. This proposal is written the same format as the requirement as IBC Section 1011.5.4.1 Nonuniform height risers. However the distinguishing difference between stripes on nonuniform height risers and those proposed for all other stairs is "nonuniform height risers shall have a distinctive marking stripe, different from any other nosing marking provided on the stair flight."

The description of the marking stripes are written to be in alignment with ANSI/ICC 117.1 Accessibility Standard Section 504.6 "Visual Contrast". Additionally this proposal modifies both Section 1011.5.4.1 and 1011.7.1 on the geometrical description of the contrasting marking stripe. Originally the stripe is defined as being one to two inches wide, this proposal more clearly defines the stripes as being one to two inches in depth and having a width that extends the width of the stair tread.

Cohen, Harvey and Pauls, Jake. Warnings and Markings for Stairs and Pedestrian Terrain. Handbook on Warnings. In: Michael Wogalter (Ed.),Lawrence Erlbaum, Inc., 2006, pp. 711-722.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

The lowest cost method for adding a stripe to stairs is painting a stripe. However to provide conservatively high estimate we have used the cost of adding a metal nosing strip to the tread of each stair and on the nosing of the landing above a stair. From estimates of costs published on the internet the costs of aluminum stair nosing are $6 to $21 per linear foot. https://kofflersales.com/product/metal-stair-nosing Similar costs are found on Grainger's and Lowes websites.

Using a medium costs of $12.50/linear foot, the material cost of adding an aluminum nosing to a 4 foot wide tread is $50/stair. According

one home improvement website, “A beginner can install a nosing on a tread in 15 to 30 minutes.” https://www.thespruce.com/installing-a-stair-nosing-strip-1822570 According to the US Bureau of Labor Statistics, the Mean Labor wage for carpenter, US average May 2022 is $ 27.99/hr https://www.bls.gov/oes/current/oes472031.htm Thus the labor cost is $14 per step to install a $50 nosing strip for a total installed cost of $64/stair tread. With 50% overhead and profit for carpenters (2020 RS Means), total cost is $96 per installed 4 foot wide nosing. For a 12 foot tall story, with 6 inch risers per step, there are 24 nosings with an installed cost of 24 x $96 = $2,304 per story.

Estimated Immediate Cost Impact Justification (methodology and variables):

Adding striping to stairs increases the cost of stairs by 1.8%. However, this cost is offset by the societal savings associated with avoiding trip and fall hazards on stairways.

Estimated Life Cycle Cost Impact:

Overall life cycle impact is negative meaning that society has an overall benefit from the increased visibility of change of level in stairs.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

In Cohen and Pauls Warnings and Markings for Stairs and Pedestrian Terrain (see bibliography), they cite that "Stair-related injuries alone were estimated to have a societal cost of nearly 50 billion dollars in 1995."

E74-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: Same reasons as E73-24. In addition, the width of the stripes should be a maximum of 2 inches. There were several issues brought up during the testimony regarding testing - how and where do you take the measurements? Can interpretations be based on plans, or is the only option to field verify? Direction must be provided for the code official. ASTM E1331-15 does not specifically address contrast. This is not the right standard. This is already addressed in Section 1025.4. (Vote: 13-1)

E74-24

Individual Consideration Agenda

Comment 1:

IBC: 1011.5, 1011.5.4.1, 1011.7.2, 1011.7.2.1, 1011.7.2.3, 1011.5.6.1.1 (New), 1011.7.2.2, 1011.6, 1011.6.1 (New), ASTM Chapter 35; IFC: [BE] 1011.5, [BE] 1011.5.4.1, 1011.7.2, 1011.7.2.1, 1011.7.2.3, [BE] 1011.5.6.1.1 (New), 1011.7.2.2, [BE] 1011.6, 1011.6.1 (New), ASTM Chapter 80

Proponents: Jonathan McHugh, McHugh Energy Consultants Inc., California Investor Owned Utilities (jon@mchughenergy.com); Eunice Noell-Waggoner, Center of Design for an Aging Society, IES Lighting for Seniors and the Visually Impaired Committee (eunice@centerofdesign.org); Koni Sims, ACB Board of Director, American Council of the Blind (ACB), Visually Impaired/Low Vision (koni.l.sims@gmail.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

1011.5 Stair treads and risers. *Stair* treads and risers shall comply with Sections 1011.5.1 through ~~1011.5.5.3~~ 1011.5.6.

1011.5.4.1 Nonuniform height risers. Where the bottom or top riser adjoins a sloping *public way*, walkway or driveway having an established grade and serving as a landing, the bottom or top riser is permitted to be reduced along the slope to less than 4 inches (102 mm) in height, with the variation in height of the bottom or top riser not to exceed one unit vertical in 12 units horizontal (8-percent slope) of *stair* width. The *nosings* at such nonuniform height risers shall have a distinctive marking stripe, different from any other *nosing* marking provided on the *stair flight*. The distinctive marking stripe shall be visible in descent of the *stair*. Marking stripes shall have a width of not less than 1 inch (25 mm) but not more than 2 inches (51 mm).

~~**1011.7.2 Markings on stairways .** Egress path markings shall be provided on interior and exterior stairways in accordance with Sections 1011.7.2.1 through 1011.7.2.3.~~

~~**Exceptions:**~~

1. ~~Stairways within individual dwelling units.~~
2. ~~Stairways with stripes complying with Section 1025.~~

~~**1011.7.2.1**~~ **1011.5.6** ~~**Steps**~~ **Marking stripes on tread nosings.** For *interior exit stairways* and *exterior exit stairways*, the leading 1 to 2 inches (25 to 51 mm) of every tread *nosing* shall have a marking stripe of a solid color that is lighter or darker than the remainder of the tread. The marking stripe shall be durable and shall extend from one side of the tread to the other side of each tread.~~A solid and continuous stripe shall be applied to the horizontal leading edge of each step and shall extend for the full length of the step. Stripes shall be a solid color having a visual contrast of dark on light or light on dark from the remainder of the tread or landing surface. Stripes have a minimum horizontal width of 1 inch (25 mm) and a maximum width of 3 inches (76 mm). The leading edge of the stripe shall be placed not more than ½ inch (12.7 mm) from the leading edge of the step and the stripe shall not overlap the leading edge of the step by not more than 1/2 inch (12.7 mm) down the vertical face of the step. The stripe shall be of material that is at least as slip resistant as the other tread surface.~~

Exceptions:

1. Portions of treads with distinctive marking stripes complying with Section 1011.5.4.1.
2. Stairways with stripes complying with Section 1025.

Revise as follows:

~~**1011.7.2.3**~~ **1011.5.6.1 Light reflectance value.** The average light reflectance value (LRV) of the lighter surface shall be no less than 50, and the average LRV of the darker surface shall be no greater than 35% of the average LRV of the lighter surface. The marking stripe light reflectance value (LRV) and the tread and landing surface LRV shall be the percent light reflectance value measured ~~determined~~ in accordance with ASTM E1331. For field measurements including those in a mock-up of a sample tread or landing, the reported LRV or CIE Y value measured by a colorimeter shall also be an allowed method of determining LRV.~~The stripe LRV shall comply with one of the following:~~

1. ~~Stripe LRV shall be no less than stair tread LRV plus 65.~~
2. ~~Stripe LRV shall be no greater than stair tread LRV minus 65.~~

Exceptions:

1. Treads and landings where the LRV of a background material cannot be accurately measured, such as a natural material, and where the marking stripe is lighter or darker than the remainder of the tread and landing.
2. Where the marking stripe is yellow that approximates traffic yellow.

Add new text as follows:

1011.5.6.1.1 Compliance. Compliance for the light reflectance value (LRV) shall be determined by at least one of the following:

1. Documentation provided by the manufacturer based on information from the supplier of the material.

2. Documentation of compliance by a testing agency.

3. Field measurement including mock-up.

~~**1011.7.2.2 Landings.** The leading edge of landings shall be marked with a stripe consistent with the dimensional requirements for steps.~~

1011.6 Stairway landings. There shall be a floor or landing at the top and bottom of each *stairway*. The width of landings, measured perpendicularly to the direction of travel, shall be not less than the width of *stairways* served. Every landing shall have a minimum depth, measured parallel to the direction of travel, equal to the width of the *stairway* or 48 inches (1219 mm), whichever is less. Doors opening onto a landing shall not reduce the landing to less than one-half the required width. When fully open, the door shall not project more than 7 inches (178 mm) into the required width of a landing. Where *wheelchair spaces* are required on the *stairway* landing in accordance with Section 1009.6.3, the *wheelchair space* shall not be located in the required width of the landing and doors shall not swing over the *wheelchair spaces*. **Exceptions:**

1. Where *stairways* connect stepped *aisles* to cross *aisles* or concourses, *stairway* landings are not required at the transition between *stairways* and stepped *aisles* constructed in accordance with Section 1030.
2. Where curved *stairways* of constant radius have intermediate landings, the landing depth shall be measured horizontally between the intersection of the walkline of the lower *flight* at the landing *nosing* and the intersection of the walkline of the upper *flight* at the *nosing* of the lowest tread of the upper *flight*.
3. Where a landing turns 90 degrees (1.57 rad) or more, the minimum landing depth in accordance with this section shall not be required where the landing provided is not less than that described by an arc with a radius equal to the width of the *flight* served.

Add new text as follows:

1011.6.1 Marking stripes on landing nosings. For *interior exit stairways* and *exterior exit stairways*, the *nosing* of all landings shall have a marking stripe complying with Section 1011.5.6.

2024 International Fire Code

[BE] 1011.5 Stair treads and risers. *Stair* treads and risers shall comply with Sections 1011.5.1 through ~~1011.5.5.3~~ 1011.5.6.

[BE] 1011.5.4.1 Nonuniform height risers. Where the bottom or top riser adjoins a sloping *public way*, walkway or driveway having an established grade and serving as a landing, the bottom or top riser is permitted to be reduced along the slope to less than 4 inches (102 mm) in height, with the variation in height of the bottom or top riser not to exceed 1 unit vertical in 12 units horizontal (8-percent slope) of *stair* width. The nosings at such nonuniform height risers shall have a distinctive marking stripe, different from any other *nosing* marking provided on the *stair flight*. The distinctive marking stripe shall be visible in descent of the *stair*. Marking stripes shall have a width of not less than 1 inch (25 mm) but not more than 2 inches (51 mm).

Revise as follows:

~~**[BE] 1011.7.2 Markings on stairways.** Egress path markings shall be provided on interior and exterior stairways in accordance with Sections 1011.7.2.1 through 1011.7.2.3.~~

~~**Exceptions:**~~

1. ~~Stairways within individual dwelling units.~~
2. ~~Stairways with stripes complying with Section 1025.~~

[BE] ~~**1011.7.2.1**~~ **1011.5.6** ~~**Steps**~~ **Marking stripes on tread nosing.** For *interior exit stairways* and *exterior exit stairways*, the leading 1 to 2 inches (25 to 51 mm) of every tread *nosing* shall have a marking stripe of a solid color that is lighter or darker than the remainder of the tread. The marking stripe shall be durable and shall extend from one side of the tread to the other side of each tread.~~A solid and continuous stripe shall be applied to the horizontal leading edge of each step and shall extend for the full length of the step. Stripes shall be a solid color having a visual contrast of dark on light or light on dark from the remainder of the tread or landing surface. Stripes have a minimum horizontal width of 1 inch (25 mm) and a maximum width of 3 inches (76 mm). The leading edge of the stripe shall be placed not more than ½ inch (12.7 mm) from the leading edge of the step and the stripe shall not overlap the leading edge of the step by not more than 1/2 inch (12.7 mm) down the vertical face of the step. The stripe shall be of material that is at least as slip resistant as the other tread surface.~~

Exceptions:

1. Portions of treads with distinctive marking stripes complying with Section 1011.5.4.1.
2. Stairways with stripes complying with Section 1025.

Revise as follows:

[BE] ~~**1011.7.2.3**~~ **1011.5.6.1 Light reflectance value.** The average light reflectance value (LRV) of the lighter surface shall be no less than 50, and the average LRV of the darker surface shall be no greater than 35% of the average LRV of the lighter surface. The marking stripe light reflectance value (LRV) and the tread and landing surface LRV shall be the percent light reflectance value measured ~~determined~~ in accordance with ASTM E1331. For field measurements including those in a mock-up of a sample tread or landing, the reported LRV or CIE Y value measured by a colorimeter shall also be an allowed method of determining LRV~~The stripe LRV shall comply with one of the following:~~

1. ~~Stripe LRV shall be no less than stair tread LRV plus 65.~~
2. ~~Stripe LRV shall be no greater than stair tread LRV minus 65.~~

Exceptions:

1. Treads and landings where the LRV of a background material cannot be accurately measured, such as a natural material, and where the marking stripe is lighter or darker than the remainder of the tread and landing.
2. Where the marking stripe is yellow that approximates traffic yellow.

Add new text as follows:

[BE] 1011.5.6.1.1 Compliance. Compliance for the light reflectance value (LRV) shall be determined by at least one of the following:

1. Documentation provided by the manufacturer based on information from the supplier of the material.
2. Documentation of compliance by a testing agency.
3. Field measurement including mock-up.

~~**[BE] 1011.7.2.2 Landings.** The leading edge of landings shall be marked with a stripe consistent with the dimensional requirements for steps.~~

[BE] 1011.6 Stairway landings. There shall be a floor or landing at the top and bottom of each *stairway*. The width of landings, measured perpendicularly to the direction of travel, shall be not less than the width of *stairways* served. Every landing shall have a minimum depth, measured parallel to the direction of travel, equal to the width of the *stairway* or 48 inches (1219 mm), whichever is less. Doors opening onto a landing shall not reduce the landing to less than one-half the required width. When fully open, the door shall not project more than 7 inches (178 mm) into the required width of a landing. Where wheelchair spaces are required on the stairway landing in accordance with Section 1009.6.3, the wheelchair space shall not be located in the required width of the landing and doors shall not swing over the wheelchair spaces. **Exceptions:**

1. Where *stairways* connect stepped *aisles* to cross *aisles* or concourses, *stairway* landings are not required at the transition between *stairways* and stepped *aisles* constructed in accordance with Section 1030.
2. Where curved *stairways* of constant radius have intermediate landings, the landing depth shall be measured horizontally between the intersection of the walkline of the lower *flight* at the landing *nosing* and the intersection of the walkline of the upper *flight* at the *nosing* of the lowest tread of the upper *flight*.
3. Where a landing turns 90 degrees (1.57 rad) or more, the minimum landing depth in accordance with this section shall not be required where the landing provided is not less than that described by an arc with a radius equal to the width of the *flight* served.

Add new text as follows:

1011.6.1 Marking stripes on landing nosings. For *interior exit stairways* and *exterior exit stairways*, the *nosing* of all landings shall have a marking stripe complying with Section 1011.5.6.

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box C700
West Conshohocken, PA 19428-2959

E 1331-15	ASTM E1331-15 (2019) Standard Test Method for Reflectance Factor and Color by Spectrophotometry Using Hemispherical Geometry

Reason: This proposal quantifies the required reflectance of a marking stripe that delineates the edge or nosing of the stair tread and the nosing of landings above stairs so that there is enough visual contrast between the edge of these surfaces and the surfaces themselves. These stripes are critical in preventing falls which has significant impact on fatalities and injury. The original proposal details the significant societal costs associated with falls on stairs.Recognizing the risk associated with not striping stairs and landings, the following countries have requirements for contrasting striping on stairs with specific reflectance requirements to create visual contrast between the leading edge of stairs and the rest of the treads and landings:
Great Britain
Germany
Australia

The reflectances required by this proposal result in luminance differences between the stripe and the background surface that have a Weber Contrast Ratio of 65%. The ICC A117.1 committee determined this 65% minimum Weber contrast to be protective against fall and trip hazards similar what was recommended by ISO 21542:2021. Weber contrast is a function of the relative light reflectance value (LRV) of the tread and the contrasting stripe.

Additionally, the ISO requires that the lighter surface have a LRV between100 and 50 (percent values) to maintain discrimination for the visual task as there is less discrimination between having dark and very dark colors. In ISO 21542:2021, they reference CIE Y which is directly equivalent to LRV. The ICC A117.1 committee has used the Weber Contrast Ratio formula as follows:

$$Cw = (Rlight - Rdark)/Rlight$$

Where,
Cw = Weber contrast ratio
Rdark = reflectance value of darker surface (lower reflectance)
Rlight = reflectance value of lighter surface (higher reflectances)

For simplicity we have used the ratio of reflectances of the stripe and the background. Rearranging the terms in the Weber formula results in a much simpler equation for determining the maximum ratio of the darker (lower) reflectance to the lighter (higher) reflectance.

Cw = (Rlight – Rdark)/Rlight = 1- Rdark/Rlight

1-Cw = Rdark/Rlight

Where

If Cw (Weber contrast) is required to be greater than 65%, then 1- Cw must be less than 35%.

As a result the ratio of the darker colored surface shall be less than 35% of the reflectance of the lighter colored surface. This LRV ratio in conjunction with the requirement that the LRV of the lighter (higher reflectance) surface be greater than 50 forms the basis of the light reflectance requirements in Section 1011.5.6.1

This proposal makes use of ASTM E1331-2015 which a repeatable method for measuring reflectances of paints, and surface reflectance. It also addresses how to measure high gloss (exclude specular component) versus low gloss (include specular component) surfaces. During the code action hearing, stakeholders asked how this standard would be enforced. This proposal added a compliance section to identify the many methods of showing compliance including manufacturer's documentation of LRV and on-site measurements. For laboratory settings that would be used to define product properties the ASTM test method makes for an accurate measurement of light reflectance value (LRV). However in updating this proposal we identified that this was limiting in terms of the inexpensive handheld products that would be appropriate for on-site measurements including those measurements that are on-site at a mock-up of the tread or landing and marking stripe. Thus for these on-site measurements, the allowable test methods were expanded to allow the use of relatively inexpensive colorimeters without an internal integrating sphere to measure the light reflectance value. Portable colorimeters are frequently used for color matching of paints to a preexisting surface and many provide the direct measurement of LRV or "CIE Y," the CIE luminance value in the CIE XYZ color space. Both LRV and CIE Y are equivalent.

This proposal also allows the use of a traffic yellow marking stripe in lieu of a marking stripe with a defined LRV relative to the tread or landing. Prior research conducted by the US Department of Transportation "Detectable Warning Surfaces: Color Contrast and Reflectance" found that high luminance contrast was more readily detected by people with visual impairment but they also found that safety yellow was most frequently chosen as "most visually detectable." The ICC A117.1 Committee has recommended that in most cases SAE AMS-STD-595A, Color ID 33538 International Yellow (also known as traffic yellow) be the required color for detectable sources in Section 705.3. "Contrast" in A117.1-2025 as this color "provides a high level of conspicuity for a given level of luminance contrast." There are already many products that meet this color specification and it is a recognized color for warning pedestrians of curb ramps and travelers the edge of rail platforms and the like. This specification has been in the California Building code in Chapter 11B Section 11B-705.1.1.3.1 as the primary method of complying with the detectable surfaces requirement as follows: "Detectable warning surfaces shall be yellow and approximate 33538 of SAE AMSSTD-595A.". In the SAE standard, color ID 33538 is listed as having CIELAB color coordinates of L* = 72.9, a* = 22.93, b* =72.42 when measured under a D65 illuminant and is listed as any of the following color names: Yellow International, Traffic Yellow, or ANA 614. This proposal is making use of the commonly recognized paint color name Traffic Yellow.

As an exception, the marking stripe being yellow and approximating the color of traffic yellow removes compliance uncertainty associated with the proposed requirements when tread reflectance is not known in advance. A stripe closely approximating traffic yellow can always be used regardless of the tread or landing surface background reflectance. This addresses variegated stairs, concrete stairs where the surface reflectance might very depending upon the concrete mix or how the surface is finished. However for designers not wishing to use a yellow stripe they can select a marking stripe with a light reflectance value relative to the reflectance of the tread as required in section 1011.5.6.1. Commenters had also brought up the concern of the feasibility of placing a colored stripe on stair treads made out of metal grating. The requirement allows a stripe between 1 and 2 inches wide. We found many metal stair treads that have at least a 1" solid sheet metal nosing on the front edge of the tread. In the committee's reason statement there were some very useful questions that are answered below:

Comment: The width of the stripes should be a maximum of 2 inches.

Reply: Agreed, this is change is in the introductory phrase to revised Section 1011.7.2 (Visual Contrast between Striping and Stairway Treads and Landings) "The leading 1 to 2 inches (25 to 51 mm) of every tread and landing shall be a stripe of a solid color with a visual contrast…"

Comment: There were several issues brought up during the testimony regarding testing - how and where do you take the measurements? Can interpretations be based on plans, or is the only option to field verify? Direction must be provided for the code official.

Reply: In response to this comment, the proposal was modified to add Section 1105.6.1.1 (Compliance) which describes the three ways one can show compliance: manufacturer's data, test data or field measurement (including mock-ups).

Comment: ASTM E1331-15 does not specifically address contrast. This is not the right standard. This is already addressed in Section 1025.4.
Reply: Section 1025.4 addresses self-luminous and photoluminescent materials. Self luminous materials are materials that emit light (such as tritium) and photoluminescent materials are those that store physical changes from absorbed light and re-emit light over time. This proposal is addressing the reflectance value of stripes that rely on illumination to instantaneously provide varying amounts of luminance contrast based on the reflectance of the stripe and the background surface. The newly defined contrast requirements in A117.1 are based on the Weber contrast relationship between the marking stripe reflectance and its background. This proposal only describes reflectance requirements without introducing the more complex equations associated with Weber Contrast. ASTM E1331-15 does not directly address contrast; it is a test method for measuring reflectance. In modifying this proposal, we have not introduced the term contrast as compliance is solely based on the ratio of reflectances of the marking stripe and the tread or landing surface.

Comment to Proposal 73: How would you verify contrast on stairways that were not a solid color?
Reply: Proposal 74 has specific average reflectance criteria and addresses this issue in four ways:
1. If the variability does not have much spatial distribution (i.e. granite with light and dark flecks but the overall color is relatively uniform), the measurement port of the reflectometer provides the needed averaging.
2. If the variability is large with large elements of dark and light, averaging is accomplished by measuring multiple locations and averaging the results.
3. The proposal E74-24 as modified specifically exempts “Treads and landings where the LRV of a background material cannot be accurately measured, such as a natural material, and where the marking stripe is lighter or darker than the remainder of the tread and landing.”
4. Also is exempted is "Where the marking stripe is yellow that approximates traffic yellow."

Note that all methods of compliance require the presence of a marking stripe, the last two do not require a measurement of reflectance contrast.

During the initial code action hearing on this proposal some commenters asked the question concerning how this would be enforced. The most common method would be for the manufacturers of stair striping and stair treads to provide light reflectance values (LRV) of these products and designer would provide these values as part of their submittal. The manufacturer could test the materials themselves or could have a test lab take the measurements. These measurements are simple and inexpensive. In some cases the data is not readily available from the manufacturer, a mock-up could be constructed, and the designer could ask for pre-approval from the AHJ based on the mock-up. Occasionally it might be required to take a site measurement. A small handheld colorimeter that reports either LRV or CIE Y values can be used to take the measurements.

Proposed Change as Submitted

Proponents: Scott Brody, None (sbrody96@gmail.com)

2024 International Building Code

Revise as follows:

1013.6 Externally illuminated exit signs. Externally illuminated exit signs shall comply with Sections 1013.6.1 through ~~1013.6.3~~ 1013.6.5.

1013.6.1 ~~Graphics~~ Exit text. Every textual exit sign and directional exit sign shall have plainly legible letters not less than 6 inches (152 mm) high with the principal strokes of the letters not less than $^{3}/_{4}$ inch (19.1 mm) wide. The word “EXIT” shall have letters having a width not less than 2 inches (51 mm) wide, except the letter “I,” and the minimum spacing between letters shall be not less than $^{3}/_{8}$ inch (9.5 mm). Signs larger than the minimum established in this section shall have letter widths, strokes and spacing in proportion to their height.The word “EXIT” shall be in high contrast with the background and shall be clearly discernible when the means of exit sign illumination is or is not energized. If a chevron directional indicator is provided as part of the exit sign, the construction shall be such that the direction of the chevron directional indicator cannot be readily changed.Exit text shall be permitted to be displayed in multiple languages. In these situations, and in jurisdictions utilizing non-Latin scripts, the size of text, and its placement with respect to directional indicators, shall be *approved*.

Add new text as follows:

1013.6.2 Exit symbols. Graphical symbol exit signs shall be based on Figure 1013.6.2 and the symbol shall be a minimum of 5.91 inches (150 mm) high.

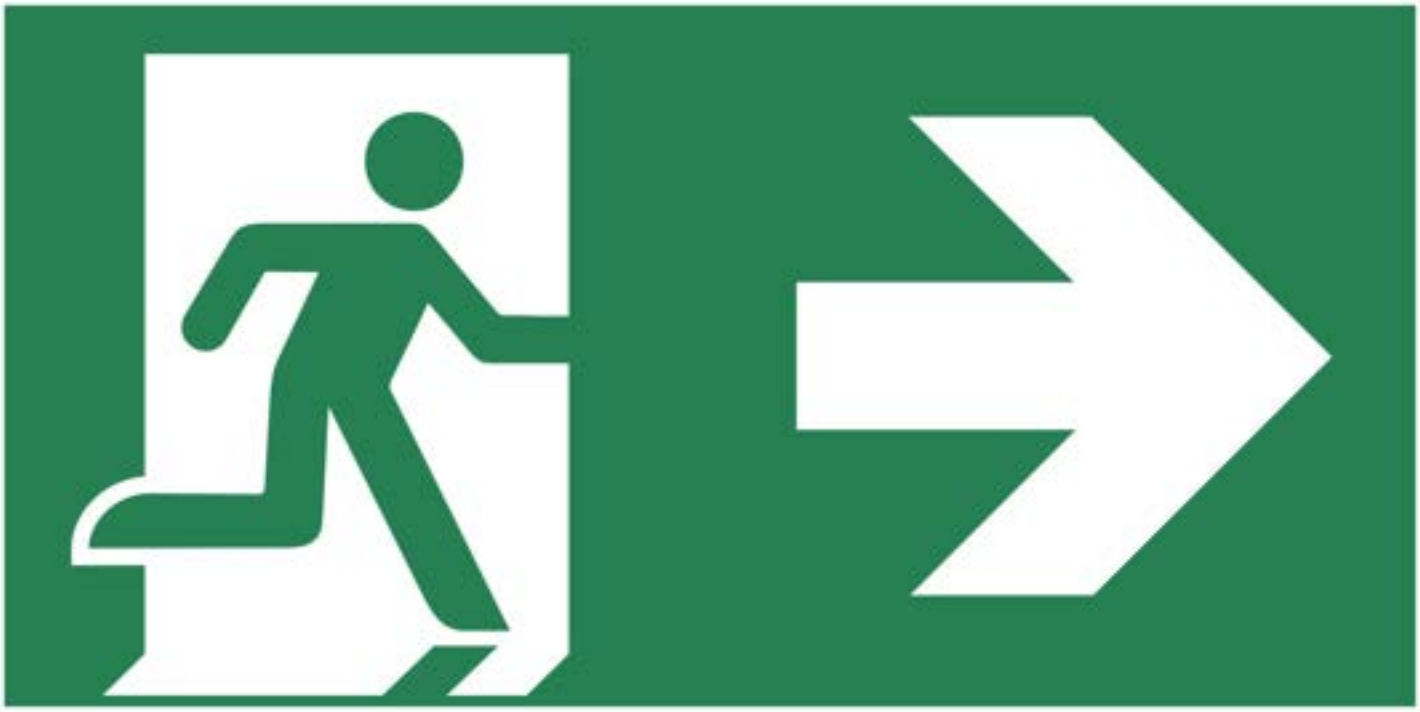

FIGURE 1013.6.2 Graphic exit symbol

1013.6.2.1 Detail proportions and color requirements. The proportions of the graphic exit symbol, and the size and positioning of any arrow, shall be in accordance with UL 924. The color of the doorway and arrow shall be white. The background and person moving through the doorway shall be green.

1013.6.3 Textual and graphic symbol exit signs. Exit signs shall include the graphic symbol or a combination of the text and graphic symbol. Where text and symbol are both provide they shall be displayed simultaneously. The text shall not obstruct the symbol or arrow. The exit text and symbols shall be on one sign or two adjacent signs.

Revise as follows:

~~**1013.6.2**~~ **1013.6.4 Exit sign illumination.** The face of an exit sign illuminated from an external source shall have an intensity of not less than 5 footcandles (54 lux).

~~**1013.6.3**~~ **1013.6.5 Power source.** Exit signs shall be illuminated at all times. To ensure continued illumination for a duration of not less than 90 minutes in case of primary power loss, the sign illumination means shall be connected to an emergency power system provided from storage batteries, unit equipment or an on-site generator. The installation of the *emergency power system* shall be in accordance with Chapter 27. Group I-2, Condition 2 exit sign illumination shall not be provided by unit equipment batteries only. **Exception:** *Approved* exit sign illumination types that provide continuous illumination independent of external power sources for a duration of not less than 90 minutes, in case of primary power loss, are not required to be connected to an emergency electrical system.

2024 International Fire Code

Revise as follows:

[BE] 1013.6 Externally illuminated exit signs. Externally illuminated exit signs shall comply with Sections 1013.6.1 through ~~1013.6.3~~ 1013.6.5.

[BE] 1013.6.1 ~~Graphics~~ Exit text. Every textual exit sign and directional exit sign shall have plainly legible letters not less than 6 inches (152 mm) high with the principal strokes of the letters not less than $^3/_4$ inch (19.1 mm) wide. The word “EXIT” shall have letters having a width not less than 2 inches (51 mm) wide, except the letter “I,” and the minimum spacing between letters shall be not less than $^3/_8$ inch (9.5 mm). Signs larger than the minimum established in this section shall have letter widths, strokes and spacing in proportion to their height.The word “EXIT” shall be in high contrast with the background and shall be clearly discernible when the means of exit sign illumination is or is not energized. If a chevron directional indicator is provided as part of the exit sign, the construction shall be such that the direction of the chevron directional indicator cannot be readily changed.Exit text shall be permitted to be displayed in multiple languages. In these situations, and in jurisdictions utilizing non-Latin scripts, the size of text, and its placement with respect to directional indicators, shall be *approved*.

Add new text as follows:

1013.6.2 Exit symbols. Graphical symbol exit signs shall be based on Figure 1013.6.2 and the symbol shall be a minimum of 5.91 inches (150 mm) high.

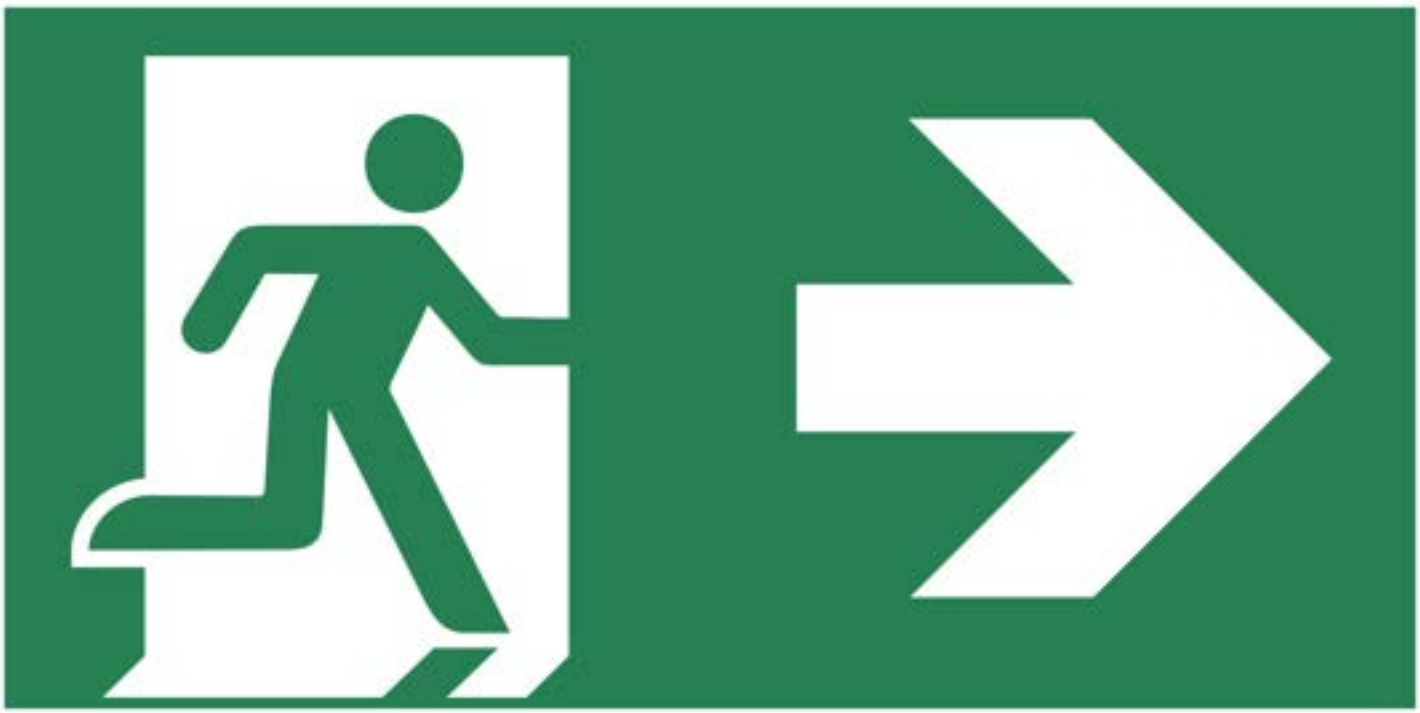

FIGURE 1013.6.2 Graphic exit symbol

1013.6.2.1 Detail proportions and color requirements. The proportions of the graphic exit symbol, and the size and positioning of any arrow, shall be in accordance with UL 924. The color of the doorway and arrow shall be white. The background and person moving through the doorway shall be green.

1013.6.3 Textual and graphic symbol exit signs. Exit signs shall include the graphic symbol or a combination of the text and graphic symbol. Where text and symbol are both provide they shall be displayed simultaneously. The text shall not obstruct the symbol or arrow. The exit text and symbols shall be on one sign or two adjacent signs.

Revise as follows:

[BE] ~~1013.6.2~~ 1013.6.4 Exit sign illumination. The face of an exit sign illuminated from an external source shall have an intensity of not less than 5 footcandles (54 lux).

[BE] ~~1013.6.3~~ 1013.6.5 Power source. Exit signs shall be illuminated at all times. To ensure continued illumination for a duration of not less than 90 minutes in case of primary power loss, the sign illumination means shall be connected to an emergency power system provided from storage batteries, unit equipment or an on-site generator. The installation of the emergency power system shall be in accordance with Section 1203. Group I-2, Condition 2 exit sign illumination shall not be provided by unit equipment batteries only. **Exception:** *Approved* exit sign illumination types that provide continuous illumination independent of external power sources for a duration of not less than 90 minutes, in case of primary power loss, are not required to be connected to an emergency electrical system.

Reason: Fixes violations of Code Council Policy #49-21, because the current language:

- Precludes the code from being adopted in certain situations internationally.
- Conflicts with International Law: World Trade Organization Technical Barriers to Trade Agreement Article 2.4

Improves safety because:

o The human brain is better at recalling information when it is presented visually.

o Symbols have faster glance recognition versus words.

o Foreigners, small children, and people with certain disabilities can better understand symbolic communication.

o People in nations using the I-codes will gain exposure to the exit symbol used in most of the world, thus they will be better prepared for emergencies while traveling abroad.

o The ISO arrow is far more legible at a distance vs the tiny chevron directional indicator referenced in the current code.

o Large ISO-type arrows can be more clearly X'd out on dynamic exit signs, which may be coming in the future.

o The proposed language also encourages and incentivizes placing door numbers on signs, which make it easier for emergency services to know what door to arrive at, without the caller having to go outside, look for a door number, and potentially get locked out.

My proposal thus takes advantage of the benefits of symbols, while providing reasonable options for supplemental text to support symbol learning where this type of exit sign has not yet been introduced (mainly the US).

Bibliography: See attachment for bibliography and further justification.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

An example of the cost of an exit sign is $20. The total cost for the building is dependent on the number of exit signs required. If you can save even a small amount on each sign, that could be a significant savings for the building.

Estimated Immediate Cost Impact Justification (methodology and variables):

Because this change provides increased flexibility, it is expected costs will be lower in some cases. This is especially true for prefabricated structures, for example jet bridges, which would not have to be imported with separate exit signs for the US market.

For ordinary externally illuminated exit signs, there is potential for cost savings because customers will be able to shop on the global marketplace for ISO signs, vs the smaller market for text signs. This could result in even higher savings in non-English speaking places using this code, because there may be a limited number of manufacturers selling signs in languages with few speakers.

For exit text and symbol signs, the costs would depend on what the AHJ requires. For example, if the AHJ only mandates small exit text, a label could be placed on top of the sign, which could cost in the range of cents more per sign. If the AHJ requires larger text, the sign could wind up larger than the existing standard. Since many sign producers charge based on the surface area of the sign, costs could be expected to be higher than existing norms. However, there would still be 0$ required cost to the builder since they retain the option to continue using text only signs. In the event custom information is added to the sign, such as door numbers, this would be expected to be more expensive than the current sign configuration. It would also generally require larger signs. Since this is only being proposed as an option, it would result in no additional cost if the building owner did not wish to exercise such rights.

Because of the multitude of factors impacting safety, and various conditions in different nations, it is not possible to definitively quantify the safety costs vs benefits of ISO exit signs, vs the current IFC standard.

Since most exit signs are internally illuminated, and these changes apply only to externally illuminated signs, the overall cost impact can be expected to be limited.

E78-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: As written the pictogram is required. This should allow for this the pictogram as an option and/or an exit only sign so that people can get used to this type of exit sign. This is only included under externally illuminated exit signage - what about internally illuminated exit signage. The cost impact indicates this a cost savings, but requiring additional signage would be a cost increase. (Vote: 14-0)

The~~ text shall not obstruct the symbol or arrow.
The exit text and symbols shall be on one sign or two adjacent signs.

Reason: I intended this proposal to only give the option of using symbol exit signs, not require them. There appears to have been an oversight during post submission processing that may have caused the proposal to read differently.

Externally Illuminated Exit Signs

My latest proposal included within this comment offers the option to use either the word or symbol. Dual symbol text signs should be especially useful for education in places where symbol exit signs are not currently widespread

Pursuant to ICC Code Council Policy CP 49-21, code changes should consider international adoption needs, not just the US.

Internally Illuminated Exit Signs

To reiterate what was stated in my narrative, symbol exit signs are already permitted for internally illuminated signs under the I-codes. Therefore, no changes are proposed regarding internally illuminated signs. To be specific, the I-codes require internally illuminated exit signs conform to ANSI/UL 924. This was updated to include a symbol option in recent years. UL's addition of the symbol option is consistent with requirements that ANSI accredited standards consider relevant international symbol standards, pursuant to WTO trade treaty requirements.

Proposed Change as Submitted

Proponents: David Cooper, Stair Manufacturing and Design Consultants, Stairbuilders and Manufacturers Association, SMA (coderep@stairways.org)

2024 International Building Code

Revise as follows:

1014.4 Handrail graspability. Required *handrails* shall comply with Section 1014.4.1 or shall provide equivalent graspability. ~~**Exception**~~ **Exceptions:**

1. In Group R-3 occupancies; within *dwelling units* in Group R-2 occupancies; and in Group U occupancies that are accessory to a Group R-3 occupancy or accessory to individual *dwelling units* in Group R-2 occupancies; *handrails* shall be Type I in accordance with Section 1014.4.1, Type II in accordance with Section 1014.4.2 or shall provide equivalent graspability.
2. Where handrails are provided along walking surfaces with slopes not steeper than 1:20, *handrails* shall be Type I in accordance with Section 1014.4.1, Type II in accordance with Section 1014.4.2 or shall provide equivalent graspability.

1014.4.1 Type I. *Handrails* with a circular cross section shall have an outside diameter of not less than $1\frac{1}{4}$ inches (32 mm) and not greater than 2 inches (51 mm). Where the *handrail* is not circular, it shall have a perimeter dimension of not less than 4 inches (102 mm) and not greater than $6\frac{1}{4}$ inches (160 mm) with a maximum cross-sectional dimension of $2\frac{1}{4}$ inches (57 mm) and minimum cross-sectional dimension of 1 inch (25 mm). Edges shall have a minimum radius of 0.01 inch (0.25 mm).

1014.4.2 Type II. *Handrails* with a perimeter greater than $6\frac{1}{4}$ inches (160 mm) shall provide a graspable finger recess area on both sides of the profile. The finger recess shall begin within a distance of $\frac{3}{4}$ inch (19 mm) measured vertically from the tallest portion of the profile and achieve a depth of not less than $\frac{5}{16}$ inch (8 mm) within $\frac{7}{8}$ inch (22 mm) below the widest portion of the profile. This required depth shall continue for not less than $\frac{3}{8}$ inch (10 mm) to a level that is not less than $1\frac{3}{4}$ inches (45 mm) below the tallest portion of the profile. The width of the *handrail* above the recess shall be not less than $1\frac{1}{4}$ inches (32 mm) to not greater than $2\frac{3}{4}$ inches (70 mm). Edges shall have a minimum radius of 0.01 inch (0.25 mm).

Revise as follows:

1014.5 Continuity. Handrail gripping surfaces shall be continuous, without interruption by newel posts or other obstructions. **Exceptions:**

1. Within a *dwelling* unit that is not an *Accessible unit* or *Type A unit*, the continuity of handrail gripping surfaces is allowed to be interrupted by a newel post at a turn or landing.
2. Within a *dwelling unit*, the use of a volute, turnout, starting easing or starting newel is allowed over the lowest tread.
3. ~~Handrail brackets or balusters~~ Supports attached to the bottom surface of the *handrail* that do not project horizontally beyond the sides of the *handrail* within $1\frac{1}{2}$ inches (38 mm) of the bottom of ~~the~~ Type I *handrails* shall not be considered obstructions. For each $\frac{1}{2}$ inch (12.7 mm) of additional handrail perimeter dimension of Type I handrails above 4 inches (102 mm), the vertical clearance dimension of $1\frac{1}{2}$ inches (38 mm) shall be permitted to be reduced by $\frac{1}{8}$ inch (3.2 mm). The entire length of Type II handrails shall be permitted to be obstructed provided any horizontal projection of the supports beyond the sides of the handrail are below the required recess.
4. ~~Where *handrails* are provided along walking surfaces with slopes not steeper than 1:20, the bottoms of the handrail gripping surfaces shall be permitted to be obstructed along their entire length where they are integral to crash rails or bumper *guards*.~~
4 ~~5~~. *Handrails* serving stepped *aisles* or ramped *aisles* are permitted to be discontinuous in accordance with Section 1030.16.1.

2024 International Fire Code

Revise as follows:

[BE] 1014.4 Handrail graspability. Required *handrails* shall comply with Section 1014.4.1 or shall provide equivalent graspability. **Exception Exceptions:**

1. In Group R-3 occupancies; within *dwelling units* in Group R-2 occupancies; and in Group U occupancies that are accessory to a Group R-3 occupancy or accessory to individual *dwelling units* in Group R-2 occupancies; *handrails* shall be Type I in accordance with Section 1014.4.1, Type II in accordance with Section 1014.4.2 or shall provide equivalent graspability.
2. Where handrails are provided along walking surfaces with slopes not steeper than 1:20, *handrails* shall be Type I in accordance with Section 1014.4.1, Type II in accordance with Section 1014.4.2 or shall provide equivalent graspability.

[BE] 1014.4.1 Type I. *Handrails* with a circular cross section shall have an outside diameter of not less than $1\,^{1}/_{4}$ inches (32 mm) and not greater than 2 inches (51 mm). Where the *handrail* is not circular, it shall have a perimeter dimension of not less than 4 inches (102 mm) and not greater than $6\,^{1}/_{4}$ inches (160 mm) with a maximum cross-sectional dimension of $2\,^{1}/_{4}$ inches (57 mm) and minimum cross-sectional dimension of 1 inch (25 mm). Edges shall have a minimum radius of 0.01 inch (0.25 mm).

[BE] 1014.4.2 Type II. *Handrails* with a perimeter greater than $6\,^{1}/_{4}$ inches (160 mm) shall provide a graspable finger recess area on both sides of the profile. The finger recess shall begin within a distance of $^{3}/_{4}$ inch (19 mm) measured vertically from the tallest portion of the profile and achieve a depth of not less than $^{5}/_{16}$ inch (8 mm) within $^{7}/_{8}$ inch (22 mm) below the widest portion of the profile. This required depth shall continue for not less than $^{3}/_{8}$ inch (10 mm) to a level that is not less than $1\,^{3}/_{4}$ inches (45 mm) below the tallest portion of the profile. The width of the *handrail* above the recess shall be not less than $1\,^{1}/_{4}$ inches (32 mm) to not greater than $2\,^{3}/_{4}$ inches (70 mm). Edges shall have a minimum radius of 0.01 inch (0.25 mm).

Revise as follows:

[BE] 1014.5 Continuity. Handrail gripping surfaces shall be continuous, without interruption by newel posts or other obstructions. **Exceptions:**

1. Within a *dwelling* unit that is not an *Accessible unit* or *Type A unit*, the continuity of handrail gripping surfaces is allowed to be interrupted by a newel post at a turn or landing.
2. Within a *dwelling unit*, the use of a volute, turnout, starting easing or starting newel is allowed over the lowest tread.
3. ~~Handrail brackets or balusters~~ Supports attached to the bottom surface of the *handrail* that do not project horizontally beyond the sides of the *handrail* within $1\,^{1}/_{2}$ inches (38 mm) of the bottom of ~~the~~ Type I *handrails* shall not be considered obstructions. For each $^{1}/_{2}$ inch (12.7 mm) of additional handrail perimeter dimension of Type I handrails above 4 inches (102 mm), the vertical clearance dimension of $1\,^{1}/_{2}$ inches (38 mm) shall be permitted to be reduced by $^{1}/_{8}$ inch (3.2 mm). The entire length of Type II handrails shall be permitted to be obstructed provided any horizontal projection of the supports beyond the sides of the handrail are below the required recess.
4. ~~Where *handrails* are provided along walking surfaces with slopes not steeper than 1:20, the bottoms of the handrail gripping surfaces shall be permitted to be obstructed along their entire length where they are integral to crash rails or bumper *guards*.~~
4 ~~5~~. *Handrails* serving stepped *aisles* or ramped *aisles* are permitted to be discontinuous in accordance with Section 1030.16.1.

Reason: Overview:

This proposal offers changes to both **1014.5 Continuity** and **1014.4 Handrail graspability** to provide a gripping surface at in hallways of Health Care and Nursing Facilities where it is currently not required by the code.

Although handrails are not required the code allows for imposters to be provided at critical locations where they are needed. Crash rails and bumper guards are in fact used as handrails and relied upon by the occupants of hospitals, nursing homes and health care facilities for the functions of guidance and support as defined in the I-Codes. They are common in hallways throughout these facilities where the slope is not steeper than 1:20. These elements are typically larger, more visible and inviting to the occupants that are most frequently in

need of mobility aids. The code offers no provision for a graspable surface but instead, in the absence of such, elicits a deceptive invitation to potential accident by default. These crash rails and bumper guards are typically taller in vertical dimension and larger in perimeter restricting access to the bottom of the rail to attain a grasp. Consequently, the current exception 4 to handrail continuity eliminates any graspable surface by allowing the entire bottom of the rail to be completely obstructed. The option to completely obstruct the bottom of the handrail has been justified as being critical to cost effective installation of the needed crash rails and bumper guards.

Handrail Graspability:

The new exception 2 to handrail graspability is added to ensure that although not required, where handrails are provided along horizontal walking surfaces that are sloped less than 1:20, a functional gripping surface is provided. Although handrails are not required at these locations, they are in fact used as handrails as defined in the I-Codes:

> **Handrail.** A horizontal or slopping rail intended for grasping by the hand for guidance or support.

Exception 2 provides for the use of Type II handrails that have been in the I-Codes for more than 20 years. Type II handrails provide a power span grip surface that is equivalent to 2-inch diameter Type I handrail, been in the I-codes for more than 20 years. Type II handrails have the distinct advantage of a continuous gripping surface that is not interrupted by supports that cause the typical grip and release hand-hopping at each support that is prevalent when trying to maintain continuous contact with the bottom gripping surface critical to the functionality of Type I handrails.

Continuity:

Changes to Exception 3…

Handrails are often supported by elements that may be panels or other objects not best described as brackets or balusters and the substitution of the general term “supports” clarifies the intent of the requirement. Currently exception 3 is worded to address the limitations of small perimeter handrails that require access to the bottom of the handrail to gain a functional grip. This should only apply to Type I handrails that must rely upon grasping the bottom of the handrail. We have inserted specific references to Type I profiles.

Type II handrails are larger in perimeter and have specific recesses designed to provide grip surfaces that need not rely on grasping the bottom of the handrail. They are not dependent upon wrapping the fingers around the bottom surface of the handrail. The new sentence inserted at the end of exception 3 clearly recognizes the unique difference between Type I and Type II handrails. Type II handrails provide an uninterrupted gripping surface not attainable with Type I gripping surfaces that are interrupted by supports attached to the bottom of the handrail.

Changes to Exception 4

Exception 4 has been deleted to assure that where provided the rail that is used as a handrail provides no less than the functionality of a Type II handrail. The design of a Type II gripping surface can easily permit obstruction of the surface below the graspable recesses and allow for the rail to also function as a crash rail or bumper guard that needs to be larger in height and perimeter prohibiting use of a Type I gripping surface as a reasonable or cost-effective solution. However, if desired this proposal does not restrict the use of Type I handrails. This change will provide for the safety of occupants without an increase in the cost of construction. Rail profiles are molded of wood or extruded from other materials. The cost is not affected by the change of profile and will not affect the cost of installation.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Handrails shapes are extruded or moulded in a lineal process where the shape does not affect cost other than the difference in material. Less material would be used in an extrusion to create the required recesses of Type II profiles. Wood mouldings would use the same amount of material but remove more when shaped to create the required recesses.

E79-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: Since this is a non-required handrail, this should not be an exception under required handrails, and it can be any size or shape - so this section would not apply. This is over reaching when applied to all occupancies. If this is a concern for health care facilities, it should be a requirement limited to those occupancies. (Vote: 14-0)

E79-24

Individual Consideration Agenda

Comment 1:

IBC: 1014.4, 1014.4.1, 1014.4.2, 1014.5; IFC: [BE] 1014.4, [BE] 1014.4.1, [BE] 1014.4.2, [BE] 1014.5

Edges shall have a minimum radius of 0.01 inch (0.25 mm).

[BE] 1014.4.2 Type II gripping surface
. *Handrails* with a perimeter greater than $6\frac{1}{4}$ inches (160 mm) shall provide a graspable finger recess area on both sides of the profile. The finger recess shall begin within a distance of $\frac{3}{4}$ inch (19 mm) measured vertically from the tallest portion of the profile and achieve a depth of not less than $\frac{5}{16}$ inch (8 mm) within $\frac{7}{8}$ inch (22 mm) below the widest portion of the profile. This required depth shall continue for not less than $\frac{3}{8}$ inch (10 mm) to a level that is not less than $1\frac{3}{4}$ inches (45 mm) below the tallest portion of the profile. The width of the *handrail* above the recess shall be not less than $1\frac{1}{4}$ inches (32 mm) to not greater than $2\frac{3}{4}$ inches (70 mm). Edges shall have a minimum radius of 0.01 inch (0.25 mm).

[BE] 1014.5 Continuity. Handrail gripping surfaces shall be continuous along their length, without interruption by ~~newel~~ posts or other obstructions along their tops or sides. The bottoms of handrails shall not be obstructed for more than 20 percent of their length within $1\frac{1}{2}$ inches (38 mm) minimum below the bottom of the handrail gripping surface.

Exceptions:

1. Within a *dwelling* unit that is not an *Accessible unit* or *Type A unit*, the continuity of handrail gripping surfaces is allowed to be interrupted by a newel post at a turn or landing.

2. Within a *dwelling unit*, the use of a volute, turnout, starting easing or starting newel is allowed over the lowest tread.

3. Supports attached to the bottom surface of the *handrail* that do not project horizontally beyond the sides of the *handrail* within $1\frac{1}{2}$ inches (38 mm) of the bottom of ~~Type I~~ the *handrail~~s~~* shall not be considered obstructions. For each $\frac{1}{2}$ inch (12.7 mm) of additional handrail perimeter dimension of ~~Type I~~ the handrail ~~s~~ above 4 inches (102 mm), the vertical clearance dimension of $1\frac{1}{2}$ inches (38 mm) shall be permitted to be reduced by $\frac{1}{8}$ inch (3.2 mm). ~~The entire length of Type II handrails shall be permitted to be obstructed provided any horizontal projection of the supports beyond the sides of the handrail are below the required recess.~~

4. Where Type II handrails are provided, the portion of the handrail below the gripping surface specified in Section 1014.4.2 shall be permitted to be obstructed along its entire length.

5. Where crash rails or bumper guards with integral handrails are provided at slopes not steeper than 1:20 a Type II gripping surface shall be permitted.

6 ~~4~~. *Handrails* serving stepped *aisles* or ramped *aisles* are permitted to be discontinuous in accordance with Section 1030.16.1.

Reason: This comment is similar to our comment for E82 in that it addresses the issue of handrail graspability and continuity but leaves clearance alone. The clearance at handrail supports remains under continuity. Although this original proposal was disapproved, committee testimony requested us to bring it back if we could restructure the intent without conflict with the "required handrails" called for under 1014.4 Handrail graspability. This comment eliminates exception 2 to 1014.4, as originally proposed, and more appropriately addresses the original intent as an one of obstruction to the gripping surface that is required to be continuous under 1014.5 Continuity and offers new exceptions thereto.

Type I and Type II are each a descriptive of a handrail gripping surface. We have added "gripping surface" to the titles of 1014.4.1 and 1014.4.2. to correlate with the charging statement of 1014.5 (shown below) and aid understanding.

> 1014.5 Continuity. *Handrail* **gripping surfaces** shall be continuous, without interruptions by newel posts or other obstructions.**<emphasis added>**

Language approved in E82 similar to that in A117.1, i.e. <sic> 20% of the length, has been added to clarify obstructions where the bottom of the handrail is a critical element of the gripping surface.

Exception 2 to handrail graspability and the language added to exception #3 of continuity in the original proposal has been deleted and restated as new and unique exceptions 4 and 5 to continuity.

This comment achieves the intent of the proponent to provide reasonable gripping surfaces at crash rails and bumper guards increasing life safety at a sorely needed location. It clarifies the gripping surface requirements of the two types of handrail profiles recognized in the code and provides a better understanding of how they are affected by obstructions.

We will ask to hear this issue following our comment to E82 that actually offers further refinement by addressing issues of obstruction that are better included under clearance than continuity. However this comment stands alone as offering a significant improvement when approved.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Handrails shapes are extruded or moulded in a lineal process where the shape does not affect cost other than the difference in material. Less material would be used in an extrusion to create the required recesses of Type II profiles. Wood mouldings would use the same amount of material but remove more when shaped to create the required recesses.

Proposed Change as Submitted

Proponents: Thomas Zuzik Jr, RailingCodes.com, National Ornamental & Miscellaneous Metals Association (NOMMA.org) (coderep@railingcodes.com)

2024 International Building Code

1014.4 Handrail graspability. Required *handrails* shall comply with Section 1014.4.1 or shall provide equivalent graspability.

Exception: In Group R-3 occupancies; within *dwelling units* in Group R-2 occupancies; and in Group U occupancies that are accesso to a Group R-3 occupancy or accessory to individual *dwelling units* in Group R-2 occupancies; *handrails* shall be Type I in accordance with Section 1014.4.1, Type II in accordance with Section 1014.4.2 or shall provide equivalent graspability.

Revise as follows:

1014.4.1 Type I. *Handrails* with a circular cross section shall have an outside diameter of not less than $1\frac{1}{4}$ inches (32 mm) and not greater than 2 inches (51 mm). Where the *handrail* is not circular, it shall have a perimeter dimension of not less than 4 inches (102 mm) and not greater than $6\frac{1}{4}$ inches (160 mm) with a maximum cross-sectional dimension of $2\frac{1}{4}$ inches (57 mm) and a minimum ~~cross-sectional~~ horizontal widthdimension of 1 inch (25 mm). Edges shall have a minimum radius of 0.01 inch (0.25 mm).

2024 International Fire Code

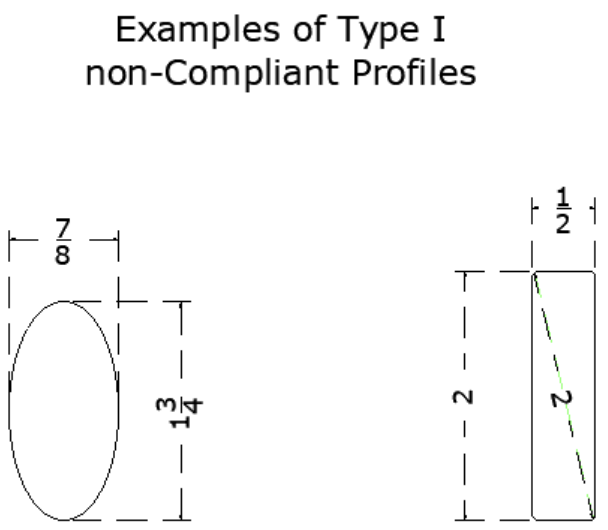
[BE] 1014.4 Handrail graspability. Required *handrails* shall comply with Section 1014.4.1 or shall provide equivalent graspability.

Exception: In Group R-3 occupancies; within *dwelling units* in Group R-2 occupancies; and in Group U occupancies that are accesso to a Group R-3 occupancy or accessory to individual *dwelling units* in Group R-2 occupancies; *handrails* shall be Type I in accordance with Section 1014.4.1, Type II in accordance with Section 1014.4.2 or shall provide equivalent graspability.

Revise as follows:

[BE] 1014.4.1 Type I. *Handrails* with a circular cross section shall have an outside diameter of not less than $1\frac{1}{4}$ inches (32 mm) and not greater than 2 inches (51 mm). Where the *handrail* is not circular, it shall have a perimeter dimension of not less than 4 inches (102 mm) and not greater than $6\frac{1}{4}$ inches (160 mm) with a maximum cross-sectional dimension of $2\frac{1}{4}$ inches (57 mm) and a minimum ~~cross-sectional~~ horizontal width dimension of 1 inch (25 mm). Edges shall have a minimum radius of 0.01 inch (0.25 mm).

Reason: In the 2012 model IBC, section 1012.3.1 Type I. handrails added the new clarifying text of "and minimum cross-sectional dimension of 1-inch (25mm).", to the end of the existing 2 1/4-inch maximum cross-sectional, text. This new minimum cross section dimension of 1-inch was added to specifically to limit the use of thinner Type I handrail profiles being installed in a vertical direction as shown in Sketch RC-02 below.

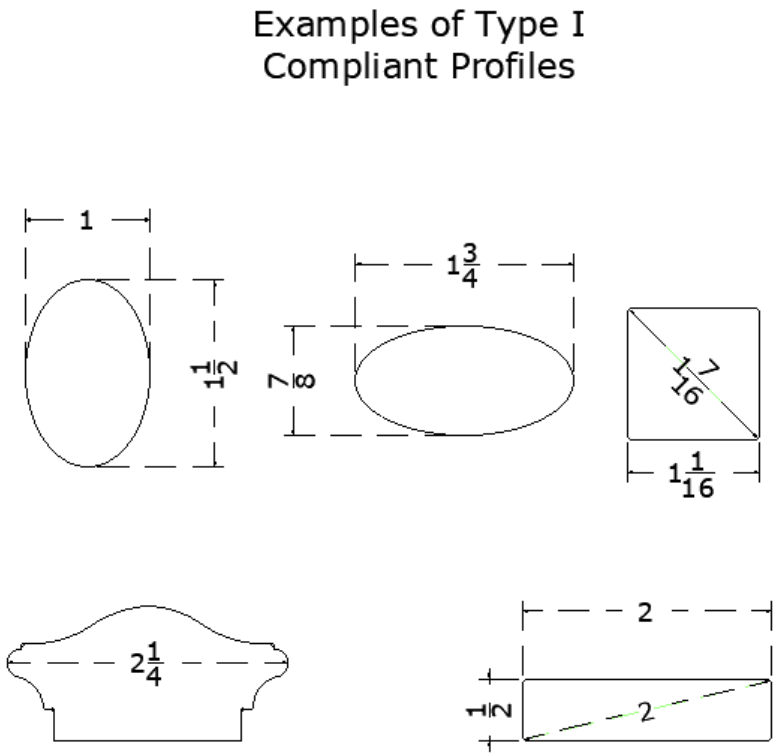


SKETCH RC-02

Of late a limited number of AHJ have been interpreting the minimum limit to be a 2nd dimensional measurement for both horizontal and vertical.

When the author of this proposed modification to clarify the minimum 1-inch dimension was on the hearing floor and testified in favor of E98-09/10, for the addition of the 1-inch minimum width, it was in support to prevent thinner width vertical handrail profiles, from being installed, not to add a 2nd vertical height dimensional requirement, that a limited number of AHJ are now questioning if applies.

Sketch RC-01 shows a group of compliant Type I handrail profiles, of which 2 of the profiles when turned vertical would not comply as depicted in Sketch RC-02 above.



SKETCH RC-01

The proposed deletion of term cross-sectional and replacement with the term horizontal, this author believes eliminates the new arising questions about the minimum and better aligns with what this author believes was the intent of the minimum dimension.

To better explain this point, the following quote is from the original proposal E98-09/10 reason statement.

- "Try doing a chin up or pull up on a 1-1/2" diameter tube versus a 3/8" x 2" steel bar having the 2 inch dimension oriented vertically."

Additionally, since the addition of the new text in the 2012 model IBC, the ICC A117.1 has published the 2017 edition with no addition to the text for a minimum cross-sectional, nor was a proposal submitted for this minimum to be added in the current A117.1 cycle started in 2022.

  - Section 505.7 Cross section. Handrails
  - Section 505.7.2 Noncircular cross sections.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

There is no cost impact to the built environment with this code change, as this proposal is cleaning up terminology for required elements of the code for Type I handrails.

E80-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The text provides clarity, but a graphic should be included. This allows for thin horizontal flat rails - this would not be comfortably grasped, so this should also be addressed. See E81-24. (Vote: 14-0).

E80-24

Individual Consideration Agenda

Comment 1:

IBC: 1014.4, 1014.4.1; IFC: [BE] 1014.4, [BE] 1014.4.1

Proponents: Thomas Zuzik Jr, RailingCodes.com, National Ornamental & Miscellaneous Metals Association (NOMMA.org) (coderep@railingcodes.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

1014.4 Handrail graspability. Required *handrails* shall comply with Section 1014.4.1 or shall provide equivalent graspability.

Exception: In Group R-3 occupancies; within *dwelling units* in Group R-2 occupancies; and in Group U occupancies that are accesso to a Group R-3 occupancy or accessory to individual *dwelling units* in Group R-2 occupancies; *handrails* shall be Type I in accordance with Section 1014.4.1, Type II in accordance with Section 1014.4.2 or shall provide equivalent graspability.

1014.4.1 Type I. *Handrails* with a circular cross section shall have an outside diameter of not less than $1\frac{1}{4}$ inches (32 mm) and not greater than 2 inches (51 mm). Where the *handrail* is not circular, it shall have a perimeter dimension of not less than 4 inches (102 mm) and not greater than $6\frac{1}{4}$ inches (160 mm) with a maximum cross-sectional dimension of $2\frac{1}{4}$ inches (57 mm) and a minimum horizontal width ~~dimension~~ of 1 inch (25 mm). Edges shall have a minimum radius of 0.01 inch (0.25 mm).

2024 International Fire Code

[BE] 1014.4 Handrail graspability. Required *handrails* shall comply with Section 1014.4.1 or shall provide equivalent graspability.

Exception: In Group R-3 occupancies; within *dwelling units* in Group R-2 occupancies; and in Group U occupancies that are accesso to a Group R-3 occupancy or accessory to individual *dwelling units* in Group R-2 occupancies; *handrails* shall be Type I in accordance with Section 1014.4.1, Type II in accordance with Section 1014.4.2 or shall provide equivalent graspability.

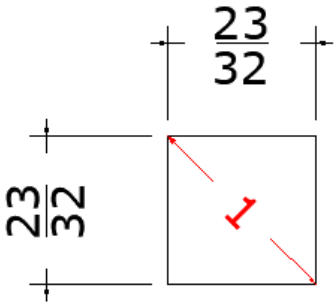
[BE] 1014.4.1 Type I. *Handrails* with a circular cross section shall have an outside diameter of not less than $1\frac{1}{4}$ inches (32 mm) and not greater than 2 inches (51 mm). Where the *handrail* is not circular, it shall have a perimeter dimension of not less than 4 inches (102 mm) and not greater than $6\frac{1}{4}$ inches (160 mm) with a maximum cross-sectional dimension of $2\frac{1}{4}$ inches (57 mm) and a minimum horizontal width ~~dimension~~ of 1 inch (25 mm). Edges shall have a minimum radius of 0.01 inch (0.25 mm).

Reason: We would ask that you review the original proposal's reason statement in addition to these additional comments.

- During the CAH1 in Florida this past April, committee members suggested that figures of handrail profiles be added into the code. Upon reviewing the large task that would need to be done to include all types of type 1 handrail profiles, we believe these diagrams would be best left for the commentary document and NOMMA would work with ICC staff on these figures for the commentary.
- Additional committee members questioned small edge heights and gripping.
  - "This allows for thin horizontal flat rails - this would not be comfortably grasped, so this should also be addressed."
  - The current wording in the IBC already allows these profiles, however they are normally kicked for bad design. Additionally the IRC, A117.1 & 2010ADA do not address the minimum cross section currently in the IBC and the intent of the proposal was not a rewrite on handrail geometry to restrict a profile, but to clarify that the minimum cross section wording was intended as a width.

    To further explain with a minimum perimeter requirement of 4-inches for type 1 handrails, having a minimum cross section of 1-inch reduces the profile to be under the 4-inch minimum perimeter, as thus, logic tells us the intent was for a minimum width, side to side.

    See figure below showing a 1-inch cross section produces a profile less than 4-inches in perimeter.



Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The requirement is already within the code, this proposal is editorial for the clarification.

Comment (CAH2)# 751

E81-24

IBC: 1014.4.1; IFC: [BE] 1014.4.1

Proposed Change as Submitted

Proponents: David Cooper, Stair Manufacturing and Design Consultants, Stairbuilders and Manufacturers Association, SMA (coderep@stairways.org)

2024 International Building Code

Revise as follows:

1014.4.1 Type I. *Handrails* with a circular cross section shall have an outside diameter of not less than $1^1/_4$ inches (32 mm) and not greater than 2 inches (51 mm). Where the *handrail* is not circular, it shall have a perimeter dimension of not less than 4 inches (102 mm) and not greater than $6^1/_4$ inches (160 mm) with a maximum cross-sectional dimension of $2^1/_4$ inches (57 mm). The minimum horizontal cross section shall be 1 inch (25 mm) and a the height of the maximum vertical cross-section shall be not less than of 5/8 inch (16 mm) ~~and minimum cross-sectional dimension of 1 inch (25 mm)~~. Edges shall have a minimum radius of 0.01 inch (0.25 mm).

2024 International Fire Code

Revise as follows:

[BE] 1014.4.1 Type I. *Handrails* with a circular cross section shall have an outside diameter of not less than $1^1/_4$ inches (32 mm) and not greater than 2 inches (51 mm). Where the *handrail* is not circular, it shall have a perimeter dimension of not less than 4 inches (102 mm) and not greater than $6^1/_4$ inches (160 mm) with a maximum cross-sectional dimension of $2^1/_4$ inches (57 mm). The minimum horizontal cross section shall be 1 inch (25 mm) and a the height of the maximum vertical cross-section shall be not less than of 5/8 inch (16 mm) ~~and minimum cross-sectional dimension of 1 inch (25 mm)~~. Edges shall have a minimum radius of 0.01 inch (0.25 mm).

Reason: The current text related to non-circular profiles is being interpreted such that the handrail profile must comply with both the maximum cross-section and minimum cross section regardless of the orientation of the handrail. This was not the intent of the original proposal E98-09/10, included here, as approved for inclusion in the 2012 IBC. The intent was to eliminate the possible use of thin profiles in the vertical orientation.

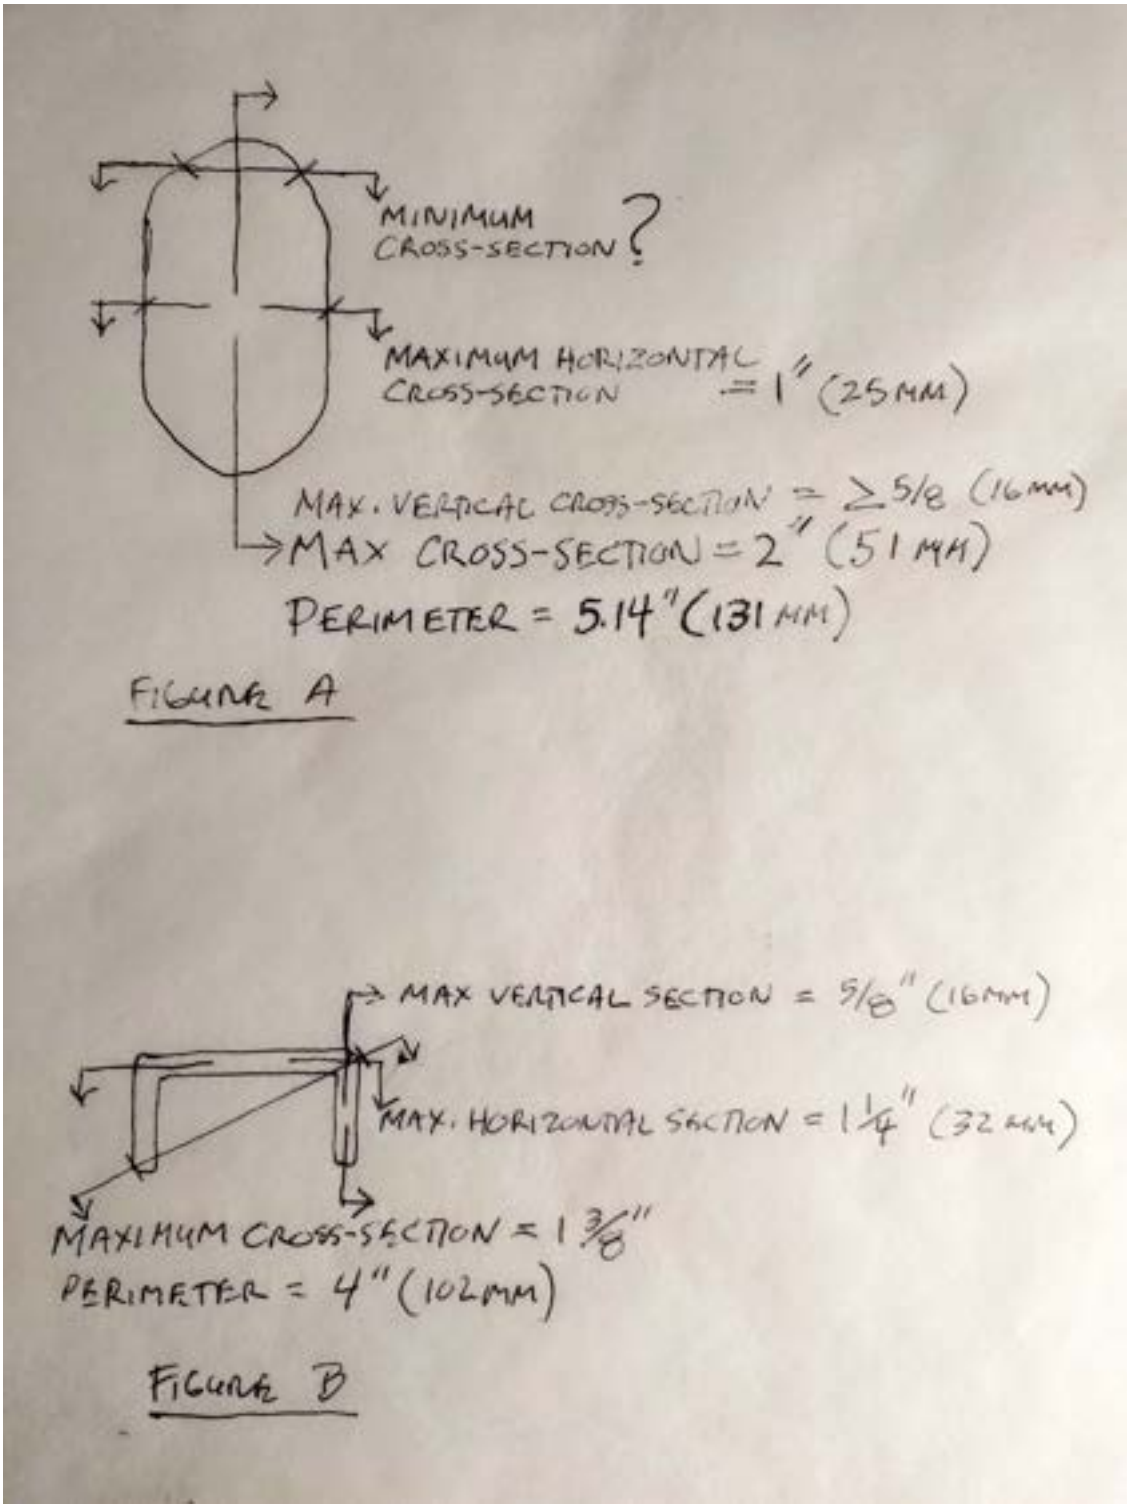
A minimum cross section can be determined at any point in any direction. Consider shapes with large corner radii, ovals, or elliptical sections. Such profiles in both the horizontal and vertical orientation provide suitable access to the bottom of the rail to attain graspability. However, the minimum cross section could be taken at the narrow end of an ellipse or oval as in Figure A. An oval with a 1 inch maximum horizontal cross-section would have a minimum cross-section of far less than an inch at any either end and be reason to reject one of the most graspable non-circular Type I handrail profiles.

Requiring the maximum vertical cross-section to be not less than 5/8 inch restricts thin profiles that would be objectionable when transverse pressure is applied but allows for common channels as in Figure B and traditional metal profiles with long accepted functionality.

The intent of the proponent of E98-09/10 would have been more aptly served had the cross-section language been limited to the horizontal cross-section and a vertical cross-section as proposed here. These dimensions combined with the perimeter range of 4 – 6 ¼ inches and the maximum cross-section provide the necessary controls essential to graspability of Type I non-circular profiles without inhibiting freedom of design.

The 1-inch minimum cross section was never proposed for the IRC where Type II profiles are prominent. Type II rails have the advantage of graspable recesses located to engage the finger and thumb in a power span grip that does not require access to the bottom of the handrail. This is especially important where the handrail typically serves as the top of the guard and is often supported by balusters/guard in-fill, more than just brackets that interrupt the bottom surface. By providing a minimum width for a Type I non-circular profile the supports at the bottom of the handrail may be less objectionable which is a serious issue with any Type one profiles causing hand hoping rather than a continuous grasp.

This change is essential to correct an anomaly in the interpretation of the graspability of non-circular type I handrail profiles.



Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal provides additional technical requirements to better regulate the shape of Type I handrails however the added requirements have no material affect upon the cost of construction.

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: Same reasons as E80-24. (Vote: 14-0)

E81-24

Individual Consideration Agenda

Comment 1:

IBC: 1014.4.1; IFC: [BE] 1014.4.1

Proponents: David Cooper, Stair Manufacturing and Design Consultants, Stairbuilders and Manufacturers Association, SMA (coderep@stairways.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

Revise as follows:

1014.4.1 Type I gripping surface. *Handrails* with a circular cross section shall have an outside diameter of not less than $1\frac{1}{4}$ inches (32 mm) and not greater than 2 inches (51 mm). Where the *handrail* is not circular, it shallcomply with all of the following:
~~have a perimeter dimension of not less than 4 inches (102 mm) and not greater than $6\frac{1}{4}$ inches (160 mm) with a maximum cross-sectional dimension of $2\frac{1}{4}$ inches (57 mm). The minimum horizontal cross section shall be 1 inch (25 mm) and a the height of the maximum vertical cross-section shall be not less than of 5/8 inch (16 mm) . Edges shall have a minimum radius of 0.01 inch (0.25 mm).~~

1. A minimum perimeter of 4 inches (102 mm).
2. A maximum perimeter of $6\frac{1}{4}$ inches (160 mm)
3. A maximum cross-section of $2\frac{1}{4}$ inches (57 mm).
4. A minimum width of 1 inch (25 mm)
5. A minimum thickness of $\frac{1}{2}$ inch (13 mm)
6. Edges shall have a minimum radius of .01 inch (0.25 mm)

2024 International Fire Code

[BE] 1014.4.1 Type I gripping surface. *Handrails* with a circular cross section shall have an outside diameter of not less than $1\frac{1}{4}$ inches (32 mm) and not greater than 2 inches (51 mm). Where the *handrail* is not circular, it shallcomply with all of the following:
~~have a perimeter dimension of not less than 4 inches (102 mm) and not greater than $6\frac{1}{4}$ inches (160 mm) with a maximum cross-~~

~~sectional dimension of $2^{+}/_{4}$ inches (57 mm). The minimum horizontal cross section shall be 1 inch (25 mm) and a the height of the maximum vertical cross-section shall be not less than of 5/8 inch (16 mm) . Edges shall have a minimum radius of 0.01 inch (0.25 mm).~~

1. A minimum perimeter of 4 inches (102 mm).
2. A maximum perimeter of $6^{1}/_{4}$ inches (160 mm)
3. A maximum cross-section of $2^{1}/_{4}$ inches (57 mm).
4. A minimum width of 1 inch (25 mm)
5. A minimum thickness of $^{1}/_{2}$ inch (13 mm)
6. Edges shall have a minimum radius of .01 inch (0.25 mm)

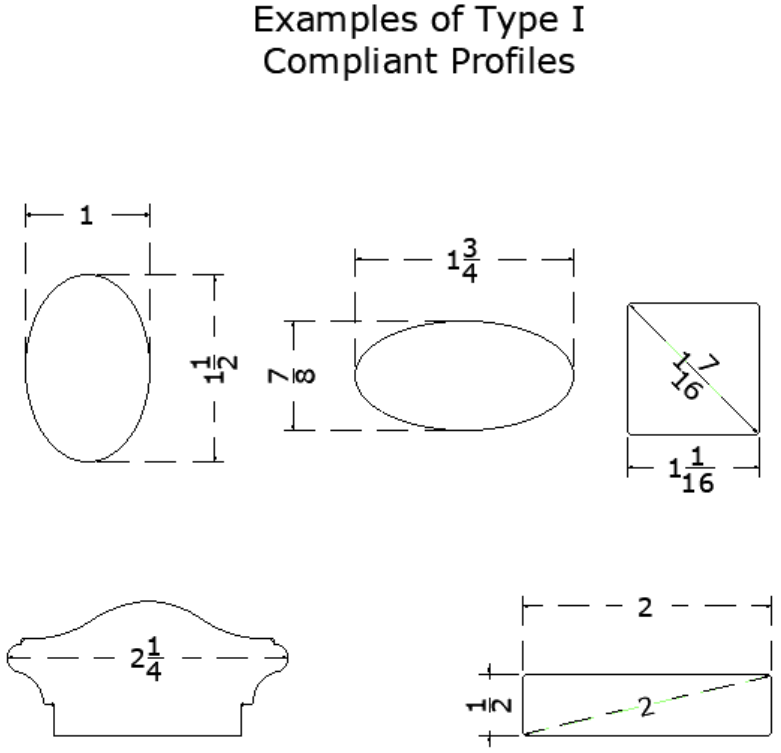
Reason: Collaboration with others from the first hearing as suggested by the Egress committee has resulted in concurrence on this modification. Specifically this eliminates the misunderstood minimum cross-section for non-circular handrail sections replacing it with a minimum width and a minimum thickness of $^{1}/_{2}$ inch rather than the $^{5}/_{8}$ inch originally proposed. To address the question raised as to how to measure the height we have changed the term to thickness which is a more common descriptive used in the trades.

Similar to our comment in E79 Type I and Type II are each a descriptive of the handrail gripping surface referred to in the 1014.5 Continuity. We have added "gripping surface" to the title of 1014.4.1 (shown below) to correlate with the charging statement of 1014.5 and aid understanding.

> 1014.5 Continuity. *Handrail* **gripping surfaces** shall be continuous, without interruptions by newel posts or other obstructions.**<emphasis added>**

Finally we have restructured the requirement to provide a very clear list of the required dimensions that classify the Type I gripping surface dimensions of non-circular handrails as it is much easier to understand than trying to include them in a sentence.

The picture below represents compliant non-circular Type I handrail profiles clearly identified by this comment.



Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal provides additional technical requirements to better regulate the shape of Type I handrails however the added requirements have no material affect upon the cost of construction.

Comment (CAH2)# 132

E82-24

IBC: 1014.5, 1014.6, 1014.8; IFC: [BE] 1014.5, [BE] 1014.6, BE] 1014.8

Proposed Change as Submitted

Proponents: Thomas Zuzik Jr, RailingCodes.com, National Ornamental & Miscellaneous Metals Association (NOMMA.org) (coderep@railingcodes.com)

2024 International Building Code

Revise as follows:

~~1014.8~~1014.5 **Clearance.** Clear space between a *handrail* and a wall or other surface shall be not less than $1^1/_2$ inches (38 mm). A *handrail* and a wall or other surface adjacent to the *handrail* shall be free of any sharp or abrasive elements. **Exceptions:**

1. A decrease in the clearance due to the curvature or angle of handrail returns shall be allowed.
2. Mounting flanges not more than $^1/_2$-inch (12.7 mm) in thickness at the returned ends of handrails shall be allowed.

~~1014.5~~ 1014.6 **Continuity.** Handrail gripping surfaces shall be continuous~~, without interruption by newel posts or other obstructions.~~ along their length and shall not be obstructed along their tops or sides. Horizontal projections shall occur $1^1/_2$ inches (38 mm) minimum below the bottom of the handrail's gripping surface and the bottoms of required handrails shall not be obstructed for more than 20 percent of their length, within $1^1/_2$ inches (38 mm) below the bottom of the handrail's gripping surface.

Exceptions:

1. Within a *dwelling* unit that is not an *Accessible unit* or *Type A unit*, the continuity of handrail gripping surfaces is allowed to be interrupted by a newel post at a turn or landing.
2. Within a *dwelling unit*, the use of a volute, turnout, starting easing or starting newel is allowed over the lowest tread.
3. ~~Handrail brackets or balusters attached to the bottom surface of the *handrail* that do not project horizontally beyond the sides of the *handrail* within $1^1/_2$ inches (38 mm) of the bottom of the *handrail* shall not be considered obstructions.~~ For each $^1/_2$ inch (12.7 mm) of additional handrail perimeter dimension above 4 inches (102 mm), the vertical clearance dimension of $1^1/_2$ inches (38 mm), on the bottom of handrail gripping surfaces, shall be permitted to be reduced by $^1/_8$ inch (3.2 mm).
4. Where *handrails* are provided along walking surfaces with slopes not steeper than 1:20, the bottoms of the handrail gripping surfaces shall be permitted to be obstructed along their entire length where they are integral to crash rails or bumper *guards*.
5. *Handrails* serving stepped *aisles* or ramped *aisles* are permitted to be discontinuous in accordance with Section 1030.16.1.

1014.7 Handrail extensions. *Handrails* shall return to a wall, *guard* or the walking surface or shall be continuous to the *handrail* of an adjacent *flight* of stairs or ramp run. Where *handrails* are not continuous between *flights*, the *handrails* shall extend horizontally not less than 12 inches (305 mm) beyond the top landing nosing and continue to slope for the depth of one tread beyond the bottom tread nosing. At *ramps* where *handrails* are not continuous between runs, the *handrails* shall extend horizontally above the landing 12 inches (305 mm) minimum beyond the top and bottom of ramp runs. The extensions of *handrails* shall be in the same direction of the *flights* of stairs at stairways and the ramp runs at *ramps* and shall extend the required minimum length before any change in direction or decrease in the clearance required by Section 1014.5 or 1014.8 . **Exceptions:**

1. *Handrails* within a *dwelling unit* that is not required to be accessible need extend only from the top riser to the bottom riser.
2. *Handrails* serving *aisles* in rooms or spaces used for assembly purposes are permitted to comply with the handrail extensions in accordance with Section 1030.16.
3. *Handrails* for *alternating tread devices* and ships ladders are permitted to terminate at a location vertically above the top and bottom risers. *Handrails* for *alternating tread devices* are not required to be continuous between *flights* or to extend beyond the top or bottom risers.

Revise as follows:

~~1014.6~~ 1014.8 **Fittings.** *Handrails* shall not rotate within their fittings.

2024 International Fire Code

Revise as follows:

[BE] ~~1014.8~~1014.5 **Clearance.** Clear space between a *handrail* and a wall or other surface shall be not less than $1\frac{1}{2}$ inches (38 mm). A *handrail* and a wall or other surface adjacent to the *handrail* shall be free of any sharp or abrasive elements.

Exceptions:

1. A decrease in the clearance due to the curvature or angle of handrail returns shall be allowed.
2. Mounting flanges not more than $\frac{1}{2}$-inch (12.7 mm) in thickness at the returned ends of handrails shall be allowed.

[BE] ~~1014.5~~ 1014.6 **Continuity.** Handrail gripping surfaces shall be continuous~~, without interruption by newel posts or other obstructions.~~ along their length and shall not be obstructed along their tops or sides. Horizontal projections shall occur $1\frac{1}{2}$ inches (38 mm) minimum below the bottom of the handrail's gripping surface and the bottoms of required handrails shall not be obstructed for more than 20 percent of their length, within $1\frac{1}{2}$ inches (38 mm) below the bottom of the handrail's gripping surface. **Exceptions:**

1. Within a dwelling unit that is not an Accessible unit or Type A unit, the continuity of handrail gripping surfaces is allowed to be interrupted by a newel post at a turn or landing.
2. Within a *dwelling unit*, the use of a volute, turnout, starting easing or starting newel is allowed over the lowest tread.
3. ~~Handrail brackets or balusters attached to the bottom surface of the *handrail* that do not project horizontally beyond the sides of the *handrail* within $1\frac{1}{2}$ inches (38 mm) of the bottom of the *handrail* shall not be considered obstructions.~~ For each $\frac{1}{2}$ inch (12.7 mm) of additional handrail perimeter dimension above 4 inches (102 mm), the vertical clearance dimension of $1\frac{1}{2}$ inches (38 mm),on the bottom of handrail gripping surfaces, shall be permitted to be reduced by $\frac{1}{8}$ inch (3.2 mm).
4. Where *handrails* are provided along walking surfaces with slopes not steeper than 1:20, the bottoms of the handrail gripping surfaces shall be permitted to be obstructed along their entire length where they are integral to crash rails or bumper guards.
5. *Handrails* serving stepped *aisles* or ramped *aisles* are permitted to be discontinuous in accordance with Section 1030.16.1.

[BE] 1014.7 Handrail extensions. Handrails shall return to a wall, guard or the walking surface or shall be continuous to the handrail of an adjacent *flight* of stairs or *ramp* run. Where handrails are not continuous between *flights*, the handrails shall extend horizontally not less than 12 inches (305 mm) beyond the top landing nosing and continue to slope for the depth of one tread beyond the bottom tread nosing. At *ramps* where handrails are not continuous between runs, the handrails shall extend horizontally above the landing 12 inches (305 mm) minimum beyond the top and bottom of *ramp* runs. The extensions of handrails shall be in the same direction of the *flights* of stairs at stairways and the *ramp* runs at *ramps* and shall extend the required minimum length before any change in direction or decrease in the clearance required by Section 1014.5 or 1014.8. **Exceptions:**

1. *Handrails* within a *dwelling unit* that is not required to be accessible need extend only from the top riser to the bottom riser.
2. *Handrails* serving *aisles* in rooms or spaces used for assembly purposes are permitted to comply with the handrail extensions in accordance with Section 1030.16.
3. *Handrails* for *alternating tread devices* and ship's ladders are permitted to terminate at a location vertically above the top and bottom risers. *Handrails* for *alternating tread devices* are not required to be continuous between *flights* or to extend beyond the top or bottom risers.

Revise as follows:

[BE] ~~1014.6~~ 1014.8 **Fittings.** *Handrails* shall not rotate within their fittings.

Reason: This code change proposal is first reorganizing the order of some of the handrail Sections to be more in common with the flow of use and enforcement.

- Section 1014.8 Clearance is moved up in order and renumbered to 1014.5.
- Section 1014.6 Fittings is moved down in the order and renumbered to 1014.8. Section
- Section 1014.5 Continuity is moved down one in the order and renumbered to 1014.6.

Next the renumbered Section 1014.6 Continuity, has been revised to better clarify within the code the following requirements.

- The first sentence has been edited to be clearer and align with the text in ICC 2017 A117.1 Section 505.6 gripping surfaces, and also aligns with the clear text within the 2010ADA for obstructions on the top and sides of the handrail profile.
- This code change brings a known requirement currently buried in the text to light and clearly establishes the minimum $1^1/_2$ inch vertical clearance that the code requires between the underside of the handrails gripping surface and any projections to either side of the handrail.
- The new conditional text for the 20% obstruction limit is a long-standing requirement within both the 2010ADA and the ANSI & ICC's A117.1 current and prior additions. As thus, the adding of this conditional text is in line with standard handrail fabrication requirements already being followed for more than a few decades.
    - What the text brings to the IBC is a uniformity between the 2 long-standing standards and the base building code.
- By incorporating the 20% obstruction language into the main text of 1014.6 Continuity, the first sentence in exception 3 can be removed, as it is no longer needed for brackets or balusters.
- The new additional text proposed in the second sentence of exception 3, better clarifies the allowed decrease for both the bracket projections from the sides and the distance for the 20% stipulation.

This code change proposal better aligns the text of the IBC with how handrails are required to be fabricated and installed on projects.

Bibliography:

- ICC model 2024 International Building Code (IBC)
    - Section 1014 Handrails
- ICC 2017 A117.1 Accessible and Usable Buildings and Facilities
    - Section 505 Handrails
- 2010ADA - ADA Standards for Accessible Design (https://ada.gov/)
    - Section 505 Handrails

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

At first glance this proposal may seem like it has a cost affect on construction, however the majority of the proposal is all editorial in nature with clarifications on requirements already within the scope of the code and or required within the ICC's A117.1 standard and the Federal 2010ADA requirements.

Individual Consideration Agenda

Comment 1:

IBC: 1014.4, 1014.4.1, 1014.4.2, 1014.6, 1014.5, 1014.7, 1014.8; IFC: [BE] 1014.4, [BE] 1014.4.1, [BE] 1014.4.2, [BE] 1014.6, [BE] 1014.5 , [BE] 1014.7, [BE] 1014.8

Proponents: David Cooper, Stair Manufacturing and Design Consultants, Stairbuilders and Manufacturers Association, SMA (coderep@stairways.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

1014.4 Handrail graspability. Required *handrails* shall comply with Section 1014.4.1 or shall provide equivalent graspability.

Exception: In Group R-3 occupancies; within *dwelling units* in Group R-2 occupancies; and in Group U occupancies that are accesso to a Group R-3 occupancy or accessory to individual *dwelling units* in Group R-2 occupancies; *handrails* shall be Type I in accordance with Section 1014.4.1, Type II in accordance with Section 1014.4.2 or shall provide equivalent graspability.

1014.4.1 Type I gripping surface. *Handrails* with a circular cross section shall have an outside diameter of not less than $1\frac{1}{4}$ inches (32 mm) and not greater than 2 inches (51 mm). Where the *handrail* is not circular, it shall have a perimeter dimension of not less than 4 inches (102 mm) and not greater than $6\frac{1}{4}$ inches (160 mm) with a maximum cross-sectional dimension of $2\frac{1}{4}$ inches (57 mm) and minimum cross-sectional dimension of 1 inch (25 mm). Edges shall have a minimum radius of 0.01 inch (0.25 mm).

1014.4.2 Type II gripping surface. *Handrails* with a perimeter greater than $6\frac{1}{4}$ inches (160 mm) shall provide a graspable finger recess area on both sides of the profile. The finger recess shall begin within a distance of $\frac{3}{4}$ inch (19 mm) measured vertically from the tallest portion of the profile and achieve a depth of not less than $\frac{5}{16}$ inch (8 mm) within $\frac{7}{8}$ inch (22 mm) below the widest portion of the profile. This required depth shall continue for not less than $\frac{3}{8}$ inch (10 mm) to a level that is not less than $1\frac{3}{4}$ inches (45 mm) below the tallest portion of the profile. The width of the *handrail* above the recess shall be not less than $1\frac{1}{4}$ inches (32 mm) to not greater than $2\frac{3}{4}$ inches (70 mm). Edges shall have a minimum radius of 0.01 inch (0.25 mm).

Revise as follows:

~~**1014.6**~~ **1014.5 Continuity.** Handrail gripping surfaces shall be continuous along their length~~ and shall not be obstructed~~ without interruptions by posts or other obstructions along their tops or sides. ~~Horizontal projections shall occur $1\frac{1}{2}$ inches (38 mm) minimum below the bottom of the handrail's gripping surface and the~~ The bottoms of ~~required~~ handrails shall not be obstructed for more than 20 percent of their length, within $1\frac{1}{2}$ inches (38 mm) below the bottom of the handrail's gripping surface.

Exceptions:

1. Within a *dwelling* unit that is not an *Accessible unit* or *Type A unit*, the continuity of handrail gripping surfaces is allowed to be interrupted by a newel post at a turn or landing.
2. Within a *dwelling unit*, the use of a volute, turnout, starting easing or starting newel is allowed over the lowest tread.
3. Supports in accordance with Section 1014.6. ~~For each $\frac{1}{2}$ inch (12.7 mm) of additional handrail perimeter dimension above 4 inches (102 mm), the vertical clearance dimension of $1\frac{1}{2}$ inches (38 mm),on the bottom of handrail gripping surfaces, shall be permitted to be reduced by $\frac{1}{8}$ inch (3.2 mm).~~
4. ~~Where *handrails* are provided along walking surfaces with slopes not steeper than 1:20, the bottoms of the handrail gripping surfaces shall be permitted to be obstructed along their entire length where they are integral to crash rails or bumper *guards.*~~ Where crash rails or bumper guards with integral handrails are provided at slopes not steeper than 1:20 a Type II gripping surface shall be permitted.
5. Where Type II handrails are provided in accordance with Section 1014.6, the portion of the handrail below the gripping surface specified in Section 1014.4.2 shall be permitted to be obstructed along its entire length.

~~5~~ 6. *Handrails* serving stepped *aisles* or ramped *aisles* are permitted to be discontinuous in accordance with Section 1030.16.1.

~~**1014.5**~~ **1014.6 Clearance.** Clear space between a *handrail* and a wall or other surface shall be not less than $1\frac{1}{2}$ inches (38 mm). Horizontal projections of supports beyond the sides of handrails shall occur $1\frac{1}{2}$ inches (38 mm) minimum below the bottom of the handrails gripping surface. A *handrail* and a wall or other surface adjacent to the *handrail* shall be free of any sharp or abrasive elements. **Exceptions:**

1. A decrease in the clearance due to the curvature or angle of handrail returns shall be allowed.
2. Mounting flanges not more than $\frac{1}{2}$-inch (12.7 mm) in thickness at the returned ends of handrails shall be allowed.
3. For each $\frac{1}{2}$ inch (12.7 mm) of additional handrail perimeter dimension above 4 inches (102 mm) , the vertical clearance dimension of $1\frac{1}{2}$ inches (38 mm) from the bottom of the handrail gripping surface shall be permitted to be reduced by $\frac{1}{8}$ inch (3.2 mm).

1014.7 Handrail extensions. *Handrails* shall return to a wall, *guard* or the walking surface or shall be continuous to the *handrail* of an adjacent *flight* of stairs or ramp run. Where *handrails* are not continuous between *flights*, the *handrails* shall extend horizontally not less than 12 inches (305 mm) beyond the top landing nosing and continue to slope for the depth of one tread beyond the bottom tread nosing. At *ramps* where *handrails* are not continuous between runs, the *handrails* shall extend horizontally above the landing 12 inches (305 mm) minimum beyond the top and bottom of ramp runs. The extensions of *handrails* shall be in the same direction of the *flights* of stairs at stairways and the ramp runs at *ramps* and shall extend the required minimum length before any change in direction or decrease in the clearance required by Section 1014.5 or 1014.8 . **Exceptions:**

1. *Handrails* within a *dwelling unit* that is not required to be accessible need extend only from the top riser to the bottom riser.
2. *Handrails* serving *aisles* in rooms or spaces used for assembly purposes are permitted to comply with the handrail extensions in accordance with Section 1030.16.
3. *Handrails* for *alternating tread devices* and ships ladders are permitted to terminate at a location vertically above the top and bottom risers. *Handrails* for *alternating tread devices* are not required to be continuous between *flights* or to extend beyond the top or bottom risers.

1014.8 Fittings. *Handrails* shall not rotate within their fittings.

2024 International Fire Code

[BE] 1014.4 Handrail graspability. Required *handrails* shall comply with Section 1014.4.1 or shall provide equivalent graspability.

Exception: In Group R-3 occupancies; within *dwelling units* in Group R-2 occupancies; and in Group U occupancies that are accesso to a Group R-3 occupancy or accessory to individual *dwelling units* in Group R-2 occupancies; *handrails* shall be Type I in accordance with Section 1014.4.1, Type II in accordance with Section 1014.4.2 or shall provide equivalent graspability.

[BE] 1014.4.1 Type I gripping surface. *Handrails* with a circular cross section shall have an outside diameter of not less than $1\frac{1}{4}$ inches (32 mm) and not greater than 2 inches (51 mm). Where the *handrail* is not circular, it shall have a perimeter dimension of not less than 4 inches (102 mm) and not greater than $6\frac{1}{4}$ inches (160 mm) with a maximum cross-sectional dimension of $2\frac{1}{4}$ inches (57 mm) and minimum cross-sectional dimension of 1 inch (25 mm). Edges shall have a minimum radius of 0.01 inch (0.25 mm).

[BE] 1014.4.2 Type II gripping surface. *Handrails* with a perimeter greater than $6\frac{1}{4}$ inches (160 mm) shall provide a graspable finger recess area on both sides of the profile. The finger recess shall begin within a distance of $\frac{3}{4}$ inch (19 mm) measured vertically from the tallest portion of the profile and achieve a depth of not less than $\frac{5}{16}$ inch (8 mm) within $\frac{7}{8}$ inch (22 mm) below the widest portion of the profile. This required depth shall continue for not less than $\frac{3}{8}$ inch (10 mm) to a level that is not less than $1\frac{3}{4}$ inches (45 mm) below the tallest portion of the profile. The width of the *handrail* above the recess shall be not less than $1\frac{1}{4}$ inches (32 mm) to not greater than $2\frac{3}{4}$ inches (70 mm). Edges shall have a minimum radius of 0.01 inch (0.25 mm).

[BE] ~~**1014.6**~~ **1014.5 Continuity.** Handrail gripping surfaces shall be continuous along their length~~ and shall not be obstructed~~ without interruptions by posts or other obstructions along their tops or sides. ~~Horizontal projections shall occur 1 1/2 inches (38 mm) minimum below the bottom of the handrail's gripping surface and the~~ The bottoms of ~~required~~ handrails shall not be obstructed for more than 20 percent of their length, within $1\frac{1}{2}$ inches (38 mm) below the bottom of the handrail's gripping surface. **Exceptions:**

1. Within a dwelling unit that is not an Accessible unit or Type A unit, the continuity of handrail gripping surfaces is allowed to be interrupted by a newel post at a turn or landing.
2. Within a *dwelling unit*, the use of a volute, turnout, starting easing or starting newel is allowed over the lowest tread.
3. Supports in accordance with Section 1014.6. ~~For each 1/2 inch (12.7 mm) of additional handrail perimeter dimension above 4 inches (102 mm), the vertical clearance dimension of 1 1/2 inches (38 mm),on the bottom of handrail gripping surfaces, shall be permitted to be reduced by 1/8 inch (3.2 mm).~~
4. ~~Where *handrails* are provided along walking surfaces with slopes not steeper than 1:20, the bottoms of the handrail gripping surfaces shall be permitted to be obstructed along their entire length where they are integral to crash rails or bumper *guards.*~~ Where crash rails or bumper guards with integral handrails are provided at slopes not steeper than 1:20 a Type II gripping surface shall be permitted.
5. Where Type II handrails are provided in accordance with Section 1014.6, the portion of the handrail below the gripping surface specified in Section 1014.4.2 shall be permitted to be obstructed along its entire length.

~~5~~ 6. *Handrails* serving stepped *aisles* or ramped *aisles* are permitted to be discontinuous in accordance with Section 1030.16.1.

[BE] ~~**1014.5**~~ **1014.6 Clearance.** Clear space between a *handrail* and a wall or other surface shall be not less than $1\frac{1}{2}$ inches (38 mm). Horizontal projections of supports beyond the sides of handrails shall occur $1\frac{1}{2}$ inches (38 mm) minimum below the bottom of the handrails gripping surface. A *handrail* and a wall or other surface adjacent to the *handrail* shall be free of any sharp or abrasive elements.

Exceptions:

1. A decrease in the clearance due to the curvature or angle of handrail returns shall be allowed.
2. Mounting flanges not more than $\frac{1}{2}$-inch (12.7 mm) in thickness at the returned ends of handrails shall be allowed.
3. For each $\frac{1}{2}$ inch (12.7 mm) of additional handrail perimeter dimension above 4 inches (102 mm) , the vertical clearance dimension of $1\frac{1}{2}$ inches (38 mm) from the bottom of the handrail gripping surface shall be permitted to be reduced by $\frac{1}{8}$ inch (3.2 mm).

[BE] 1014.7 Handrail extensions. Handrails shall return to a wall, guard or the walking surface or shall be continuous to the handrail of an adjacent *flight* of stairs or *ramp* run. Where handrails are not continuous between *flights*, the handrails shall extend horizontally not less than 12 inches (305 mm) beyond the top landing nosing and continue to slope for the depth of one tread beyond the bottom tread nosing. At *ramps* where handrails are not continuous between runs, the handrails shall extend horizontally above the landing 12 inches (305 mm) minimum beyond the top and bottom of *ramp* runs. The extensions of handrails shall be in the same direction of the *flights* of stairs at stairways and the *ramp* runs at *ramps* and shall extend the required minimum length before any change in direction or decrease in the clearance required by Section 1014.5 or 1014.8. **Exceptions:**

1. *Handrails* within a *dwelling unit* that is not required to be accessible need extend only from the top riser to the bottom riser.
2. *Handrails* serving *aisles* in rooms or spaces used for assembly purposes are permitted to comply with the handrail extensions in accordance with Section 1030.16.
3. *Handrails* for *alternating tread devices* and ship's ladders are permitted to terminate at a location vertically above the top and bottom risers. *Handrails* for *alternating tread devices* are not required to be continuous between *flights* or to extend beyond the top or bottom risers.

[BE] 1014.8 Fittings. *Handrails* shall not rotate within their fittings.

Reason: The original proposal was approved because it moves what should be a requirement from the exception however it moves it to the wrong location. In thorough review of this proposal it seemed that issues of clearance at handrails and handrail continuity are still confused. Currently requirements for clearance are stated under both Continuity and Clearance. This modification meets the intent of the original proposal but moves the requirement describing "vertical clearance" where it should be into Clearance, newly located as 1014.6. This puts all the clearance requirements in one section and clarifies the Continuity section which need simply state the requirement for a continuous handrail.This comment is similar to our comment for E79 in that it addresses the issue of handrail graspability and continuity but also includes clearance. Although this original proposal was approved, we have restructured the requirements for clearance, continuity and graspabilty and hope E79 will be heard following this comment. this comment more appropriately addresses the original intent as an one of obstruction to the gripping surface that is required to be continuous under 1014.5 Continuity and offers new exceptions thereto.

Type I and Type II are each a descriptive of a handrail gripping surface. We have added "gripping surface" to the titles of 1014.4.1 and 1014.4.2. to correlate with the charging statement of 1014.5 (shown below) and aid understanding.

> 1014.5 Continuity. *Handrail* **gripping surfaces** shall be continuous, without interruptions by newel posts or other obstructions.**<emphasis added>**

The language similar to that in A117.1, i.e. <sic> 20% of the length..., approved in CAH1 remains and clarifies obstructions allowed where the bottom of the handrail is a critical element of the gripping surface.

Exception 3 to continuity now simply needs to reference clearance. Exception 4 is revised as in E79 to clarify that a Type II gripping surface can be provided rather than the current exception that allows no gripping surface at all.

Exception 5 recognizes that a Type II gripping surface has graspable recesses and that obstructions below the gripping surface that comply with 1014.6 Clearance are not restricted.

This comment achieves the intent of the proponent to provide reasonable gripping surfaces at crash rails and bumper guards increasing life safety at a sorely needed location. It clarifies the gripping surface requirements of the two types of handrail profiles recognized in the code and provides a better understanding of how they are affected by obstructions. Finally it gathers all the handrail clearance requirements and exceptions in one section titled clearance.
This comment offers a complete and thorough restructuring that will significantly improve consistent interpretation and enforcement.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

At first glance this proposal may seem like it has a cost affect on construction, however the majority of the proposal is all editorial in nature with clarifications on requirements already within the scope of the code and or required within the ICC's A117.1 standard and the Federal 2010ADA requirements.

Comment (CAH2)# 64

E86-24

IBC: 1014.10; IFC: [BE] 1014.10

Proposed Change as Submitted

Proponents: Jeff Grove, Chair, Building Code Action Committee (BCAC) (bcac@iccsafe.org)

2024 International Building Code

Revise as follows:

1014.10 Intermediate handrails. *Stairways* with a required width of greater than 60 inches, shall have intermediate *handrails* located in such a manner that all portions of the *stairway* minimum width or required capacity are within 30 inches (762 mm) of a *handrail*. On monumental *stairs*, where intermediate handrails are required, *handrails* shall be located along the most direct path of egress travel.

2024 International Fire Code

Revise as follows:

[BE] 1014.10 Intermediate handrails. *Stairways* with a required width of greater than 60 inches, shall have intermediate *handrails* located in such a manner that all portions of the *stairway* minimum width or required capacity are within 30 inches (762 mm) of a *handrail*. On monumental *stairs*, where intermediate handrails are required, *handrails* shall be located along the most direct path of egress travel.

Reason: The intermediate handrail requirement can be inadvertently read to require an intermediate handrail every 5', or to require a center handrail with a center door. This is a clarification for where they would be required. This is not a technical change.

Where there is sufficient distance for occupants to navigate to the sides of a monumental stairway the most direct path of egress, the centerline of the door to the exit, may not be the natural path.

This modification gives guidance to the building official to allow intermediate handrails to be installed in the correct locations.

This proposal is submitted by the ICC Building Code Action Committee (BCAC).

BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 the BCAC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the BCAC website at BCAC webpage.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is a clarification for the requirements for a central handrail on wider stairways.

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: While some of the committee felt that this was a clarification, where the handrail overlaps the required stairway

width, the stairway can be wider than 60" and a person could still be within 30" of a handrail. The confusion is a misinterpretation of the difference between provided stairway width and required stairway width. See also E87-24. (Vote: 9-5)

E86-24

Individual Consideration Agenda

Comment 1:

IBC: 1014.10; IFC: [BE] 1014.10

Proponents: Shane Nilles, Self (snilles@awc.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

1014.10 Intermediate handrails. *Stairways* with a required width of greater than ~~60~~ 88inches~~,~~ shall have intermediate *handrails* located in such a manner that all portions of the *stairway* minimum width or required capacity are within 30 inches (762 mm) of a *handrail*. On monumental *stairs*, where intermediate handrails are required, *handrails* shall be located along the most direct path of egress travel.

2024 International Fire Code

[BE] 1014.10 Intermediate handrails. *Stairways* with a required width of greater than ~~60~~88 inches~~,~~ shall have intermediate *handrails* located in such a manner that all portions of the *stairway* minimum width or required capacity are within 30 inches (762 mm) of a *handrail*. On monumental *stairs*, where intermediate handrails are required, *handrails* shall be located along the most direct path of egress travel.

Reason: The original proposal obstructs the usable width of a stairway by reducing the width by which a stairway would be required to be provided with an intermediate handrail. Because the current code relies on the distance to the handrail as the location that all portions of the required egress width must be within 30" of, and the allowance for a handrail to project up to 4.5" into the stair, the current code could have a stair with a required egress width up to 69" wide without an intermediate handrail. The proposal reduces that by making the required width of the stair the trigger with no consideration for handrail projection, meaning that the trigger for an intermediate handrail would be reduced by 9". This is a technical change and therefore the original proposal was mischaracterized as being a clarification only.

The unintended benefit of the proposal is that it highlighted the issue with the current code as written. Because of the effective current code requirement to provide an intermediate handrail at 70" of required stair width, the stair is obstructed by the handrail in a manner that actually makes the actual occupant capacity of the stair reduced as opposed to a 69" wide stair. A handrail is supposed to enhance the safety of a stair, not reduce the time of egress for the occupants, so this issue with the current code should be addressed.

The proposed revision per this comment addresses both the original proponent's intent of clarifying when the 1st intermediate handrail is required, as well as fixes the unintended hazard by not requiring the intermediate handrail until the required egress width exceeds 88 inches. The provided figures illustrate the issues with the original proposal, the current code, and the appropriate solution provided by this comment:

Figure 1. Shows the minimum current code width of a stair, and the resulting minimum width between handrails. This illustrates how the original proposal would result in the usable widths of the stair serving 305 occupants (Figure 2) to be less than what is required for a stair serving <50 occupants. It also shows that this comment meets the usable widths of a stair serving 440 occupants (Figure 3) as what is provided for a stair serving 50>220 occupants.

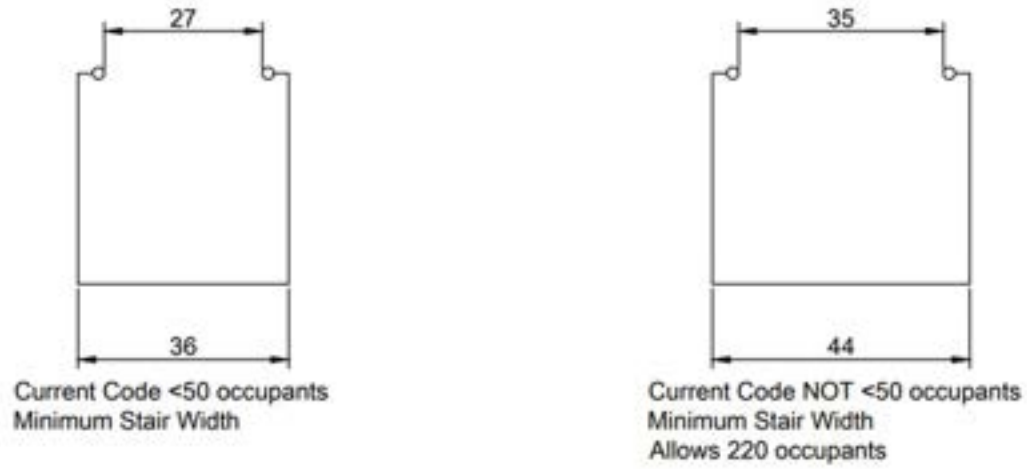

Figure 2. Shows a) the width of stair requiring an intermediate handrail per the original proposal, b) the width of stair requiring an intermediate handrail per the current code, and c) the ability to have 3 occupants within the width of a stair not requiring an intermediate handrail per the current code, that would be prohibited by the original proposal as it would require the handrail thereby obstructing the middle of the stair.

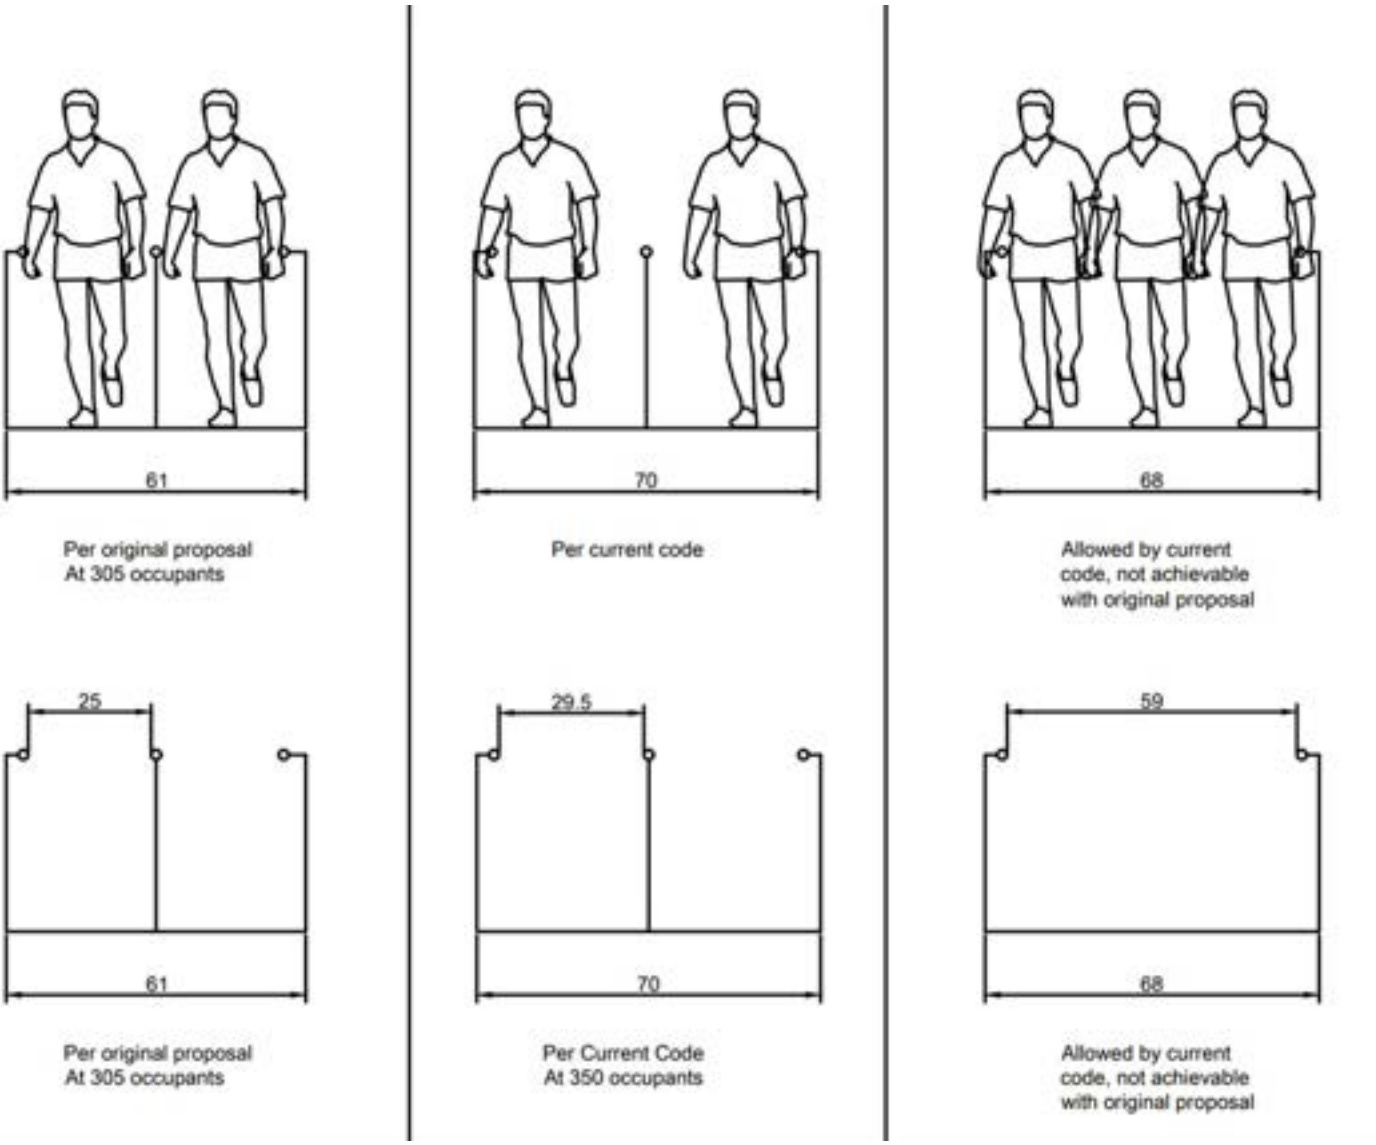

Figure 3. Shows a) the width of a stair requiring an intermediate handrail per this comment and the ability to have 2 occupants use the stair on both sides of the intermediate handrail and b) the width of a stair requiring two intermediate handrails per the current code to

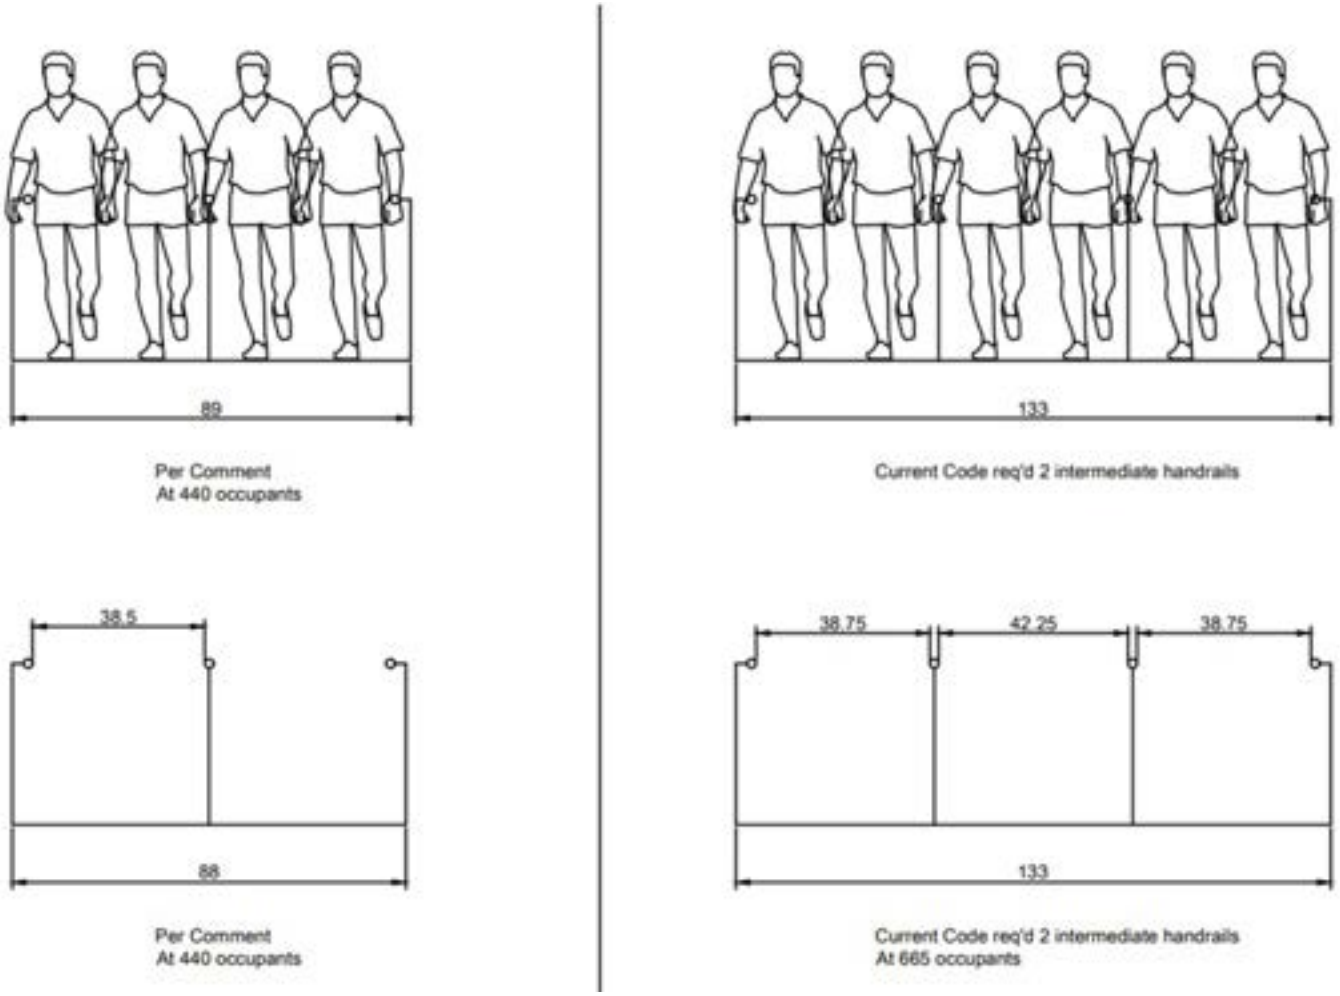
illustrate that this comment properly aligns with how the code intends to require intermediate handrails at widths still providing the ability to have 2 occupants on all sides of the intermediate handrail(s).



Cost Impact: Decrease

Estimated Immediate Cost Impact:

$0 - Decrease in cost of construction

Estimated Immediate Cost Impact Justification (methodology and variables):

The proposed comment will allow for a wider stairway before requiring an intermediate handrail. This will allow for savings by eliminating the cost to fabricate/install the intermediate handrail for stairs with a required egress width between 69" and 88".

Comment (CAH2)# 485

Comment 2:

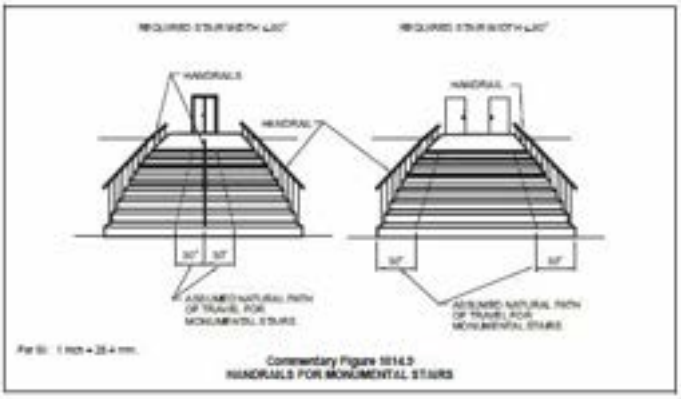
Proponents: Jeff Grove, Chair, Building Code Action Committee (BCAC) (bcac@iccsafe.org) requests As Submitted

Reason: We believe this proposal was disapproved based on incorrect testimony. Examples were given stating a center handrail was not required until 69", but that is assuming handrail projections. Other proponents thought a center handrail was required on a 44 inch wide stairway. This misunderstanding is why this change is needed.

The proposal uses the required width of 60 inches as the starting point for this requirement. Handrails do not have to project into the required width of the stairway - it is an option (Section 1014.3). If you had handrails that did protrude 4-1/2" and a double center handrail (Se3ction 1014.9), the required width could be wider than 60" and meet the required reach to a handrail of 30". Below are the relevant sections and a picture from the IBC commentary illustrating Section 1014.9.

1014.3 Lateral location. Handrails **located outward from the edge of the walking surface** of flights of stairways, ramps, stepped aisles and ramped aisles shall be located 6 inches (152.4 mm) or less measured horizontally from the edge of the walking surface. Handrails projecting into the width of the walking surface shall comply with Section 1014.9.

1014.9 Projections. On ramps and on ramped aisles that are part of an accessible route, the clear width between handrails shall be36 inches (914 mm) minimum. **Projections into the required width** of aisles, stairways and ramps at each side shall not exceed 41/2inches (114 mm) at or below the handrail height. Projections into the required width shall not be limited above the minimum head-room height required in Section 1011.3. **Projections due to intermediate handrails** shall not constitute a reduction in the egress width. Where a pair of intermediate handrails are provided within the stairway width without a walking surface between the pair of intermediate handrails and the distance between the pair of intermediate handrails is greater than 6inches (152 mm), the available egress width shall be reduced by the distance between the closest edges of each such intermediate pair of handrails that is greater than 6 inches (152 mm).



Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Comment (CAH2)# 222

E87-24

IBC: 1014.10; IFC: [BE] 1014.10

Proposed Change as Submitted

Proponents: David Cooper, Stair Manufacturing and Design Consultants, Stairbuilders and Manufacturers Association, SMA (coderep@stairways.org)

2024 International Building Code

Revise as follows:

1014.10 Intermediate handrails. *Stairways* shall have intermediate *handrails* located in such a manner that all portions of the *stairway* minimum width or required capacity are within 30 inches (762 mm) of a *handrail*. Where intermediate *handrails* are required on ~~On monumental~~ *stairs* in excess of the required width or required capacity, *handrails* shall be located along the most direct path of egress travel.

2024 International Fire Code

Revise as follows:

[BE] 1014.10 Intermediate handrails. *Stairways* shall have intermediate *handrails* located in such a manner that all portions of the *stairway* minimum width or required capacity are within 30 inches (762 mm) of a *handrail*.Where intermediate *handrails* are required on ~~On monumental~~ *stairs*in excess of the required width or required capacity, *handrails* shall be located along the most direct path of egress travel.

Reason: What is a monumental stair? Ask different people and the answers will be varied. “Monumental stair” is not a defined term and interpretation is inconsistent. A search of the IBC shows that **1014.9** is the only place where the term “monumental stairs” is used so it would seem that a better description of the intent of the requirement would be more reasonable than adding a definition for a term that is used in a solitary requirement.

The intent of this requirement is to provide for handrails that are within the reach of the users on wider stairs. The intent of the second sentence of this requirement is to assure that functional intermediate handrails are provided for stairways that are designed with an aesthetic of exaggerated width in proportion to the required width /egress capacity.

Eliminating the vague and often misunderstood term of “Monumental” and inserting text to describe the condition will allow for consistent interpretation and enforcement.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The substitution language replaces a misunderstood term that lacks clear definition without technical change to the intent of the code. The change is of no consequence to the methods or cost of construction.

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The term monumental stairways is commonly understood. The proponent should review the submitted modification and work with the proponents of E86-24. (Vote: 13-1)

E87-24

Individual Consideration Agenda

Comment 1:

IBC: SECTION 202 (New), 1014.10; IFC: SECTION 202 (New), [BE] 1014.10

Proponents: David Cooper, Stair Manufacturing and Design Consultants, Stairbuilders and Manufacturers Association, SMA (coderep@stairways.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

Add new definition as follows:

MONUMENTAL STAIRWAY . A stairway that exceeds the minimum required width and capacity such that at least one intermediate handrail is required.

1014.10 Intermediate handrails. *Stairways* shall have intermediate *handrails* located in such a manner that all portions of the *stairway* minimum width or required capacity are within 30 inches (762 mm) of a *handrail*. On monumental stairways ~~Where intermediate *handrails* are required on *stairs in excess of the required width or required capacity*~~, *handrails* shall be located along the most direct path of egress travel.

2024 International Fire Code

Add new definition as follows:

[BE] MONUMENTAL STAIRWAY . A stairway that exceeds the minimum required width and capacity such that at least one intermediate handrail is required.

[BE] 1014.10 Intermediate handrails. *Stairways* shall have intermediate *handrails* located in such a manner that all portions of the *stairway* minimum width or required capacity are within 30 inches (762 mm) of a *handrail*. On monumental stairways ~~Where intermediate *handrails* are required on *stairs in excess of the required width or required capacity*~~, *handrails* shall be located along the most direct path of egress travel.

Reason: Based upon the committee's action and the confusing testimony it seems prudent to offer a definition though the original proposal sought not to do so. This comment allows the current code text to remain for those who know one when they see one. For those who do not know when they see one, i.e. most users of the code other than code officials, a definition has been provided for a term that is obscure at best and used only once in the code.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The substitution language replaces a misunderstood term that lacks clear definition without technical change to the intent of the code.

The change is of no consequence to the methods or cost of construction.

Comment (CAH2)# 176

E89-24

IBC: 1015.2; IFC: [BE] 1015.2

Proposed Change as Submitted

Proponents: John Grenier, National Council of Structural Engineers' Associations (NCSEA) (jgrenier@greniereng.com)

2024 International Building Code

Revise as follows:

1015.2 Where required. *Guards* shall be located along open-sided walking surfaces, such as *mezzanines*, *equipment platforms*, *aisles*, *stairs*, *ramps* and landings, that are located more than 30 inches (762 mm) measured vertically to the floor or grade below at any point within 36 inches (914 mm) horizontally to the edge of the open side, ~~and~~ at the perimeter of occupiable roofs, and at walking surfaces near retaining walls in accordance with Section 1807.2.5. *Guards* shall be adequate in strength and attachment in accordance with Section 1607.9.

Exceptions: *Guards* are not required for the following locations:

1. On the loading side of loading docks or piers.
2. On the audience side of *stages* and raised *platforms*, including *stairs* leading up to the *stage* and raised *platforms*.
3. On raised *stage* and *platform* floor areas, such as runways, *ramps* and side *stages* used for entertainment or presentations.
4. At vertical openings in the performance area of *stages* and *platforms*.
5. At elevated walking surfaces appurtenant to *stages* and *platforms* for access to and utilization of special lighting or equipment.
6. Along vehicle service pits not accessible to the public.
7. In assembly seating areas at cross *aisles* in accordance with Section 1030.17.2.
8. On the loading side of station platforms on fixed guideway transit or passenger rail systems.
9. Portions of an *occupiable roof* located less than 30 inches (762 mm) measured vertically to adjacent unoccupiable roof areas where *approved guards* are present at the perimeter of the roof.
10. At portions of an *occupiable roof* where an *approved* barrier is provided.

2024 International Fire Code

Revise as follows:

[BE] 1015.2 Where required. *Guards* shall be located along open-sided walking surfaces, such as *mezzanines*, equipment platforms, *aisles*, *stairs*, *ramps* and landings, that are located more than 30 inches (762 mm) measured vertically to the floor or grade below at any point within 36 inches (914 mm) horizontally to the edge of the open side, ~~and~~ at the perimeter of *occupiable roofs*, and at walking surfaces near retaining walls in accordance with Section 1807.2.5 of the International Building Code. *Guards* shall be adequate in strength and attachment in accordance with Section 1607.9 of the International Building Code.

Exception: *Guards* are not required for the following locations:

1. On the loading side of loading docks or piers.
2. On the audience side of stages and raised platforms, including *stairs* leading up to the stage and raised platforms.
3. On raised stage and platform floor areas, such as runways, *ramps* and side stages used for entertainment or presentations.
4. At vertical openings in the performance area of stages and platforms.

5. At elevated walking surfaces appurtenant to stages and platforms for access to and utilization of special lighting or equipment.
6. Along vehicle service pits not accessible to the public.
7. In assembly seating areas at cross *aisles* in accordance with Section 1030.17.2.
8. On the loading side of station platforms on fixed guideway transit or passenger rail systems.
9. Portions of an *occupiable roof* located less than 30 inches (762 mm) measured vertically to adjacent unoccupiable roof areas where approved guards are present at the perimeter of the roof.
10. At portions of an *occupiable roof* where an *approved* barrier is provided.

Reason: 1. To clarify that walls and retaining walls associated with a building or a site, also require Guards to protect against falls.

2. Section **1807.2.5 Guards** was added to the 2024 IBC via code change proposal S157-22. The proposed new language in Section 1015.2 will be a pointer to that section.

3. The 2021 IBC Commentary states "Where one or more sides of a walking surface are open to the floor level or grade below, a guard system must be provided to minimize the possibility of occupants accidentally falling to the surface below". The pointer to section 1807.2.5 is important to eliminate potential confusion and possible misunderstanding that walls and retaining walls are not governed by the IBC.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The requirement for guards at retaining walls is in Section 1807.2.5, so this is just pointing to that guard requirement.

E89-24

Public Hearing Results (CAH1)

Committee Action: **As Modified by Committee (AMC1)**

Committee Modification:
2024 International Building Code

1015.2 Where required. *Guards* shall be located along open-sided walking surfaces, such as *mezzanines*, *equipment platforms*, *aisles*, *stairs*, *ramps* and landings, that are located more than 30 inches (762 mm) measured vertically to the floor or grade below at any point within 36 inches (914 mm) horizontally to the edge of the open side, at the perimeter of occupiable roofs, and at ~~walking surfaces near~~ retaining walls in accordance with Section 1807.2.5. *Guards* shall be adequate in strength and attachment in accordance with Section 1607.9.

Exceptions: *Guards* are not required for the following locations:

1. On the loading side of loading docks or piers.
2. On the audience side of *stages* and raised *platforms*, including *stairs* leading up to the *stage* and raised *platforms*.
3. On raised *stage* and *platform* floor areas, such as runways, *ramps* and side *stages* used for entertainment or presentations.
4. At vertical openings in the performance area of *stages* and *platforms*.

5. At elevated walking surfaces appurtenant to *stages* and *platforms* for access to and utilization of special lighting or equipment.
6. Along vehicle service pits not accessible to the public.
7. In assembly seating areas at cross *aisles* in accordance with Section 1030.17.2.
8. On the loading side of station platforms on fixed guideway transit or passenger rail systems.
9. Portions of an *occupiable roof* located less than 30 inches (762 mm) measured vertically to adjacent unoccupiable roof areas where *approved guards* are present at the perimeter of the roof.
10. At portions of an *occupiable roof* where an *approved* barrier is provided.

2024 International Fire Code

[BE] 1015.2 Where required. *Guards* shall be located along open-sided walking surfaces, such as *mezzanines*, equipment platforms, *aisles*, *stairs*, *ramps* and landings, that are located more than 30 inches (762 mm) measured vertically to the floor or grade below at any point within 36 inches (914 mm) horizontally to the edge of the open side, at the perimeter of *occupiable roofs*, and at ~~walking surfaces near~~ retaining walls in accordance with Section 1807.2.5 of the International Building Code. *Guards* shall be adequate in strength and attachment in accordance with Section 1607.9 of the International Building Code.

Exception: *Guards* are not required for the following locations:

1. On the loading side of loading docks or piers.
2. On the audience side of stages and raised platforms, including *stairs* leading up to the stage and raised platforms.
3. On raised stage and platform floor areas, such as runways, *ramps* and side stages used for entertainment or presentations.
4. At vertical openings in the performance area of stages and platforms.
5. At elevated walking surfaces appurtenant to stages and platforms for access to and utilization of special lighting or equipment.
6. Along vehicle service pits not accessible to the public.
7. In assembly seating areas at cross *aisles* in accordance with Section 1030.17.2.
8. On the loading side of station platforms on fixed guideway transit or passenger rail systems.
9. Portions of an *occupiable roof* located less than 30 inches (762 mm) measured vertically to adjacent unoccupiable roof areas where approved guards are present at the perimeter of the roof.
10. At portions of an *occupiable roof* where an *approved* barrier is provided.

Committee Reason: The modification removed subjective language. The requirement should be in the guards section, not in Section 1807.2.5, however, until this gets relocated, the proposal added a necessary pointer for guards on retaining walls. (Vote: 12-2)

requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

1015.2 Where required. *Guards* shall be located along open-sided walking surfaces, such as *mezzanines*, *equipment platforms*, *aisles*, *stairs*, *ramps* and landings, that are located more than 30 inches (762 mm) measured vertically to the floor or grade below at any point within 36 inches (914 mm) horizontally to the edge of the open side, and at the perimeter of occupiable roofs~~, and at retaining walls in accordance with Section 1807.2.5~~. Guards shall be located at retaining walls having an upper grade level that is more than 30 inches (762 mm) measured vertically above the lower grade level at any point within 36 inches (914 mm) horizontally from the exposed face of wall, and is open to unanticipated pedestrian access that would have the possibility of a fall to the lower level such as a walking surface, parking area, playground, yard, planter, or similar use areas. *Guards* shall be adequate in strength and attachment in accordance with Section 1607.9.

Exceptions: *Guards* are not required for the following locations:

1. On the loading side of loading docks or piers.
2. On the audience side of *stages* and raised *platforms*, including *stairs* leading up to the *stage* and raised *platforms*.
3. On raised *stage* and *platform* floor areas, such as runways, *ramps* and side *stages* used for entertainment or presentations.
4. At vertical openings in the performance area of *stages* and *platforms*.
5. At elevated walking surfaces appurtenant to *stages* and *platforms* for access to and utilization of special lighting or equipment.
6. Along vehicle service pits not accessible to the public.
7. In assembly seating areas at cross *aisles* in accordance with Section 1030.17.2.
8. On the loading side of station platforms on fixed guideway transit or passenger rail systems.
9. Portions of an *occupiable roof* located less than 30 inches (762 mm) measured vertically to adjacent unoccupiable roof areas where *approved guards* are present at the perimeter of the roof.
10. At portions of an *occupiable roof* where an *approved* barrier is provided.
11. At retaining walls in locations that cannot be accessed by the public as determined by the building code official.

1807.2.5 Guards. *Guards* shall be provided at retaining walls in accordance with Section 1015.2 ~~Sections 1807.2.5.1 through 1807.2.5.3.~~ ~~**Exception:** *Guards* are not required at retaining walls not accessible to the public.~~

Delete without substitution:

~~**1807.2.5.1 Where required.** At retaining walls located within 36 inches (914mm) of walking surfaces, a *guard* shall be required between the walking surface and the open side of the retaining wall where the walking surface is located more than 30 inches (762 mm) measured vertically to the surface or grade below at any point within 36 inches (914mm) horizontally to the edge of the open side. *Guards* shall comply with Section 1607.9.~~

~~**1807.2.5.2 Height.** Required *guards* at retaining walls shall comply with the height requirements of Section 1015.3.~~

~~**1807.2.5.3 Opening limitations.** Required *guards* shall comply with the opening limitations of Section 1015.4.~~

2024 International Fire Code

[BE] 1015.2 Where required. *Guards* shall be located along open-sided walking surfaces, such as *mezzanines*, *equipment platforms*, *aisles*, *stairs*, *ramps* and landings, that are located more than 30 inches (762 mm) measured vertically to the floor or grade

below at any point within 36 inches (914 mm) horizontally to the edge of the open side, and at the perimeter of occupiable roofs~~, and at retaining walls in accordance with Section 1807.2.5 of the International Building Code~~. Guards shall be located at retaining walls having an upper grade level that is more than 30 inches (762 mm) measured vertically above the lower grade level at any point within 36 inches (914 mm) horizontally from the exposed face of wall, and is open to unanticipated pedestrian access that would have the possibility of a fall to the lower level such as a walking surface, parking area, playground, yard, planter, or similar use areas. *Guards* shall be adequate in strength and attachment in accordance with Section 1607.9 of the International Building Code.

Exception: *Guards* are not required for the following locations:

1. On the loading side of loading docks or piers.
2. On the audience side of stages and raised platforms, including *stairs* leading up to the stage and raised platforms.
3. On raised stage and platform floor areas, such as runways, *ramps* and side stages used for entertainment or presentations.
4. At vertical openings in the performance area of stages and platforms.
5. At elevated walking surfaces appurtenant to stages and platforms for access to and utilization of special lighting or equipment.
6. Along vehicle service pits not accessible to the public.
7. In assembly seating areas at cross *aisles* in accordance with Section 1030.17.2.
8. On the loading side of station platforms on fixed guideway transit or passenger rail systems.
9. Portions of an *occupiable roof* located less than 30 inches (762 mm) measured vertically to adjacent unoccupiable roof areas where approved guards are present at the perimeter of the roof.
10. At portions of an *occupiable roof* where an *approved* barrier is provided.
11. At retaining walls in locations that cannot be accessed by the public as determined by the building code official.

Reason: This comment is being submitted at the recommendation of ICC Staff and based on the comments in the Committee Reason Statement: "The requirement should be in the guards section, not in Section 1807.2.5, however, until this gets relocated, the proposal added a necessary pointer for guards on retaining walls."

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The requirement for guards at retaining walls is in Section 1807.2.5, so this change is just pointing to that guard requirement.

Comment (CAH2)# 705

E91-24

IBC: 1015.3; IFC: [BE] 1015.3

Proposed Change as Submitted

Proponents: David Cooper, Stair Manufacturing and Design Consultants, Stairbuilders and Manufacturers Association, SMA (coderep@stairways.org)

2024 International Building Code

Revise as follows:

1015.3 Height. Required *guards* shall be not less than 42 inches (1067 mm) high, measured vertically as follows:

1. From the adjacent walking surfaces.
2. On *stairways* and stepped *aisles*, from the line connecting the *nosings*.
3. On *ramps* and ramped *aisles*, from the ramp surface at the guard.

Exceptions:

1. For occupancies in Group R-3 not more than three *stories* above grade in height and within individual *dwelling units* in occupancies in Group R-2 not more than three *stories* above grade in height with separate *means of egress*, required *guards* shall be not less than 36 inches (914 mm) in height measured vertically above the adjacent walking surfaces.
2. For occupancies in Groups R-2 and R-3, within the interior conditioned space of individual *dwelling units*, where the open-sided walking surface is located not more than 25 feet (7.62 meters) measured vertically to the floor or walking surface below, required *guards* shall not be less than 36 inches (914 mm) in height measured vertically above the adjacent walking surface.
3. For occupancies in Group R-3, and within individual *dwelling units* in occupancies in Group R-2, *guards* on the open sides of *stairs* shall have a height not less than 34 inches (864 mm) measured vertically from a line connecting the *nosings* .
4. For occupancies in Group R-3, and within individual *dwelling units* in occupancies in Group R-2, where the top of the *guard* serves as a *handrail* on the open sides of *stairs*, the top of the *guard* shall be not less than 34 inches (864 mm) and not more than 38 inches (965 mm) measured vertically from a line connecting the l *nosings* .
5. For occupancies in Group R-3, and within individual dwelling units in occupancies in Group R-2, where the top of the guard on the open side of stairs serves as a handrail, the height of the guard transition at the top of a flight is permitted to be less than the required guard height for a distance over the landing not greater than 12 inches (305 mm) as measured horizontally from the landing nosing.

~~5~~ 6. The *guard* height in assembly seating areas shall comply with Section 1030.17 as applicable.

~~6~~ 7. Along *alternating tread devices* and ships ladders, *guards* where the top rail serves as a *handrail* shall have height not less than 30 inches (762 mm) and not more than 34 inches (864 mm), measured vertically from a line connecting the leading edge of the treads.

~~7~~ 8. In Group F occupancies where *exit access stairways* serve fewer than three *stories* and such *stairways* are not open to the public, and where the top of the *guard* also serves as a *handrail*, the top of the *guard* shall be not less than 34 inches (864 mm) and not more than 38 inches (965 mm) measured vertically from a line connecting the nosings.

2024 International Fire Code

Revise as follows:

[BE] 1015.3 Height. Required *guards* shall be not less than 42 inches (1067 mm) high, measured vertically as follows:

[BE] 1015.3 Height. Required *guards* shall be not less than 42 inches (1067 mm) high, measured vertically as follows:

1. From the adjacent walking surfaces.
2. On *stairways* and stepped *aisles*, from the line connecting the *nosings*.
3. On *ramps* and ramped *aisles*, from the *ramp* surface at the *guard*.

Exceptions:

1. For occupancies in Group R-3 not more than three *stories* above grade in height and within individual *dwelling units* in occupancies in Group R-2 not more than three *stories* above grade in height with separate *means of egress*, required *guards* shall be not less than 36 inches (914 mm) in height measured vertically above the adjacent walking surfaces.
2. For occupancies in Groups R-2 and R-3, within the interior conditioned space of individual *dwelling units*, where the open-sided walking surface is located not more than 25 feet (7.62 meters) measured vertically to the floor or walking surface below, required *guards* shall not be less than 36 inches (914 mm) in height measured vertically above the adjacent walking surface.
3. For occupancies in Group R-3, and within individual *dwelling units* in occupancies in Group R-2, *guards* on the open sides of *stairs* shall have a height not less than 34 inches (864 mm) measured vertically from a line connecting the *nosings* .
4. For occupancies in Group R-3, and within individual *dwelling units* in occupancies in Group R-2, where the top of the *guard* serves as a *handrail* on the open sides of *stairs*, the top of the *guard* shall be not less than 34 inches (864 mm) and not more than 38 inches (965 mm) measured vertically from a line connecting the l *nosings* .

5. For occupancies in Group R-3, and within individual dwelling units in occupancies in Group R-2, where the top of the guard on the open side of stairs serves as a handrail, the height of the guard transition at the top of a flight is permitted to be less than the required guard height for a distance over the landing not greater than 12 inches (305 mm) as measured horizontally from the landing nosing.

~~5~~ 6. The *guard* height in assembly seating areas shall comply with Section 1030.17 as applicable.

~~6~~ 7. Along *alternating tread devices* and ships ladders, *guards* where the top rail serves as a *handrail* shall have height not less than 30 inches (762 mm) and not more than 34 inches (864 mm), measured vertically from a line connecting the leading edge of the treads.

~~7~~ 8. In Group F occupancies where *exit access stairways* serve fewer than three *stories* and such *stairways* are not open to the public, and where the top of the *guard* also serves as a *handrail*, the top of the *guard* shall be not less than 34 inches (864 mm) and not more than 38 inches (965 mm) measured vertically from a line connecting the nosings.

Reason: In the residencies cited in the new exception the required handrail/stair guard height is 34 – 38 inches. The handrail/stair guard often intersects an adjacent landing guard at the top of a flight. The guard at an open sided landing measured from the walking surface of the landing has a minimum height of 36 inches but has no maximum. Typically guards at a landing may be at a height of as much as 42 inches. The typical difference in height between handrail and level guard is 4 -8 inches directly over the top riser. At this point the handrail must be 34-38".

However, the floor surface at the nosing of the landing, from which guard height is determined, extends as much as 1 1/4 inches beyond the top riser. The resulting landing guard is typically 4 - 8 inches higher than the handrail that is required to be continuous to a point directly over the top riser. This presents a conflict in determining whether the guard height or the handrail height is to be accommodated at this intersection of handrail and guard. This can especially problematic when the occupant has children and requests the handrail be positioned as low as possible.

In most situations a continuous transition is preferred to achieve integrity of the design for safety, structural and aesthetic concerns. However, the strictest interpretation of the code only provides for a more vertical transition from as low as 34 inches to 42 inches to achieve both handrail and guard height requirements. Although an exception to handrail height allows for a handrail fitting to exceed the required handrail height it is often better to allow the handrail height to remain constant and afford an inconsequential reduction of the required guard height for a short distance.

Some might apply the opening limitation requirements when interpreting this situation however, this is not always the case. This proposal will allow for consistent interpretation of a smooth transition of the handrail/guard of the stair with the guard at an open sided landing and extension of the handrail at constant height. The horizontal dimension of 12 inches provides the necessary distance to configure an extension of the handrail without undue compromise of the guard's function to minimize the possibility of a fall to the floor or grade below. See figures 1 & 2.

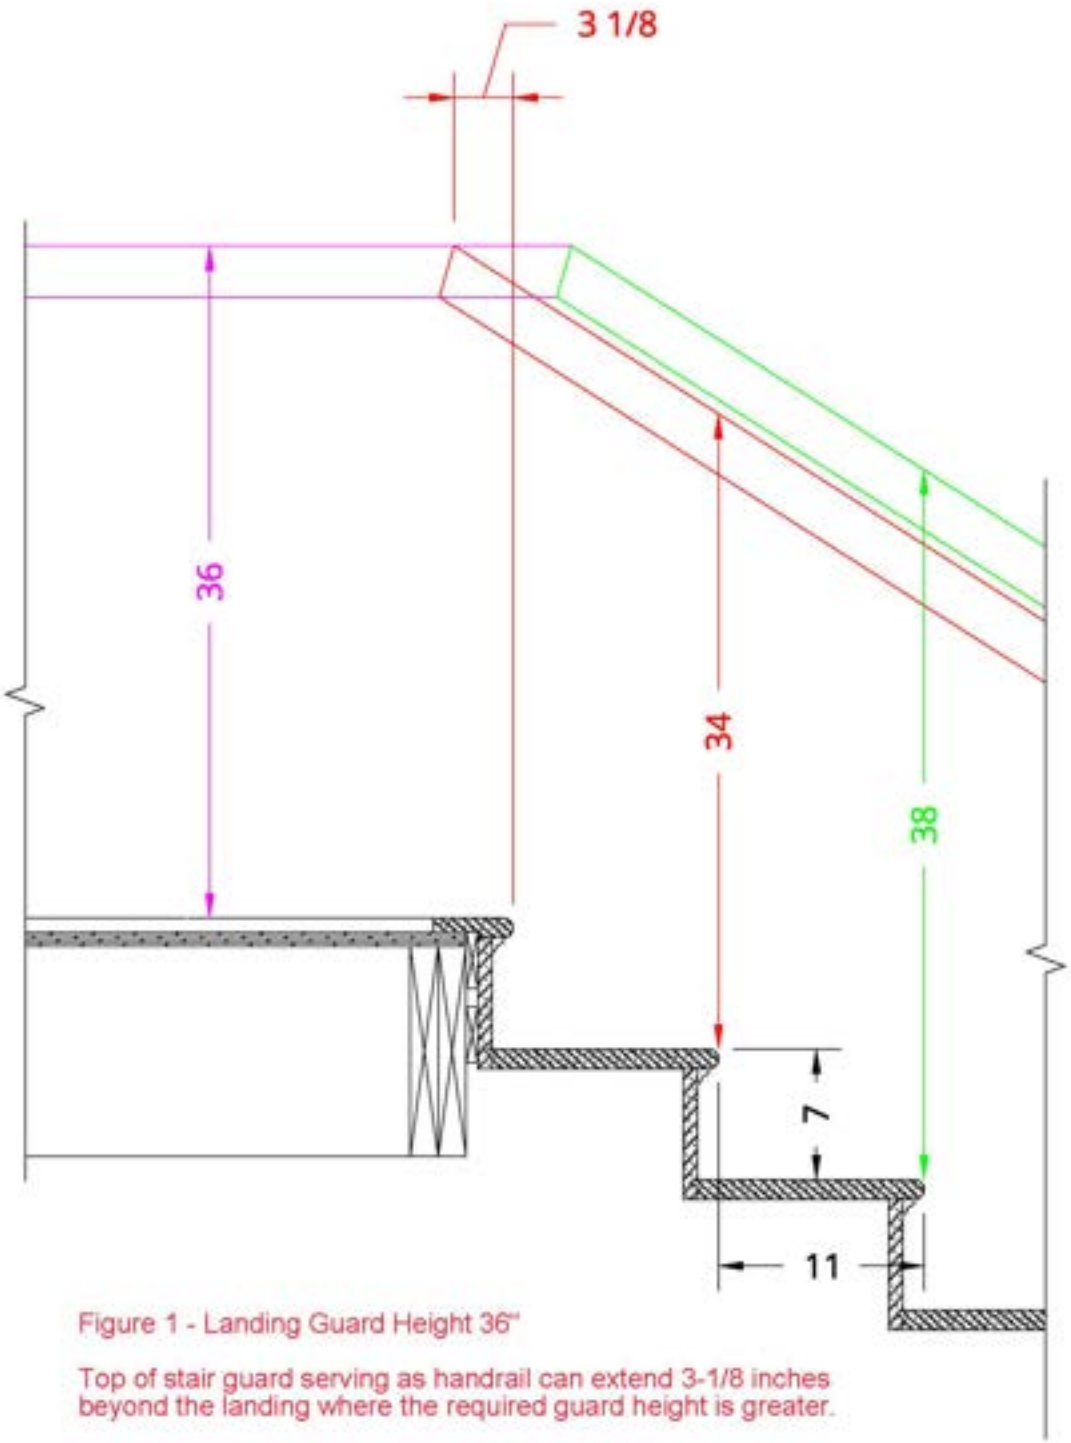

Figure 1 - Landing Guard Height 36"

Top of stair guard serving as handrail can extend 3-1/8 inches beyond the landing where the required guard height is greater.

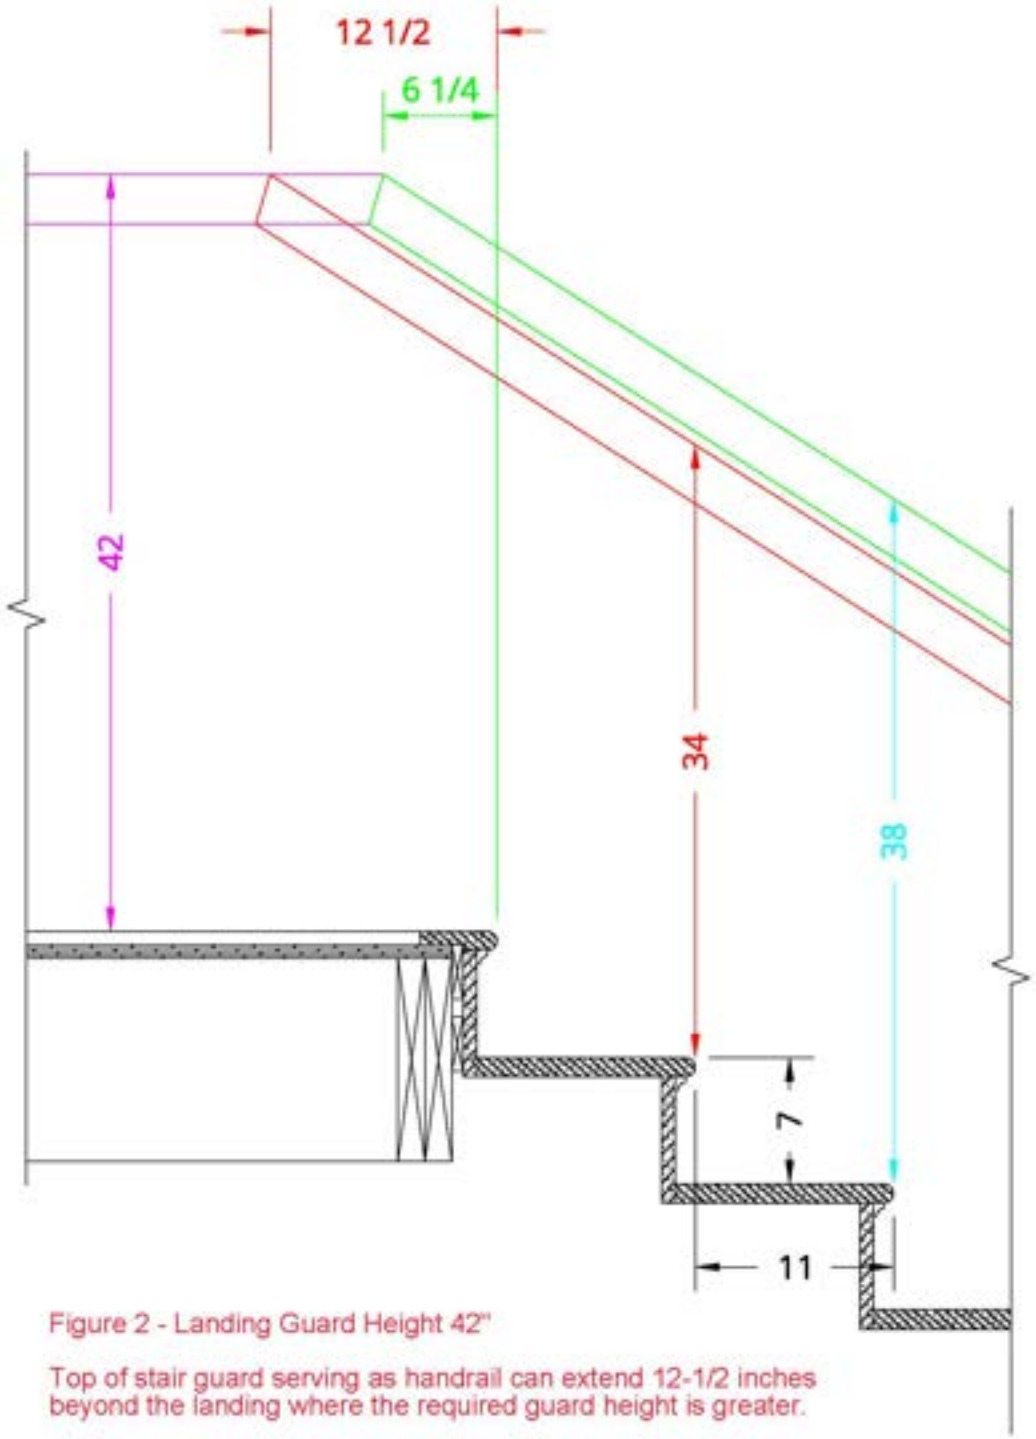

Figure 2 - Landing Guard Height 42"

Top of stair guard serving as handrail can extend 12-1/2 inches beyond the landing where the required guard height is greater.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The technical changes only provide for an alternate location of the related elements. There is no change in the material or labor required that has any consequence upon the cost of construction.

E91-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: This is a run on sentence that needs to be edited. (Vote: 14-0)

Individual Consideration Agenda

Comment 1:

IBC: 1015.3; IFC: [BE] 1015.3

Proponents: David Cooper, Stairbuilders and Manufacturers Association, Stairbuilders and Manufacturers Association, SMA (coderep@stairways.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

Revise as follows:

1015.3 Height. Required *guards* shall be not less than 42 inches (1067 mm) high, measured vertically as follows:

1. From the adjacent walking surfaces.
2. On *stairways* and stepped *aisles*, from the line connecting the *nosings*.
3. On *ramps* and ramped *aisles*, from the ramp surface at the guard.

Exceptions:

1. For occupancies in Group R-3 and within individual *dwelling units* in occupancies in Group R-2, the required height of *guards* is permitted to be reduced in accordance with the following:

   1.1. ~~For occupancies in Group R-3~~ Where not more than three *stories* above grade in height and ~~within individual *dwelling units* in occupancies in Group R-2 not more than three *stories* above grade in height~~ with separate *means of egress*, required *guards* shall be not less than 36 inches (914 mm) in height measured vertically above the adjacent walking surfaces.

   1.2. ~~For occupancies in Groups R-2 and R-3, within the interior conditioned space of individual *dwelling units*, where~~ Where the open-sided walking surface is located not more than 25 feet (7.62 meters) measured vertically to the floor or walking surface below, required *guards* shall not be less than 36 inches (914 mm) in height measured vertically above the adjacent walking surface.

   1.3. ~~For occupancies in Group R-3, and within individual *dwelling units* in occupancies in Group R-2, *guards*~~ *Guards* on the open sides of *stairs* shall have a height not less than 34 inches (864 mm) measured vertically from a line connecting the *nosings*.

   1.4. ~~For occupancies in Group R-3, and within individual *dwelling units* in occupancies in Group R-2, where~~ Where the top of the *guard* serves as a *handrail* on the open sides of *stairs*, the top of the *guard* shall be not less than 34 inches (864 mm) and not more than 38 inches (965 mm) measured vertically from a line connecting the *nosings*.

   1.5. ~~For occupancies in Group R-3, and within individual dwelling units in occupancies in Group R-2, where the top of the guard on the open side of stairs serves as a handrail, the height of the guard~~ At the transition of the handrail to the guard at the top of a flight, ~~is permitted to be less than~~ the required guard height ~~for a distance over the landing~~ shall not be less than the handrail height for a distance not greater than 12 inches (305 mm) as measured horizontally from the landing nosing.

2. ~~6.~~ The *guard* height in assembly seating areas shall comply with Section 1030.17 as applicable.

3. ~~7.~~ Along *alternating tread devices* and ships ladders, *guards* where the top rail serves as a *handrail* shall have height not less than 30 inches (762 mm) and not more than 34 inches (864 mm), measured vertically from a line connecting the leading edge of the treads.

4. ~~8.~~ In Group F occupancies where *exit access stairways* serve fewer than three *stories* and such *stairways* are not open to the public, and where the top of the *guard* also serves as a *handrail*, the top of the *guard* shall be not less than 34 inches (864 mm) and not more than 38 inches (965 mm) measured vertically from a line connecting the nosings.

2024 International Fire Code

Revise as follows:

[BE] 1015.3 Height. Required *guards* shall be not less than 42 inches (1067 mm) high, measured vertically as follows:

1. From the adjacent walking surfaces.
2. On *stairways* and stepped *aisles*, from the line connecting the *nosings*.
3. On *ramps* and ramped *aisles*, from the *ramp* surface at the *guard*.

Exceptions:

1. For occupancies in Group R-3 and within individual *dwelling units* in occupancies in Group R-2, the required height of *guards* is permitted to be reduced in accordance with the following:

   1.1. ~~For occupancies in Group R-3~~ Where not more than three *stories* above grade in height and ~~within individual *dwelling units* in occupancies in Group R-2 not more than three *stories* above grade in height~~ with separate *means of egress*, required *guards* shall be not less than 36 inches (914 mm) in height measured vertically above the adjacent walking surfaces.

   1.2. ~~For occupancies in Groups R-2 and R-3, within the interior conditioned space of individual *dwelling units*, where~~ Where the open-sided walking surface is located not more than 25 feet (7.62 meters) measured vertically to the floor or walking surface below, required *guards* shall not be less than 36 inches (914 mm) in height measured vertically above the adjacent walking surface.

   1.3. ~~For occupancies in Group R-3, and within individual *dwelling units* in occupancies in Group R-2, *guards*~~ *Guards* on the open sides of *stairs* shall have a height not less than 34 inches (864 mm) measured vertically from a line connecting the *nosings*.

   1.4. ~~For occupancies in Group R-3, and within individual *dwelling units* in occupancies in Group R-2, where~~ Where the top of the *guard* serves as a *handrail* on the open sides of *stairs*, the top of the *guard* shall be not less than 34 inches (864 mm) and not more than 38 inches (965 mm) measured vertically from a line connecting the *nosings*.

   1.5. ~~For occupancies in Group R-3, and within individual dwelling units in occupancies in Group R-2, where the top of the guard on the open side of stairs serves as a handrail, the height of the guard~~ At the transition of the handrail to the guard at the top of a flight, ~~is permitted to be less than~~ the required guard height ~~for a distance over the landing~~ shall not be less than the handrail height for a distance not greater than 12 inches (305 mm) as measured horizontally from the landing nosing.

2. ~~6.~~ The *guard* height in assembly seating areas shall comply with Section 1030.17 as applicable.

3. ~~7.~~ Along *alternating tread devices* and ships ladders, *guards* where the top rail serves as a *handrail* shall have height not less than 30 inches (762 mm) and not more than 34 inches (864 mm), measured vertically from a line connecting the leading edge of the treads.

4. ~~8.~~ In Group F occupancies where *exit access stairways* serve fewer than three *stories* and such *stairways* are not open to the public, and where the top of the *guard* also serves as a *handrail*, the top of the *guard* shall be not less than 34 inches (864 mm) and not more than 38 inches (965 mm) measured vertically from a line connecting the nosings.

Reason: For the most part the original text was defeated as being lengthy and verbose but most testimony agreed with the reason/need for the change. This comment provides the terse, cohesive language the committee and the majority of opposition testimony had suggested was necessary. The proposed list format grouping of all the residential guard height exceptions further aids understanding. Other CAH1 testimony was opposed because they misinterpreted the drawings submitted and the 12 inch dimension as illustrating handrail extensions.. That is not the case as the illustrations only represent certain residential applications where the top of the stair guard is permitted to serve as the handrail and be at the lower height of handrails. Please see the photos and renderings as labeled below that more clearly identify the intent of this comment and the original proposal.

This is a needed change for two critical reasons:

1. Most consumers feel it advantageous to have the handrail at the lower end of the required height range, especially in homes with children and older persons unable to maintain erect posture or with shrinking stature that is inherent with aging.
2. The code measures stair guard and handrail height from a line connecting the nosings however guards at landings and floors are measured from the walking surface. Handrails must be continuous to a point directly above the riser however the landing extends beyond the riser as much as $1\,^{1}/_{4}$ inches. Currently the stair guard would have to be the exact same height as the level guard to have a "sharp" and precise transition or a considerably higher stair guard to allow for a smooth transition by an over easing or a

wreathed fitting, i.e. curved stair handrails. (A wreathed handrail "twists" to conform to the angle of incidence of the users grip as they ambulate through the raked turn of the stair).

The ability to make a smooth rounded transition from stair guard to the level guard at the landing allows a safe and continuous grasp of the handrail. This proposal offers a superior alternative to the use of a gooseneck (vertical type transition) or post at the transition from the stair guard/handrail (allowed in the code) providing a greater level of safety. The minimal decrease from the required landing guard height is only allowed at the top of a flight and occurs for a negligible distance. This type of transition has been common throughout the built environment for hundreds of years. Please review the photographic examples below of common transitions.

Figure 1

Handrail to Post as permitted by code

Gooseneck from Handrail to Post as permitted by code

Gooseneck from Handrail to Guard as permitted by code

Figure 2

Simple Bisect of Handrail and Guard at Exactly Same Height
The arrow indicates area addressed by new exception

Figure 3

Wreathed transitions from Handrail to Landing Guard that provide continuous grip without interruption but require the proposed exception to the required landing guard height.

Figure 4

Preferred smooth transition of Handrail to landing Guard using over-easing at the top of a flight provides for continuous grip without interruption. Red dimension arrow indicates maximum 12 Inch distance where guard height exception would apply.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The technical changes only provide for an alternate location of the related elements. There is no change in the material or labor required that has any consequence upon the cost of construction.

~~b. Buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2. See Section 903 for occupancies where automatic sprinkler systems are permitted in accordance with Section 903.3.1.2.~~

~~c. Buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.~~

b ~~d~~. Group H occupancies equipped throughout with an automatic sprinkler system in accordance with Section 903.2.5.1.

~~e. Group R-3 and R-4 buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.3. See Section 903.2.8 for occupancies where automatic sprinkler systems are permitted in accordance with Section 903.3.1.3.~~

c. The exit access travel distance shall only apply in a Group R-3 and R-4 occupancy located in a mixed occupancy building.

Reason: The intent of this group of proposal is to make the tables in Chapter8 and 10 consistent with the revisions to Table 504.3, 504.4, 506.2 – using S13, S13R, S13D and NP for sprinkler requirements. This would clarify what happens when an NFPA 13D sprinkler system is used. This is not intent to change current allowances; just to clarify what requirements are applicable for an NFPA13D system. Discussion during the BCAC calls has indicated that it is needed to identifying specific code sections so that everyone has the same understanding.

Group R-4 requirements do not always have to be stated as Section 310.5 states “Group R-4 occupancies shall meet the requirements for construction as defined for Group R-3, except as otherwise provided for in this code.” However, since a lot of people miss that, we are including R-4 in the proposed applicable footnotes.

Townhouses are defined as attached dwelling units that extend from foundation to grade and are open on at least two sides. If a townhouse is 3 stories or less, it can choose to comply with the IBC or IRC (Section 101.2). The IRC Section P2904 is similar to an NFPA 13D system. If the IBC is used, townhouses subdivided by firewalls into 1 or 2 units per building is a Group R-3 (Section 310.4) and townhouses subdivided by fire partitions (Section 420.2) are a Group R-2 (Section 310.3). This is important to clarify because all townhouses can use a 13D sprinkler system: Section 903.2.8 references 903.3, and 903.1.3.3 specifically stating that “Automatic sprinkler systems installed in … and townhouses shall be permitted to be installed throughout in accordance with NFPA 13D.” To make this obvious in the tables, a reference to 903.2.8 and 903.1.3.3 are added in the footnote.

Specifics for this change –

- adds the S13, S13R, S13D and NS in the table titles and footnotes with the section references for sprinklers.
- add columns for NFPA13D and rows to separate out Group R requirements.
- Footnotes b, c and e are redundant and deleted.
- The new footnote is added to coordinate with the singe exit allowance in Section 1006.3.4 Item 4.
- “NP” instead of “not permitted” is for consistency in table styles.

This proposal is submitted by the ICC Building Code Action Committee (BCAC).

BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 the BCAC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the BCAC website at BCAC webpage.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is a clarification of requirements for Group R where an NFPA13D system is permitted. There are no changes to construction requirements.

E93-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The proposal needs to clarify that Group R-2 townhouses are limited to 3 stories when using a NFPA13D system - this might be in the new footnote. It needs to be clarified where Group R-3 and R-4 are allowed to not have a limit on the exit access travel distance. Section 1006.2.2.6 this appears to reduce the travel distance to 125' for Group R-3 and 75' for Group R-4. (Vote:12-2)

E93-24

Individual Consideration Agenda

Comment 1:

Proponents: Jeff Grove, Chair, Building Code Action Committee (BCAC) (bcac@iccsafe.org) requests As Submitted

Reason: BCAC had 5 different proposals dealing with requirements for buildings where an NFPA13D sprinkler system is permitted. Proposal FS94-24, E16-24 and E95-24 were approved. We are asking for approval of code changes E22-24 and E93-24 for consistency within the code.

In these tables, by not listing an NFPA13D system, there is no information on exit access travel distance for buildings where an NFPA13D system is permitted. Non-sprinklered buildings say 'NP' for 'not permitted', so information is missing.

Much of the discussion with the committee was about where an NFPA13D system can be used. That is outside the scope of these proposals. However, Code change F100-24 was approved as modified to clarify where an NFPA13D system can be use. This is the approved text.

2024 International Fire/Building Code
Revise as follows:
903.2.8 Group R. An automatic sprinkler system installed in accordance with Section 903.3.1 shall be provided throughout all buildings with a Group R fire area.
Delete without substitution:
~~903.2.8.1 Group R-3. An automatic sprinkler system installed in accordance with Section 903.3.1.3 shall be permitted in Group R-3 occupancies.~~
~~903.2.8.2 Group R-4, Condition 1. An automatic sprinkler system installed in accordance with Section 903.3.1.3 shall be permitted in Group R-4, Condition 1 occupancies.~~
~~903.2.8.3 Care facilities. An automatic sprinkler system installed in accordance with Section 903.3.1.3 shall be permitted in care facilities with five or fewer individuals in a single-family dwelling.~~
Revise as follows:
903.3.1.3 NFPA 13D sprinkler systems. Automatic sprinkler systems installed in one- and two-family dwellings and townhouses; Group R-3; and Group R-4~~, Condition 1; and townhouses~~ shall be permitted to be installed throughout in accordance with NFPA13D.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Comment (CAH2)# 141

Proposed Change as Submitted

Proponents: Richard Walke, Creative Technology Inc., SAFTIFIRST (richwalke61@gmail.com)

2024 International Building Code

Revise as follows:

TABLE 1020.2 CORRIDOR FIRE-RESISTANCE RATING

OCCUPANCY	OCCUPANT LOAD SERVED BY CORRIDOR	REQUIRED FIRE-RESISTANCE RATING (hours)	
		Without automatic sprinkler system	With automatic sprinkler system
H-1, H-2, H-3	All	Not Permitted	1[c]
H-4, H-5	Greater than 30	Not Permitted	1[c]
A, B, ~~E,~~ F, M, S, U	Greater than 30	1	0
E	All	1	1
R	Greater than 10	Not Permitted	0.5[c]/1[d]
I-2[a]	All	Not Permitted	0
I-1, I-3	All	Not Permitted	1[b, c]
I-4	All	1	0

a. For requirements for occupancies in Group I-2, see Sections 407.2 and 407.3.

b. For a reduction in the fire-resistance rating for occupancies in Group I-3, see Section 408.8.

c. Buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2 where allowed.

d. Group R-3 and R-4 buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.3. See Section 903.2.8 for occupancies where automatic sprinkler systems are permitted in accordance with Section 903.3.1.3.

2024 International Fire Code

Revise as follows:

[BE] TABLE 1020.2 CORRIDOR FIRE-RESISTANCE RATING

OCCUPANCY	OCCUPANT LOAD SERVED BY CORRIDOR	REQUIRED FIRE-RESISTANCE RATING (hours)	
		Without automatic sprinkler system	With automatic sprinkler system
H-1, H-2, H-3	All	Not Permitted	1[c]
H-4, H-5	Greater than 30	Not Permitted	1[c]
A, B, ~~E,~~ F, M, S, U	Greater than 30	1	0
E	All	1	1
R	Greater than 10	Not Permitted	0.5[c]/1[d]
I-2[a]	All	Not Permitted	0
I-1, I-3	All	Not Permitted	1[b, c]
I-4	All	1	0

a. For requirements for occupancies in Group I-2, see Sections 407.2 and 407.3 of the International Building Code.

b. For a reduction in the fire-resistance rating for occupancies in Group I-3, see Section 408.8 of the International Building Code.

c. Buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2 where allowed.

d. Group R-3 and R-4 buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.3. See Section 903.2.8 for occupancies where automatic sprinkler systems are permitted in accordance with Section 903.3.1.3.

Reason: This proposal is intended add a requirement for a 1 hr fire-resistance rating on corridor walls in sprinkled E Occupancies. It emulates an amendment which was made when the City of Chicago adopted the International Building Code.

The City of Chicago suffered a tragic loss of ninety-two students and three nuns during the Our Lady of the Angels School Fire on December 1, 1958. Many of these lives were lost due to flames and smoke blocking their normal means of egress. No doubt this fire and the tragic loss of life was on the minds of the City Council members when amending their code. And it should be on our minds when considering this proposal. There is no more important a responsibility we as a collective group should have here this week than to protect the lives of our children and grandchildren through requirements for safe building construction methods.

The need for rated corridors was removed for the sprinkled occupancies during the transition from the legacy codes to the International Building Code. Since that time, if I have heard it once, I have heard it one hundred times, “We need to reinstate the requirement for rated corridors in our schools.” So here is our opportunity.

When voting on this proposal, please keep in mind the chaotic environment which would exist in a school fire. Even though the students and facility do practice fire drills, an actual fire is far different. The practiced means of egress may not be available due to fire, smoke and toxic gases. So having the redundancy of sprinklers and fire-resistance-rated construction certainly increases the likely-hood of a safe ending to a school fire. Please vote to reinstate the requirement for protecting corridors in sprinkled E occupancies. Do it for the children!

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

The average additional installed cost of constructing a 1 hr fire-resistance-rated gypsum board wall as compared to a non-rated gypsum board wall is approximately $1 to $2 / sq ft. The average additional installed cost of constructing a 1 hr fire-resistance-rated concrete masonry unit (CMU) wall as compared to a non-rated CMU wall is approximately $2 to $4 / sq ft. In addition to the additional cost of construction the wall, the various breaches will need to be likewise protected in accordance with Sections 714, 715, 716 and 717 of the International Building Code. Below is the average cost for installing this additional protection:

1. Based on industry and manufacturer input, the average cost of an installed firestop system is $50 to $60 per penetration.
2. Based on industry and manufacturer input, the average cost of an installed joint system is $25 to $40 per lineal foot.
3. Based on industry and manufacturer input, the average increase in cost of an installed 20 minute without hose stream door versus a non-rated door is $50 to $100 per door.
4. Based on industry and manufacturer input, the average increase in cost of an installed 20 or 45 minute fire-protection glazing versus a non-rated glazing is $25 to $40 per sq ft of opening.
5. Based on industry and manufacturer input, the average cost of an installed fire, smoke or combination fire/smoke damper is $300 to $500, $1,000 to $1,500 and $1,000 to $1,500 per damper, respectively.

Estimated Immediate Cost Impact Justification (methodology and variables):

This cost includes average materials and labor costs for the above items. The cost range includes protecting both sides of wall assembly where appropriate. In the end, the exact increase in cost is based on the specific building design in question.

E96-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The proposal was disapproved. The school fire in 1958 is not an appropriate reference for school buildings as they are built today - schools are constructed with passive and active fire protection systems. Children have monthly fire drills their entire life, so they are well trained in school evacuation. There have been no fire deaths in a school since 1958. There is no recent fire data provided for this significant change in cost for schools - this is not an incremental cost as indicated in the cost impact statement. Closers on classrooms doors are a problem for younger children to open on their own - so fire rated doors will be propped open by the teacher. (Vote: 14-0)

Individual Consideration Agenda

Comment 1:

IBC: TABLE 1020.2; IFC: [BE] TABLE 1020.2

Proponents: Richard Walke, Creative Technology Inc., SAFTIFIRST (richwalke61@gmail.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

TABLE 1020.2 CORRIDOR FIRE-RESISTANCE RATING

OCCUPANCY	OCCUPANT LOAD SERVED BY CORRIDOR	REQUIRED FIRE-RESISTANCE RATING (hours)	
		Without automatic sprinkler system	With automatic sprinkler system
H-1, H-2, H-3	All	Not Permitted	1[c]
H-4, H-5	Greater than 30	Not Permitted	1[c]
A, B, F, M, S, U	Greater than 30	1	0
E	All	1	~~1~~0.5
R	Greater than 10	Not Permitted	0.5[c]/1[d]
I-2[a]	All	Not Permitted	0
I-1, I-3	All	Not Permitted	1[b, c]
I-4	All	1	0

a. For requirements for occupancies in Group I-2, see Sections 407.2 and 407.3.

b. For a reduction in the fire-resistance rating for occupancies in Group I-3, see Section 408.8.

c. Buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2 where allowed.

d. Group R-3 and R-4 buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.3. See Section 903.2.8 for occupancies where automatic sprinkler systems are permitted in accordance with Section 903.3.1.3.

2024 International Fire Code

[BE] TABLE 1020.2 CORRIDOR FIRE-RESISTANCE RATING

OCCUPANCY	OCCUPANT LOAD SERVED BY CORRIDOR	REQUIRED FIRE-RESISTANCE RATING (hours)	
		Without automatic sprinkler system	With automatic sprinkler system
H-1, H-2, H-3	All	Not Permitted	1[c]
H-4, H-5	Greater than 30	Not Permitted	1[c]
A, B, F, M, S, U	Greater than 30	1	0
E	All	1	~~1~~0.5
R	Greater than 10	Not Permitted	0.5[c]/1[d]
I-2[a]	All	Not Permitted	0
I-1, I-3	All	Not Permitted	1[b, c]
I-4	All	1	0

a. For requirements for occupancies in Group I-2, see Sections 407.2 and 407.3 of the International Building Code.

b. For a reduction in the fire-resistance rating for occupancies in Group I-3, see Section 408.8 of the International Building Code.

c. Buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1 or 903.3.1.2 where allowed.

d. Group R-3 and R-4 buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.3. See Section 903.2.8 for occupancies where automatic sprinkler systems are permitted in accordance with Section 903.3.1.3.

Reason: The need for rated corridors was removed for the sprinklered E occupancies during the transition from the legacy codes to the International Building Code. Since that time, if I have heard it once, I have heard it one hundred times, “We need to reinstate the requirement for rated corridors in our schools.” So here is our opportunity.

The proposal as originally written proposed a change in the fire-resistance rating from 0 hr to 1 hr on corridors in sprinklered E occupancies. This was intended to emulates an amendment which was made when the City of Chicago adopted the International Building Code. The original proposal is being modified based on input received from multiple sources both during and after Committee Action Hearing #1.

The modification to the original proposal is to change the required fire resistance rating for sprinklered E occupancies from 1 hr to 0.5 hr. The 0.5 hr rating for sprinklered applications is consistent with other sections or tables of the IBC including the R occupancies within the corridor Table 1020.2 and dwelling and sleeping unit separations covered by Section 708.3.

The landscape of school safety has changed dramatically over the last several decades. Arson fires now account for 43 percent of the school fires. The arson fire could be set by a student simply wanting to get out of a test that day to a mass shooter with using fire to carry out violence against the students and teachers as they evacuate the classrooms due to the fire. And there certainly could be multiple ignition locations.

The Report of Committee Action Hearing #1 mentions there has not been a fire death in a school since 1958. That statement contradicts published information from NFPA Research.[1] The referenced report sites the following statistics relating to school fires during the five-year period from 2014 through 2018:

- The fire services responded to an average of 3,230 school fires per year.
- School fires caused an average of 1 civilian death per year, 39 civilian injuries per year and $37 million in direct property damage per year.
- Arson is the leading cause of school fires, representing 43% of the fires.
- Arson fires accounted 60% of the civilian injuries and 54% of the direct property damage.
- Arson fires were more prevalent in high schools and middle schools than elementary schools.
- 65% of school fires were during school hours, 8a – 4p.
- School fires most often originate in the lavatories and locker rooms.

During Committee Action Hearing #1, testimony cited a growing threat from arson fires targeting violence against persons. Testimony stated the number of fires of this type increased by 57% from 2019 and 2020 in cities having a population of at least 1,000,000 persons and 11% in cities having a population under 10,000 persons.[2] These statistics are particularly frightening for large cities.

Testimony at Committee Action Hearing #1 also questioned why we require rated corridors in sprinklered I-1, I-3 and R occupancies but

not E occupancies. While I recognize the different risk levels of these occupancies as compared to E occupancies, I also recognize the need to protect our vulnerable children. There is no more important a responsibility we as a collective group should have here this week than to protect the lives of our children and grandchildren through requirements for safe building construction methods in our schools. Having the redundancy of sprinklers and fire-resistance-rated construction certainly increases the likely-hood of a safe ending to a school fire. Please vote to reinstate the requirement for protecting corridors in sprinklered E occupancies. Do it for the children!

Bibliography: [1] NFPA Research, September, 2020 - Structure Fires in Schools, by Richard Campbel
[2] Cybersecurity & Infrastructure Security Agency - Fire as a Weapon

Cost Impact: Increase

Estimated Immediate Cost Impact:

The average additional installed cost of constructing a 1/2 hr fire-resistance-rated gypsum board wall as compared to a non-rated gypsum board wall is approximately $1 to 2 / sq ft. The average additional installed cost of constructing a 1/2 hr fire-resistance-rated concrete masonry unit (CMU) wall as compared to a non-rated CMU wall is approximately $2 to 4 / sq ft. In addition to the additional cost of construction the wall, the various breaches will need to be likewise protected in accordance with Sections 714, 715, 716 and 717 of the International Building Code. Below is the average cost for installing this additional protection:

1. Based on industry and manufacturer input, the average cost of an installed firestop system is $50 to $60 per penetration.
2. Based on industry and manufacturer input, the average cost of an installed joint system is $25 to $40 per lineal foot.
3. Based on industry and manufacturer input, the average increase in cost of an installed 20 minute without hose stream door versus a non-rated door is $200 to $300 per door, including the cost of the necessary hardware.
4. Based on industry and manufacturer input, the average increase in cost of an installed 20-minute fire-protection glazing versus a non rated glazing is $25 to $40 per sq ft of opening.
5. Based on industry and manufacturer input, the average cost of an installed fire, smoke or combination fire/smoke damper is $300 to $500, $1,000 to $1,500 and $1,000 to $1,500 per damper, respectively.

Estimated Immediate Cost Impact Justification (methodology and variables):

This includes average materials and labor costs for the above items. The cost range includes protecting both wall assemblies of the corridor, where appropriate. In the end, the exact increase in cost is based on the specific building design in question.

Proposed Change as Submitted

Proponents: Jenifer Gilliland, Seattle Department of Construction and Inspections, Washington Association of Building Officials Technical Code Development Committee (jenifer.gilliland@seattle.gov); Micah Chappell, Seattle Department of Construction and Inspections, Washington Association of Building Officials Technical Code Development Committee (micah.chappell@seattle.gov); Angela Haupt, City of Kirkland, Washington Association of Building Officials, Technical Code Development Committee (ashaupt@kirklandwa.gov)

2024 International Building Code

Add new definition as follows:

EXIT PATHWAY.
An exit component that serves to meet one or more means of egress design requirements and is open to sky.

Revise as follows:

[BE] EXIT. That portion of a *means of egress* system between the *exit access* and the *exit discharge* or *public way*. Exit components include exterior exit doors at the *level of exit discharge*, *interior exit stairways* and *ramps*, *exit passageways*, *exit pathways*, *exterior exit stairways* and *ramps* and *horizontal exits*.

1022.1 General. *Exits* shall comply with Sections 1022 through 1027 and the applicable requirements of Sections 1003 through 1015. An *exit* shall not be used for any purpose that interferes with its function as a *means of egress*. Once a given level of *exit* protection is achieved, such level of protection shall not be reduced until arrival at the *exit discharge.* ~~Exits shall be continuous from the point of entry into the *exit* to the *exit discharge*~~.

Add new text as follows:

1022.3 Exit continuity. Exits shall be continuous from the point of entry into the *exit* to the *exit discharge*. The path within *exits* is permitted to consist of any combination of *interior exit stairways*, *interior exit ramps*, *exit passageways*, *exit pathways*, *exterior exit stairways*, and *exterior exit ramps*.

Revise as follows:

~~**1023.3.1**~~ **1022.3.1 Extension.** Where an *exit passageway* is used to provide continuity of an *exit*, ~~*interior exit stairways* and *ramps* are extended to an *exit discharge* or a *public way* by an *exit passageway*,~~ the *interior* or exterior *exit stairway* and *ramp* shall be separated from the *exit passageway* by a *fire barrier* constructed in accordance with Section 707 or a *horizontal assembly* constructed in accordance with Section 711, or both. The *fire-resistance rating* of the exit passageway shall be not less than that required for the *interior exit stairway* and *ramp*. A *fire door assembly* complying with Section 716 shall be installed in the *fire barrier* to provide a *means of egress* from the *interior* or exterior *exit stairway* and *ramp* to the *exit passageway*. Openings in the *fire barrier* other than the *fire door assembly* are prohibited. Penetrations of the *fire barrier* are prohibited.

Exceptions:

1. Penetrations of the *fire barrier* in accordance with Section 1023.5 shall be permitted.
2. Separation between an *interior exit stairway* or *ramp* and the *exit passageway* extension shall not be required where there are no openings into the *exit passageway* extension.

3. Separation between an *interior exit stairway* or *ramp* and the *exit passageway* extension shall not be required where the *interior exit stairway* and the *exit passageway* extension are pressurized in accordance with Section 909.20.4.

Add new text as follows:

1022.3.2 Exit pathways. *Exit pathways* shall be permitted to serve as an exit component in the *means of egress* system where they connect *interior* or *exterior exit stairways and ramps* of the same *building* and comply with the requirements in Section 1022.3.2.1 through 1022.3.2.3.

1022.3.2.1 Construction and openings. The floor, walls, and openings of the *exit pathway* shall be constructed in accordance with Section 1024 for *exit passageways* for a minimum horizontal distance of 10 feet from the edges of *exit pathway* and a minimum vertical distance of 10 feet from the floor of the *exit pathway*.

1022.3.2.2 Location. The *exit pathway* shall have a minimum *fire separation distance* of 10 feet (3048 mm) measured at right angles from the exterior edge of the *exit pathway*, to:

1. The closest interior *lot line*.
2. The centerline of a street, an alley, or *public way*.
3. An imaginary line between two *buildings* on the lot.

1022.3.2.3 Path marking. *Exit pathways* shall be delineated or marked to clearly indicate the path of travel.

Revise as follows:

1008.3 Illumination required by an emergency electrical system. An emergency electrical system shall be provided to automatically illuminate the following areas in the event of a power supply failure:

1. In rooms or spaces that require two or more exits or access to exits:
   1.1. *Aisles*.
   1.2. *Corridors*.
   1.3. *Exit access stairways* and *ramps*.
2. In *buildings* that require two or more exits or access to exits:
   2.1. Interior *exit access stairways* and *ramps*.
   2.2. Interior and *exterior exit stairways* and *ramps*.
   2.3 *Exit pathways*
   ~~2.3.~~ 2.4. Exit passageways.
   ~~2.4.~~ 2.5. Vestibules and areas on the level of discharge used for *exit discharge* in accordance with Section 1028.2.
   ~~2.5.~~ 2.6. Exterior landings as required by Section 1010.1.5 for exit doorways that lead directly to the *exit discharge*.

3. In other rooms and spaces:
    3.1. Electrical equipment rooms.
    3.2. *Fire command centers*.
    3.3. Fire pump rooms.
    3.4. Generator rooms.
    3.5. Public restrooms with an area greater than 300 square feet (27.87 m^2).

1024.5 Openings. Exit passageway opening protectives shall be in accordance with the requirements of Section 716. Except as permitted in Section 402.8.7, openings in exit passageways other than unprotected exterior openings shall be limited to those necessary for *exit access* to the *exit passageway* from normally occupied spaces and for egress from the *exit passageway*.

Where an *interior exit stairway* or *ramp* is extended to an *exit discharge* or a *public way* by an *exit passageway*, the *exit passageway* shall comply with Section ~~1023.3.1~~1022.3.1.

Elevators shall not open into an *exit passageway*.

2024 International Fire Code

Add new definition as follows:

EXIT PATHWAY. An exit component that serves to meet one or more means of egress design requirements and is open to sky.

Revise as follows:

[BE] EXIT. That portion of a *means of egress* system between the *exit access* and the *exit discharge* or *public way*. Exit components include exterior exit doors at the *level of exit discharge*, *interior exit stairways* and *ramps*, *exit passageways*, exit pathways, *exterior exit stairways* and *ramps* and *horizontal exits*.

[BE] 1022.1 General. *Exits* shall comply with Sections 1022 through 1027 and the applicable requirements of Sections 1003 through 1015. An *exit* shall not be used for any purpose that interferes with its function as a *means of egress*. Once a given level of exit protection is achieved, such level of protection shall not be reduced until arrival at the *exit discharge*. ~~*Exits* shall be continuous from the point of entry into the *exit* to the *exit discharge*.~~

Add new text as follows:

1022.3 Exit continuity. Exits shall be continuous from the point of entry into the *exit* to the *exit discharge*. The path within *exits* is permitted to consist of any combination of *interior exit stairways*, *interior exit ramps*, *exit passageways*, *exit pathways*, *exterior exit stairways*, and *exterior exit ramps*.

Revise as follows:

[BE] ~~1023.3.1~~ 1022.3.1 Extension. Where an *exit passageway* is used to provide continuity of an *exit*, ~~*interior exit stairways* and *ramps* are extended to an *exit discharge* or a *public way* by an *exit passageway*,~~ the *interior* or exterior *exit stairway* and *ramp* shall be separated from the *exit passageway* by a *fire barrier* constructed in accordance with Section 707 of the International Building Code or a *horizontal assembly* constructed in accordance with Section 711 of the International Building Code, or both. The *fire-resistance rating* of the exit passageway shall be not less than that required for the *interior exit stairway* and *ramp*. A *fire door assembly* complying with Section 716 of the International Building Code shall be installed in the *fire barrier* to provide a *means of egress* from the *interior* or exterior *exit stairway* and *ramp* to the *exit passageway*. Openings in the *fire barrier* other than the *fire door assembly* are prohibited. Penetrations of the *fire barrier* are prohibited. **Exceptions:**

1. Penetrations of the *fire barrier* in accordance with Section 1023.5 shall be permitted.

2. Separation between an *interior exit stairway* or *ramp* and the *exit passageway* extension shall not be required where there are no openings into the *exit passageway* extension.
3. Separation between an *interior exit stairway* or *ramp* and the *exit passageway* extension shall not be required where the *interior exit stairway* and the *exit passageway* extension are pressurized in accordance with Section 909.20.4 of the International Building Code.

Add new text as follows:

1022.3.2 Exit pathways. *Exit pathways* shall be permitted to serve as an exit component in the *means of egress* system where they connect *interior* or *exterior exit stairways and ramps* of the same *building* and comply with the requirements in Section 1022.3.2.1 through 1022.3.2.3.

1022.3.2.1 Construction and openings. The floor, walls, and openings of the *exit pathway* shall be constructed in accordance with Section 1024 for *exit passageways* for a minimum horizontal distance of 10 feet from the edges of *exit pathway* and a minimum vertical distance of 10 feet from the floor of the *exit pathway*.

1022.3.2.2 Location. The exit pathway shall have a minimum fire separation distance of 10 feet (3048 mm) measured at right angles from the exterior edge of the exit pathway, to:

1. The closest interior lot line.
2. The centerline of a street, an alley, or public way.
3. An imaginary line between two buildings on the lot.

1022.3.2.3 Path marking. *Exit pathways* shall be delineated or marked to clearly indicate the path of travel.

Revise as follows:

[BE] 1008.3 Illumination required by an emergency electrical system. An emergency electrical system shall be provided to automatically illuminate the following areas in the event of a power supply failure:

1. In rooms or spaces that require two or more exits or access to exits:
   1.1. *Aisles*.
   1.2. *Corridors*.
   1.3. *Exit access stairways* and *ramps*.
2. In *buildings* that require two or more exits or access to exits:
   2.1. Interior *exit access stairways* and *ramps*.
   2.2. Interior and *exterior exit stairways* and *ramps*.
   2.3 Exit pathways
   ~~2.3.~~ 2.4. Exit passageways.
   ~~2.4.~~ 2.5. Vestibules and areas on the level of discharge used for *exit discharge* in accordance with Section 1028.2.
   ~~2.5.~~ 2.6. Exterior landings as required by Section 1010.1.5 for exit doorways that lead directly to the *exit discharge*.

3. In other rooms and spaces:
   3.1. Electrical equipment rooms.
   3.2. *Fire command centers*.
   3.3. Fire pump rooms.
   3.4. Generator rooms.
   3.5. Public restrooms with an area greater than 300 square feet (27.87 m^2).

[BE] 1024.5 Openings. *Exit passageway* opening protectives shall be in accordance with the requirements of Section 716 of the International Building Code.
Except as permitted in Section 402.8.7 of the International Building Code, openings in *exit passageways* other than unprotected exterior openings shall be limited to those necessary for *exit access* to the *exit passageway* from normally occupied spaces and for egress from the *exit passageway*.

Where an *interior exit stairway* or *ramp* is extended to an *exit discharge* or a *public way* by an *exit passageway*, the *exit passageway* shall comply with Section ~~1023.3.1~~1022.3.1.

Elevators shall not open into an *exit passageway*.

Reason: The design of new buildings on small complex sites with steep or varying grades can result in buildings with multiple levels and entrances, towers of differing heights, parking garages that are partially underground with large roof decks near grade, etc. Complying with *means of egress* requirements can be difficult and some applicants propose using outdoor spaces such as roofs or roof decks as part of an *exit* or to connect *exit* components. There is no obvious code path allowing a surface like a roof or deck that is open to sky to be used to connect exit components without requiring it to be enclosed with an *exit passageway*, which is cost prohibitive.

Proposed Solution: Exit Pathway

This proposal combines *exit* continuity language from other Chapter 10 locations into Section 1022 Exits and adds new sections and definitions to establish a new option for connecting *exit* components, the *exit pathway.* The *exit pathway* has two attributes: it must be open to sky and is an *exit* component. An *exit pathway* is a delineated route that crosses a space that is open to sky and connects *exit* components, in a similar manner to how an *exit passageway* connects two *interior exit stairways* within a building (see Figure 1 below).

The purpose of the changes in each section is as follows:

1022.1 General. The last sentence, "*Exits* shall be continuous from the point of entry into the *exit* to the *exit discharge,*" is being relocated to section 1022.3 to create a new section, Exit continuity.

1022.3 Exit continuity. This section addresses two important aspects of an *exit*: they must be continuous from beginning to end and an exit can be a combination of several different *exit* components, including the new *exit pathway*.

This proposal also adds *exterior exit stairways and ramps* to the list of exit components that can be daisy-chained together to form the egress path to the exit discharge or public way. Using Figure 1 as an example, if the delineated *exit pathway* crosses the podium of a podium building, in many designs, an *exterior exit stairway* (minus the stair penthouse shown in the figure) is used to get from the podium level to the public way. The language in the current code (1023.3, Exception) would not allow this, yet the level of safety of an *exterior exit stairway* is presumed to be the same as the other *exit* components.

1022.3.1 Extension. The *exit passageway* extension requirement used to separate the *interior or exterior exit stairway and ramp* from the *exit passageway* is being relocated from Section 102**3**.3.1 into Section 102**2**.3.1. *Exit* continuity needs to be maintained through all components of an *exit*, not just *interior exit stairways* and ramps, so the relocation to Section 1022, the general exiting section, is more appropriate.

1022.3.2 *Exit pathways*: Adds scoping language for the new *exit pathway section.*

1022.3.2.1 Construction and openings: The floors and walls of the *exit pathway* would be protected like an *exit passageway,* but there

would be no ceiling that needs protection. The exit pathway is protected from fires below by requiring the horizontal assembly required in 1024.3 to extend 10 feet from the edge of the pathway. Where there is a minimum of 10 feet of horizontal separation between the edge of the *exit pathway* and other parts of the building, then no walls would be required. However, where *building* walls are less than 10 feet from the edge of *exit pathway*, they must be protected for a vertical distance of 10 feet (see Figure 2 below).

1022.3.2.2 Location: The hazard of adjacent buildings is mitigated with a requirement to have 10 feet of *fire separation distance* between the edge of the *exit pathway* and the lot line, centerline of the right-of-way, or an imaginary lot line, which is similar to how Section 1027.5 protects exterior stairs.

1022.3.2.3 Path marking: Marking the *exit pathway* is required. It can be disorienting to leave an exit stairway or other area and suddenly find yourself in an open to sky area that isn't at grade. Providing a visual cue for the *exit pathway* will allow people to get to the other exit component efficiently in the event of an emergency.

1008.3 Illumination required by an emergency electrical system: To coordinate with the change requiring illumination made in 1002.3.2.4, *exit pathways* is added as item 2.3, requiring the emergency electrical system to automatically illuminate the pathway if there is a power failure. Ambient lighting is not an effective substitute for artificial lighting especially in dense urban environments. Areas like podium plazas, may get little ambient light because of shadows from neighboring buildings and the top floor of many high-rise buildings are stepped back and of a such height that no other building is nearby that can provide the ambient light necessary to light the *exit pathway*. In recognition of the limitations of ambient lighting, the code hasn't relied on the use of ambient lighting to light the exit discharge since the 2018 IBC.

1024.5 Openings: The reference to 102**3**.3.1 is being changed to 102**2**.3.1 to reflect the relocation of the extension section for *exit passageway*s in 1023 to 1022.3.1. See comments on 1022.3.1.

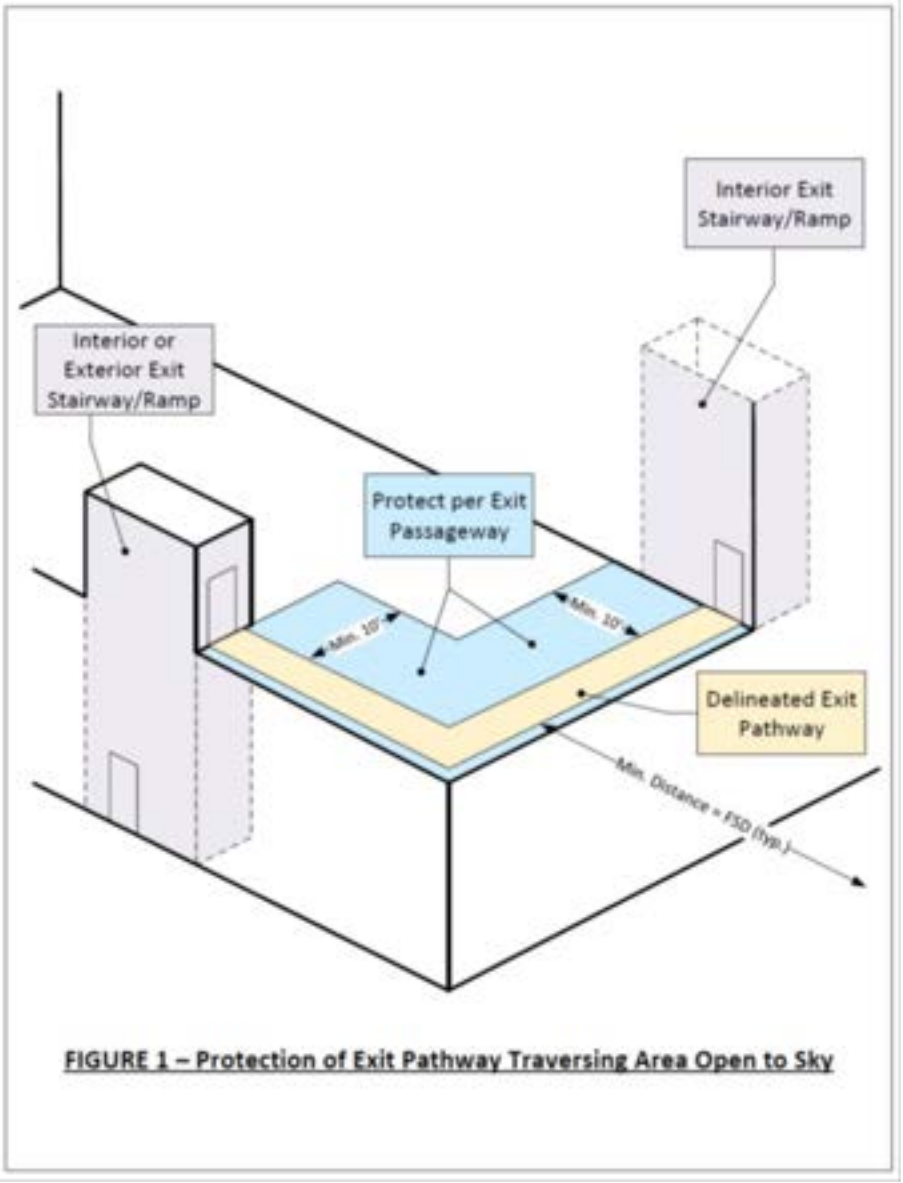

FIGURE 1 – Protection of Exit Pathway Traversing Area Open to Sky

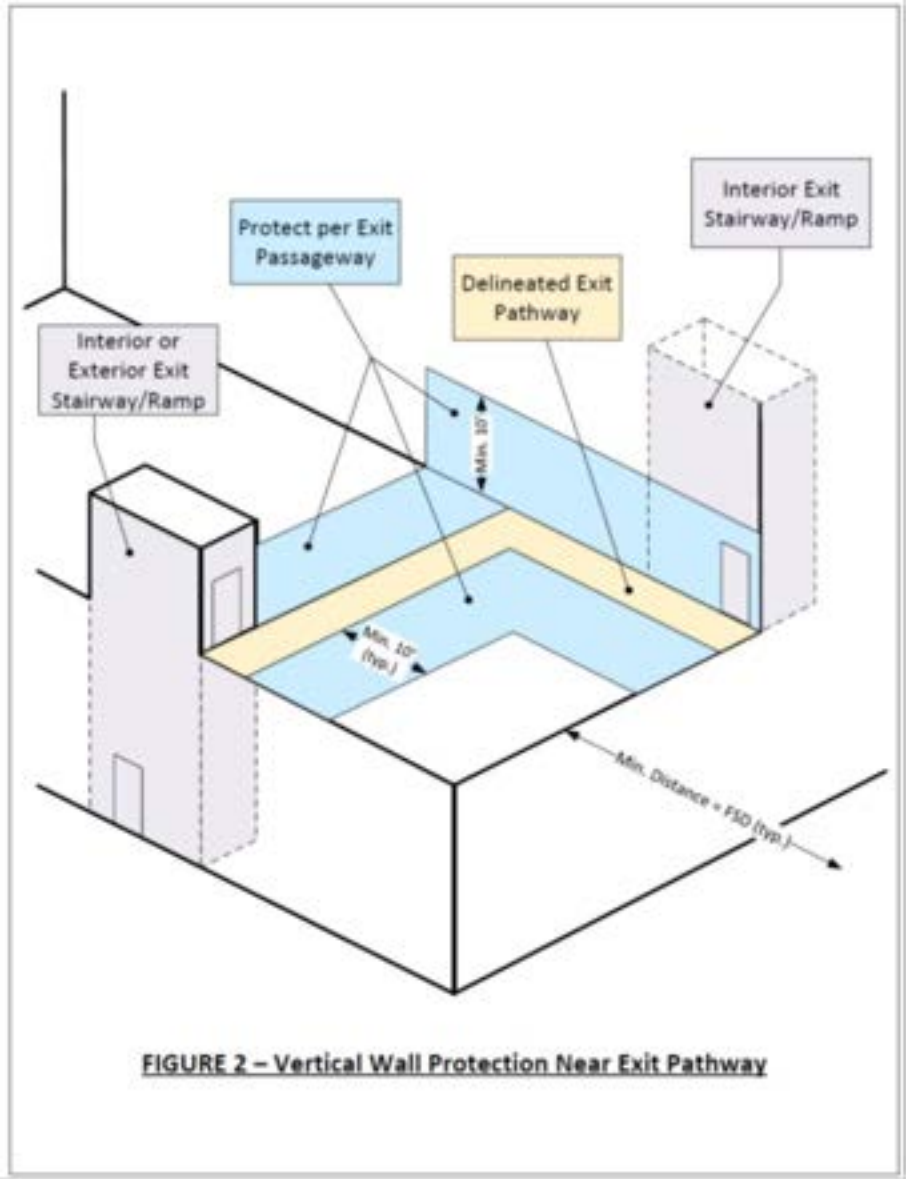

FIGURE 2 – Vertical Wall Protection Near Exit Pathway

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

Much depends on what the applicant proposes and what the building official will approve for delineating or marking the exit pathway. Barriers and guards could make sense depending on if amenities are provided on the roof or other outdoor surface. It is more likely that striping and paint will be used. The exit pathway may need to be redone or touched up in the future. A cursory review of online prices for traffic striping paint and pavement marking tape revealed the following:

Paint

HD Supply Solutions: $70.39 to $199.00 per gallon HD Supply Solutions

Pavement marking tape (retroreflective polymer pavement marking tape)

(yellow) 3M Stamark 24"x30 yard: $320 Uline; $416.78 Stop-Painting.com

3M Stamark Surface Preparation Adhesive P50, 1 gallon: $85.07 Industrial General Store

An analysis of the cost of luminous of egress path markings, such as those required by Section 1025, is not included as they are

generally not designed for outdoor use.

Estimated Immediate Cost Impact Justification (methodology and variables):

This change provides a new option to use an exit pathway across a roof to connect two exit components and an exterior exit stairway or ramp to be used as one of the connected components. It is not creating a new requirement, so there is no cost impact or most likely a decrease in cost.
Currently, the only way an outdoor portion of a building like a roof or roof deck can be used as part of the *exit* would be to put enclose that portion of the roof in an exit passageway. Exit passageways are required to have fire resistance rated construction on the floor, ceiling and walls for the entire length of the exit passageway. With this change, at a minimum, someone opting to use the exit pathway approach where other portions of the surface are within 10 feet of the pathway or where the pathway is within a fire separation distance of 10 feet would not need to rate its ceiling while still rating its walls and floor. This is a cost reduction because they don't need to rate the of the ceiling of what would normally be required, an exit passageway. In cases where the exit pathway is more than 10 feet away from other items on the roof and adjacent buildings, only the floor of would need to be rated. Again, this represents a cost reduction from full compliance with the requirements of an exit passageway. In addition, many podium buildings have roofs and other outdoor surfaces that may already be appropriately fire resistance rated due to other code requirements and nothing would need to be required other than marking and lighting the path. This is also a cost reduction from full compliance with an exit passageway. Exit passageways are required to be provided with lighting and markings, so the minimal lighting and path marking requirements for the exit pathways would certainly cost the same or possibly less.

There could be costs associated with maintaining the exit pathway markings over time, depending on the material or product approved by the building official.

The lighting would not present increased costs over lighting already required in an exit pathway.

E97-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The proposal was disapproved. To leave a protected exit stairway for a path open to the outside and then back into a protected exit stairway does not seem to maintain the the same level of protection to the exit discharge. If an 'exit pathway' is a new exit element, it should be in it's own section, similar to exit passageways, not lumped under the general exit requirements in Section 1022. The stairway termination requirements need to be addressed. Ways to keep the outside path clear need to be addressed. Either clarify what markings are required, or provide something more substantial than just a marked path. There are no limitation on the use of the roof for other occupancies that might be an obstruction for the path of egress. There are no travel distance limits for this element. This seems like it could already be addressed with horizontal exits. (Vote: 13-0)

E97-24

Individual Consideration Agenda

Comment 1:

IBC: SECTION 202, SECTION 1022, 1022.1, 1022.3, 1022.3.1, SECTION 1023, 1023.3, SECTION 1024, 1024.5, SECTION 1025 (New), 1022.3.2, 1022.3.2.1, 1022.3.2.2, 1022.3.2.3, 1008.3; IFC: SECTION 202, SECTION 1022, [BE] 1022.1, 1022.3, [BE] 1022.3.1, SECTION 1023, [BE] 1023.3, SECTION 1024, [BE] 1024.5, SECTION 1025 (New), 1022.3.2, 1022.3.2.1, 1022.3.2.2, 1022.3.2.3, [BE]

1008.3

Proponents: Jenifer Gilliland, Seattle Department of Construction and Inspections, Washington Association of Building Officials Technical Code Development Committee (jenifer.gilliland@seattle.gov); Micah Chappell, Seattle Department of Construction and Inspections, Washington Association of Building Officials Technical Code Development Committee (micah.chappell@seattle.gov) requests As Modified by Committee (AMC2)

Further modify as follows:

2024 International Building Code

Revise as follows:

EXIT PATHWAY.
An exit component that serves to meet one or more means of egress design requirements and is open to sky and may or may not be open on one or both sides.

[BE] EXIT. That portion of a *means of egress* system between the *exit access* and the *exit discharge* or *public way*. Exit components include exterior exit doors at the *level of exit discharge*, *interior exit stairways* and *ramps*, *exit passageways*, *exit pathways, exterior exit stairways* and *ramps* and *horizontal exits*.

SECTION 1022
EXITS

1022.1 General. *Exits* shall comply with Sections 1022 through ~~1027~~ 1028 and the applicable requirements of Sections 1003 through 1015. An *exit* shall not be used for any purpose that interferes with its function as a *means of egress*. Once a given level of *exit* protection is achieved, such level of protection shall not be reduced until arrival at the *exit discharge.*

1022.3 Exit continuity. Exits shall be continuous from the point of entry into the *exit* to the *exit discharge*. The path within *exits* is permitted to consist of any combination of *interior exit stairways*, *interior exit ramps*, *exit passageways*, *exit pathways*, *exterior exit stairways*, and *exterior exit ramps*.

1022.3.1 Extension. Where an *exit passageway* is used to provide continuity of an *exit*, the *interior* or exterior *exit stairway* and *ramp* shall be separated from the *exit passageway* by a *fire barrier* constructed in accordance with Section 707 or a *horizontal assembly* constructed in accordance with Section 711, or both. The *fire-resistance rating* of the exit passageway shall be not less than that required for the *interior exit stairway* and *ramp*. A *fire door assembly* complying with Section 716 shall be installed in the *fire barrier* to provide a *means of egress* from the *interior* or exterior *exit stairway* and *ramp* to the *exit passageway*. Openings in the *fire barrier* other than the *fire door assembly* are prohibited. Penetrations of the *fire barrier* are prohibited.

Exceptions:

1. Penetrations of the *fire barrier* in accordance with Section 1023.5 shall be permitted.
2. Separation between an *interior exit stairway* or *ramp* and the *exit passageway* extension shall not be required where there are no openings into the *exit passageway* extension.
3. Separation between an *interior exit stairway* or *ramp* and the *exit passageway* extension shall not be required where the *interior exit stairway* and the *exit passageway* extension are pressurized in accordance with Section 909.20.4.

SECTION 1023
INTERIOR EXIT STAIRWAYS AND RAMPS

Revise as follows:

1023.3 Termination. *Interior exit stairways* and *ramps* shall terminate at an *exit discharge* or a *public way*. **Exception:** A

combination of *interior exit stairways*, *interior exit ramps*, ~~and~~ *exit passageways*, and *exit pathways* constructed in accordance with Sections 1022.3.1, 1023.2, ~~1023.3.1, and~~ 1024, and 1025 respectively, and forming a continuous protected enclosure, shall be permitted to extend an *interior exit stairway* or *ramp* to the *exit discharge* or a *public way*.

SECTION 1024
EXIT PASSAGEWAYS

1024.5 Openings. Exit passageway opening protectives shall be in accordance with the requirements of Section 716. Except as permitted in Section 402.8.7, openings in exit passageways other than unprotected exterior openings shall be limited to those necessary for *exit access* to the *exit passageway* from normally occupied spaces and for egress from the *exit passageway*.

Where an *interior exit stairway* or *ramp* is extended to an *exit discharge* or a *public way* by an *exit passageway*, the *exit passageway* shall comply with Section1022.3.1.

Elevators shall not open into an *exit passageway*.

Add new text as follows:

SECTION 1025
EXIT PATHWAYS

Revise as follows:

~~**1022.3.2**~~**1025.1 General ~~Exit pathways.~~** *Exit pathways* shall be permitted to serve as an exit component in the *means of egress* system where they connect *interior* or *exterior exit stairways and ramps* of the same *building* and comply with the requirements in Section ~~1022.3.2.1~~ 1025.1 through ~~1022.3.2.3~~ 1025.4.

~~**1022.3.2.1**~~**1025.2 Construction and openings.** The floor~~, walls, and openings~~ of the *exit pathway* shall be constructed in accordance with Section 1024 for *exit passageways* ~~for a minimum horizontal distance of 10 feet from the edges of *exit pathway* and a minimum vertical distance of 10 feet from the floor of the *exit pathway*.~~ Fire resistance rating and opening protection shall extend horizontally not less than 10 feet from the edges of the exit pathway or to the perimeter of the building, whichever is less. Other portions of the building located within 10 feet of the exit pathway shall be separated from the exit pathway by fire-resistance rated construction in accordance with Section 1024 for exit passageways. This separation shall extend vertically from the floor of the exit pathway to a point 10 feet (3048 mm) above the exit pathway, or to the roof line, whichever is lower.

~~**1022.3.2.2**~~**1025.3 Location.** The *exit pathway* shall have a minimum *fire separation distance* of 10 feet (3048 mm) measured at right angles from the exterior edge of the *exit pathway,* to:

1. The closest interior *lot line*.
2. The centerline of a street, an alley, or *public way*.
3. An imaginary line between two *buildings* on the lot.

~~**1022.3.2.3**~~**1025.4 Path marking.** *Exit pathways* shall be delineated or marked to clearly indicate the path of travel, as approved by the *building official.*

1008.3 Illumination required by an emergency electrical system. An emergency electrical system shall be provided to automatically illuminate the following areas in the event of a power supply failure:

1. In rooms or spaces that require two or more exits or access to exits:
   1.1. *Aisles*.
   1.2. *Corridors*.
   1.3. *Exit access stairways* and *ramps*.

2. In *buildings* that require two or more exits or access to exits:
   2.1. Interior *exit access stairways* and *ramps*.
   2.2. Interior and *exterior exit stairways* and *ramps*.
   2.3 *Exit pathways*
   2.4. Exit passageways.
   2.5. Vestibules and areas on the level of discharge used for *exit discharge* in accordance with Section 1028.2.
   2.6. Exterior landings as required by Section 1010.1.5 for exit doorways that lead directly to the *exit discharge*.

3. In other rooms and spaces:
   3.1. Electrical equipment rooms.
   3.2. *Fire command centers*.
   3.3. Fire pump rooms.
   3.4. Generator rooms.
   3.5. Public restrooms with an area greater than 300 square feet (27.87 m^2).

2024 International Fire Code

EXIT PATHWAY. An exit component that serves to meet one or more means of egress design requirements and is open to sky and may or may not be open on one or both sides.

[BE] EXIT. That portion of a *means of egress* system between the *exit access* and the *exit discharge* or *public way*. Exit components include exterior exit doors at the *level of exit discharge*, *interior exit stairways* and *ramps*, *exit passageways*, exit pathways, *exterior exit stairways* and *ramps* and *horizontal exits*.

SECTION 1022
EXITS

[BE] 1022.1 General. *Exits* shall comply with Sections 1022 through ~~1027~~1028 and the applicable requirements of Sections 1003 through 1015. An *exit* shall not be used for any purpose that interferes with its function as a *means of egress*. Once a given level of exit protection is achieved, such level of protection shall not be reduced until arrival at the *exit discharge*.

1022.3 Exit continuity. Exits shall be continuous from the point of entry into the *exit* to the *exit discharge*. The path within *exits* is permitted to consist of any combination of *interior exit stairways*, *interior exit ramps*, *exit passageways*, *exit pathways*, *exterior exit stairways*, and *exterior exit ramps*.

[BE] 1022.3.1 Extension. Where an *exit passageway* is used to provide continuity of an *exit*, the *interior* or exterior *exit stairway* and *ramp* shall be separated from the *exit passageway* by a *fire barrier* constructed in accordance with Section 707 of the International Building Code or a *horizontal assembly* constructed in accordance with Section 711 of the International Building Code, or

both. The *fire-resistance rating* of the exit passageway shall be not less than that required for the *interior exit stairway* and *ramp*. A *fire door assembly* complying with Section 716 of the International Building Code shall be installed in the *fire barrier* to provide a *means of egress* from the *interior* or exterior *exit stairway* and *ramp* to the *exit passageway*. Openings in the *fire barrier* other than the *fire door assembly* are prohibited. Penetrations of the *fire barrier* are prohibited. **Exceptions:**

1. Penetrations of the *fire barrier* in accordance with Section 1023.5 shall be permitted.
2. Separation between an *interior exit stairway* or *ramp* and the *exit passageway* extension shall not be required where there are no openings into the *exit passageway* extension.
3. Separation between an *interior exit stairway* or *ramp* and the *exit passageway* extension shall not be required where the *interior exit stairway* and the *exit passageway* extension are pressurized in accordance with Section 909.20.4 of the International Building Code.

SECTION 1023
INTERIOR EXIT STAIRWAYS AND RAMPS

[BE] 1023.3 Termination. *Interior exit stairways* and *ramps* shall terminate at an *exit discharge* or a *public way*. **Exception:** A combination of *interior exit stairways, interior exit ramps*, ~~and~~ *exit passageways*, and *exit pathways* constructed in accordance with Sections 1022.3.1, 1023.2, ~~1023.3.1,~~ ~~and~~ 1024, and 1025 respectively, and forming a continuous protected enclosure, shall be permitted to extend an *interior exit stairway* or *ramp* to the *exit discharge* or a *public way*.

SECTION 1024
EXIT PASSAGEWAYS

[BE] 1024.5 Openings. *Exit passageway* opening protectives shall be in accordance with the requirements of Section 716 of the International Building Code.
Except as permitted in Section 402.8.7 of the International Building Code, openings in *exit passageways* other than unprotected exterior openings shall be limited to those necessary for *exit access* to the *exit passageway* from normally occupied spaces and for egress from the *exit passageway*.

Where an *interior exit stairway* or *ramp* is extended to an *exit discharge* or a *public way* by an *exit passageway*, the *exit passageway* shall comply with Section 1022.3.1.

Elevators shall not open into an *exit passageway*.

Add new text as follows:

SECTION 1025
EXIT PATHWAYS

Revise as follows:

~~**1022.3.2**~~**1025.1 ~~Exit pathways~~General.** *Exit pathways* shall be permitted to serve as an exit component in the *means of egress* system where they connect *interior* or *exterior exit stairways and ramps* of the same *building* and comply with the requirements in Section ~~1022.3.2.1~~ 1025.1 through ~~1022.3.2.3~~ 1025.4.

~~**1022.3.2.1**~~**1025.2 Construction and openings.** The floor~~, walls, and openings~~ of the *exit pathway* shall be constructed in accordance with Section 1024 for *exit passageways* ~~for a minimum horizontal distance of 10 feet from the edges of *exit pathway* and a minimum vertical distance of 10 feet from the floor of the *exit pathway*~~. Fire resistance rating and opening protection shall extend horizontally not less than 10 feet from the edges of the exit pathway or to the perimeter of the building, whichever is less. Other portions of the building

located within 10 feet of the exit pathway shall be separated from the exit pathway by fire-resistance rated construction in accordance with Section 1024 for exit passageways. This separation shall extend vertically from the floor of the exit pathway to a point 10 feet (3048 mm) above the exit pathway, or to the roof line, whichever is lower.

~~1022.3.2.2~~1025.3 **Location.** The exit pathway shall have a minimum fire separation distance of 10 feet (3048 mm) measured at right angles from the exterior edge of the exit pathway, to:

1. The closest interior lot line.
2. The centerline of a street, an alley, or public way.
3. An imaginary line between two buildings on the lot.

~~1022.3.2.3~~1025.4 **Path marking.** *Exit pathways* shall be delineated or marked to clearly indicate the path of travel, as approved by the building official.

[BE] 1008.3 Illumination required by an emergency electrical system. An emergency electrical system shall be provided to automatically illuminate the following areas in the event of a power supply failure:

1. In rooms or spaces that require two or more exits or access to exits:
   1.1. *Aisles*.
   1.2. *Corridors*.
   1.3. *Exit access stairways* and *ramps*.
2. In *buildings* that require two or more exits or access to exits:
   2.1. Interior *exit access stairways* and *ramps*.
   2.2. Interior and *exterior exit stairways* and *ramps*.
   2.3 Exit pathways
   2.4. Exit passageways.
   2.5. Vestibules and areas on the level of discharge used for *exit discharge* in accordance with Section 1028.2.
   2.6. Exterior landings as required by Section 1010.1.5 for exit doorways that lead directly to the *exit discharge*.
3. In other rooms and spaces:
   3.1. Electrical equipment rooms.
   3.2. *Fire command centers*.
   3.3. Fire pump rooms.
   3.4. Generator rooms.
   3.5. Public restrooms with an area greater than 300 square feet (27.87 m^2).

Reason: After reviewing the committee's vote of disapproval, we would like to clarify that the proposal's goal is to create a new exit component, the exit pathway, to allow a roof or similar outdoor surface to be used as part of a building's means of egress.

The proposal is based on the following assumptions:

- This is a new "exit" component and can be daisy-chained together with other exit components. It is **not** part of the "exit **discharge**". See Figure 3 below.
- The space open to sky next to and above a path that traverses a roof or other outdoor surface presents no fire hazard or smoke hazard because it is open.
- The lack of hazard in this pathway and its associated adjacent space creates protection equivalent to that of other exit components.

- The efficacy of the pathway and its associated adjacent space to protect path users is dependent on the width and height of both.
- It is protected from fire below by construction with a fire resistance rating equal to what is a required for an *exit passageway*. Where located too close to other portions of the building, fire rated walls meeting *exit passageway* requirements may be required.
- The concept of an *exit pathway* does not easily fit into any of the current *exit* component sections in Chapter 10. It most resembles an *exit passageway* but without a ceiling, and in some cases, walls.
- Many jurisdictions already approve this configuration using alternative means and methods.
- The code generally doesn't require the marking of or cordoning off of portions of the *means of egress* within buildings.

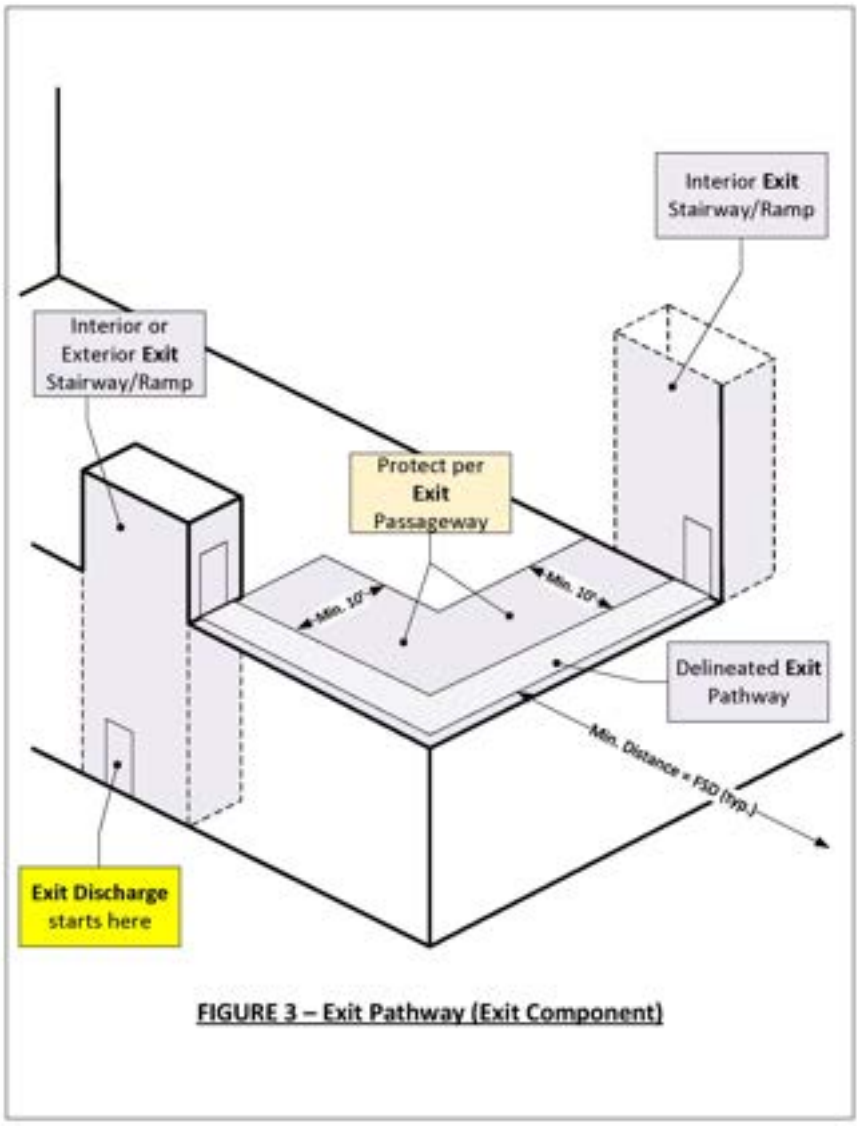

FIGURE 3 – Exit Pathway (Exit Component)

Response to Committee Concerns:

The requirements for exit pathways should be located in a separate Chapter 10 section: Agreed. We have removed this proposed language from 1022 Exits and created a new section **1025 Exit Pathways**.**Leaving a protected exit stairway and traversing an unprotected roof doesn't continue the protection of the exit stairway:** We disagree. What is the hazard posed by the open sky to people exiting a roof? No hazard is posed from an adjacent building if there is proper fire separation distance between the exit pathway and other buildings. There is also no hazard if adequate space is maintained between the pathway and rooftop structures, like photovoltaic panels and modules, and glazing materials, like skylights. Depending on the distance to other buildings and structures on the roof, there could be additional protection required in the form of walls, like *an exit passageway*. We are extending the fire resistive walls in the traditional sense, but the path is protected and safe because of the absence of a hazard. At a minimum, there will always be the protection afforded by the roof/ceiling assembly. See Figure 4. **This should be left to the alternative means and methods process.**

Yes, many jurisdictions do allow this, but lack of a nationwide standard results in inconsistent application of requirements for applicants and building officials alike, not to mention the additional headache and paperwork of the alternative means and methods process. If it can be allowed outright everyone wins.

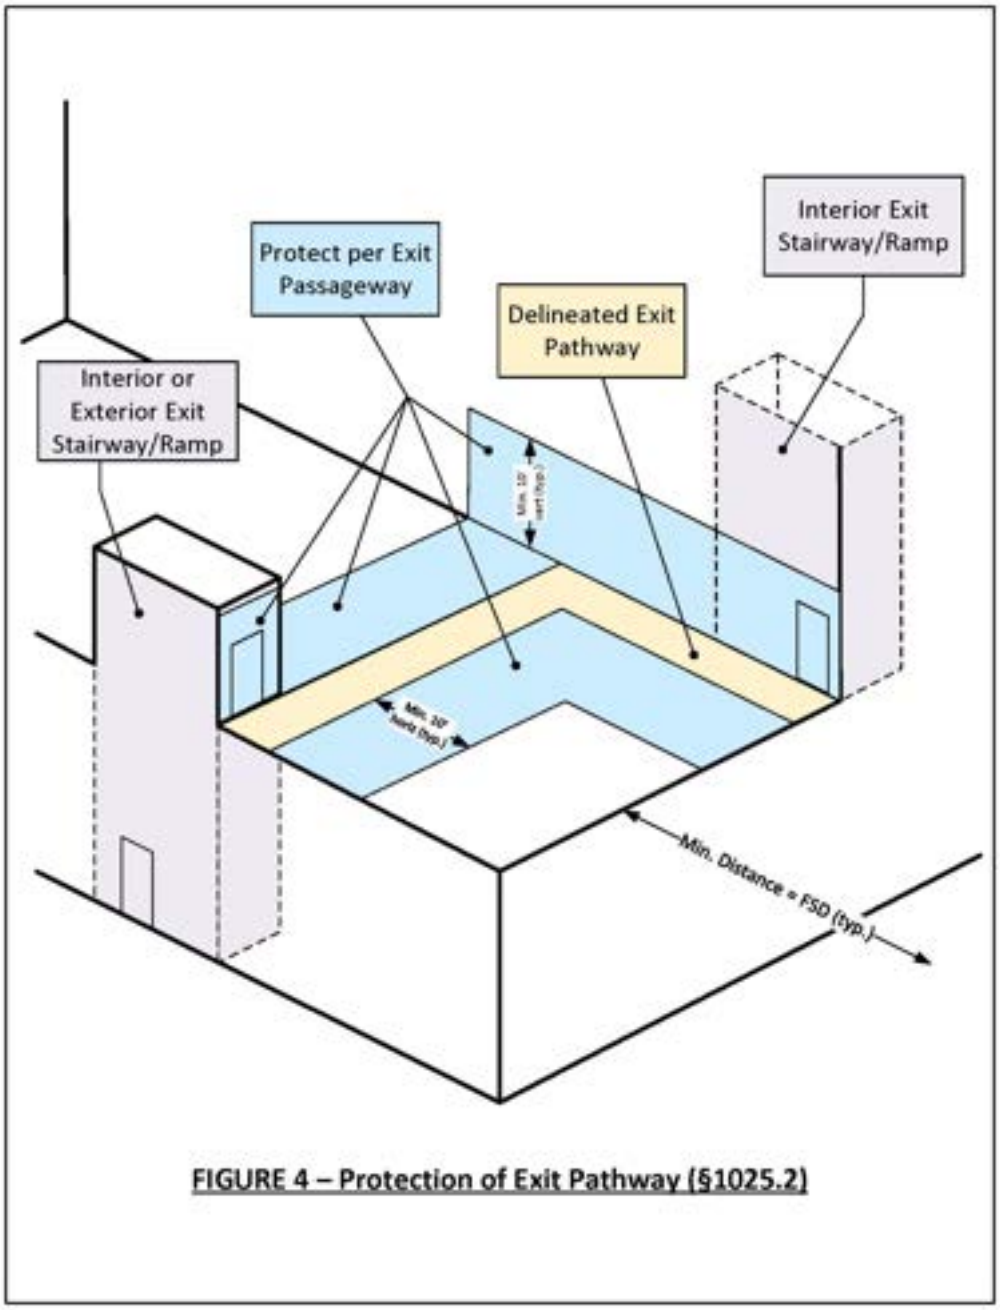

FIGURE 4 – Protection of Exit Pathway (§1025.2)

Stairway termination requirements in 1023.3 and 1023.3.3 need to be addressed/modified. This comment seems to be a misunderstanding of the original proposal and the portion of the building to which the change applies. The pathway connects two exit components, one of which terminates at the exit discharge. The most likely scenario is where an exit stair from one portion of the building connects to an exit pathway that transverses a roof which then connects to another exit stair that ends at the level of exit discharge. See Figure 1 in the reason statement for the original proposal.

Means of egress can only be used for means of egress. A painted walkway doesn't guarantee that the section of the roof the pathway is on will only be used for that purpose. Many other portions of the means of egress are unmarked and are not guaranteed for

their use either. Why would we penalize the *exit pathway* and no other portions of the *means of egress*?

Keeping the pathway clear needs to be addressed. Maintenance for the *means of egress* is addressed by the *International Fire Code* in Section 1031.3.

1031.3 Obstructions. A *means of egress* shall be free from obstructions that would prevent its use, including the accumulation of snow and ice."

Exterior exit stairways and ramps, as well as the *exit discharge*, are also subject to weather conditions, but there are no requirements to keep them clear, aside from the Fire Code. Why would we require an *exit pathway* to meet more stringent requirements than other portions of the *means of egress*? The code is mostly silent on this because of the drastic difference in outdoor conditions. The requirements for maintaining a reliable roof top *exit pathway* in Phoenix, AZ vary greatly from what may be needed in Minneapolis, Mn. Designers need flexibility to make decisions about what works for the client and the location.

The exit pathway is still subject to general means of egress requirements for the use of slip resistant materials and secure attachment.

Clarify what markings are required or provide something more substantial than a marked path. The delineation of an egress path is not required in other portions of the building. Other portions of the means of egress that are unmarked are not guaranteed to only be used for means of egress purposes either. Also, we don't require delineation of any kind of path for people using the roof as an amenity to direct them to the interior or exterior exit stairway. We are going the extra mile by requiring the delineation of the path.

No limits on other rooftop occupancies that might obstruct the MOE. Other portions of the building are not limited in the types of occupancies that can be adjacent to or served by a particular portion of the *means of egress*. Why should exit pathways be? Keeping chairs and other moveable items out of the means of egress is a maintenance issue.

No travel distance limits are provided for this element. Why should there be? There is no travel distance limitation for exit passageways because you are within the *exit* not in the *exit access. Exit pathways, just like exit passageways would* be considered protected portions of the building and are both exit components. A person using either one as part of an *exit* is not exposed to the same hazards as when they are in the *exit access* portion of a building.

This is not needed. You can already do this with horizontal exits. An *exit pathway* gives designers flexibility and is just another option to use instead of a *horizontal exit or exit passageway*. They all serve a similar purpose. *Horizontal exits* have their own constraints, such a requirement for standpipes on both ends of the passageway that a building designer or building owner may not want depending on the design

Cost Impact: Decrease

Estimated Immediate Cost Impact:

See original cost impact statement. No changes.

Estimated Immediate Cost Impact Justification (methodology and variables):

See original cost impact justification. No changes.

Proposed Change as Submitted

Proponents: Jeff Grove, Chair, Building Code Action Committee (BCAC) (bcac@iccsafe.org)

2024 International Building Code

Revise as follows:

1027.6 Exterior exit stairway and ramp protection. *Exterior exit stairways* and *ramps* shall be separated from the interior of the *building* as required in Section 1023.2. Openings shall be limited to those necessary for egress from normally occupied spaces. Where a vertical plane projecting from the edge of an *exterior exit stairway* or *ramp* and landings is exposed by other parts of the *building* at an angle of less than 180 degrees (3.14 rad), the *exterior wall* shall be rated in accordance with Section 1023.7. Where the exterior exit stairway is recessed into the building, the separation for the exterior exit stairway or ramp shall extend to the exterior walls. **Exceptions:**

1. Separation from the interior of the *building* is not required for occupancies, other than those in Group R-1 or R-2, in *buildings* that are not more than two *stories above grade plane* where a *level of exit discharge* serving such occupancies is the first *story above grade plane*.
2. Separation from the interior of the *building* is not required where the *exterior exit stairway* or *ramp* is served by an *exterior exit ramp* or balcony that connects two remote exterior exit *stairways* or other *approved exits* with a perimeter that is not less than 50 percent open. To be considered open, the opening shall be not less than 50 percent of the height of the enclosing wall, with the top of the openings not less than 7 feet (2134 mm) above the top of the balcony.
3. Separation from the *open-ended corridor* of the *building* is not required for *exterior exit stairways* or *ramps*, provided that Items 3.1 through 3.5 are met:
   3.1. The *building*, including *open-ended corridors*, and *stairways* and *ramps*, shall be equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or 903.3.1.2.
   3.2. The *open-ended corridors* comply with Section 1020.
   3.3. The *open-ended corridors* are connected on each end to an *exterior exit stairway* or *ramp* complying with Section 1027. At the location where the exterior exit stairway or ramp is open to an open-ended corridor, the separation from the interior of the building shall extend to the extent of the required landing.
   3.4. The *exterior walls* and openings adjacent to the *exterior exit stairway* or *ramp* comply with Section 1023.7.
   3.5. At any location in an open-ended *corridor* where a change of direction exceeding 45 degrees (0.79 rad) occurs, a clear opening of not less than 35 square feet (3.3 m^2) or an *exterior stairway* or *ramp* shall be provided. Where clear openings are provided, they shall be located so as to minimize the accumulation of smoke or *toxic* gases.
4. In Group R-3 occupancies not more than four *stories* in height, *exterior exit stairways* and *ramps* serving individual *dwelling units* are not required to be separated from the interior of the *building* where the *exterior exit stairway* or *ramp* discharges directly to grade.

2024 International Fire Code

Revise as follows:

[BE] 1027.6 Exterior exit stairway and ramp protection. *Exterior exit stairways* and *ramps* shall be separated from the interior of the building as required in Section 1023.2. Openings shall be limited to those necessary for egress from normally occupied spaces. Where a vertical plane projecting from the edge of an *exterior exit stairway* or *ramp* and landings is exposed by other parts of the building at an angle of less than 180 degrees (3.14 rad), the *exterior wall* shall be rated in accordance with Section 1023.7. Where the exterior exit stairway is recessed into the building, the separation for the exterior exit stairway or ramp shall extend to the exterior walls.

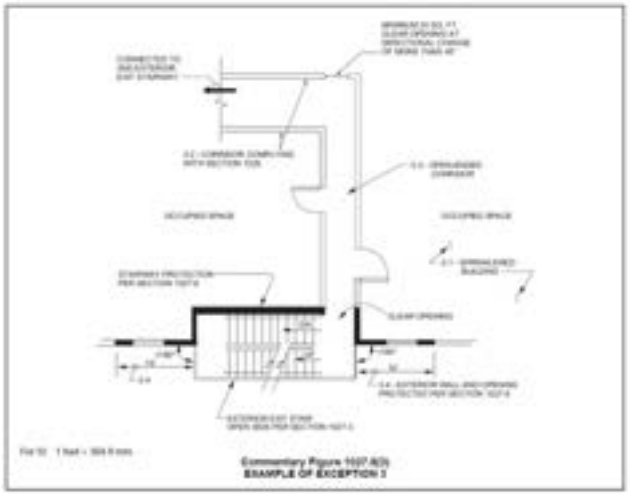
Exceptions:

1. Separation from the interior of the building is not required for occupancies, other than those in Group R-1 or R-2, in buildings that are not more than two stories above *grade plane* where a *level of exit discharge* serving such occupancies is the first story above *grade plane*.
2. Separation from the interior of the building is not required where the *exterior exit stairway* or *ramp* is served by an *exterior exit ramp* or balcony that connects two remote *exterior exit stairways* or other *approved exits*, with a perimeter that is not less than 50 percent open. To be considered open, the opening shall be not less than 50 percent of the height of the enclosing wall, with the top of the openings not less than 7 feet (2134 mm) above the top of the balcony.
3. Separation from the *open-ended corridor* of the building is not required for *exterior exit stairways* or *ramps*, provided that Items 3.1 through 3.5 are met:
   3.1. The building, including *open-ended corridors*, and *stairways* and *ramps*, shall be equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or 903.3.1.2.
   3.2. The *open-ended corridors* comply with Section 1020.
   3.3. The *open-ended corridors* are connected on each end to an *exterior exit stairway* or *ramp* complying with Section 1027. <u>At the location where the exterior exit stairway or ramp is open to an open-ended corridor, the separation from the interior of the building shall extend to the extent of the required landing.</u>
   3.4. The *exterior walls* and openings adjacent to the *exterior exit stairway* or *ramp* comply with Section 1023.7.
   3.5. At any location in an *open-ended corridor* where a change of direction exceeding 45 degrees (0.79 rad) occurs, a clear opening of not less than 35 square feet (3.3 m^2) or an exterior *stairway* or *ramp* shall be provided. Where clear openings are provided, they shall be located so as to minimize the accumulation of smoke or toxic gases.
4. In Group R-3 occupancies not more than four stories in height, *exterior exit stairways* and *ramps* serving individual *dwelling units* are not required to be separated from the interior of the building where the *exterior exit stairway* or *ramp* discharges directly to grade.

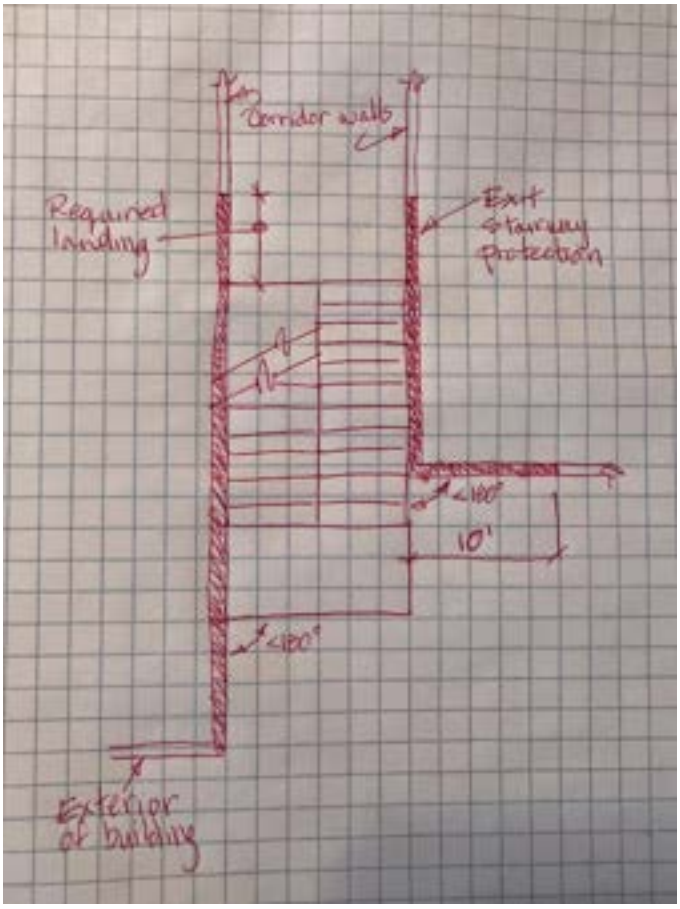
Reason: This proposal has two purposes:

1. Address the rating/separation requirements for exterior exit stairways that are open to a breezeway at the floor landings
2. To address where a stairway may be recessed into the footprint of the building.

There has been a misinterpretation that the walls on the open-ended corridor are exterior walls in accordance with Item 3.4 instead of the corridor in accordance with 3.2. This can lead to unnecessary ratings on the corridor walls. The added sentence in 3.3 clarifies this. The sentence added in the base paragraph is to address a situation where the exterior exit stairway is completely recessed into the building. It is not clear if the walls between the exterior exit stairway and the exterior of the building is an exterior wall. However, BCAC felt the stairway does need to be available for people to leave the building, so the protection needs to be available. The following is an existing figure in IBC Commentary.



The illustration below gives an orientation of a rotated stair that is partially within the building , illustrating where the rating would stop at the extent of the landing as well as illustrating how the requirement for the ten foot of exterior wall is required to be rated when less than 180 degrees.



This proposal is submitted by the ICC Building Code Action Committee (BCAC).
BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 the BCAC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the BCAC website at BCAC webpage.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is a clarification of existing provisions for exterior exit stairway configurations and fire-resistance ratings for the surrounding walls. There are no changes to construction requirements.

E107-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: There should be a limit to the distance for the the exterior wall length when the building is recessed. It needs to be more specific on the extent of the wall protection. Suggestion to remove "recessed" and find better wording. (Vote: 12-2)

E107-24

Replace as follows:

2024 International Building Code

1027.6 Exterior exit stairway and ramp protection. *Exterior exit stairways* and *ramps* shall be separated from the interior of the *building* as required in Section 1023.2. Openings shall be limited to those necessary for egress from normally occupied spaces. Where a vertical plane projecting from the edge of an *exterior exit stairway* or *ramp* and landings is exposed by other parts of the *building* at an angle of less than 180 degrees (3.14 rad), the *exterior wall* shall be rated in accordance with Section 1023.7. **Exceptions:**

1. Separation from the interior of the *building* is not required for occupancies, other than those in Group R-1 or R-2, in *buildings* that are not more than two *stories above grade plane* where a *level of exit discharge* serving such occupancies is the first *story above grade plane*.
2. Separation from the interior of the *building* is not required where the *exterior exit stairway* or *ramp* is served by an *exterior exit ramp* or balcony that connects two remote exterior exit *stairways* or other *approved exits* with a perimeter that is not less than 50 percent open. To be considered open, the opening shall be not less than 50 percent of the height of the enclosing wall, with the top of the openings not less than 7 feet (2134 mm) above the top of the balcony.

3. Separation from the *open-ended corridor* of the *building* is not required for *exterior exit stairways* or *ramps*, provided that Items 3.1 through 3.5 are met:

   3.1. The *building*, including *open-ended corridors*, and *stairways* and *ramps*, shall be equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or 903.3.1.2.

   3.2. The *open-ended corridors* comply with Section 1020.

   3.3. The *open-ended corridors* are connected on each end to an *exterior exit stairway* or *ramp* complying with Section 1027. At the location where the exterior exit stairway or ramp is open to an open-ended corridor, the separation from the interior of the building shall extend to the extent of the required landing.

   3.4. The *exterior walls* and openings adjacent to the *exterior exit stairway* or *ramp* comply with Section 1023.7.

   3.5. At any location in an open-ended *corridor* where a change of direction exceeding 45 degrees (0.79 rad) occurs, a clear opening of not less than 35 square feet (3.3 m^2) or an *exterior stairway* or *ramp* shall be provided. Where clear openings are provided, they shall be located so as to minimize the accumulation of smoke or *toxic* gases.

4. In Group R-3 occupancies not more than four *stories* in height, *exterior exit stairways* and *ramps* serving individual *dwelling units* are not required to be separated from the interior of the *building* where the *exterior exit stairway* or *ramp* discharges directly to grade.

2024 International Fire Code

[BE] 1027.6 Exterior exit stairway and ramp protection. *Exterior exit stairways* and *ramps* shall be separated from the interior of the building as required in Section 1023.2. Openings shall be limited to those necessary for egress from normally occupied spaces. Where a vertical plane projecting from the edge of an *exterior exit stairway* or *ramp* and landings is exposed by other parts of the building at an angle of less than 180 degrees (3.14 rad), the *exterior wall* shall be rated in accordance with Section 1023.7. **Exceptions:**

1. Separation from the interior of the building is not required for occupancies, other than those in Group R-1 or R-2, in buildings that are not more than two stories above *grade plane* where a *level of exit discharge* serving such occupancies is the first story above *grade plane*.
2. Separation from the interior of the building is not required where the *exterior exit stairway* or *ramp* is served by an *exterior exit ramp* or balcony that connects two remote *exterior exit stairways* or other *approved exits*, with a perimeter that is not less than 50 percent open. To be considered open, the opening shall be not less than 50 percent of the height of the enclosing wall, with the top of the openings not less than 7 feet (2134 mm) above the top of the balcony.
3. Separation from the *open-ended corridor* of the building is not required for *exterior exit stairways* or *ramps*, provided that Items 3.1 through 3.5 are met:

   3.1. The building, including *open-ended corridors*, and *stairways* and *ramps*, shall be equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or 903.3.1.2.

   3.2. The *open-ended corridors* comply with Section 1020.

   3.3. The *open-ended corridors* are connected on each end to an *exterior exit stairway* or *ramp* complying with Section 1027. At the location where the exterior exit stairway or ramp is open to an open-ended corridor, the separation from the interior of the building shall extend to the extent of the required landing.

   3.4. The *exterior walls* and openings adjacent to the *exterior exit stairway* or *ramp* comply with Section 1023.7.

   3.5. At any location in an *open-ended corridor* where a change of direction exceeding 45 degrees (0.79 rad) occurs, a clear opening of not less than 35 square feet (3.3 m^2) or an exterior *stairway* or *ramp* shall be provided. Where clear openings are provided, they shall be located so as to minimize the accumulation of smoke or toxic gases.

4. In Group R-3 occupancies not more than four stories in height, *exterior exit stairways* and *ramps* serving individual *dwelling units* are not required to be separated from the interior of the building where the *exterior exit stairway* or *ramp* discharges directly to grade.

Reason: This proposal has been split into two parts so that the two issues with exterior exit stairways can be addressed separately.The revision to Exception 3 address the rating/separation requirements for exterior exit stairways that are open to a breezeway at the floor landings

There has been a misinterpretation that the walls on the open-ended corridor are exterior walls in accordance with Item 3.4 instead of the corridor in accordance with 3.2. This can lead to unnecessary ratings on the corridor walls. The added sentence in 3.3 clarifies this. Where the stairway and the corridor/breezeway, the extent of the stairway protection is for the stairway landing. The corridor/breezeway is not an exterior wall that would require the rating to extend to 10 feet from the top of the stairway. See the reason statement for the original proposal for examples.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is a clarification of existing provisions for exterior exit stairway configurations and fire-resistance ratings for the surrounding walls. There are no changes to construction requirements.

Comment 2:

IBC: 1027.6; IFC: [BE] 1027.6

Proponents: Jeff Grove, Chair, Building Code Action Committee (BCAC) (bcac@iccsafe.org) requests As Modified by Committee (AMC2)

Replace as follows:

2024 International Building Code

Revise as follows:

1027.6 Exterior exit stairway and ramp protection. *Exterior exit stairways* and *ramps* shall be separated from the interior of the *building* as required in Section 1023.2. Openings shall be limited to those necessary for egress from normally occupied spaces. Where a vertical plane projecting from the edge of an *exterior exit stairway* or *ramp* and landings is exposed by other parts of the *building* at an angle of less than 180 degrees (3.14 rad), the *exterior wall* shall be rated in accordance with Section 1023.7. Where the exterior exit stairway is recessed into the building, for the purposes of this section, the path of travel at the level of exit discharge shall be considered an egress court and shall comply with Sections 1028 and 1029. **Exceptions:**

1. Separation from the interior of the *building* is not required for occupancies, other than those in Group R-1 or R-2, in *buildings* that are not more than two *stories above grade plane* where a *level of exit discharge* serving such occupancies is the first *story above grade plane*.
2. Separation from the interior of the *building* is not required where the *exterior exit stairway* or *ramp* is served by an *exterior exit ramp* or balcony that connects two remote exterior exit *stairways* or other *approved exits* with a perimeter that is not less than 50 percent open. To be considered open, the opening shall be not less than 50 percent of the height of the enclosing wall, with the top of the openings not less than 7 feet (2134 mm) above the top of the balcony.

3. Separation from the *open-ended corridor* of the building is not required for *exterior exit stairways* or *ramps*, provided that Items 3.1 through 3.5 are met:
    3.1. The *building*, including *open-ended corridors*, and *stairways* and *ramps*, shall be equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or 903.3.1.2.
    3.2. The *open-ended corridors* comply with Section 1020.
    3.3. The *open-ended corridors* are connected on each end to an *exterior exit stairway* or *ramp* complying with Section 1027.
    3.4. The *exterior walls* and openings adjacent to the *exterior exit stairway* or *ramp* comply with Section 1023.7.
    3.5. At any location in an open-ended *corridor* where a change of direction exceeding 45 degrees (0.79 rad) occurs, a clear opening of not less than 35 square feet (3.3 m^2) or an *exterior stairway* or *ramp* shall be provided. Where clear openings are provided, they shall be located so as to minimize the accumulation of smoke or *toxic* gases.
4. In Group R-3 occupancies not more than four *stories* in height, *exterior exit stairways* and *ramps* serving individual *dwelling units* are not required to be separated from the interior of the *building* where the *exterior exit stairway* or *ramp* discharges directly to grade.

2024 International Fire Code

Revise as follows:

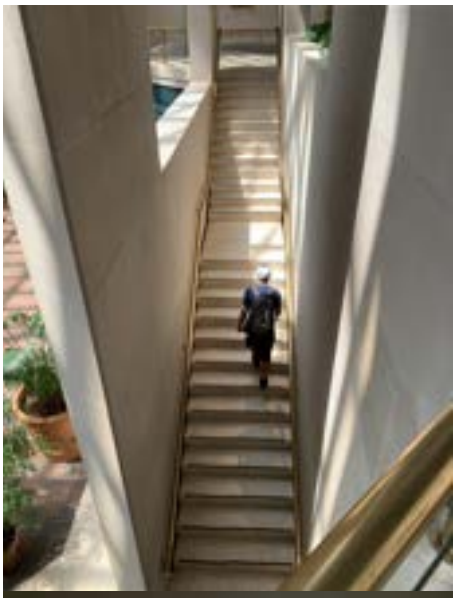
[BE] 1027.6 Exterior exit stairway and ramp protection. *Exterior exit stairways* and *ramps* shall be separated from the interior of the building as required in Section 1023.2. Openings shall be limited to those necessary for egress from normally occupied spaces. Where a vertical plane projecting from the edge of an *exterior exit stairway* or *ramp* and landings is exposed by other parts of the building at an angle of less than 180 degrees (3.14 rad), the *exterior wall* shall be rated in accordance with Section 1023.7. Where the exterior exit stairway is recessed into the building, for the purposes of this section, the path of travel at the level of exit discharge shall be considered an egress court and shall comply with Sections 1028 and 1029. **Exceptions:**

1. Separation from the interior of the building is not required for occupancies, other than those in Group R-1 or R-2, in buildings that are not more than two stories above *grade plane* where a *level of exit discharge* serving such occupancies is the first story above *grade plane*.
2. Separation from the interior of the building is not required where the *exterior exit stairway* or *ramp* is served by an *exterior exit ramp* or balcony that connects two remote *exterior exit stairways* or other *approved exits*, with a perimeter that is not less than 50 percent open. To be considered open, the opening shall be not less than 50 percent of the height of the enclosing wall, with the top of the openings not less than 7 feet (2134 mm) above the top of the balcony.
3. Separation from the *open-ended corridor* of the building is not required for *exterior exit stairways* or *ramps*, provided that Items 3.1 through 3.5 are met:
    3.1. The *building*, including *open-ended corridors*, and *stairways* and *ramps*, shall be equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or 903.3.1.2.
    3.2. The *open-ended corridors* comply with Section 1020.
    3.3. The *open-ended corridors* are connected on each end to an *exterior exit stairway* or *ramp* complying with Section 1027.
    3.4. The *exterior walls* and openings adjacent to the *exterior exit stairway* or *ramp* comply with Section 1023.7.
    3.5. At any location in an open-ended *corridor* where a change of direction exceeding 45 degrees (0.79 rad) occurs, a clear opening of not less than 35 square feet (3.3 m^2) or an *exterior stairway* or *ramp* shall be provided. Where clear openings are provided, they shall be located so as to minimize the accumulation of smoke or *toxic* gases.
4. In Group R-3 occupancies not more than four stories in height, *exterior exit stairways* and *ramps* serving individual *dwelling units* are not required to be separated from the interior of the building where the *exterior exit stairway* or *ramp* discharges directly to grade.

Reason: This proposal has been split into two parts so that the two issues with exterior exit stairways can be addressed separately.

This change is to address where a stairway may be recessed into the footprint of the building.

The modification is to address a situation where the exterior exit stairway is completely recessed into the building. The reference to exit discharge and exit court requirements will remind designers that protection is required where the path of travel is confined between when you leave the exterior exit stairway and the public way. Below are a couple of the exterior exit stairways we are attempting to address.



Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is a clarification of existing provisions for exterior exit stairway configurations and fire-resistance ratings for the surrounding walls. There are no changes to construction requirements.

Comment (CAH2)# 227

E110-24

IBC: 1028.2; IFC: [BE] 1028.2

Proposed Change as Submitted

Proponents: Jeffrey Grove, Coffman Engineers, Coffman Engineers (jeff.grove@coffman.com)

2024 International Building Code

Revise as follows:

1028.2 Exit discharge. *Exits* shall discharge directly to the exterior of the *building*. The *exit discharge* shall be at grade or shall provide a direct path of egress travel to grade. The *exit discharge* shall not reenter a *building*. The combined use of Exceptions 1 and 2 shall not exceed 50 percent of the number and minimum width or required capacity of the required *exits*. **Exceptions:**

1. Not more than 50 percent of the number and minimum width or required capacity of *interior exit stairways* and *ramps* is permitted to egress through areas, including *atriums*, on the level of discharge provided that all of the following conditions are met:
   1.1. Discharge of *interior exit stairways* and *ramps* shall be provided with a free and unobstructed path of travel to an exterior *exit* door and such *exit* is readily visible and identifiable by exit signage from the point of termination of the enclosure.
   1.2. The entire area of the *level of exit discharge* is separated from areas below by construction conforming to the *fire-resistance rating* for the enclosure.
   1.3. The egress path from the *interior exit stairway* and *ramp* on the *level of exit discharge* is protected throughout by an *approved automatic sprinkler system*. Portions of the *level of exit discharge* with access to the egress path shall be either equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1 or 903.3.1.2, or separated from the egress path in accordance with the requirements for the enclosure of *interior exit stairways* or *ramps*.
   1.4. Where a required *interior exit stairway* or *ramp* and an *exit access stairway* or *ramp* serve the same floor level and terminate at the same *level of exit discharge*, the termination of the *exit access stairway* or *ramp* and the *exit discharge* door of the *interior exit stairway* or *ramp* shall be separated by a distance of not less than 30 feet (9144 mm) or not less than one-fourth the length of the maximum overall diagonal dimension of the *building*, whichever is less. The distance shall be measured in a straight line between the *exit discharge* door from the *interior exit stairway* or *ramp* and the last tread of the *exit access stairway* or termination of slope of the *exit access ramp*.
2. Not more than 50 percent of the number and minimum width or required capacity of the *interior exit stairways* and *ramps* is permitted to egress through a vestibule provided that all of the following conditions are met:
   2.1. The entire area of the vestibule is separated from areas below by construction conforming to the *fire-resistance rating* of the *interior exit stairway* or *ramp enclosure*.
   2.2. The depth from the exterior of the *building* is not greater than 10 feet (3048 mm) and the length is not greater than 30 feet (9144 mm).
   2.3. The area is separated from the remainder of the *level of exit discharge* by a *fire partition* constructed in accordance with Section 708. **Exception:** The maximum transmitted temperature rise is not required.
   2.4. The area is used only for *means of egress* and *exits* directly to the outside.
3. *Horizontal exits* complying with Section 1026 shall not be required to discharge directly to the exterior of the *building*.

2024 International Fire Code

Revise as follows:

[BE] 1028.2 Exit discharge. *Exits* shall discharge directly to the exterior of the building. The *exit discharge* shall be at grade or shall provide a direct path of egress travel to grade. The *exit discharge* shall not reenter a building. The combined use of Exceptions 1 and 2 shall not exceed 50 percent of the number and minimum width or required capacity of the required *exits*. **Exceptions:**

1. Not more than 50 percent of the number and minimum width or required capacity of *interior exit stairways* and *ramps* is permitted to egress through areas, including atriums, on the *level of discharge* provided that all of the following conditions are met:
   1.1. Discharge of *interior exit stairways* and *ramps* shall be provided with a free and unobstructed path of travel to an exterior exit door and such *exit* is readily visible and identifiable by exit signage from the point of termination of the enclosure.
   1.2. The entire area of the *level of exit discharge* is separated from areas below by construction conforming to the *fire-resistance rating* for the enclosure.
   1.3. The egress path from the *interior exit stairway* and *ramp* on the *level of exit discharge* is protected throughout by an *approved automatic sprinkler system*. Portions of the *level of exit discharge* with access to the egress path shall either be equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1 or 903.3.1.2, or separated from the egress path in accordance with the requirements for the enclosure of *interior exit stairways* or *ramps*.
   1.4. Where a required *interior exit stairway* or *ramp* and an *exit access stairway* or *ramp* serve the same floor level and terminate at the same *level of exit discharge*, the termination of the *exit access stairway* or *ramp* and the exit discharge door of the *interior exit stairway* or *ramp* shall be separated by a distance of not less than 30 feet (9144 mm) or not less than one-fourth the length of the maximum overall diagonal dimension of the building, whichever is less. The distance shall be measured in a straight line between the exit discharge door from the *interior exit stairway* or *ramp* and the last tread of the *exit access stairway* or termination of slope of the *exit access ramp*.
2. Not more than 50 percent of the number and minimum width or required capacity of the *interior exit stairways* and *ramps* is permitted to egress through a vestibule provided that all of the following conditions are met:
   2.1. The entire area of the vestibule is separated from areas below by construction conforming to the *fire-resistance rating* of the *interior exit stairway* or *ramp* enclosure.
   2.2. The depth from the exterior of the building is not greater than 10 feet (3048 mm) and the length is not greater than 30 feet (9144 mm).
   2.3. The area is separated from the remainder of the *level of exit discharge* by a *fire partition* constructed in accordance with Section 708 of the International Building Code. **Exception:** The maximum transmitted temperature rise is not required.
   2.4. The area is used only for *means of egress* and *exits* directly to the outside.
3. *Horizontal exits* complying with Section 1026 shall not be required to discharge directly to the exterior of the building.

Reason: Through the 2015 editions of both the IBC and NFPA 101, Life Safety Code, these two codes were consistent in their language and interpretation regarding exit discharge of interior exit stairways and ramps through areas of the building on the level of exit discharge. The 2018 edition of NFPA 101 included an amendment to Section 7.7.2(3) that clarified the intent of the code to permit the use of exit signage to direct occupants discharging from an exit enclosure to the nearest exterior exit door:

> *"The interior exit discharge shall lead to a free and unobstructed way to the exterior of the building, and such way shall be readily apparent or shall be identifiable by exit signage from the point of discharge from the exit."*

The 2018 IBC and subsequent 2021 and 2024 editions have lagged behind NFPA 101 and have not yet amended Section 1028.2 Exception 1.1 to provide this clarification.

This proposal will clarify that exit signage is permitted to be used for this purpose and will remove the common misconception that an exterior exit discharge must be visible from the point of exit enclosure termination. The proposal will also bring the IBC back into alignment with NFPA on this issue, as had long been the case until 2018.

Bibliography: NFPA 101, Life Safety Code

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposed text clarifies the original intent to allow utilization of exit signage to achieve interior exit stairway discharge through areas of the building on the level of exit discharge. The exit signage required for this purpose would already be required by Section 1013.1 and thus adds no cost."

E110-24

Public Hearing Results (CAH1)

Committee Action: **As Submitted**

Committee Reason: This will help identify requirements for lobby exit options for how to determine "readily visible and identifiable". If someone used this exception, this would over ride the exception for lobby entrances to not have exits signs in Section 1013.1. (Vote: 13-0)

E110-24

Individual Consideration Agenda

Comment 1:

IBC: 1028.2; IFC: [BE] 1028.2

Proponents: Jeffrey Grove, Coffman Engineers, Coffman Engineers (jeff.grove@coffman.com) requests As Modified by Committee (AMC2)

Further modify as follows:

2024 International Building Code

1028.2 Exit discharge. *Exits* shall discharge directly to the exterior of the *building*. The *exit discharge* shall be at grade or shall provide a direct path of egress travel to grade. The *exit discharge* shall not reenter a *building*. The combined use of Exceptions 1 and 2 shall not exceed 50 percent of the number and minimum width or required capacity of the required *exits*. **Exceptions:**

1. Not more than 50 percent of the number and minimum width or required capacity of *interior exit stairways* and *ramps* is permitted to egress through areas, including *atriums*, on the level of discharge provided that all of the following conditions are met:

   1.1. Discharge of *interior exit stairways* and *ramps* shall be provided with a free and unobstructed path of travel to an exterior *exit* door and such *exit* is readily visible ~~and~~ or identifiable by exit signage from the point of termination of the enclosure.

   1.2. The entire area of the *level of exit discharge* is separated from areas below by construction conforming to the *fire-resistance rating* for the enclosure.

   1.3. The egress path from the *interior exit stairway* and *ramp* on the *level of exit discharge* is protected throughout by an *approved automatic sprinkler system*. Portions of the *level of exit discharge* with access to the egress path shall be either equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1 or 903.3.1.2, or separated from the egress path in accordance with the requirements for the enclosure of *interior exit stairways* or *ramps*.

   1.4. Where a required *interior exit stairway* or *ramp* and an *exit access stairway* or *ramp* serve the same floor level and terminate at the same *level of exit discharge*, the termination of the *exit access stairway* or *ramp* and the *exit discharge* door of the *interior exit stairway* or *ramp* shall be separated by a distance of not less than 30 feet (9144 mm) or not less than one-fourth the length of the maximum overall diagonal dimension of the *building*, whichever is less. The distance shall be measured in a straight line between the *exit discharge* door from the *interior exit stairway* or *ramp* and the last tread of the *exit access stairway* or termination of slope of the *exit access ramp*.

2. Not more than 50 percent of the number and minimum width or required capacity of the *interior exit stairways* and *ramps* is permitted to egress through a vestibule provided that all of the following conditions are met:

   2.1. The entire area of the vestibule is separated from areas below by construction conforming to the *fire-resistance rating* of the *interior exit stairway* or *ramp enclosure*.

   2.2. The depth from the exterior of the *building* is not greater than 10 feet (3048 mm) and the length is not greater than 30 feet (9144 mm).

   2.3. The area is separated from the remainder of the *level of exit discharge* by a *fire partition* constructed in accordance with Section 708. **Exception:** The maximum transmitted temperature rise is not required.

   2.4. The area is used only for *means of egress* and *exits* directly to the outside.

3. *Horizontal exits* complying with Section 1026 shall not be required to discharge directly to the exterior of the *building*.

2024 International Fire Code

[BE] 1028.2 Exit discharge. *Exits* shall discharge directly to the exterior of the building. The *exit discharge* shall be at grade or shall provide a direct path of egress travel to grade. The *exit discharge* shall not reenter a building. The combined use of Exceptions 1 and 2 shall not exceed 50 percent of the number and minimum width or required capacity of the required *exits*. **Exceptions:**

1. Not more than 50 percent of the number and minimum width or required capacity of *interior exit stairways* and *ramps* is permitted to egress through areas, including atriums, on the *level of discharge* provided that all of the following conditions are met:
   1.1. Discharge of *interior exit stairways* and *ramps* shall be provided with a free and unobstructed path of travel to an exterior exit door and such *exit* is readily visible ~~and~~ or identifiable by exit signage from the point of termination of the enclosure.
   1.2. The entire area of the *level of exit discharge* is separated from areas below by construction conforming to the *fire-resistance rating* for the enclosure.
   1.3. The egress path from the *interior exit stairway* and *ramp* on the *level of exit discharge* is protected throughout by an *approved automatic sprinkler system*. Portions of the *level of exit discharge* with access to the egress path shall either be equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1 or 903.3.1.2, or separated from the egress path in accordance with the requirements for the enclosure of *interior exit stairways* or *ramps*.
   1.4. Where a required *interior exit stairway* or *ramp* and an *exit access stairway* or *ramp* serve the same floor level and terminate at the same *level of exit discharge*, the termination of the *exit access stairway* or *ramp* and the exit discharge door of the *interior exit stairway* or *ramp* shall be separated by a distance of not less than 30 feet (9144 mm) or not less than one-fourth the length of the maximum overall diagonal dimension of the building, whichever is less. The distance shall be measured in a straight line between the exit discharge door from the *interior exit stairway* or *ramp* and the last tread of the *exit access stairway* or termination of slope of the *exit access ramp*.

2. Not more than 50 percent of the number and minimum width or required capacity of the *interior exit stairways* and *ramps* is permitted to egress through a vestibule provided that all of the following conditions are met:
   2.1. The entire area of the vestibule is separated from areas below by construction conforming to the *fire-resistance rating* of the *interior exit stairway* or *ramp* enclosure.
   2.2. The depth from the exterior of the building is not greater than 10 feet (3048 mm) and the length is not greater than 30 feet (9144 mm).
   2.3. The area is separated from the remainder of the *level of exit discharge* by a *fire partition* constructed in accordance with Section 708 of the International Building Code. **Exception:** The maximum transmitted temperature rise is not required.
   2.4. The area is used only for *means of egress* and *exits* directly to the outside.

3. *Horizontal exits* complying with Section 1026 shall not be required to discharge directly to the exterior of the building.

Reason: This modification will revise the word “and” to “or” to clarify that Section 1028.1 Exception 1.1 does not require exit signage. Rather, exit signage is one option to meet this exception – the other option is for the exterior exit door to be readily visible. Exit signage may or may not be required based on IBC 1013.1 and its exceptions.

Additionally, the use of the word “or” will bring this code language further into alignment with the corresponding language of NFPA 101 (as outlined in the reason statement for the original E110-24 proposal).

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Cost impact remains unchanged from the original code change proposal.

Comment (CAH2)# 766

Comment 2:

Proponents: Gabriel Levy, incandescence life safety, inc, Colorado Chapter Code Development Committee (glevy@incandescencels.com); Richard Williams, Washington Association of Building Officials Technical Code Development Committee (richard@cwaconsultants.net); Micah Chappell, Seattle Department of Construction and Inspections, Washington Association of Building Officials Technical Code Development Committee (micah.chappell@seattle.gov) requests Disapproved

Reason: LEVY: E110-24 was written and approved such that its interpretation by the approving committee is opposite the intent of the author. The proponent of E110 reasons that the "intent of the code [is] to permit the use of exit signage to direct occupants discharging from an exit enclosure to the nearest exterior exit door... This proposal will clarify that exit signage is permitted to be used for this purpose and will remove the common misconception that an exterior exit discharge must be visible from the point of exit enclosure termination." The author intended for directional wayfinding to be acceptable along the path of stair discharge - that is, direct line of sight to an exterior exit door should not be required so long as the path is marked by exit signs. The change was intended to create a leniency for stair discharge and allow for longer and more complicated discharge travel paths than what is currently permitted.

The committee approved this submittal, but for reasons unintended by the proponent. The recorded committee reason is that "If someone used this exception, this would override the exception for lobby entrances to not have exits signs in Section 1013.1." This interpretation was possibly overlooked by the original author. A buildings main exit often does not require exit signage. However, with the proposed change, discharge through a lobby requires the exterior exit door to have exit signage. Additionally, the exit signage required for the stair discharge is tied to the exterior exit door. In the E110 reason statement, the referenced NFPA 101 sections require that the exit signage is required along the path of travel. However, E110 was written in such a way that the exit signage to at the exterior exit door rather than along the path. Ultimately, this proposal was approved as a more stringent requirement than what the IBC previously required, such that the main exit's exit sign exception would not be permitted if a stair discharged through the space.This CAH2 comment proposes to overturn committee action and disapprove of E110 because of the unintended consequence. The additional exit signage required by this change is unnecessary and unjustified. There is no identifiable need or loss history correlated to an exit signs presence (or lack of) at a building's "main" exit after stair discharge. By approving this code modification, we create redundant requirements and further limit building design options unnecessarily. Furthermore, the additional exit sign has an inherent cost increase - something that was not accounted for in the author's proposal or in testimony.

WILLIAMS/CHAPPELL: During the Committee Action Hearing, the proponent stated the purpose for this proposal was to align discharge provisions with NFPA 101, but the reason why this was necessary was not explained, since there are currently many differences between the two codes. In fact, E110 would still result in a difference between the IBC and NFPA because the corresponding NFPA section allows for the exit to be readily apparent OR identifiable by exit signage. E110 states the exit shall be readily visible AND identifiable by exit signage. The proponent acknowledged that NFPA language could be interpreted to be less restrictive than the IBC but that they were trying to go to another recognized standard that also addresses egress. It is not clear to us what was meant by this.

We don’t necessarily have a problem with adding a greater requirement for exit signage for this door, even though there are situations where it could be more restrictive than current code requirements specified per IBC Section 1013.1 exception 2. This was pointed out by a committee member during the testimony. The problem we have is that this language can be read two different ways. First, it can be interpreted as having two separate requirements: A) to provide an exit that is readily visible and B) for that exit to be identifiable by exit signage. That is how it currently reads (except for the additional requirement for exit signage) and based on committee reason statements, this seems to be the way many of them read and understood this. However, this can also be read as one requirement for the exit sign to be readily visible and identifiable. Exit signage would be the sole control, meaning the exterior exit door would not be required to be readily visible when leaving the exit enclosure. This reading appears to align more closely with the proponent’s intent per the reason statement, as compared to the committee’s reason statement.

As currently adopted, this first exception for Section 1028.2 is very limited in what it allows, and it is that way for a reason. In all other situations, the stair must discharge to the outside of the building, or it must be extended to the outside of the building with an exit passageway. We are opposed to this proposal because if read to allow for the exit signage to be the control, it would allow for the exit discharge to be extended indefinitely inside the building as long as signage is provided. This could create a situation that allows for a path from the stair to the exterior of the building that is similar to an exit passageway but is not protected like one. During their testimony one of the proponents stated that distance is not an issue because you are in an area of the building where the greatest distance you could ever have from the stair door to the outside door would be the exit access travel distance. This is not correct since travel distance is satisfied once access is gained into the stair enclosure. When the occupant leaves the interior exit stairway, they are in the exit

discharge, not the exit access. We feel this proposal should be disapproved and this section should be left as it is currently written.

Cost Impact: No change to code.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Comment (CAH2)# 441

E111-24

IBC: 1028.2; IFC: [BE] 1028.2

Proposed Change as Submitted

Proponents: Ali Fattah, City of San Diego Development Services Department, San Diego Area Chapter of ICC (afattah@sandiego.gov)

2024 International Building Code

Revise as follows:

1028.2 Exit discharge. *Exits* shall discharge directly to the exterior of the *building*. The *exit discharge* shall be at grade or shall provide a direct path of egress travel to grade. The *exit discharge* shall not reenter a *building*. The combined use of Exceptions 1 and 2 shall not exceed 50 percent of the number and minimum width or required capacity of the required *exits*. **Exceptions:**

1. Not more than 50 percent of the number and minimum width or required capacity of *interior exit stairways* and *ramps* is permitted to egress through areas, including *atriums*, on the level of discharge provided that all of the following conditions are met:
   1.1. Discharge of *interior exit stairways* and *ramps* shall be provided with a free and unobstructed path of travel to an exterior *exit* door and such *exit* is readily visible and identifiable from the point of termination of the enclosure.
   1.2. The entire ~~area~~ story of the *level of exit discharge* is separated from ~~areas~~ stories below by construction conforming to the *fire-resistance rating* for the enclosure.
   1.3. The egress path from the *interior exit stairway* and *ramp* on the *level of exit discharge* is protected throughout by an *approved automatic sprinkler system* . Portions of the *level of exit discharge* with access to the egress path shall be either equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1 or 903.3.1.2, or separated from the egress path in accordance with the requirements for the enclosure of *interior exit stairways* or *ramps.*
   1.4. Where a required *interior exit stairway* or *ramp* and an *exit access stairway* or *ramp* serve the same floor level and terminate at the same *level of exit discharge*, the termination of the *exit access stairway* or *ramp* and the *exit discharge* door of the *interior exit stairway* or *ramp* shall be separated by a distance of not less than 30 feet (9144 mm) or not less than one-fourth the length of the maximum overall diagonal dimension of the *building*, whichever is less. The distance shall be measured in a straight line between the *exit discharge* door from the *interior exit stairway* or *ramp* and the last tread of the *exit access stairway* or termination of slope of the *exit access ramp*.
2. Not more than 50 percent of the number and minimum width or required capacity of the *interior exit stairways* and *ramps* is permitted to egress through a vestibule provided that all of the following conditions are met:
   2.1. The entire area of the vestibule is separated from areas below by construction conforming to the *fire-resistance rating* of the *interior exit stairway* or *ramp enclosure*.
   2.2. The depth from the exterior of the *building* is not greater than 10 feet (3048 mm) and the length is not greater than 30 feet (9144 mm).
   2.3. The area is separated from the remainder of the *level of exit discharge* by a *fire partition* constructed in accordance with Section 708. **Exception:** The maximum transmitted temperature rise is not required.
   2.4. The area is used only for *means of egress* and *exits* directly to the outside.
3. *Horizontal exits* complying with Section 1026 shall not be required to discharge directly to the exterior of the *building*.

2024 International Fire Code

Revise as follows:

[BE] 1028.2 Exit discharge. *Exits* shall discharge directly to the exterior of the building. The *exit discharge* shall be at grade or shall provide a direct path of egress travel to grade. The *exit discharge* shall not reenter a building. The combined use of Exceptions 1 and 2 shall not exceed 50 percent of the number and minimum width or required capacity of the required *exits*. **Exceptions:**

1. Not more than 50 percent of the number and minimum width or required capacity of *interior exit stairways* and *ramps* is permitted to egress through areas, including atriums, on the *level of discharge* provided that all of the following conditions are met:
   1.1. Discharge of *interior exit stairways* and *ramps* shall be provided with a free and unobstructed path of travel to an exterior exit door and such *exit* is readily visible and identifiable from the point of termination of the enclosure.
   1.2. The entire ~~area~~ story of the *level of exit discharge* is separated from ~~areas~~ stories below by construction conforming to the *fire-resistance rating* for the enclosure.
   1.3. The egress path from the *interior exit stairway* and *ramp* on the *level of exit discharge* is protected throughout by an *approved automatic sprinkler system* . Portions of the *level of exit discharge* with access to the egress path shall be either equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1 or 903.3.1.2, or separated from the egress path in accordance with the requirements for the enclosure of *interior exit stairways* or *ramps.*
   1.4. Where a required *interior exit stairway* or *ramp* and an *exit access stairway* or *ramp* serve the same floor level and terminate at the same *level of exit discharge*, the termination of the *exit access stairway* or *ramp* and the exit discharge door of the *interior exit stairway* or *ramp* shall be separated by a distance of not less than 30 feet (9144 mm) or not less than one-fourth the length of the maximum overall diagonal dimension of the building, whichever is less. The distance shall be measured in a straight line between the exit discharge door from the *interior exit stairway* or *ramp* and the last tread of the *exit access stairway* or termination of slope of the *exit access ramp*.
2. Not more than 50 percent of the number and minimum width or required capacity of the *interior exit stairways* and *ramps* is permitted to egress through a vestibule provided that all of the following conditions are met:
   2.1. The entire area of the vestibule is separated from areas below by construction conforming to the *fire-resistance rating* of the *interior exit stairway* or *ramp* enclosure.
   2.2. The depth from the exterior of the building is not greater than 10 feet (3048 mm) and the length is not greater than 30 feet (9144 mm).
   2.3. The area is separated from the remainder of the *level of exit discharge* by a *fire partition* constructed in accordance with Section 708 of the International Building Code. **Exception:** The maximum transmitted temperature rise is not required.
   2.4. The area is used only for *means of egress* and *exits* directly to the outside.
3. *Horizontal exits* complying with Section 1026 shall not be required to discharge directly to the exterior of the building.

Reason: This is an editorial code change that helps make code application of the requirements more consistent. Interior exit stairway protection terminates at horizontal exits and exterior exit doorways, or the stairway is extended to exterior exit doorways with exit passageways.

As written the IBC uses the undefined term area that some code users interpret to be the portion of the story at the level of exit discharge used to access the exterior exit doorways. Other code users interpret the requirement to apply to the entire story.

The latter interpretation is consistent with the IBC's philosophy that the level of protection along an egress path is not reduced and that the exceptions should be equivalent. Exit passageways, shaft enclosures protecting interior exit stairways and horizontal exits provide protection from the entire story. Additionally, fire sprinkler protection should be throughout the story since the stairway protection protects the stairway from the entire story.

When extended with an exit passageway the path of egress is defined and the protection has a top and sides and a bottom. As a consequence, at a minimum when exception 1.3 is applied the floor between the fire barriers should be fire resistance rated and when the fire sprinkler tradeoff is selected the entire floor above the story below should be protected. Most of the cases we have seen were when the entire story is protected with fire sprinklers.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

The increased cost of spray fireproofing between IIB and IIA construction is approximately $11 per sq ft. Between IB and IA, it is similar.

Estimated Immediate Cost Impact Justification (methodology and variables):

The cost was determined by analyzing the ICC Building Valuation Table and determining average variations across types of construction and occupancies for Type II and Type I.

E111-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: This proposal was disapproved. It is not necessary to protect the entire floor where the intent is to protect the area where occupants are discharging. Protecting stories below would include protecting the entire supporting elements and would be a high cost for minimal benefits. Adding "stories" would not address crawl spaces or other areas below that are not a true story. (Vote: 13-0)

E111-24

Individual Consideration Agenda

Comment 1:

IBC: 1028.2; IFC: [BE] 1028.2

Proponents: Ali Fattah, City of San Diego Development Services Department, San Diego Area Chapter of ICC (afattah@sandiego.gov) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

1028.2 Exit discharge. *Exits* shall discharge directly to the exterior of the *building*. The *exit discharge* shall be at grade or shall provide a direct path of egress travel to grade. The *exit discharge* shall not reenter a *building*. The combined use of Exceptions 1 and 2 shall not exceed 50 percent of the number and minimum width or required capacity of the required *exits*. **Exceptions:**

1. Not more than 50 percent of the number and minimum width or required capacity of *interior exit stairways* and *ramps* is permitted to egress through areas, including *atriums*, on the level of discharge provided that all of the following conditions are met:
   1.1. Discharge of *interior exit stairways* and *ramps* shall be provided with a free and unobstructed path of travel to an exterior *exit* door and such *exit* is readily visible and identifiable from the point of termination of the enclosure.
   1.2. The entire story of the *level of exit discharge* is separated from stories or usable areas below by construction conforming to the *fire-resistance rating* for the enclosure.
   1.3. The egress path from the *interior exit stairway* and *ramp* on the *level of exit discharge* is protected throughout by an *approved automatic sprinkler system* . Portions of the *level of exit discharge* with access to the egress path shall be either equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1 or 903.3.1.2, or separated from the egress path in accordance with the requirements for the enclosure of *interior exit stairways* or *ramps.*
   1.4. Where a required *interior exit stairway* or *ramp* and an *exit access stairway* or *ramp* serve the same floor level and terminate at the same *level of exit discharge*, the termination of the *exit access stairway* or *ramp* and the *exit discharge* door of the *interior exit stairway* or *ramp* shall be separated by a distance of not less than 30 feet (9144 mm) or not less than one-fourth the length of the maximum overall diagonal dimension of the *building*, whichever is less. The distance shall be measured in a straight line between the *exit discharge* door from the *interior exit stairway* or *ramp* and the last tread of the *exit access stairway* or termination of slope of the *exit access ramp*.
2. Not more than 50 percent of the number and minimum width or required capacity of the *interior exit stairways* and *ramps* is permitted to egress through a vestibule provided that all of the following conditions are met:
   2.1. The entire area of the vestibule is separated from areas below by construction conforming to the *fire-resistance rating* of the *interior exit stairway* or *ramp enclosure*.
   2.2. The depth from the exterior of the *building* is not greater than 10 feet (3048 mm) and the length is not greater than 30 feet (9144 mm).
   2.3. The area is separated from the remainder of the *level of exit discharge* by a *fire partition* constructed in accordance with Section 708. **Exception:** The maximum transmitted temperature rise is not required.
   2.4. The area is used only for *means of egress* and *exits* directly to the outside.
3. *Horizontal exits* complying with Section 1026 shall not be required to discharge directly to the exterior of the *building*.

2024 International Fire Code

[BE] 1028.2 Exit discharge. *Exits* shall discharge directly to the exterior of the building. The *exit discharge* shall be at grade or shall

provide a direct path of egress travel to grade. The *exit discharge* shall not reenter a building. The combined use of Exceptions 1 and 2 shall not exceed 50 percent of the number and minimum width or required capacity of the required *exits*. **Exceptions:**

1. Not more than 50 percent of the number and minimum width or required capacity of *interior exit stairways* and *ramps* is permitted to egress through areas, including atriums, on the *level of discharge* provided that all of the following conditions are met:
   1.1. Discharge of *interior exit stairways* and *ramps* shall be provided with a free and unobstructed path of travel to an exterior exit door and such *exit* is readily visible and identifiable from the point of termination of the enclosure.
   1.2. The entire story of the *level of exit discharge* is separated from stories or usable areas below by construction conforming to the *fire-resistance rating* for the enclosure.
   1.3. The egress path from the *interior exit stairway* and *ramp* on the *level of exit discharge* is protected throughout by an *approved automatic sprinkler system* . Portions of the *level of exit discharge* with access to the egress path shall be either equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1 or 903.3.1.2, or separated from the egress path in accordance with the requirements for the enclosure of *interior exit stairways* or *ramps.*
   1.4. Where a required *interior exit stairway* or *ramp* and an *exit access stairway* or *ramp* serve the same floor level and terminate at the same *level of exit discharge*, the termination of the *exit access stairway* or *ramp* and the exit discharge door of the *interior exit stairway* or *ramp* shall be separated by a distance of not less than 30 feet (9144 mm) or not less than one-fourth the length of the maximum overall diagonal dimension of the building, whichever is less. The distance shall be measured in a straight line between the exit discharge door from the *interior exit stairway* or *ramp* and the last tread of the *exit access stairway* or termination of slope of the *exit access ramp*.

2. Not more than 50 percent of the number and minimum width or required capacity of the *interior exit stairways* and *ramps* is permitted to egress through a vestibule provided that all of the following conditions are met:
   2.1. The entire area of the vestibule is separated from areas below by construction conforming to the *fire-resistance rating* of the *interior exit stairway* or *ramp* enclosure.
   2.2. The depth from the exterior of the building is not greater than 10 feet (3048 mm) and the length is not greater than 30 feet (9144 mm).
   2.3. The area is separated from the remainder of the *level of exit discharge* by a *fire partition* constructed in accordance with Section 708 of the International Building Code. **Exception:** The maximum transmitted temperature rise is not required.
   2.4. The area is used only for *means of egress* and *exits* directly to the outside.

3. *Horizontal exits* complying with Section 1026 shall not be required to discharge directly to the exterior of the building.

Reason: The Means of Egress Committee did not approve the original code change since a speaker in opposition observed that the exiting code would not address usable underfloor areas that also need to be separated from the egress path. The added text was adapted from footnote (n) to Table 721.1 (3) of the IBC, where roof ceiling and floor-ceiling assemblies can omit a portion of the assembly above or below when the area above or below is not usable. The proposal separates the level of exit discharge from the stories and usable areas below since the exception allows the egress path from the exit not to be defined as it would be with an exit passageway that would fully encapsulate the egress path.

The committee comments that the proposed code change is excessive because protecting supporting construction would add unnecessary costs is reasonable; however, Section 712.3 requires protection of the horizontal assembly to remain in place for the fire resistance rating. If permanent construction is not required to define the egress path, it would be difficult to define the extent of the partially protected floor insofar as the proposed code change is concerned. In proponent's experience, partially protected buildings are difficult to enforce.

A further reason for the code change is that the actual path is not defined by construction alterations of the level exit discharge over the life of the building. This may result in a modified egress path being located or areas not being protected. This would be a difficult item to determine in plan check and inspection. The scope of exceptions should be the same as the scope of the base code requirement, which is that exits terminate at the exit discharge by extending the interior exit enclosure or terminating it at an exterior exit doorway. The egress path would be at the exterior or fully encapsulated on both sides, above and below, and the supporting construction fully protected for the full span of the supporting construction.

The proponent requests approval as submitted with further modification through public comment.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposed code change is editorial and may result in a cost increase in jurisdictions that do not interpret the term areas as the entire story below.

Comment (CAH2)# 565

E114-24

IBC: 1031.2; IFC: [BE] 1031.2

Proposed Change as Submitted

Proponents: Jeffrey Munsterteiger, National Association of Home Builders, National Association of Home Builders (jmunsterteiger@nahb.org)

2024 International Building Code

Revise as follows:

1031.2 Where required. In addition to the *means of egress* required by this chapter, *emergency escape and rescue openings* shall be provided in the following occupancies:

1. Group R-2 occupancies located in *stories* with only one *exit* or access to only one *exit* as permitted by Tables 1006.3.4(1) and 1006.3.4(2).
2. Group R-3 and R-4 occupancies.

Basements and sleeping rooms below the fourth *story above grade plane* shall have not fewer than one *emergency escape and rescue opening* in accordance with this section. Where *basements* contain one or more sleeping rooms, an *emergency escape and rescue opening* shall be required in each sleeping room, but shall not be required in adjoining areas of the *basement*. Such openings shall open directly into a *public way* or to a *yard* or *court* that opens to a *public way, or to an egress balcony that leads to a public way* .

Exceptions:

1. *Basements* with a ceiling height of less than 80 inches (2032 mm) shall not be required to have *emergency escape and rescue openings*.
2. *Emergency escape and rescue openings* are not required from *basements* or sleeping rooms that have an *exit* door or *exit access* door that opens directly into a *public way* or to a *yard*, *court* or exterior egress balcony that leads to a *public way*.
3. *Basements* without *habitable spaces* and having not more than 200 square feet (18.6 m^2) in floor area shall not be required to have *emergency escape and rescue openings*.
4. *Storm shelters* are not required to comply with this section where the shelter is constructed in accordance with ICC 500.
5. Within individual *dwelling* and *sleeping units* in Groups R-2 and R-3, where the *building* is equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1, 903.3.1.2 or 903.3.1.3, *sleeping rooms* in *basements* shall not be required to have *emergency escape and rescue openings* provided that the *basement* has one of the following:

   5.1. One *means of egress* and one *emergency escape and rescue opening*.

   5.2. Two *means of egress*.

6. In Groups R-2 and R-3, a yard shall not be required to open directly into a public way where the yard opens to an unobstructed path from the yard to the public way. Such path shall have a width of not less than 36-inches (914 mm).

2024 International Fire Code

Revise as follows:

[BE] 1031.2 Where required. In addition to the *means of egress* required by this chapter, *emergency escape and rescue openings* shall be provided in the following occupancies:

1. Group R-2 occupancies located in stories with only one *exit* or access to only one *exit* as permitted by Tables 1006.3.4(1) and 1006.3.4(2).
2. Group R-3 and R-4 occupancies.

Basements and sleeping rooms below the fourth *story above grade plane* shall have not fewer than one *emergency escape and rescue opening* in accordance with this section. Where *basements* contain one or more sleeping rooms, an *emergency escape and rescue opening* shall be required in each sleeping room, but shall not be required in adjoining areas of the *basement*. Such openings shall open directly into a *public way* or to a *yard* or *court* that opens to a *public way* , or to an egress balcony that leads to a *public way* .

Exceptions:

1. *Basements* with a ceiling height of less than 80 inches (2032 mm) shall not be required to have *emergency escape and rescue openings*.
2. *Emergency escape and rescue openings* are not required from *basements* or sleeping rooms that have an *exit* door or *exit access* door that opens directly into a *public way* or to a *yard*, *court* or exterior egress balcony that leads to a *public way*.
3. *Basements* without *habitable spaces* and having not more than 200 square feet (18.6 m^2) in floor area shall not be required to have *emergency escape and rescue openings*.
4. *Storm shelters* are not required to comply with this section where the shelter is constructed in accordance with ICC 500.
5. Within individual *dwelling* and *sleeping units* in Groups R-2 and R-3, where the building is equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1, 903.3.1.2 or 903.3.1.3, sleeping rooms in *basements* shall not be required to have *emergency escape and rescue openings* provided that the *basement* has one of the following:

   5.1. One *means of egress* and one *emergency escape and rescue opening*.

   5.2. Two *means of egress*.

6. <u>In Groups R-2 and R-3, a yard shall not be required to open directly into a public way where the yard opens to an unobstructed path from the yard to the public way. Such path shall have a width of not less than 36-inches (914 mm).</u>

Reason: The purpose of this code change is to allow an EERO to discharge into a yard that does not directly open onto a public way if a minimum 36-inch-wide path is provided from the yard to the public way. This language is similar to language that was approved in the IRC last cycle. In many cities, new townhouses are being constructed on infill lots with tight space limitations. Back yards may already be enclosed because of placement of fences on neighboring lots. There are many examples of this in cities throughout the country where backyard fences are added after the structure was built leaving existing EERO to discharge into a fenced back yard. In some cases, a builder may want to construct two rows of townhouses that are tight up to the street but that have fenced backyards for each unit. Under the current code, the builder must construct all EERO facing the front of the units, with a window well in the sidewalk to access a basement EERO or forgo the private fenced yards as there will likely not be enough space to provide a 10-foot wide “public way”. The problems with placing an EERO in the front to allow a fenced yard in the back include coordinating the location with entry doors and front steps, coordinating the location with utilities, and providing a secure cover over the window well that prevents passers-by from dropping trash into the window well or falling. The problem with forgoing fenced yards is the loss of security for children and pets, and privacy.

While a 10-foot-wide path between back-to-back fenced yards is almost certainly not feasible, a 3-foot path may be in many cases. The new exception would allow such a path, that occupants could use to get out of their yard after escaping through an EERO or that firefighters could use to access the fenced yard for firefighting and rescue operations without having to breach or climb over a series of fences. In these multi-family arrangements this space most-likely would be a common space maintained by the management company or by an association.

Support for choosing the 36-inch minimum width can be found in NFPA 101 (2024) where exit discharge paths leading to a public way are allowed to be a minimum of 36-inches wide in Section 7.7.1.2 for all occupancies and occupant loads. Similarly, IBC Table 1020.3 allows corridors 36-inches in width when serving any occupant load of less than 50 in all occupancies.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The code change proposal will not increase or decrease the cost of construction. The code change does not change the requirement to provide an EERO for sleeping rooms. Thus, there should be no increase in cost because of this proposal.

There may be a modest savings from the added ability to locate a basement EERO in the rear of the home, where covers may not be required and coordination with utilities is easier.

E114-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: How is the path guaranteed and maintained to the public way? The exception is not needed - it can be permitted with current text. (Vote: 13-1)

E114-24

Individual Consideration Agenda

Comment 1:

IBC: 1031.2; IFC: [BE] 1031.2

Proponents: Jeffrey Munsterteiger, National Association of Home Builders, National Association of Home Builders (jmunsterteiger@nahb.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

Revise as follows:

1031.2 Where required. In addition to the *means of egress* required by this chapter, *emergency escape and rescue openings* shall be provided in the following occupancies:

1. Group R-2 occupancies located in *stories* with only one *exit* or access to only one *exit* as permitted by Tables 1006.3.4(1) and 1006.3.4(2).
2. Group R-3 and R-4 occupancies.

Basements and sleeping rooms below the fourth *story above grade plane* shall have not fewer than one *emergency escape and rescue opening* in accordance with this section. Where *basements* contain one or more sleeping rooms, an *emergency escape and rescue opening* shall be required in each sleeping room, but shall not be required in adjoining areas of the *basement*. Such openings shall open directly into a *public way* or to a *yard* or *court* that opens to a *public way, or to an egress balcony that leads to a public way* .

Exceptions:

1. *Basements* with a ceiling height of less than 80 inches (2032 mm) shall not be required to have *emergency escape and rescue openings*.

2. *Emergency escape and rescue openings* are not required from *basements* or sleeping rooms that have an *exit* door or *exit access* door that opens directly into a *public way* or to a *yard*, *court* or exterior egress balcony that leads to a *public way*.
3. *Basements* without *habitable spaces* and having not more than 200 square feet (18.6 m^2) in floor area shall not be required to have *emergency escape and rescue openings*.
4. *Storm shelters* are not required to comply with this section where the shelter is constructed in accordance with ICC 500.
5. Within individual *dwelling* and *sleeping units* in Groups R-2 and R-3, where the *building* is equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1, 903.3.1.2 or 903.3.1.3, *sleeping rooms* in *basements* shall not be required to have *emergency escape and rescue openings* provided that the *basement* has one of the following:

   5.1. One *means of egress* and one *emergency escape and rescue opening*.

   5.2. Two *means of egress*.

6. In Groups R-2 and R-3, a yard shall not be required to open directly into a public way where the yard opens to an unobstructed path from the yard to the public way. Such path shall have a width of not less than 36-inches (914 mm) and shall be maintained in accordance with the International Fire Code. Pathways shall be located on the same lot or be on property secured for the life of the structure by legal means.
7. Emergency escape and rescue openings shall be permitted to discharge to an egress court complying with Section 1029 or safe dispersal area complying with Section 1028.5.

2024 International Fire Code

Revise as follows:

[BE] 1031.2 Where required. In addition to the *means of egress* required by this chapter, *emergency escape and rescue openings* shall be provided in the following occupancies:

1. Group R-2 occupancies located in stories with only one *exit* or access to only one *exit* as permitted by Tables 1006.3.4(1) and 1006.3.4(2).
2. Group R-3 and R-4 occupancies.

Basements and sleeping rooms below the fourth *story above grade plane* shall have not fewer than one *emergency escape and rescue opening* in accordance with this section. Where *basements* contain one or more sleeping rooms, an *emergency escape and rescue opening* shall be required in each sleeping room, but shall not be required in adjoining areas of the *basement*. Such openings shall open directly into a *public way* or to a *yard* or *court* that opens to a *public way* , or to an egress balcony that leads to a *public way* .

Exceptions:

1. *Basements* with a ceiling height of less than 80 inches (2032 mm) shall not be required to have *emergency escape and rescue openings*.
2. *Emergency escape and rescue openings* are not required from *basements* or sleeping rooms that have an *exit* door or *exit access* door that opens directly into a *public way* or to a *yard*, *court* or exterior egress balcony that leads to a *public way*.
3. *Basements* without *habitable spaces* and having not more than 200 square feet (18.6 m^2) in floor area shall not be required to have *emergency escape and rescue openings*.
4. *Storm shelters* are not required to comply with this section where the shelter is constructed in accordance with ICC 500.

5. Within individual *dwelling* and *sleeping units* in Groups R-2 and R-3, where the building is equipped throughout with an *automatic sprinkler system* installed in accordance with Section 903.3.1.1, 903.3.1.2 or 903.3.1.3, sleeping rooms in *basements* shall not be required to have *emergency escape and rescue openings* provided that the *basement* has one of the following:

   5.1. One *means of egress* and one *emergency escape and rescue opening*.

   5.2. Two *means of egress*.

6. In Groups R-2 and R-3, a yard shall not be required to open directly into a public way where the yard opens to an unobstructed path from the yard to the public way. Such path shall have a width of not less than 36-inches (914 mm) and shall be maintained in accordance with the International Fire Code. Pathways shall be located on the same lot or be on property secured for the life of the structure by legal means

7. Emergency escape and rescue openings shall be permitted to discharge to an egress court complying with Section 1029 or safe dispersal area complying with Section 1028.5.

Reason: The purpose of this comment is to address committee concerns and questions with the original proposal. The code change was intended to allow an Emergency Escape and Rescue Opening (EERO) to discharge into a yard that does not directly open onto a public way if a minimum 36-inch-wide path is provided from the yard to the public way.

When discussing EEROs, one must consider that an EERO is not a component of the Means of Egress system (MOES). MOE is defined in the IBC and IFC. The MOES is made up of three components, the Exit Access, Exit and Exit Discharge. Definitions from the 2024 IBC are included here for clarity:

[BE]EMERGENCY ESCAPE AND RESCUE OPENING. *An operable exterior window, door or other similar device that provides for a means of escape and access for rescue in the event of an emergency.*

[BE]MEANS OF EGRESS. *A continuous and unobstructed path of vertical and horizontal egress travel from any occupied portion of a building or structure to a public way. A means of egress consists of three separate and distinct parts: the exit access, the exit and the exit discharge.*

[BE]EXIT ACCESS. *That portion of a means of egress system that leads from any occupied portion of a building or structure to an exit.*

[BE]EXIT. *That portion of a means of egress system between the exit access and the exit discharge or public way. Exit components include exterior exit doors at the level of exit discharge, interior exit stairways and ramps, exit passageways, exterior exit stairways and ramps and horizontal exits.*

[BE]EXIT DISCHARGE. *That portion of a means of egress system between the termination of an exit and a public way.*

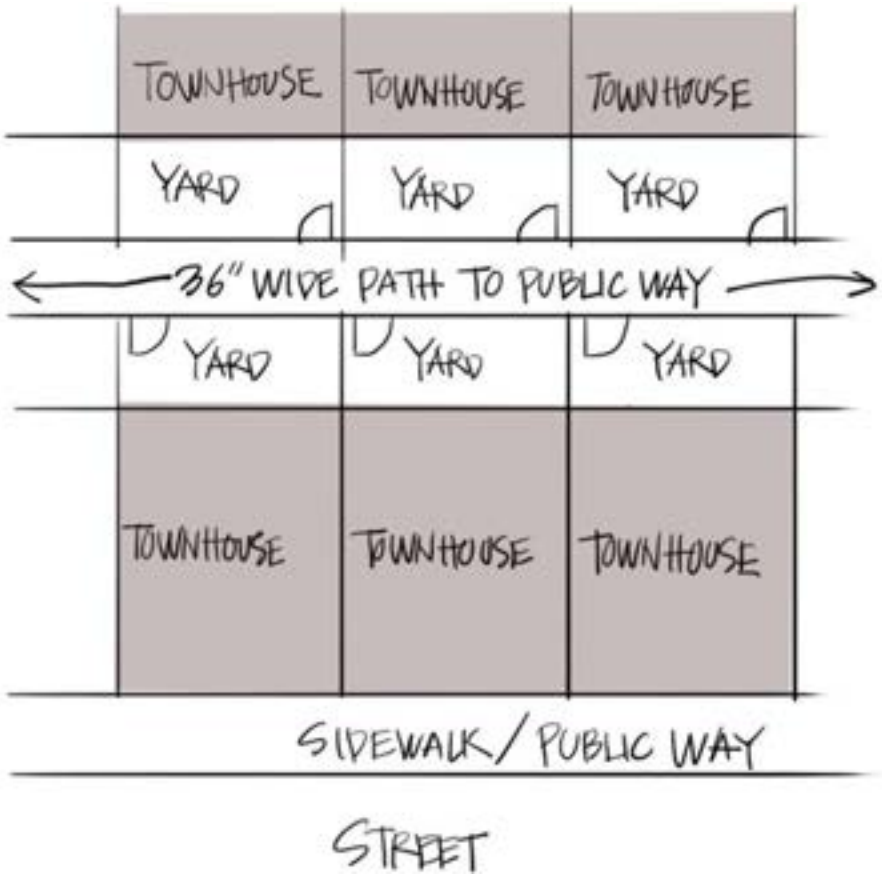
Considering these definitions one can see that EEROs are not treated the same as other MOE components in chapter 10. Much of chapter 10 doesn't apply directly to an EERO, because they are not part of the MOES, as its defined. In this context, one also shouldn't apply more restrictive requirements to EERO than the other exiting components.

To address committee concerns about other options the code provides, Exception 7 was added to allow them to discharge to an egress court. An additional method of discharging to a safe dispersal area is also referenced. While the committee felt the code already allows this, keep in mind EEROs are not currently included in the definitions as an exit component, and there are examples where code officials have interpreted otherwise.

The originally proposed Exception 6 was revised to clarify that if providing the path, maintenance shall be in accordance with the International Fire Code, and that the pathway shall be located on the same lot or be on property secured for the life of the structure by legal means. Legal means could be through legal easements, deeded access or other property rights considerations, none of which are typically addressed directly in the building code. There is no nationwide standard applicable to the terminology so the phrase "by legal means" is used.

The yards addressed in item 6 could be enclosed with fences or building walls or by other means. As it applies to the path being unobstructed, the term would carry the meaning as it applies to other egress components and paths. All building means of egress paths encounter doors or gates that typically are not considered as an obstruction to the path of travel; the same logic should apply in this case. In 1003.6 of the 2024 IBC it says "***Obstructions*** *shall not be placed in the minimum width or required capacity of a means of egress*

component except projections permitted by this chapter." Code Officials should apply the same interpretation of an obstruction in the path from an EERO as they previously have when applying the Means of Egress Continuity Section 1003.6.



Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The code change does not change the requirement to provide an EERO for sleeping rooms. Thus, there should be no increase in cost because of this proposal.

There may be a modest savings from the added ability to locate a basement EERO in the rear of the home, where covers may not be required and coordination with utilities is easier.

Comment (CAH2)# 273

E117-24

IBC: 1105.1

Proposed Change as Submitted

Proponents: Steve Thomas, Shums Coda Associates, Himself (sthomas@coloradocode.net)

2024 International Building Code

Revise as follows:

1105.1 Public entrances. In addition to accessible entrances required by Sections 1105.1.2 through 1105.1.8, at least 60 percent of all *public entrances* shall be accessible. **Exceptions:**

1. An accessible entrance is not required to areas not required to be accessible.
2. Loading and *service entrances* that are not the only entrance to a tenant space.
3. Groups R-2, R-3 or R-4 occupancies containing Accessible, Type A or Type B Units, including accessory occupancies in accordance with Section 508.2 shall be provided with no fewer than one accessible public entrance.

Reason: The Federal Fair Housing Act does not require more than one entrance to buildings regulated under that standard. The intent of this proposal is to be consistent with those provisions and clarify that 60% of the entrances are not required to be accessible but that at least one entrance must be accessible. Section 1108.4 states the following:

Not fewer than one accessible route shall connect accessible building or facility entrances with the primary entrance of each Accessible unit, Type A unit and Type B unit within the building or facility and with those exterior and interior spaces and facilities that serve the units.

We believe that this provides supporting documentation that only one accessible route and entrance is required to a residential building.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is a clarification of the intent of the code. This requirement is consistent with the Fair Housing Act and the current code language in 1105.1.8.

E117-24

Public Hearing Results (CAH1)

Committee Action: **As Submitted**

Committee Reason: Allowing for one accessible entrance for apartment buildings would be consistent with Fair Housing. This will also align with Sections 1105.1.8 and 1108.4. (Vote: 10-4)

E117-24

Individual Consideration Agenda

Comment 1:

Proponents: C. Scott Anderson, City of Minneapolis, Self (c.scott.anderson@minneapolismn.gov) requests Disapproved

Reason: The committee should reconsider its actions from the hearings in April and disapprove this change.

2000 IBC required 50% of entrances to be accessible.

2006 changed to 60% of public entrances to be accessible.

18 years of requiring a majority of public entrances to be accessible.

FHA – published in 1996 and updated in 1998 – 26 year old standard. There is no indication that it will be updated in the future.

FHA pages 1.32 + 1.34 acknowledges that non-accessible entrances while acceptable under the guidelines may be required to be accessible to meet Local, state or other emergency egress requirements.

Reason statement in E117-24 references IBC 1108.4 which is accessible route not accessible entrances. This section requires an accessible route connect the unit entrance to ALL accessible building entrances.

The reason statement also references IBC 1105.1.8 as justification, however that section is specific to the individual dwelling unit entrance not the building as a whole.

Accepting this proposal could easily result in the only accessible entrance to a new apartment building be the one most remote from the "front door". Worse it could result in a condition where the only accessible entrance is located in the parking garage.

The fact that ICC requires a higher level accessibility than a 26 year old federal standard is not surprising, nor unusual. The FHA standard for example has no requirements for type A or accessible units. Should we therefore eliminate these unit types? For the sake of uniformity of standards.

The current requirement meets the FHA requirement. If you have 60% of public entrance accessible then at least one is, therefore the requirement is met. This is not a conflict in the standards or requirements. This proposed change significantly reduces the ability of people with disabilities to access R-2 facilities and should not be approved.

As an alternative to total disapproval, the proposal could be modified so that it is limited to R-3 and R-4 occupancies. These are smaller structures and often only have one or perhaps two entrances as a result of their size.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Comment (CAH2)# 99

E119-24

IBC: 1106.3.1 (New)

Proposed Change as Submitted

Proponents: Gene Boecker, CCI, self (geneb@codeconsultants.com); Matt Lescher, CCI, self (mattl@codeconsultants.com); Richard Williams, CWA Consultants, Self (richard@cwaconsultants.net); Marsha Mazz, United Spinal Association, United Spinal Association (mmazz@accessibility-services.com)

2024 International Building Code

1106.3 Groups R-2, R-3 and R-4. Accessible parking spaces shall be provided in Group R-2, R-3 and R-4 occupancies in accordance with the greatest number of parking spaces of any of the following:

1. In Group R-2, R-3 and R-4 occupancies that are required to have *Accessible*, Type A or *Type B dwelling units* or *sleeping units*, at least 2 percent, but not less than one, of each type of parking space provided shall be accessible.
2. Where at least one parking space is provided for each *dwelling unit* or *sleeping unit*, at least one accessible parking space shall be provided for each *Accessible* and *Type A unit*.

Add new text as follows:

1106.3.1 Parking for other than residents. In parking lots serving Group R-2, R-3 and R-4 occupancies, where parking spaces are provided for persons other than residents, parking for such spaces shall be provided in accordance with Table 1106.2.

Reason: The additional text is necessary to clarify that the parking spaces at residential facilities can be based upon each “facility” and that guest parking, employee parking, parking for the leasing office, etc. are not intended to be included as parking the calculation for residential parking noted in Section 1106.3. The language is the same as that in Section 208.2.3.3. This is also consistent with the manner in which HUD interprets the condition.

Bibliography: 2010 ADA Standards for Accessible Design

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The intent is only to provide clarity to the condition where confusion has been present for non-resident parking requirements.

E119-24

Public Hearing Results (CAH1)

Committee Action: **As Submitted**

Committee Reason: This is a clarification for where visitor/business parking is indicated on the site. This matches the current intent of the code and this is how this is commonly interpreted. (Vote: 10-4)

E119-24

Individual Consideration Agenda

Comment 1:

IBC: 1106.3.1

Proponents: Jeffrey Munsterteiger, National Association of Home Builders, National Association of Home Builders (jmunsterteiger@nahb.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

Revise as follows:

1106.3.1 Parking for ~~other than residents~~ serving other facilities. In parking lots serving Group R-2, R-3 and R-4 occupancies, where parking spaces are provided ~~for persons other than residents~~ serving other facilities, parking for such ~~spaces~~ facilities shall be provided in accordance with ~~Table~~ Section 1106.2.

Reason:
The purpose of this committee comment is to accomplish two things. First, referencing Section 1106.2 in place of a direct refence to Table 1106.2 preserves the exceptions found in that section. There is no reason these exceptions should not continue to be applicable in the context of this code change.
The second change is modifying the text "for persons other than residents" with" serving other facilities". Accessible parking is based on each "facility" and by the code's definition, a signed parking space is not a separate facility. The proponents original reason statement also says parking is based "upon each facility" and since that is a defined term and that the term is used throughout the fair housing design manual it should be used here.

Attached to this proposal are pages from the Fair Housing Act Design Manual and Fair Housing Act Accessibility Guidelines. Examples referenced are as annotated in the attachment.
On PDF page 2, Example 1 it is clear that parking shown is a separate parking facility serving a non-residential facility. In this example parking is calculated separately using Section 1106.2. But this isn't what this proposal is addressing as it was submitted.
On PDF page 2, Example 2 a single residential building and pool are served by two surface parking lots. And one can surmise from the driveway leading to the left side of the building that an enclosed parking structure is also provided under the building. One can also surmise that the striped spaces indicate required access aisles at curb ramps as shown. As many as 6 accessible parking spaces are shown. What this proposal as submitted says is that if you then added a sign that says parking for deliveries or guest parking, additional accessible spaces are required because there are no longer 3 parking facilities, it is now 5. Each new "facility" requires at least one parking space with an access aisle. This does not fit the definition of a separate parking facility and doesn't meet the intent of what the FHA documents describe for parking.
The proponents' reason statement referenced HUD documents as requiring separate accessible parking for guests, and those documents simply don't state that. What they do say is that when visitor parking spaces are provided, such parking must be "sufficient" to provide access. The Guidelines do not specify a number or percentage of accessible visitor spaces and no evidence was provided that new residential buildings are being provided with fewer numbers of accessible parking spaces than required. Guest parking is most often provided away from the main entrance and guests are permitted to park in any accessible parking spaces.
It is however understood that if the leasing office or a common use space were provided as separate buildings then the parking specific to them would need to provide accessible parking in compliance with Section 1106.2. This is clearly referenced in the HUD documents and the change in this comment makes it clear that this is the intent.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

No cost impact is anticipated with this change. But without these clarifications, costs could be incalculable.

IBC: 1107.2, 1107.2.1, 1107.2.2, 1107.2.2.1 (New), 1107.2.3 (New), 1107.2.3.1 (New), 1107.2.3.2 (New), 1107.2.3.3 (New), 1107.2.4 (New), 1107.2.4.1 (New), 1107.2.4.2 (New), 1112.1

Proposed Change as Submitted

Proponents: Jeffrey Grove, Southern Nevada ICC Chapter (jeff.grove@coffman.com)

2024 International Building Code

Revise as follows:

1107.2 Electrical vehicle charging stations. *Electrical vehicle charging stations* shall comply with Sections 1107.2.1 ~~and 1107.2.2~~ through 1107.2.4. **Exceptions:**

1. *Electrical vehicle charging stations* provided to serve Group R-3 and R-4 occupancies are not required to comply with this section.
2. Electric vehicle charging stations used exclusively by buses, trucks, other delivery vehicles, law enforcement vehicles and motor pools are not required to comply with this section.

1107.2.1 Number of accessible vehicle spaces. Not less than 5 percent of vehicle spaces on the *site* served by electrical vehicle charging systems, but not fewer than one for each type of electric vehicle charging system, shall be accessible. Where new electric vehicle charging stations are installed in facilities with existing electric vehicle charging stations, the total number of accessible spaces provided shall include both existing and new electric vehicle charging stations. Where an electric vehicle charging station charger can simultaneously charge more than one vehicle, the number of electric vehicle charging stations provided shall be considered equivalent to the number of electric vehicles that can be simultaneously charged. Parking spaces serving electric vehicle charging stations shall not be permitted to count towards the number of accessible parking spaces required by Section 1106.

1107.2.2 Vehicle space size. Accessible vehicle charging spaces shall ~~comply with the requirements for a van accessible parking space that is~~ be132 inches (3350 mm) minimum in width, 240 inches (6096 mm) minimum in length, and 98 inches (2489 mm) minimum in height with an adjoining access aisle ~~that is 60 inches (1525 mm) minimum in width~~ complying with Section 1107.2.3.

Add new text as follows:

1107.2.2.1 Vehicle charging space marking. The vehicle charging spaces shall be marked to define the width and length. Where vehicle charging spaces are marked with lines, the width measurements of vehicle charging spaces and adjacent access aisles shall be made from the centerline of the markings. **Exceptions:**

1. Where parking spaces or access aisles are not adjacent to another vehicle charging space or access aisle, measurements shall be permitted to include the full width of the line defining the vehicle charging space or access aisle.
2. Vehicle charging space in pull-through electric vehicle charging stations are not required to comply with this section.

1107.2.3 Access aisle. The vehicle charging spaces shall have an adjacent access aisle complying with Section 1107.2.3.1 through 1107.2.3.3. Access aisles shall adjoin an accessible route. Two vehicle charging spaces shall be permitted to share a common access aisle. Access aisles shall not overlap with the vehicular way. The vehicle charging spaces shall be permitted to have access aisles placed on either side of the vehicle charging space.

1107.2.3.1 Width. Access aisles serving the vehicle charging spaces shall be 60 inches (1525 mm) minimum in width.

1107.2.3.2 Length. Access aisles shall extend the full length of the vehicle charging spaces they serve.

1107.2.3.3 Marking. Access aisles shall be marked so as to discourage parking in them. Where access aisles are marked with lines, the width measurements of access aisles and adjacent vehicle charging spaces shall be made from the centerline of the markings. Exceptions:

1. Where access aisles or vehicle charging spaces are not adjacent to another access aisle or vehicle charging space, measurements shall be permitted to include the full width of the line defining the access aisle or vehicle charging space
2. Vehicle charging space in pull-through EV charging stations are not required to comply with this section.

1107.2.4 Accessible routes. Accessible routes shall be provided to serve *electric vehicle charging stations* in accordance with Sections 1107.2.4.1 and 1107.2.4.2.

1107.2.4.1 Building or facility. Accessible *electric vehicle charging stations* that serve a building or facility on the same site shall be located along an *accessible route* providing access to an *accessible* building entrance. Where *accessible electric vehicle charging stations* do not serve a building or facility on the same site, they shall be located along an accessible route providing access to the *public way.*

1107.2.4.2 Charging stations. *Accessible electric vehicle charging stations* shall be provided with an *accessible route* between the *accessible* aisle serving it and all related operable parts and other equipment. When a vehicle is being charged, the *accessible route* shall not be obstructed by the cable between the vehicle and the charging station.

Revise as follows:

1112.1 Signs. Required accessible elements shall be identified by the International Symbol of Accessibility at the following locations.

1. Accessible parking spaces required by Section 1106.2. **Exception:** Where the total number of parking spaces provided is four or less, identification of accessible parking spaces is not required.
2. Accessible parking spaces required by Section 1106.3. **Exception:** In Group I-1, R-2, R-3 and R-4 *facilities*, where parking spaces are assigned to specific *dwelling units* or *sleeping units*, identification of accessible parking spaces is not required.
3. Accessible electric vehicle charging station signs shall include “Accessible EV Charing - Use Last”. Signs shall be 60 inches (1525 mm) minimum above the floor of the vehicle charging space, measured to the bottom of the sign.
4. Accessible passenger loading zones.
5. Accessible toilet or bathing rooms where not all toilet or bathing rooms are *accessible*.
6. Accessible entrances where not all entrances are accessible.
7. Accessible checkout aisles where not all aisles are accessible. The sign, where provided, shall be above the checkout aisle in the same location as the checkout aisle number or type of checkout identification.
8. Accessible dressing, fitting and locker rooms where not all such rooms are accessible.
9. *Accessible areas of refuge* in accordance with Section 1009.9.
10. Exterior areas for assisted rescue in accordance with Section 1009.9.
11. In recreational *facilities*, lockers that are required to be accessible in accordance with Section 1110.12.

Reason: This code change is proposing to add language to more closely align accessibility requirements with the existing requirements for parking and accessibility in Section 1106 and ANSI A117.1 as well as the recommendations from the U.S. Access board while allowing for more sustainable implementation. The current language attempts to rely on the provisions in ANSI 117.1 to identify the requirements of vehicle charging spaces such as is done with accessible parking spaces. Currently, ANSI 117.1 does not have requirements specific to vehicle charging spaces. This leaves language open to misinterpretation and increases the probability of

conflicts between the two code documents.

The vehicle space size was chosen based on the recommendations of the U.S. Access Board. It was determined that these mobility features allow sufficient space for a person who uses a mobility device to exit and maneuver around the vehicle, retrieve the EV connector, and plug the connector into the electric vehicle charging inlet. Since EVs do not have a uniform vehicle charging inlet location, a larger vehicle charging space is needed to maneuver around all sides of the electric vehicle.

The current version of the code would allow for the accessible charging stations to be counted towards the overall accessible parking requirement for the site. Making the charging station a required accessible parking space with accessible signage could potentially prevent people who are able bodied from being permitted to utilize the charging stations without facing fines and/or other legal penalties. In a small group of charging stations this could lead to an extremely low utilization rate on the charging stations affecting the viability of the installation. By allowing smaller groups of charging stations to be accessible without requiring them to be dedicated, the utilization rates will be higher. Adding the signage requirement to Section 1112.1 would further clarify anyone may use the accessible charging space with preference that it be used last. The overall resources required will be reduced allowing for a more rapid implementation of the charging network.

Adding a requirement to provide access to a building or public way is necessary to provide equal access. An accessible route to a building will by default provide access to a public way as the code already requires buildings be connected to a public way by an accessible route. Requiring charging stations not on a site with buildings to connect to a public way allows users to have access to public transportation or businesses off site. While many charging stations are rapid charging stations, some take a significant amount of time to complete a charge. In that time people may walk to get some food or use a nearby restroom facility. Another scenario where this becomes important is in the event the vehicle becomes disabled at the charging station and the user needs to leave the site to seek shelter or other transportation.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

Typical fast charger equipment cost is $30,000-$50,000.

Estimated Immediate Cost Impact Justification (methodology and variables):

By eliminating the need to install a dedicated accessible underutilized charger, the overall number of chargers can be reduced by at least 1. There are too many variables to estimate the additional infrastructure cost. Distance from utility access to 3 phase power, free capacity on existing service, site characteristics, ect. are all highly variable contributors to the construction cost.

E120-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: This proposal was disapproved. The next edition of the A117.1 will include technical criteria for EV charging spaces so a lot of this text is not needed. The proponent might want to consider coming back with just the requirement for the accessible route from the EV charging spaces to the building. (Vote 11-2)

E120-24

Individual Consideration Agenda

Comment 1:

IBC: 1107.2, 1107.2.1, 1107.2.2, 1107.2.2.1 (New), 1107.2.2.2 (New), 1112.1

Proponents: Jeffrey Grove, Southern Nevada ICC Chapter (jeff.grove@coffman.com) requests As Modified by Committee (AMC2)

Replace as follows:

2024 International Building Code

Revise as follows:

1107.2 Electrical vehicle charging stations. *Electrical vehicle charging stations* shall comply with Sections 1107.2.1 ~~and~~ through ~~1107.2.2~~ 1107.2.2.2. **Exceptions:**

1. *Electrical vehicle charging stations* provided to serve Group R-3 and R-4 occupancies are not required to comply with this section.
2. Electric vehicle charging stations used exclusively by buses, trucks, other delivery vehicles, law enforcement vehicles and motor pools are not required to comply with this section.

1107.2.1 Number of accessible vehicle spaces. Not less than 5 percent of vehicle spaces on the *site* served by electrical vehicle charging systems, but not fewer than one for each type of electric vehicle charging system, shall be accessible. . Where an electric vehicle charging station charger can simultaneously charge more than one vehicle, the number of electric vehicle charging stations provided shall be considered equivalent to the number of electric vehicles that can be simultaneously charged. Parking spaces serving electric vehicle charging stations shall not be permitted to count towards the number of accessible parking spaces required by Section 1106 unless they meet all of the requirements for accessible parking spaces in addition to the requirements for electric vehicle charging stations.

1107.2.2 ~~Vehicle space size~~ Accessible routes. ~~Accessible vehicle spaces shall comply with the requirements for a van accessible parking space that is 132 inches (3350 mm) minimum in width with an adjoining access aisle that is 60 inches (1525 mm) minimum in width.~~ Accessible routes shall be provided to serve electric vehicle charging stations in accordance with Sections 1107.2.2.1 and 1107.2.2.2.

Add new text as follows:

1107.2.2.1 Building or facility. Accessible electric vehicle charging stations that serve a building or facility on the same site shall be located along an accessible route providing access to an accessible building entrance. Where accessible electric vehicle charging stations do not serve a building or facility on the same site, they shall be located along an accessible route providing access to the public way.

1107.2.2.2 Charging stations. Accessible electric vehicle charging stations shall be provided with an accessible route between the accessible aisle serving it and all related operable parts and other equipment. When a vehicle is being charged, the accessible route shall not be obstructed by the cable between the vehicle and the charging station.

Revise as follows:

1112.1 Signs. Required accessible elements shall be identified by the International Symbol of Accessibility at the following locations.

1. Accessible parking spaces required by Section 1106.2.
   Exception: Where the total number of parking spaces provided is four or less, identification of accessible parking spaces is not required.

2. Accessible parking spaces required by Section 1106.3.
   Exception: In Group I-1, R-2, R-3 and R-4 *facilities*, where parking spaces are assigned to specific *dwelling units* or *sleeping units*, identification of accessible parking spaces is not required.

3. Accessible passenger loading zones.

4. Accessible toilet or bathing rooms where not all toilet or bathing rooms are *accessible*.

5. Accessible entrances where not all entrances are accessible.

6. Accessible checkout aisles where not all aisles are accessible. The sign, where provided, shall be above the checkout aisle in the same location as the checkout aisle number or type of checkout identification.

7. Accessible dressing, fitting and locker rooms where not all such rooms are accessible.

8. *Accessible areas of refuge* in accordance with Section 1009.9.

9. Exterior areas for assisted rescue in accordance with Section 1009.9.

10. In recreational *facilities*, lockers that are required to be accessible in accordance with Section 1110.12.

11. Accessible electric vehicle charging station signs shall include “Accessible EV Charging - Use Last”. Signs shall be 60 inches (1525 mm) minimum above the floor of the vehicle charging space, measured to the bottom of the sign.

Reason: During CAH 1, the committee voted this proposal down based on the desire that the technical language be placed in ICC A117.1. The original proposal was written with these items in it due to the fact A117.1 has not been finalized and there is no guarantee that it will be adopted as part of the 2027 IBC. In an effort to preserve the scoping previsions of this code change proposal in the appropriate location of the IBC, the technical requirements have been removed and left to ICC A117.1. Part of this change was removing the vehicle charging station space size as it is technical in nature and would also be better left to ICC A117.1.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

Information is unchanged from original proposal.

Estimated Immediate Cost Impact Justification (methodology and variables):

Information is unchanged from original proposal.

Comment (CAH2)# 486

Comment 2:

IBC: 1112.1

Proponents: Steven Rosenstock, Edison Electric Institute, Edison Electric Institute (srosenstock@eei.org); Genevieve Cullen, Electric Drive Transportation Association (EDTA), EDTA (gcullen@electricdrive.org); Emily Kelly, ChargePoint (emily.kelly@chargepoint.com); Rick Tempchin, Alliance for Transportation Electrification (rick@evtransportationalliance.org); Tessa Sanchez, Tesla, Tesla, Inc. (tesanchez@tesla.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

Revise as follows:

1112.1 Signs. Required accessible elements shall be identified by the International Symbol of Accessibility at the following locations.

1. Accessible parking spaces required by Section 1106.2. **Exception:** Where the total number of parking spaces provided is four or less, identification of accessible parking spaces is not required.

2. Accessible parking spaces required by Section 1106.3. **Exception:** In Group I-1, R-2, R-3 and R-4 *facilities*, where parking spaces are assigned to specific *dwelling units* or *sleeping units*, identification of accessible parking spaces is not required.

3. ~~Accessible electric vehicle charging station signs shall include "Accessible EV Charing - Use Last". Signs shall be 60 inches (1525 mm) minimum above the floor of the vehicle charging space, measured to the bottom of the sign.~~

4. Accessible passenger loading zones.

5. Accessible toilet or bathing rooms where not all toilet or bathing rooms are *accessible*.

6. Accessible entrances where not all entrances are accessible.

7. Accessible checkout aisles where not all aisles are accessible. The sign, where provided, shall be above the checkout aisle in the same location as the checkout aisle number or type of checkout identification.

8. Accessible dressing, fitting and locker rooms where not all such rooms are accessible.

   Accessible areas of refuge in accordance with Section 1009.9.

10 Exterior areas for assisted rescue in accordance with Section 1009.9.

11. In recreational *facilities*, lockers that are required to be accessible in accordance with Section 1110.12.

Reason: With the requirements for EV space marking already included in Section 1107, there is no need for a sign. Also, the phrase "use last" will likely cause confusion, since EV owners who need the accessible parking are allowed to use the space (and the charging) first.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

Eliminating the requirement for accessible EV charging station signs will reduce the cost.

Estimated Immediate Cost Impact Justification (methodology and variables):

It will reduce the immediate costs by taking out the requirement for EV charging station signs.

Estimated Life Cycle Cost Impact:

This will reduce life cycle costs as signs will not need to be replaced in the future.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

Eliminating the first cost and future cost of a sign creates $0 life cycle costs, which will be lower than the cost to purchase, maintain, and replace a sign.

Comment (CAH2)# 412

IBC: 1108.5.1.1, 1108.5.1.2, 1108.5.2.1, 1108.5.4, 1110.2.2, 1110.2.2.1, 1110.2.2.2, 1110.2.2.2.1, 1110.2.2.2.2, 1110.2.2.2.3, 1110.2.2.3, 1110.2.2.4, 1110.2.2.5, 1110.2.2.6, 1110.2.3, 1110.2.3.1, 1110.2.3.2, 1110.2.3.3, 1110.2.3.3.1, 1110.2.3.3.2, 1110.2.3.4, 1110.2.3.5, 1110.2.3.6, 1110.2.3.7, 1110.2.3.8, 1110.2.3.9

Proposed Change as Submitted

Proponents: Matt Lescher, CCI, self (mattl@codeconsultants.com); Marsha Mazz, United Spinal Association, United Spinal Association (mmazz@accessibility-services.com); Gene Boecker, CCI, self (geneb@codeconsultants.com); Jim Safranek, Safranek Group LLC, Self (jim@safranekgroup.com)

2024 International Building Code

1108.5 Group I. *Accessible units* and *Type B units* shall be provided in Group I occupancies in accordance with Sections 1108.5.1 through 1108.5.5.

1108.5.1 Group I-1. *Accessible units* and *Type B units* shall be provided in Group I-1 occupancies in accordance with Sections 1108.5.1.1 and 1108.5.1.3.

Revise as follows:

1108.5.1.1 Accessible units. In Group I-1, Condition 1, at least 4 percent, but not less than one, of the *dwelling units* and *sleeping units* shall be *Accessible units*. *Accessible dwelling units* and *sleeping units* shall be dispersed among the various classes of units. **Exceptions:**

1. Water closets shall be permitted to comply with assisted toileting requirements in accordance with ICC A117.1 Section 611 ~~not be required to comply with ICC A117.1 where such water closets comply with Section 1110.2.2~~, in not more than 50 percent of the *Accessible units.*
2. Roll-in-type showers shall be permitted to comply with assisted bathing requirements in accordance with ICC A117.1 Section 611.7 ~~not be required to comply with ICC A117.1 where such water closets comply with Section 1110.2.3~~, in not more than 50 percent of the *Accessible units*.

1108.5.1.2 Accessible units in Group I-1, Condition 2. In Group I-1, Condition 2, at least 10 percent, but not less than one, of the *dwelling units* and *sleeping units* shall be *Accessible units*. *Accessible dwelling units* and *sleeping units* shall be dispersed among the various classes of units. **Exceptions:**

1. Water closets shall be permitted to comply with assisted toileting requirements in accordance with ICC A117.1 Section 611 ~~not be required to comply with ICC A117.1 where such water closets comply with Section 1110.2.2~~, in not more than 50 percent of the *Accessible units.*
2. Roll-in-type showers shall be permitted to comply with assisted bathing requirements in accordance with ICC A117.1 Section 611.7 ~~not be required to comply with ICC A117.1 where such water closets comply with Section 1110.2.3~~, in not more than 50 percent of the *Accessible units*.

1108.5.1.3 Type B units. In *structures* with four or more *dwelling units* or *sleeping units intended to be occupied as a residence* , every *dwelling unit* and *sleeping unit intended to be occupied as a residence* shall be a *Type B unit*. **Exception:** The number of *Type B units* is permitted to be reduced in accordance with Section 1108.7.

1108.5.2 Group I-2 nursing homes. *Accessible units* and *Type B units* shall be provided in *nursing homes* of Group I-2, Condition 1 occupancies in accordance with Sections 1108.5.2.1 and 1108.5.2.2.

Revise as follows:

1108.5.2.1 Accessible units. At least 50 percent but not less than one of each type of the *dwelling units* and *sleeping units* shall be *Accessible units*. **Exceptions:**

1. Water closets shall be permitted to comply with assisted toileting requirements in accordance with ICC A117.1 Section 611 ~~not be required to comply with ICC A117.1 where such water closets comply with Section 1110.2.2~~, in not more than 90 percent of the *Accessible units*.
2. Roll-in-type showers shall be permitted to comply with assisted bathing requirements in accordance with ICC A117.1 Section 611.7 ~~not be required to comply with ICC A117.1 where such water closets comply with Section 1110.2.3~~, in not more than 90 percent of the *Accessible units.*

1108.5.2.2 Type B units. In *structures* with four or more *dwelling units* or *sleeping units intended to be occupied as a residence*, every *dwelling unit* and *sleeping unit intended to be occupied as a residence* shall be a *Type B unit*. **Exception:** The number of *Type B units* is permitted to be reduced in accordance with Section 1108.7.

1108.5.3 Group I-2 hospitals. *Accessible units* and *Type B units* shall be provided in general-purpose *hospitals*, psychiatric *facilities* and *detoxification facilities* of Group I-2 occupancies in accordance with Sections 1108.5.3.1 and 1108.5.3.2.

1108.5.3.1 Accessible units. At least 10 percent, but not less than one, of the *dwelling units* and *sleeping units* shall be *Accessible units*.
Exception: Entry doors to *Accessible dwelling units* or *sleeping units* shall not be required to provide the maneuvering clearance beyo the latch side of the door.

1108.5.3.2 Type B units. In *structures* with four or more *dwelling units* or *sleeping units intended to be occupied as a residence*, every *dwelling unit* and *sleeping unit intended to be occupied as a residence* shall be a *Type B unit*. **Exception:** The number of *Type B units* is permitted to be reduced in accordance with Section 1108.7.

Revise as follows:

1108.5.4 Group I-2 rehabilitation facilities. In *hospitals* and rehabilitation *facilities* of Group I-2 occupancies that specialize in treating conditions that affect mobility, or units within either that specialize in treating conditions that affect mobility, 100 percent of the *dwelling units* and *sleeping units* shall be *Accessible units*. **Exceptions:**

1. Water closets shall be permitted to comply with assisted toileting requirements in accordance with ICC A117.1 Section 611 ~~not be required to comply with ICC A117.1 where such water closets comply with Section 1110.2.2~~, in not more than 50 percent of *Accessible units*.
2. Roll-in-type showers shall be permitted to comply with assisted bathing requirements in accordance with ICC A117.1 Section 611.7 ~~not be required to comply with ICC A117.1 where such water closets comply with Section 1110.2.3~~, in not more than 50 percent of *Accessible units*.

Delete without substitution:

~~**1110.2.2 Water closets designed for assisted toileting.** Water closets designed for assisted toileting shall comply with Sections 1110.2.2.1 through 1110.2.2.6.~~

~~**1110.2.2.1 Location.** The centerline of the water closet shall be not less than 24 inches (610 mm) and not greater than 26 inches (660 mm) from one side of the required clearance.~~

~~**1110.2.2.2 Clearance.** Clearance around the water closet shall comply with Sections 1110.2.2.2.1 through 1110.2.2.2.3.~~

~~**1110.2.2.2.1 Clearance width.** Clearance around a water closet shall be not less than 66 inches (1675 mm) in width, measured~~

perpendicularly from the side of the clearance that is not less than 24 inches (610 mm) and not greater than 26 inches (660 mm) from the water closet centerline.

1110.2.2.2.2 Clearance depth. Clearance around the water closet shall be not less than 78 inches (1980 mm) in depth, measured perpendicularly from the rear wall

1110.2.2.2.3 Clearance overlap. The required clearance around the water closet shall permit overlaps per ICC A117.1, Section 604.3.3

1110.2.2.3 Height. The height of the water closet seats shall comply with ICC A117.1, Section 604.4.

1110.2.2.4 Swing-up grab bars. Swing-up grab bars shall comply with ICC A117.1, Sections 609.2 and 609.8. Swing-up grab bars shall be provided on both sides of the water closet and shall comply with all of the following:

1. The centerline of the grab bar shall be not less than 14 inches (356 mm) and not greater than 16 inches (405 mm) from the centerline of the water closet.
2. The length of the grab bar is not less than 36 inches (915 mm) in length, measured from the rear wall to the end of the grab bar.
3. The top of the grab bar in the down position is not less than 30 inches (760 mm) and not greater than 34 inches (865 mm) above the floor.

1110.2.2.5 Flush controls. Flush controls shall comply with ICC A117.1, Section 604.6.

1110.2.2.6 Dispensers. Toilet paper dispensers shall be mounted on at least one of the swing-up grab bars and the outlet of the dispenser shall be located not less than 24 inches (610 mm) and not greater than 36 inches (915 mm) from the rear wall.

1110.2.3 Standard roll-in-type shower compartment designed for assisted bathing. Standard roll-in-type shower compartments designed for assisted bathing shall comply with Sections 1110.2.3.1 through 1110.2.3.9.

1110.2.3.1 Size. Standard roll-in-type shower compartments shall have a clear inside dimension of not less than 60 inches (1525 mm) in width and 30 inches (760 mm) in depth, measured at the center point of opposing sides. An entry not less than 60 inches (1525 mm) in width shall be provided.

1110.2.3.2 Clearance. A clearance of not less than 60 inches (1525 mm) in length adjacent to the 60-inch (1525 mm) width of the open face of the shower compartment, and not less than 30 inches (760 mm) in depth, shall be provided. **Exceptions:**

1. A lavatory complying with ICC A117.1, Section 606 shall be permitted at one end of the clearance.
2. Where the shower compartment exceeds minimum sizes, the clear floor space shall be placed adjacent to the grab bars and not less than 30 inches (762 mm) from the back wall.

1110.2.3.3 Grab bars. Grab bars shall comply with ICC A117.1, Section 609 and shall be provided in accordance with Sections 1110.2.3.3.1 and 1110.2.3.3.2. In standard roll-in-type shower compartments, grab bars shall be provided on three walls. Where multiple grab bars are used, required horizontal grab bars shall be installed at the same height above the floor. Grab bars can be separate bars or one continuous bar.

1110.2.3.3.1 Back-wall grab bar. The back-wall grab bar shall extend the length of the back wall and extend within 6 inches (150 mm) maximum from the two adjacent sidewalls. **Exception:** The back-wall grab bar shall not be required to exceed 48 inches (1220 mm) in length. The rear grab bar shall be located with one end within 6 inches maximum of a sidewall with a grab bar complying with Section 1110.2.3.3.2.

~~**1110.2.3.3.2 Sidewall grab bars.** The sidewall grab bars shall extend the length of the wall and extend within 6 inches (150 mm) of the adjacent back wall. **Exceptions:**~~

1. ~~The sidewall grab bar shall not be required to exceed 30 inches (760 mm) in length. The side grab bar shall be located with one end within 6 inches (152 mm) of the back wall with a grab bar complying with Section 1110.2.3.3.1.~~
2. ~~Where the sidewalls are located 72 inches (1830 mm) or greater apart, a grab bar is not required on one of the sidewalls.~~

~~**1110.2.3.4 Seats.** Wall-mounted folding seats shall not be installed.~~

~~**1110.2.3.5 Controls and hand showers.** In standard roll-in-type showers, the controls and hand shower shall be located not less than 38 inches (965 mm) and not greater than 48 inches (1220 mm) above the shower floor. Controls shall be located to facilitate caregiver access.~~

~~**1110.2.3.6 Hand showers.** Hand showers shall comply with ICC A117.1, Section 608.5.~~

~~**1110.2.3.7 Thresholds.** Thresholds shall comply with ICC A117.1, Section 608.6.~~

~~**1110.2.3.8 Shower enclosures.** Shower compartment enclosures for shower compartments shall comply with ICC A117.1, Section 608.7.~~

~~**1110.2.3.9 Water temperature.** Water temperature shall comply with ICC A117.1, Section 608.8.~~

Reason: The next edition of ICC A117.1 will include requirements for assisted toileting and bathing in Section 611. This proposal was 06-84-2021. Information can be viewed on the ICC A117.1 webpage at https://www.iccsafe.org/icc-asc-a117-1/. These provisions include several improvements to the text currently in the IBC. This section should be deleted from the IBC and reference the appropriate sections in the ICC A117.1.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

These requirements are being replaced with similar requirements in the next edition of ICC A117.1. There scoping will remain the same for this option.

E122-24

Public Hearing Results (CAH1)

Errata: This proposal includes unpublished errata in the following sections of the IBC.
1108.5.1.1 Accessible units. In Group I-1, Condition 1, at least 4 percent, but not less than one, of the dwelling units and sleeping units shall be Accessible units. Accessible dwelling units and sleeping units shall be dispersed among the various classes of units.
Exceptions:
1. Water closets shall be permitted to comply with assisted toileting requirements in accordance with ICC A117.1 Section 611 in not more than 50 percent of the Accessible units.
2. Roll-in-type showers shall be permitted to comply with assisted ~~toileting~~ bathing requirements in accordance with ICC A117.1 Section 611.7 in not more than 50 percent of the Accessible units.

1108.5.1.2 Accessible units in Group I-1, Condition 2. In Group I-1, Condition 2, at least 10 percent, but not less than one, of the dwelling units and sleeping units shall be Accessible units. Accessible dwelling units and sleeping units shall be dispersed among the

various classes of units.

Exceptions:

1. Water closets shall be permitted to comply with assisted toileting requirements in accordance with ICC A117.1 Section 611, in not more than 50 percent of the Accessible units.
2. Roll-in-type showers shall be permitted to comply with assisted ~~toileting~~ bathing requirements in accordance with ICC A117.1 Section 611.7 in not more than 50 percent of the Accessible units.

1108.5.2.1 Accessible units. At least 50 percent but not less than one of each type of the dwelling units and sleeping units shall be Accessible units.

Exceptions:

1. Water closets shall be permitted to comply with assisted toileting requirements in accordance with ICC A117.1 Section 611 in not more than 90 percent of the Accessible units.
2. Roll-in-type showers shall be permitted to comply with assisted ~~toileting~~ bathing requirements in accordance with ICC A117.1 Section 611.7 in not more than 90 percent of the Accessible units.

1108.5.4 Group I-2 rehabilitation facilities. In hospitals and rehabilitation facilities of Group I-2 occupancies that specialize in treating conditions that affect mobility, or units within either that specialize in treating conditions that affect mobility, 100 percent of the dwelling units and sleeping units shall be Accessible units.

Exceptions:

1. Water closets shall be permitted to comply with assisted toileting requirements in accordance with ICC A117.1 Section 611 in not more than 50 percent of Accessible units.
2. Roll-in-type showers shall be permitted to comply with assisted ~~toileting~~ bathing requirements in accordance with ICC A117.1 Section 611.7 in not more than 50 percent of Accessible units.

Committee Action: **Disapproved**

Committee Reason: These criteria should not be deleted until the next edition of the ICC A117.1 is finalized. (Vote: 12-0)

E122-24

Individual Consideration Agenda

Comment 1:

Proponents: Gene Boecker, CCI, self (geneb@codeconsultants.com); Matt Lescher, CCI, self (mattl@codeconsultants.com) requests As Submitted

Reason: BOECKER: The only reason offered by the committee was that these items should not be deleted until the A117.1 is finalized. There were no technical objections. A request to approve as originally submitted is offered to keep this item "alive."

This particular portion of the A117.1 has been reviewed and approved and is now a part of the final draft. As such, it's final form is complete. At the time of this submission in July, final votes on the content of the new A117.1 have not occurred. So, it is not possible to say that the A117.1 is a "next edition" yet. However, the timeline for inclusion in the 2027 IBC requires it to be published prior to the publication of the 2027 IBC, technically December 2026 although it should be a few months earlier for practical purposes. Also, from a practical perspective, the final active for Group A and B items will be at the public hearings from April 19-28, 2026. Even at the current pace, the A117.1 will be completed by then.

The committee has the option to either vote to approve As Submitted since the A117.1 will certainly be completed before the Public hearings in 2026 or to again vote to Disapprove and kick the can to the next round of public comments. My preference is to have fewer public comments in the future.

LESCHER: The reason that the code change was disapproved was: " These criteria should not be deleted until the next edition of the ICC A117.1 is finalized." The requirments for assisted toilet and bathing facilities has already been approved by the A117.1 Committee and will be in the next edition of the standard. The entire standard is anticipated to be completed by the end of 2026 at the latest.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Comment (CAH2)# 728

IBC: 1108.6.2

Proposed Change as Submitted

Proponents: Matt Lescher, CCI, self (mattl@codeconsultants.com); Jim Safranek, Safranek Group LLC, Self (jim@safranekgroup.com); Gene Boecker, CCI, self (geneb@codeconsultants.com); Marsha Mazz, United Spinal Association, United Spinal Association (mmazz@accessibility-services.com)

2024 International Building Code

Revise as follows:

1108.6.2 Group R-2. *Accessible units, Type A units* and *Type B units* shall be provided in Group R-2 occupancies in accordance with Sections 1108.6.2.1 through 1108.6.2.3. Where Group R-2 apartments will have dwelling units intended to also be Group R-1 occupancies, those units shall comply with Section 1108.6.1.

Reason: In the old days it was generally simple to distinguish the difference between an apartment building and a hotel building. However, in recent years as the demand for short term rentals has increased exponentially, many multifamily R-2 projects are being designed with a group of units where the intention is that they will be used for short term stays. In many instances, these units will be covered by the ADA and/or Fair Housing Act (FHA). One of the main objectives of Chapter 11 is to harmonize with the ADA and FHA requirements because the Building Official is charged with enforcing the IBC and does not otherwise have authority to enforce the ADA or FHA. There are many factors that must be considered when determining the application of the ADA and FHA, such as ownership, management, length of stays, etc., but we have attempted to provide some generalizations in order to simplify and capture some of the major concerns.

If these units will be available to be rented by the general public, it is likely that they will be covered by the ADA as transient lodging. Similar to hotels, this code change proposal requires compliance with the R-1 requirements of Section 1108.6.1. Accessible units will be required in accordance with Table 1108.6.1.1. Per Section 1108.6.1.2, the remaining units will be required to be Type B if they are intended to be occupied as a residence to meet the requirements of the Fair Housing Act (FHA), if these units will only function for short term stays, like a standard hotel, then the remaining units would not be Type B.

If these units will only be available as an amenity for residents and will not be available for rental by the general public, then it is unlikely that the ADA will apply to these units. However, the units will likely be covered by the FHA. While covered by the FHA, the FHA safe harbor documents do not state how they should be addressed. Requiring compliance with Section 1108.6.1 will cover this concern. Fully accessible units will be required per Table 1108.6.1.1 and the determination for Type B is whether or not these units are intended to be occupied as a residence.

In this proposal, the term apartment houses was used for consistency with the other applicable sections for R-2. As such, it is intended to cover both apartment houses and condominiums.

There will be times where there is no way to know how certain units will be used in the future. Therefore, designers, Building Officials, owners, and other interested parties, must use the best information available at that time when applying these requirements.

Another goal of this proposal is to avoid future litigation as these short term rentals are covered by the ADA and FHA and must provide accessibility to people with disabilities.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

In our opinion, this proposal is a clarification for how the requirements should be applied to short term rental units. These units do not function as standard apartment/condominium units and should be classified as R-1 units, not as R-2 where the occupancy is longer than 30 days.

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: This is already addressed in Chapter 3 for all buildings used for two purposes. A change of occupancy can be address through enforcement. (Vote: 11-1)

E123-24

Individual Consideration Agenda

Comment 1:

IBC: 1108.6.2

Proponents: Matt Lescher, CCI, self (mattl@codeconsultants.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

Revise as follows:

1108.6.2 Group R-2. *Accessible units, Type A units* and *Type B units* shall be provided in Group R-2 occupancies in accordance with Sections 1108.6.2.1 through 1108.6.2.3. Where Group R-2 ~~apartments~~ apartment houses will have dwelling units or sleeping units intended to also be used on a transient basis ~~Group R-1 occupancies~~, the ~~those~~ units intended for transient purposes shall comply with ~~Section~~ Sections 302.1 and1108.6.1.

Reason: The revised proposal addresses the reason for disapproval by incorporating Section 302.1. The modification removed the reference to R-1 occupancies because there are many times where the Authority Having Jurisdiction will allow the units to be classified as R-2, however, in doing so, the building would not comply with the ADA and/or FHA unless the short term rental units are subject to the unit counts for fully accessible units.

Bibliography: Report from the Rocky Mountain ADA Center

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This requirement is a clarification. Where units are provided for use on a transient basis, compliance with Table 1108.6.2.1 should have already been required, either because the units should be classified as R-1, or because they should comply with Section 1108.2.3. Further, the federal ADA and associated 2010 Standards and/or the FHA require these units include fully accessible, so an argument that this increases construction costs would be based on a building that is not built in compliance with federal accessibility laws.

Comment (CAH2)# 402

E127-24 Part I

IBC: SECTION 202 (New), 1110.4.2, IAPMO (New)

Proposed Change as Submitted

Proponents: Misty Guard, Regulosity LLC, MAG Industries LLC (misty.guard@regulosity.com)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE IBC EGRESS CODE COMMITTEE. PART II WILL BE HEARD BY THE PLUMBING/PRIVATE SEWAGE CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Building Code

Add new definition as follows:

ADULT CHANGING STATIONS. An *assistive table* and the associated maneuvering clearances.

ASSISTIVE TABLE. A product produced, generally available, or used by or for persons with a physical, or cognitive disability intended to facilitate and support personal care or hygiene with a changing surface to support a user in a reclined or lying position. Assistive Tables can be fixed or adjustable height and have integrated plumbing fittings and fixtures.

1110.4 Adult changing stations. Where provided, adult changing stations shall be accessible. Where required, adult changing stations shall be accessible and shall comply with Sections 1110.4.1 through 1110.4.4.

1110.4.1 Where required. Not fewer than one adult changing station shall be provided in the following locations:

1. In assembly and mercantile occupancies, where family or assisted-use toilet or bathing rooms are required to comply with Section 1110.2.1.
2. In Group B occupancies providing educational *facilities* for students above the 12th grade, where an aggregate of 12 or more male and female water closets are required to serve the classrooms and lecture halls.
3. In Group E occupancies, where a room or space used for assembly purposes requires an aggregate of six or more male and female water closets for that room or space.
4. In highway rest stops and highway service plazas.

Revise as follows:

1110.4.2 Room. Adult changing stations shall be located in toilet rooms that include only one water closet and only one lavatory. The assistive tables shall comply with IAPMO Z1390. Fixtures located in such rooms shall be included in determining the number of fixtures provided in an occupancy. The occupants shall have access to the required adult changing station at all times that the associated occupancy is occupied. **Exception:** Adult changing stations shall be permitted to be located in family or assisted toilet rooms required in Section 1110.2.1.

1110.4.3 Prohibited location. The *accessible route* from separate-sex toilet or bathing rooms to an accessible adult changing station shall not require travel through security checkpoints.

1110.4.4 Travel distance. The adult changing station shall be located on an *accessible route* such that a *person* is not more than two *stories* above or below the *story* with the adult changing station and the path of travel to such *facility* shall not exceed 2,000 feet (609.6 m).

Add new standard(s) as follows:

IAPMO Z1390-20XX. Assistive Tables

Reason: Assistive tables are plumbing products that facilitate and support the personal hygiene of individuals who are physically challenged, disabled, or elderly. While the assistive table is not a new product, the products are required in new commercial buildings and substantial renovations of existing bathrooms in Arkansas, Arizona, California, New Hampshire, and Pennsylvania. Massachusetts, Michigan, Minnesota, and Wisconsin have pending legislation for these products. A technical subcommittee of manufacturers, consultants, installers, and disability experts wrote the product performance and safety standard, IAPMO Z1390 Assistive Tables. IAPMO Z1390 covers 1) product design requirements for user weight, maximum loads, heights, operation, locking safety mechanisms, mechanical wear, cleaning and disinfection, changing surface, grab rails, safety restraint systems, electrical, support structure, integrated plumbing fittings, integrated plumbing fixtures, 2) performance requirements for height, vertical movement, locking mechanisms, changing surface tests, grab bars, support structures, waste fitting connections, and body part entrapment, 3) marking and signage requirements, and 4) installation documentation.

Bibliography: IAPMO Z1390 Assistive Tables

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

This requirement will increase the cost of these products by requiring the product manufacturer to obtain testing through a testing laboratory and third-party certification. Laboratory testing and third-party certification fees for products typically range between $3,000 to $20,000. The increase in cost is offset by the benefits to public health and safety of products that conform to product safety and performance standards resulting in a reduction of harm to users.

Estimated Immediate Cost Impact Justification (methodology and variables):

This requirement will increase the cost of these products by requiring the product manufacturer to obtain testing through a testing laboratory and third-party certification. The increase in cost is offset by the benefits to public health and safety of products that conform to product safety and performance standards resulting in a reduction of harm to users.

E127-24 Part I

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: This proposal was disapproved because while a safety standard for adult changing tables are important, the IAPMO Z1390 is not yet finalized. (Vote: 10-4)

E127-24 Part I

Individual Consideration Agenda

Comment 1:

Proponents: Misty Guard, Regulosity LLC, MAG Industries LLC (misty.guard@regulosity.com) requests As Submitted

Reason: *IAPMO Z1390 Assistive Tables* standard was published on July 8, 2024. The publication of the safety standard addresses the Committee's concern.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

NOTE: E127-24 PART II DID NOT RECEIVE A COMMENT (CAH2) AND IS REPRODUCED FOR INFORMATIONAL PURPOSES ONLY

E127-24 Part II

IPC: SECTION 202 (New), SECTION 427 (New), 427.1 (New), 427.1.1 (New), 427.1.2 (New), 427.1.3 (New), 427.1.4 (New), IAPMO (New)

Proposed Change as Submitted

Proponents: Misty Guard, Regulosity LLC, MAG Industries LLC (misty.guard@regulosity.com)

2024 International Plumbing Code

Add new definition as follows:

ADULT CHANGING STATIONS. An *assistive table* and the associated maneuvering clearances.

ASSISTIVE TABLE. A product produced, generally available, or used by or for persons with a physical, or cognitive disability intended to facilitate and support personal care or hygiene with a changing surface to support a user in a reclined or lying position. Assistive Tables can be fixed or adjustable height and have integrated plumbing fittings and fixtures.

Add new text as follows:

SECTION 427
ASSISTIVE TABLES

427.1 Adult changing stations.. Where provided, adult changing stations shall be accessible. Where required, adult changing stations shall be accessible and shall comply with Sections 427.1.1 through 427.1.4.

427.1.1
Where required
. Not fewer than one adult changing station shall be provided in the following locations:

1. In assembly and mercantile occupancies, where family or assisted-use toilet or bathing rooms are required to comply with Section 1110.2.1 of the International Building Code.
2. In Group B occupancies providing educational *facilities* for students above the 12th grade, where an aggregate of 12 or more male and female water closets are required to serve the classrooms and lecture halls.
3. In Group E occupancies, where a room or space used for assembly purposes requires an aggregate of six or more male and female water closets for that room or space.
4. In highway rest stops and highway service plazas.

427.1.2 Room. Adult changing stations shall be located in toilet rooms that include only one water closet and only one lavatory. The assistive tables shall comply with IAPMO Z1390. Fixtures located in such rooms shall be included in determining the number of fixtures provided in an occupancy. The occupants shall have access to the required adult changing station at all times that the associated occupancy is occupied. **Exception:** Adult changing stations shall be permitted to be located in family or assisted toilet rooms required in Section 1110.2.1.

427.1.3 Prohibited location. The *accessible route* from separate-sex toilet or bathing rooms to an accessible adult changing station shall not require travel through security checkpoints.

427.1.4 Travel distance. The adult changing station shall be located on an *accessible route* such that a *person* is not more than two *stories* above or below the *story* with the adult changing station and the path of travel to such *facility* shall not exceed 2,000 feet (609.6 m).

IAPMO Z1390-20XX. Assistive Tables

Reason: Assistive tables are plumbing products that facilitate and support the personal hygiene of individuals who are physically challenged, disabled, or elderly. While the assistive table is not a new product, the products are required in new commercial buildings and substantial renovations of existing bathrooms in Arkansas, Arizona, California, New Hampshire, and Pennsylvania. Massachusetts, Michigan, Minnesota, and Wisconsin have pending legislation for these products. A technical subcommittee of manufacturers, consultants, installers, and disability experts wrote the product performance and safety standard, IAPMO Z1390 Assistive Tables. IAPMO Z1390 covers 1) product design requirements for user weight, maximum loads, heights, operation, locking safety mechanisms, mechanical wear, cleaning and disinfection, changing surface, grab rails, safety restraint systems, electrical, support structure, integrated plumbing fittings, integrated plumbing fixtures, 2) performance requirements for height, vertical movement, locking mechanisms, changing surface tests, grab bars, support structures, waste fitting connections, and body part entrapment, 3) marking and signage requirements, and 4) installation documentation.

Bibliography: IAPMO Z1390 Assistive Tables

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

This requirement will increase the cost of these products by requiring the product manufacturer to obtain testing through a testing laboratory and third-party certification. Laboratory testing and third-party certification fees for products typically range between $3,000 to $20,000. The increase in cost is offset by the benefits to public health and safety of products that conform to product safety and performance standards resulting in a reduction of harm to users.

Estimated Immediate Cost Impact Justification (methodology and variables):

This requirement will increase the cost of these products by requiring the product manufacturer to obtain testing through a testing laboratory and third-party certification. The increase in cost is offset by the benefits to public health and safety of products that conform to product safety and performance standards resulting in a reduction of harm to users.

E127-24 Part II

Public Hearing Results (CAH1)

Committee Reason: The committee agreed with the published reason statement. (Vote: 10-3)

E127-24 Part II

RM1-24

IRC: M1305.1.2, M1305.1.2.2 (New)

Proposed Change as Submitted

Proponents: David Crawford Bixby, Air Conditioning Contractors of America (ACCA), ACCA (david.bixby@acca.org)

2024 International Residential Code

M1305.1.2 Appliances in attics. *Attics* containing *appliances* shall be provided with an opening and a clear and unobstructed passageway large enough to allow removal of the largest *appliance*, but not less than 30 inches (762 mm) high and 22 inches (559 mm) wide and not more than 20 feet (6096 mm) long measured along the centerline of the passageway from the opening to the *appliance*. The passageway shall have continuous solid flooring in accordance with Chapter 5 not less than 24 inches (610 mm) wide. A level service space not less than 30 inches (762 mm) deep and 30 inches (762 mm) wide shall be present along all sides of the *appliance* where access is required. The clear access opening dimensions shall be not less than of 20 inches by 30 inches (508 mm by 762 mm), and large enough to allow removal of the largest *appliance*. **Exceptions:**

1. The passageway and level service space are not required where the *appliance* can be serviced and removed through the required opening.
2. Where the passageway is unobstructed and not less than 6 feet (1829 mm) high and 22 inches (559 mm) wide for its entire length, the passageway shall be not more than 50 feet (15 250 mm) long.

Add new text as follows:

M1305.1.2.2 Permanent service access. For new construction, a permanent means of access without the use of a portable ladder shall be provided in order to comply with M1305.1. Such means shall include the use of either pulldown stairs or other permanent steps acceptable to the code official. **Exception:** Existing construction.

Reason: Section M1305.1.2 provides specifications for the size of the minimum clear and unobstructed opening and passageway to allow removal of the largest appliance. However, the need for a safe and secure energy efficient access is not specified and should be added for the safety of personnel and consumers. For consumers, replacement of HVAC filters is recommended maintenance and access to the attic should be as safe as possible. ACCA believes that there is an urgent need for new homes to be constructed to take care of future service, repair, replacement and overall general safety for all including the homeowner, contractors, insurance representatives, regular structural pest control inspections, especially first responders and anyone else who may need to access to this part of the home in the future. The exception limits the proposal to new construction only. ACCA is not suggesting that existing homes anywhere in the country change their access to a stair/ladder access when they change their heating and cooling equipment or any other items in their attics. The proposal is similar to an amendment to the Georgia building code that became effective January 1, 2020.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

The code change proposal **will increase** the cost of construction. It is estimated that attic stairs/ladders may add $250-$350 to a new home cost, but the savings in safety over time is significantly overcome and justified.

Estimated Immediate Cost Impact Justification (methodology and variables):

A range of costs was determined based on surveying available pull-down attic stairs that are widely available in the marketplace.

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee voted to disapprove of this proposal 9-1. The reason provided was that the cost estimate was way off, as the requirement to add insulation was not factored in. In addition to the inaccurate cost estimate, additional arguments suggest that these stairs take up a lot of space. The example given was the use of these stairs in townhomes without having the required room to properly use the stairs in halls or closets. The continued discussion noted that the practicality of the proposal simply does not work. There is also no standard available for ladders to be installed per this proposed application.

RM1-24

Individual Consideration Agenda

Comment 1:

IRC: M1305.1.2, M1305.1.2.2 , M1305.1.2.3 (New)

Proponents: David Bixby, Air Conditioning Contractors of America (ACCA), ACCA (david.bixby@acca.org) requests As Modified by Committee (AMC2)

Further modify as follows:

2024 International Residential Code

M1305.1.2 Appliances in attics. *Attics* containing *appliances* shall be provided with an opening and a clear and unobstructed passageway large enough to allow removal of the largest *appliance*, but not less than 30 inches (762 mm) high and 22 inches (559 mm) wide and not more than 20 feet (6096 mm) long measured along the centerline of the passageway from the opening to the *appliance*. The passageway shall have continuous solid flooring in accordance with Chapter 5 not less than 24 inches (610 mm) wide. A level service space not less than 30 inches (762 mm) deep and 30 inches (762 mm) wide shall be present along all sides of the *appliance* where access is required. The clear access opening dimensions shall be not less than of 20 inches by 30 inches (508 mm by 762 mm), and large enough to allow removal of the largest *appliance*. **Exceptions:**

1. The passageway and level service space are not required where the *appliance* can be serviced and removed through the required opening.
2. Where the passageway is unobstructed and not less than 6 feet (1829 mm) high and 22 inches (559 mm) wide for its entire length, the passageway shall be not more than 50 feet (15 250 mm) long.

M1305.1.2.2 Permanent service access. For new construction, a permanent means of access without the use of a portable ladder shall be provided in order to comply with M1305.1. Such means shall include the use of either pulldown stairs or other permanent steps acceptable to the code official.

Exception: Existing construction.

Add new text as follows:

M1305.1.2.3 Pulldown Stairs Duty Rating. Pulldown stairs shall have a duty rating of not less than 350 lbs. and be installed according to the manufacturer's instructions.

Reason: Additional criteria is proposed which is similar to the City of Houston Mechanical Code requirements (305.2.3) for inside access of furnaces installed in attics. In addition, the Houston requirement specifies pulldown stairs having a rated load capacity of not less than 350 lbs. This capacity rating is covered under ANSI A14.9 – 2019, *Standard for Disappearing Attic Stairways*, as published by the American Ladder Institute (ALI). The scope of the standard is shown below.

SCOPE: This standard prescribes rules concerning the safe design, construction, testing, care, installation and use of permanently installed metal or wood, disappearing attic stairways of various types designed to be used for access to upper levels such as attics. Household units with duty ratings of 250, 300 and 350 lbs., or commercial units with a rating of 500 lbs. are the only units covered in this standard. This standard is not intended to apply to any attic stairway covered in any other ANSI A14 standards or disappearing attic stairways intended for use with ceiling heights in excess of 12 feet. This standard also prescribes rules and minimum requirements for installation instructions and labeling of disappearing attic stairways in order to promote safety under normal conditions of usage. This standard is not intended to cover requirements for fire separation that may be required by various building codes. It does not apply where training, supervision, or established safety procedures are in conflict with, or serve in lieu of, this standard.

Cost Impact: Increase

Estimated Immediate Cost Impact:

According to the website shown below, attic ladder installation costs range from $340 to $1,240, including labor and materials, while the average cost to install an attic ladder comes in at $490. The price to install an attic ladder depends on the ladder length, material, labor, permits, and more. https://www.bobvila.com/articles/attic-ladder-installation-cost/

Estimated Immediate Cost Impact Justification (methodology and variables):

See website link on methodology and variables: https://www.bobvila.com/articles/attic-ladder-installation-cost/

Comment (CAH2)# 555

RM2-24

IRC: M1401.1, ASHRAE Chapter 44 (New)

Proposed Change as Submitted

Proponents: Emily Toto, ASHRAE, ASHRAE (etoto@ashrae.org)

2024 International Residential Code

Revise as follows:

M1401.1 Installation. Heating and cooling *equipment* and *appliances* shall be installed in accordance with the manufacturer's instructions and the requirements of this code. Heating and cooling equipment using a refrigeration system shall also be installed in accordance with ASHRAE 15.2.

Add new standard(s) as follows:

ASHRAE

ASHRAE
180 Technology Parkway
Peachtree Corners, GA 30092

15.2-2022 Safety Standard for Refrigeration Systems in Residential Applications

Reason: This code change proposal adds the reference to ASHRAE 15.2, the installation standard for residential air conditioning. This code change closes the hole that was created in the Code when ASHRAE 15 split its scope between standards 15 and 15.2.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

These changes will have no impact on the cost of construction. The equipment design of residential systems is covered by the product design standard, UL 60335-2-40. Additionally, installation instructions will be found in the installation manuals provided by the Original Equipment Manufacturers (OEMs). However, the reference to ASHRAE 15.2 is necessary, as it is now the required application standard for residential systems serving a single dwelling or sleeping unit.

RM2-24

Public Hearing Results (CAH1)

Committee Action: **As Submitted**

Committee Reason: The committee voted to approve this proposal as submitted 6-5. The discussion centered around ASHRAE 15.2 being added in this code section for specific use of residential installations. The consensus for approval is that this standard is already included in manufacturers instructions.

RM2-24

Individual Consideration Agenda

Comment 1:

IRC: CHAPTER 14, SECTION M1401, M1401.1, SECTION M1411, M1411.1, M1411.2, M 1411.3

Proponents: Nathan Kahre, National Association of Home Builders (nkahre@nahb.org); Vladimir G. Kochkin, NAHB, NAHB (vkochkin@nahb.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Residential Code

CHAPTER 14
HEATING AND COOLING EQUIPMENT AND APPLIANCES

SECTION M1401
GENERAL

Revise as follows:

M1401.1 Installation. Heating and cooling *equipment* and *appliances* shall be installed in accordance with the manufacturer's instructions and the requirements of this code. ~~Heating and cooling equipment using a refrigeration system shall also be installed in accordance with ASHRAE 15.2.~~
[No changes to sections M1402-M1410]

SECTION M1411
HEATING AND COOLING EQUIPMENT

M1411.1 Approved refrigerants. Refrigerants used in direct refrigerating systems shall conform to the applicable provisions of ANSI/ASHRAE 34.

M1411.2 Refrigeration system listing. Refrigeration systems using Group A2L refrigerants shall be *listed* and *labeled* to UL/CSA 60335-2-40. Manufacturer's installation instructions for refrigeration systems using Group A2L refrigerants shall be included in the listing and shall comply with the applicable requirements of UL/CSA 60335-2-40 and ASHRAE 15.2. Refrigeration systems using Group A1 refrigerants shall be *listed* to UL/CSA 60335-2-40 or UL 1995. The equipment shall be installed in accordance with the listing.

M 1411.3 Refrigeration system installation. Refrigeration systems shall be installed in accordance with the manufacturer's installation instructions. After installation, the manufacturer's installation instructions, owner's manuals, service manuals and any other product literature provided with the equipment shall be attached to the indoor unit or left with the homeowner.

Reason: This change achieves two goals:

- It locates the new installation requirements in the appropriate section for heating and cooling equipment (Section M1411)
- It updates the requirements to ensure that the new installation practices are included in the manufacturer's installation instructions

ASHRAE 15.2 is an engineering standard and the complex format of the information in ASHRAE 15.2 is not conducive to direct implementation in the field for residential construction. The only effective way to ensure that the new measures are implemented correctly in the field is to include the applicable information in the installation instructions.

The proposed revision ensures that installation instruction from all equipment manufacturers include the necessary measures and that these measures are consistent with the equipment safety features built into the equipment from the specific manufacturer. Most of the information in ASHRAE 15.2 will not apply to the standard equipment used for one- and two-family dwellings. All relevant information can

be easily and more effectively communicated via installation instructions resulting in more consistent implementation in the field and in better enforcement. Requiring the HVAC installers to retrieve a few bits of relevant information from ASHRAE 15.2 rather than rely on installation instructions is not a feasible strategy to roll out A2L refrigerants.

2024 IRC already includes key provisions for addressing A2L refrigerants in Section M1411. The language that was added by RM2 at the April committee hearings (CAH1) causes duplication of requirements with Section M1411. The proposed change resolves this conflict and offers the optimum balance between the requirements of the IRC provisions and the installation instructions. In addition, this format will allow manufacturers to update their installation instructions as ASHRAE 15.2 gets updated on a continuous cycle.

Moreover, the transition to A2Ls has already begun and is required by law to be complete years before 2027 IRC will begin to be adopted and implemented by jurisdictions. The only way this transition can be successfully implemented if all applicable requirements are addressed through the installation instructions on day one as the new equipment arrives on job sites around the country. The IRC should provide a path that reflects the most effective practice for equipment installation and inspection. Having multiple compliance documents on the job site will lead to counterproductive outcomes.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

The transition to A2L refrigerants will increase cost of construction due to additional costs for new equipment and new refrigerants. However, the proposed modification seeks to consolidate installation requirements into a single document and gain efficiencies in installation and inspections processes, which can lead to mitigating effects on the cost impact. The expected cost decrease will come from savings of time installers and code officials would otherwise need to spend on reviewing, understanding, and coordinating installation requirements from different documents.

At the time of submitting this comment, ASHRAE 15. 2 costs $105 but it's expected that ASHRAE will post 15.2 for access free of charge.

Estimated Immediate Cost Impact Justification (methodology and variables):

The key variable is the time needed for installers and code officials to ensure that manufacturer's installation instructions comply with an engineering standard (ASHRAE 15.2). Because ASHRAE 15.2 is a complex engineering document, additional time will be required to determine which provisions apply and how these provisions apply to the specific equipment and its installation and resolving any differences with installation instructions.

Comment (CAH2)# 204

Comment 2:

IRC: SECTION R202, SECTION 202 (New), CHAPTER 14, SECTION M1401, M1401.1, SECTION M1411, M1411.6, ASHRAE Chapter 44

SECTION R202
DEFINITIONS

Add new definition as follows:

[MP] REFRIGERANT LEAK DETECTION SYSTEM. A system, installed by the manufacturer or installed in accordance with the manufacturer's instructions, capable of sensing and responding to a refrigerant leak.

CHAPTER 14
HEATING AND COOLING EQUIPMENT AND APPLIANCES

SECTION M1401
GENERAL

M1401.1 Installation. Heating and cooling *equipment* and *appliances* shall be installed in accordance with the manufacturer's instructions and the requirements of this code. ~~Heating and cooling equipment using a refrigeration system shall also be installed in accordance with ASHRAE 15.2.~~

SECTION M1411
HEATING AND COOLING EQUIPMENT

M1411.6 Refrigerant charge. Refrigeration systems shall have refrigerant charge in compliance with the equipment manufacturer's installation instructions and the requirements of the listing. Group A2L refrigerant charge for an individual refrigeration system shall not exceed ~~34.5~~ 35.1 pounds (~~15.7~~ 15.9 kg).Refrigerant charge for Group A2L refrigeration systems that do not have a *refrigerant leak detection system* shall also be in accordance with ASHRAE 15.2.

ASHRAE

ASHRAE
180 Technology Parkway
Peachtree Corners, GA 30092

15.2-2022 Safety Standard for Refrigeration Systems in Residential Applications

Reason: Refrigerant leak detection systems have been selected by HVAC original equipment manufacturers as the primary risk mitigation measure for heating and cooling systems with A2L refrigerants in one- and two-family dwellings. Centralized A/C and heat pump systems and many mini-split systems will incorporate a refrigerant leak detection system. The refrigerant charge limit for equipment with a refrigerant leak detection system is much higher than IRC-compliant installations will require, simplifying compliance requirements.

The proposed change reserves ASHRAE 15.2 for equipment that is employing mitigation methods other than a refrigerant leak detection system. The proposed modification requires that the amount of refrigerant charge installed in such equipment is determined in accordance with ASHRAE 15.2. This determination of compliance with ASHRAE 15.2 can also be accomplished via manufacturer's installation instructions, yet the proposed language creates an additional pointer for installers and code officials to consult where needed.

UL 60355-2-40 – the required listing standard for this equipment – includes requirements for both functions of a refrigerant leak detection system: (1) refrigerant detection and (2) appropriate mitigation actions. A definition of Refrigerant Leak Detection System is also added to IRC to complement the proposed provisions.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This modification to RM2-24 is intended to improve coordination between IRC provisions and ASHRAE 15.2 and to simplify compliance.

Comment (CAH2)# 620

RM5-24

IRC: SECTION 202, M1413.1, CHAPTER 15, SECTION M1502, M1502.3, SECTION M1504, M1504.3, M1602.1

Proposed Change as Submitted

Proponents: Mike Moore, Stator LLC, Broan-NuTone (mmoore@statorllc.com)

2024 International Residential Code

[MP] LIVING SPACE. Space within a *dwelling unit* utilized for living, sleeping, eating, cooking, bathing, washing and sanitation purposes. For the definition applicable in Chapter 11, see Section N1101.6. For the definition applicable in Chapter 24, see Section G2403.

Revise as follows:

M1413.1 General. Evaporative cooling *equipment* and *appliances* shall comply with UL 1995 or UL/CSA 60335-2-40, and shall be installed:

1. In accordance with the manufacturer's instructions.
2. On level platforms in accordance with Section M1305.1.3.1.
3. So that openings in exterior walls are flashed in accordance with Section R703.4.
4. So as to protect the potable water supply in accordance with Section P2902.
5. So that outdoor air intake opening locations are in accordance with Section R325.4.1.

CHAPTER 15
EXHAUST AND VENTILATION SYSTEMS

SECTION M1502
CLOTHES DRYER EXHAUST

Revise as follows:

M1502.3 Duct termination. Exhaust ducts shall terminate on the outside of the *building*. Exhaust duct terminations shall be in accordance with the dryer manufacturer's installation instructions. If the manufacturer's instructions do not specify a termination location, the exhaust duct shall terminate not less than 3 feet (914 mm) in any direction from openings into *buildings*, including openings in ventilated soffits. Exhaust duct terminations shall be equipped with a backdraft damper. Screens shall not be installed at the duct termination. Exhaust air shall not be directed onto walkways.

SECTION M1504
VENTILATION SUPPLY DUCTS, LIVING SPACE EXHAUST DUCTS, AND LIVING SPACE EXHAUST TERMINATIONS ~~OPENINGS~~

M1504.3 Location of ~~E~~exhaust terminations serving living spaces~~openings.~~ Exhaust air shall not be directed onto walkways. ~~Air exhaust openings shall terminate~~ Exhaust terminations serving dwelling-unit toilet rooms, bathrooms, kitchens, and other dwelling unit living spaces shall be located as follows:

1. Not less than 3 feet (914 mm) from property lines.

2. Not less than 3 feet (914 mm) from gravity outdoor air intake openings, operable windows and doors except where the exhaust opening is located not less than 1 foot (305 mm) above the gravity air intake opening, operable windows and doors.
3. Not less than 10 feet (3048 mm) from mechanical outdoor air intake openings except where either of the following apply:
   3.1. The exhaust termination ~~opening~~ is located not less than 3 feet (914 mm) above the air intake opening.
   3.2. The exhaust termination ~~opening~~ is part of a factory-built intake/exhaust combination termination fitting installed in accordance with the fan manufacturer's instructions, and the exhaust air is drawn from a *living space*.
4. ~~In accordance with Sections R303.5.2 and R303.6.~~

M1505.4 Exhaust termination protection. Exhaust terminations serving dwelling-unit toilet rooms, bathrooms, kitchens, and other dwelling unit living spaces shall be protected with corrosion-resistant screens, louvers, or grilles having an opening size of not less than 1/4 inch (6 mm) and a maximum opening size of 1/2 inch (13 mm), in any dimension. Exhaust terminations shall be protected against local weather conditions.

M1602.1 Outdoor air intake openings. Outdoor air intake openings shall be located in accordance with Section R~~325.4.1~~303.5.1. Opening protection shall be in accordance with Section R~~325.5~~303.6.

Reason: In the 2009/2010 cycle, Section M1504.3 was formed through proposal RM12-09/10 based on the rationale that outdoor air intake openings should be addressed in Chapter 3 and that exhaust terminations should be addressed elsewhere. After multiple cycles, the language has become muddled, and modifications are needed to clarify the intent. This proposal does the following:

1. Uses the term "outdoor air intake opening" where referenced in Chapters 14, 15, and 16, consistent with the language in R303.5.1.

2. Uses consistent terminology when referring to "exhaust terminations," "clothes dryer exhaust duct terminations," and "vent and chimney terminations."

3. Moves the R303.5.2 prohibition for directing exhaust onto walkways to Sections M1504.3 and M1502.3, which address exhaust termination locations for exhaust air from living spaces and exhaust air from clothes dryers, respectively. Note that Table G2427.8 (503.8) already prohibits appliance vent terminations from being located above public walkways.

4. Moves the R303.6 requirements for exhaust termination protection to Section M1504.4, as this only applies to exhaust terminations that serve dwelling-unit toilet rooms, bathrooms, kitchens, and other dwelling-unit living spaces.

5. Modifies the titles for various sections to align with the material contained in those sections.

To coordinate these modifications with Sections R303.5 and R303.6 of the IRC, a companion proposal is planned for the Group B hearings.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal is a clarification of existing requirements.

RM5-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee voted to disapprove of this proposal 10-0. The consensus of the committee is that the sections referenced for M1413.1 are not correct and that the proposed code language as written for section M1502.3 is limited to how exhaust air

should be erected on sidewalks. The committee suggests this specific code language proposed would be more conducive of being added to the IRC.

RM5-24

Individual Consideration Agenda

IRC: SECTION 202, M1413.1, CHAPTER 15, SECTION M1502, M1502.3, M1502.3.1, M1502.4.6, M1502.4.6.1, SECTION M1504, M1504.1, M1504.2, M1504.3, M1504.4 (New), M1505.1, M1505.2, M1505.3, M1602.1, TABLE M1505.5

Proponents: Mike Moore, Stator LLC, Broan-NuTone (mmoore@statorllc.com) requests As Modified by Committee (AMC2)

Replace as follows:

2024 International Residential Code

[MP] LIVING SPACE. Space within a *dwelling unit* utilized for living, sleeping, eating, cooking, bathing, washing and sanitation purposes. For the definition applicable in Chapter 11, see Section N1101.6. For the definition applicable in Chapter 24, see Section G2403.

M1413.1 General. Evaporative cooling *equipment* and *appliances* shall comply with UL 1995 or UL/CSA 60335-2-40, and shall be installed:

1. In accordance with the manufacturer's instructions.
2. On level platforms in accordance with Section M1305.1.3.1.
3. So that openings in exterior walls are flashed in accordance with Section R703.4.
4. So as to protect the potable water supply in accordance with Section P2902.
5. So that outdoor air intake opening locations are in accordance with Section R325.4.1.

CHAPTER 15
EXHAUST AND VENTILATION SYSTEMS

SECTION M1502
CLOTHES DRYER EXHAUST

M1502.3 ~~Duct~~ Exhaust termination. Exhaust ducts shall terminate on the outside of the *building*. Exhaust ~~duct~~ terminations shall be in accordance with the dryer manufacturer's installation instructions. If the manufacturer's instructions do not specify an exhaust termination location, the exhaust duct shall terminate not less than 3 feet (914 mm) in any direction from openings into *buildings*, including openings in ventilated soffits. Exhaust ~~duct~~ terminations shall be equipped with a backdraft damper. Screens shall not be installed at the ~~duct~~ exhaust termination. Exhaust air shall not be directed onto walkways.

M1502.3.1 Exhaust termination outlet and passageway size. The passageway of dryer exhaust ~~duct terminals~~terminations shall be undiminished in size and shall provide an open area of not less than 12.5 square inches (8065 mm^2).

M1502.4.6 Duct length. The maximum allowable exhaust duct length shall be determined by one of the methods specified in Sections M1502.4.6.1 through M1502.4.6.3.

M1502.4.6.1 Specified length. The maximum length of the exhaust duct shall be 35 feet (10 668 mm) from the connection to the transition duct from the dryer to the ~~outlet terminal~~exhaust termination. Where fittings are used, the maximum length of the exhaust duct shall be reduced in accordance with Table M1502.4.6.1. The maximum length of the exhaust duct does not include the transition duct.

SECTION M1504
~~EXHAUST~~ VENTILATION DUCTS AND EXHAUST ~~OPENINGS~~TERMINATIONS

M1504.1 Duct construction. Where ~~exhaust~~ ventilation duct construction is not specified in this chapter, construction shall comply with Chapter 16.

M1504.2 Duct length. The length of exhaust and supply ducts used with ventilating *equipment* shall not exceed the lengths determined in accordance with Table M1504.2. **Exception:** Duct length shall not be limited where the *duct system* complies with the manufacturer's design criteria or where the airflow rate of the installed ventilating *equipment* is verified by the installer or *approved* third party using integrated diagnostic equipment, a flow hood, flow grid, or other airflow measuring device.

M1504.3 Exhaust termination location ~~openings~~. Exhaust air shall not be directed onto walkways. ~~Air exhaust openings shall terminate~~ Exhaust terminations serving *living spaces*, *attics*, or *crawl spaces* shall be located as follows:

1. Not less than 3 feet (914 mm) from property lines.
2. Not less than 3 feet (914 mm) from gravity outdoor air intake openings, operable windows and doors except where the exhaust opening is located not less than 1 foot (305 mm) above the gravity air intake opening, operable windows and doors.
3. Not less than 10 feet (3048 mm) from mechanical outdoor air intake openings except where either of the following apply:
   3.1. The exhaust termination ~~opening~~ is located not less than 3 feet (914 mm) above the outdoor air intake opening.
   3.2. The exhaust termination ~~opening~~ is part of a factory-built intake/exhaust combination termination fitting installed in accordance with the fan manufacturer's instructions, and the exhaust air is drawn from a *living space*.
4. ~~In accordance with Sections R303.5.2 and R303.6.~~

Add new text as follows:

M1504.4 Exhaust termination protection. Exhaust terminations shall meet the provisions for exterior wall opening protectives in accordance with this code. Exhaust terminations shall be protected with corrosion-resistant screens, louvers or grilles having an opening size of not less than ¼ inch (6 mm) and a maximum opening size of ½ inch (13 mm), in any dimension. Exhaust terminations shall be protected against local weather conditions. **Exception:** Screens, louvers, or grilles shall not be required for exhaust terminations serving *clothes dryers* or for *v*ent and chimney terminals serving fuel-burning *appliances* or *fireplaces*.

M1505.1 General. Where *local exhaust* or whole-house mechanical *ventilation* is provided, the ventilation system shall be designed in accordance with this section. Ventilation ducts shall comply with Section M1504.

M1505.2 Recirculation of air. Exhaust air from bathrooms and toilet rooms shall not be recirculated within a residence or circulated to another *dwelling unit* and shall be exhausted directly to the outdoors. Exhaust air from bathrooms, toilet rooms and *kitchens* shall not discharge into an *attic*, *crawl space* or other areas inside the *building*. This section shall not prohibit the installation of ductless range hoods in accordance with the exception to Section M1503.3. **Exception:** Recirculation of exhaust air within a single *dwelling unit* shall be permitted during temporary defrost operation of a heat recovery ventilator or energy recovery ventilator.

M1505.3 ~~Exhaust~~ Ventilating equipment listings. Exhaust fans and whole-house mechanical ventilation fans shall be *listed* and *labeled* for airflow ~~as providing the minimum required airflow~~ based on laboratory testing in accordance with ANSI/AMCA 210-ANSI/ASHRAE

51 or HVI 916.
The *listed* airflow shall meet or exceed the airflow required by Section M1505.4.3 and Section M1505.5, as applicable, at not less than one speed setting.

M1602.1 Outdoor air intake openings. Outdoor air intake openings shall be located in accordance with Section R325.~~4~~3.1. Opening protection shall be in accordance with Section R325.~~5~~4.

TABLE M1505.5 MINIMUM REQUIRED LOCAL EXHAUST RATES ~~FOR ONE- AND TWO-FAMILY DWELLINGS~~

AREA TO BE EXHAUSTED	EXHAUST RATES
Kitchens	100 cfm intermittent or 25 cfm continuous
Bathrooms-Toilet Rooms	~~Mechanical exhaust capacity of~~ 50 cfm intermittent or 20 cfm continuous

For SI: 1 cubic foot per minute = 0.0004719 m^3/s, 1 inch water column = 0.2488 kPa.

Reason: In the 2009/2010 cycle, Section M1504.3 was formed through proposal RM12-09/10 based on the rationale that outdoor air intake openings should be addressed in Chapter 3 and that exhaust terminations should be addressed elsewhere. After multiple cycles, the language has become muddled, and modifications are needed to clarify the intent. This proposal does the following:

1. Uses the term "outdoor air intake opening" where referenced in Chapters 14, 15, and 16, consistent with the language in R325.4.1.
2. Uses consistent terminology when referring to "exhaust terminations," "clothes dryer exhaust duct terminations," and "vent and chimney terminations."
3. Moves the R325.4.2 prohibition for directing exhaust onto walkways to Sections M1504.3 and M1502.3, which address exhaust termination locations for exhaust air from living spaces and exhaust air from clothes dryers, respectively. Note that Table G2427.8 (503.8) already prohibits appliance vent terminations from being located above public walkways.
4. Moves the R325.5 requirements for exhaust termination protection to Section M1504.4, as this only applies to exhaust terminations that serve living spaces, not exhaust terminations that serve clothes dryers or vent and chimney terminations.
5. Modifies the titles for various sections to align with the material contained in those sections.

Specific rationale for modifications to certain sections follows:

M1504.2 Exception: Integrated diagnostic equipment is recognized by Section 403.6.3 of the 2024 IECC-R for field verification of ventilation airflow rates, and it should also be recognized here for consistency.

M1505.1: A cross reference to Section M1504 is proposed to ensure that the duct requirements are not overlooked.

M1505.2: Adding an exception for recirculation defrost operation of HRVs and ERVs (collectively, HERVs) is needed to ensure that recirculation defrost is permitted temporarily within a single dwelling unit when needed to maintain HERV operation under very cold conditions. Recirculation defrost is likely the most common method for controlling defrost in unitary HERVs.

M1505.3: Clarification is needed to communicate that the airflows required are not provided by ANSI/AMCA 210-ANSI/ASHRAE 51 or HVI 916, but by Sections M1505.4.3 (whole-house mechanical ventilation airflow rates) and Section M1505.5 (local exhaust airflow rates), as applicable.

Table M1505.5: "One- and two-family dwellings" should be removed from the header, because this table is meant to apply to all occupancies within the scope of the IRC (e.g., including townhouses), not just one- and two-family dwellings.

To coordinate these modifications with Sections R325.4 and R325.5 of the IRC, a companion proposal is planned for the Group B hearings. Following is the proposal that is planned for Group B:

~~**R325.4 Opening location**. Outdoor intake and exhaust openings shall be located in accordance with Sections R325.4.1. and R325.4.2.~~

R325.~~3~~4.~~1~~ Outdoor air ~~l~~intake openings~~location~~. Mechanical and gravity outdoor air intake openings shall be located not less than 10 feet (3048 mm) from any hazardous or noxious contaminant, such as vents, chimneys, plumbing vents, streets, alleys, parking lots, and loading docks. ~~For the purpose of this section, the exhaust from dwelling unit toilet rooms, bathrooms and kitchens shall not be considered as hazardous or noxious.~~

Exceptions:

1. The 10-foot (3048 mm) separation is not required where the intake opening is located 3 feet (914 mm) or greater below the contaminant source.

2. Separation fromVvents and chimneys terminals serving fuel-burning appliances or fireplaces shall be terminated in accordance complywith the applicable provisions of Chapters 18 and 24.

3. Separation fromCclothes dryer exhaust duct terminations shall be terminated in accordance comply with Section M1502.3.

4. Separation from exhaust terminations serving living spaces, attics, or crawl spaces shall comply with Section M1504.3.

~~**R325.4.2 Exhaust openings.** Exhaust air shall not be directed onto walkways.~~

R325.4~~5 Outside~~ Outdoor air intakeopening protection. ~~Air exhaust and~~Outdoor airintake openings ~~that terminate outdoors~~ shall be protected with corrosion-resistant screens, louvers or grilles having an opening size of not less than 1/4 inch (6 mm) and a maximum opening size of 1/2 inch (13 mm), in any dimension. Outdoor air intake ~~O~~openings shall be protected against local weather conditions.Outdoor air ~~exhaust and~~intake openings shall meet the provisions for exterior wall opening protectives in accordance with this code.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Within this proposal, there are no substantive changes that would affect the cost of compliance. The proposal is intended to clarify current requirements and to better coordinate with the IECC-R.

Comment (CAH2)# 720

RM7-24

IRC: M1601.1.1

Proposed Change as Submitted

Proponents: Jeanne Rice, NYS DOS, NYS DOS (jeanne.rice@dos.ny.gov); Chad Sievers, NYS, NYS DOS (chad.sievers@dos.ny.gov); Kevin Duerr-Clark, NYS DOS, NYS DOS (kevin.duerr-clark@dos.ny.gov); China Clarke, New York State Dept of State, Manager Technical Support Unit (china.clarke@dos.ny.gov)

2024 International Residential Code

Revise as follows:

M1601.1.1 Above-ground duct systems. Above-ground *duct systems* shall conform to the following:

1. *Equipment* connected to *duct systems* shall be designed to limit discharge air temperature to not greater than 250°F (121°C).
2. Factory-made ducts shall be *listed* and *labeled* in accordance with UL 181 and installed in accordance with the manufacturer's instructions.
3. Fibrous glass duct construction shall conform to the *SMACNA Fibrous Glass Duct Construction Standards or NAIMA Fibrous Glass Duct Construction Standards* .
4. Field-fabricated and shop-fabricated metal and flexible duct constructions shall conform to the *SMACNA HVAC Duct Construction Standards—Metal and Flexible* except as allowed by Table M1601.1.1. Galvanized steel shall conform to ASTM A653.
5. The use of gypsum products to construct return air ducts or plenums is permitted, provided that the air temperature does not exceed 125°F (52°C) and exposed surfaces are not subject to condensation.
6. *Duct systems* shall be constructed of materials having a *flame spread index* of not greater than 200.
7. ~~Stud wall cavities and the spaces between solid floor joists to be used as air plenums shall comply with the following conditions:~~ *Building* framing cavities shall not be used as ducts or plenums.
   - 7.1. ~~These cavities or spaces shall not be used as a plenum for supply air.~~
   - 7.2. ~~These cavities or spaces shall not be part of a required fire-resistance-rated assembly.~~
   - 7.3. ~~Stud wall cavities shall not convey air from more than one floor level.~~
   - 7.4. ~~Stud wall cavities and joist space plenums shall be isolated from adjacent concealed spaces by tight fitting *fireblocking* in accordance with Section R302.11. *Fireblocking* materials used for isolation shall comply with Section R302.11.1.~~
   - 7.5. ~~Stud wall cavities in the outside walls of building envelope assemblies shall not be utilized as air plenums.~~
   - 7.6. ~~Building cavities used as plenums shall be sealed.~~
8. Volume dampers, equipment and other means of supply, return and exhaust air adjustment used in system balancing shall be provided with access.

Reason: Section N1103.3.7 (R403.3.7 in the IECCC) states that *building* framing cavities shall not be used as ducts or plenums. However, section M1601.1.1 provides provisions for using joist framing cavities as return air plenums, which contradicts section N1103.3.7. This change would align M1601.1.1 with N1103.3.7, prohibiting the use of framing cavities as plenums.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Sections M1601.1.1 and N1103.3.7 are contradictory on the subject of joist cavities used as return air plenums. Section 102.1 states that, in the event of such a conflict, the more restrictive provision shall apply. In this case, section 1103.3.7 is the more restrictive provision,

and as such, is the provision which should govern. This proposed change merely clarifies section M1601.1.1 so that there is no confusion for users who may or may not notice the contradiction.

RM7-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee voted to disapprove of this proposal with a vote of 9-1. The committee justified its decision based on the notion of an increased cost impact. Additionally, builders should have some latitude in jurisdictions where these codes have yet to be adopted and should be allowed to continue to utilize framing cavities as plenums. The committee contended that since depressurization impacts other cavities, adjustments to the energy code, not the residential mechanical code, are suggested.

RM7-24

Individual Consideration Agenda

Comment 1:

IRC: M1601.1.1

Proponents: Jeanne Rice, NYSDOS (jeanne.rice@dos.ny.gov); Chad Sievers, NYS, NYS DOS (chad.sievers@dos.ny.gov); Kevin Duerr-Clark, NYS DOS, NYS DOS (kevin.duerr-clark@dos.ny.gov); Stephen Van Hoose, NYS DOS, NYS DOS (stephen.vanhoose@dos.ny.gov); China Clarke, New York State Dept of State, Manager Technical Support Unit (china.clarke@dos.ny.gov) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Residential Code

Revise as follows:

M1601.1.1 Above-ground duct systems. Above-ground *duct systems* shall conform to the following:

1. *Equipment* connected to *duct systems* shall be designed to limit discharge air temperature to not greater than 250°F (121°C).
2. Factory-made ducts shall be *listed* and *labeled* in accordance with UL 181 and installed in accordance with the manufacturer's instructions.
3. Fibrous glass duct construction shall conform to the *SMACNA Fibrous Glass Duct Construction Standards or NAIMA Fibrous Glass Duct Construction Standards .*
4. Field-fabricated and shop-fabricated metal and flexible duct constructions shall conform to the *SMACNA HVAC Duct Construction Standards—Metal and Flexible* except as allowed by Table M1601.1.1. Galvanized steel shall conform to ASTM A653.
5. The use of gypsum products to construct return air ducts or plenums is permitted, provided that the air temperature does not exceed 125°F (52°C) and exposed surfaces are not subject to condensation.
6. *Duct systems* shall be constructed of materials having a *flame spread index* of not greater than 200.

7. ~~Stud wall cavities and the spaces between solid floor joists to be used as air plenums shall comply with the following conditions:~~ *Building* framing cavities shall not be used as ducts or plenums.

   ~~7.1. These cavities or spaces shall not be used as a plenum for supply air.~~

   ~~7.2. These cavities or spaces shall not be part of a required fire-resistance-rated assembly.~~

   ~~7.3. Stud wall cavities shall not convey air from more than one floor level.~~

   ~~7.4. Stud wall cavities and joist space plenums shall be isolated from adjacent concealed spaces by tight fitting *fireblocking* in accordance with Section R302.11. *Fireblocking* materials used for isolation shall comply with Section R302.11.1.~~

   ~~7.5. Stud wall cavities in the outside walls of building envelope assemblies shall not be utilized as air plenums.~~

   ~~7.6. Building cavities used as plenums shall be sealed.~~

8. Volume dampers, equipment and other means of supply, return and exhaust air adjustment used in system balancing shall be provided with access.

Reason: In the 2012 IRC, Section N1103.2.3 was updated to state "Building framing cavities shall not be used as ducts or plenums." All newer versions of the IRC have included this requirement (Section N1103.3.7 in the 2021 IRC - Chapter 11 of the 2024 IRC was not available at the time of writing). However, Section M1601.1.1 of the IRC conflicts with Section N1103.3.7 of the IRC, which has led to confusion and questions on whether or not plenums are permitted. If a jurisdiction chooses to not adopt or to modify Chapter 11 of the IRC, such jurisdiction can also choose to modify Section M1601.1.1. However, the current IRC, with no modifications, is in conflict with itself. This proposal modifies Section M1601.1.1 to match Section N1103.3.7 so that the IRC is consistent throughout the document.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Sections M1601.1.1 and N1103.3.7 are contradictory on the subject of joist cavities used as return air plenums. Section 102.1 states that, in the event of such a conflict, the more restrictive provision shall apply. In this case, section 1103.3.7 is the more restrictive provision, and as such, is the provision which should govern. This proposed change merely clarifies section M1601.1.1 so that there is no confusion for users who may or may not notice the contradiction.

Comment (CAH2)# 459

RP3-24

IRC: P3103.1.2, P3103.1.4

Proposed Change as Submitted

Proponents: Jeanne Rice, NYS DOS, NYS DOS (jeanne.rice@dos.ny.gov); Chad Sievers, NYS, NYS DOS (chad.sievers@dos.ny.gov); Kevin Duerr-Clark, NYS DOS, NYS DOS (kevin.duerr-clark@dos.ny.gov); China Clarke, New York State Dept of State, Manager Technical Support Unit (china.clarke@dos.ny.gov)

2024 International Residential Code

Revise as follows:

P3103.1.2 Roof used for recreational or assembly purposes. ~~Where a roof is to be used for assembly, as a promenade, observation deck or sunbathing deck, or for similar purposes, open vent pipes shall terminate not less than 7 feet (2134 mm) above the roof.~~ Where a roof is to be used as a promenade, restaurant, bar, or sunbathing deck, as an observation deck, or for similar purposes, open vent pipes shall terminate not less than 7 feet (2134 mm) above the roof.

P3103.1.4 Sidewall vent terminal. Vent terminals extending through the wall shall terminate not less than 10 feet (3048 mm) from ~~a~~ the *lot line* and ~~not less than~~ 10 feet (3048 mm) above the highest adjacent grade ~~elevation~~ within 10 feet (3048 mm) ~~in any direction~~ horizontally of the vent terminal. V~~ent pipes shall not terminate under the overhang of a structure where the overhang includes soffit vents. Such vent terminals shall be protected by a method that prevents birds and rodents from entering or blocking the vent pipe opening and that does not reduce the open area of the vent pipe.~~
Vent terminals shall not terminate under the overhang of a structure with soffit vents. Sidewall vent terminals shall be protected to prevent birds and rodents from entering or blocking the vent opening.

Reason: The language in sections 3103.1.2 and 3103.1.4 (IRC) do not match sections 903.1.2 and 903.1.4 of the IPC. This proposed change edits the IRC provisions to match the ones found in the IPC.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposed change merely edits the provision language to match the IPC. The code requirements are not changed, merely edited into a more clear format.

RP3-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The terms "restaurants" and "bars" are inappropriate for the IRC. This section doesn't need to match the IPC. (10-0)

RP3-24

Individual Consideration Agenda

Comment 1:

IRC: P3103.1.2, P3103.1.4

Proponents: Jeanne Rice, NYSDOS (jeanne.rice@dos.ny.gov); Chad Sievers, NYS, NYS DOS (chad.sievers@dos.ny.gov); Kevin Duerr-Clark, NYS DOS, NYS DOS (kevin.duerr-clark@dos.ny.gov); Stephen Van Hoose, NYS DOS, NYS DOS (stephen.vanhoose@dos.ny.gov); China Clarke, New York State Dept of State, Manager Technical Support Unit (china.clarke@dos.ny.gov) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Residential Code

P3103.1.2 Occupiable Roofs ~~Roof used for recreational or assembly purposes.~~ ~~Where a roof is to be used as a promenade, restaurant, bar, or sunbathing deck, as an observation deck, or for similar purposes, open~~ Open vent pipes which are to be located within 7 feet of an occupiable roof shall terminate not less than 7 feet (2134 mm) above ~~the~~ such roof.

P3103.1.4 Sidewall vent terminal. Vent terminals extending through the wall shall terminate not less than 10 feet (3048 mm) from the *lot line* and 10 feet (3048 mm) above the highest adjacent grade within 10 feet (3048 mm) horizontally of the vent terminal. V
Vent terminals shall not terminate under the overhang of a structure with soffit vents. Sidewall vent terminals shall be protected to prevent birds and rodents from entering or blocking the vent opening.

Reason: The committee denied this proposal at CAH1, stating that:

"The terms "restaurants" and "bars" are inappropriate for the IRC. This section doesn't need to match the IPC."

Residential roofs are sometimes occupiable, as is acknowledged by the use of the term "occupiable roof" throughout the IRC. We have adjusted this proposal to utilize the existing term "occupiable roof" in conformance with IRC language, in lieu of matching the IPC language. Since residential roofs may be occupiable, such roofs could be impacted by placement of open vent pipes terminating in close proximity to the occupiable roof. This proposal attempts to minimize this potential for impact without affecting vents which are located far away from the occupiable roof (such as side wall vents, or vents on a non-occupiable portion of the roof).

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The 2024 IRC already requires vent pipes to terminate 7 feet above roofs used for recreational purposes. This proposal merely edits the language for clarity regarding vents which are located far away from the occupiable portion of the roof, and standardizes the terminology with existing terminology used throughout the IRC.

Comment (CAH2)# 421

RP7-24

IRC: TABLE P2903.2

Proposed Change as Submitted

Proponents: Diana Burk, Energy Solutions, Energy Solutions (dburk@energy-solution.com)

2024 International Residential Code

Revise as follows:

TABLE P2903.2 MAXIMUM FLOW RATES AND CONSUMPTION FOR PLUMBING FIXTURES AND FIXTURE FITTINGS [b]

PLUMBING FIXTURE OR FIXTURE FITTING	MAXIMUM FLOW RATE OR QUANTITY
Lavatory faucet	2.2 gpm at 60 psi
Shower head [a]	~~2.5~~2.0 gpm at 80 psi
Sink faucet	2.2 gpm at 60 psi
Water closet	1.6 gallons per flushing cycle

For SI: 1 gallon per minute = 3.785 L/m, 1 pound per square inch = 6.895 kPa.

a. A hand-held shower spray shall be considered to be a shower head. Where a shower compartment is served by multiple shower heads, the concurrent discharge of all shower heads controlled by a single valve shall not exceed the maximum flow rate.

b. Consumption tolerances shall be determined from referenced standards.

Reason: This proposal requires a maximum flow-rate of 2.0 gpm at 80 psi standard for showerheads in residential homes. This requirement is consistent with a similar requirement in the 2024 International Plumbing Code. More stringent standards have been adopted in multiple states including Maine, Hawaii, Washington, Oregon, New York and California. There is wide technological availability and very cost-effective water and energy savings for hot water usage. There is wide technological availability—of the 17,275 showerheads listed in DOE's Compliance Certification Database, 14,146 or 82% meet the 2.0 gpm standard. Plumbing systems in older buildings are not expected to be negatively impacted as the standards allow for only 20% less water to flow (for a 5 minute shower, that would mean 8 gallons of water with a compliant showerhead versus 10 gallons of water for a non-compliant showerhead). For a typical single family home which has roughly 2.2 showerheads, this proposal would save approximately 5,100 gallons of water per year and result in $1,170 in utility cost savings over the 10 year life of the fixture. While this has significant energy and water savings, the incremental impact for a building's plumbing system is negligible.

[4] https://appliance-standards.org/sites/default/files/States%20Go%20First.pdf
[5] https://www.eia.gov/consumption/residential/data/2020/#waterheating

[6] https://www.eia.gov/electricity/monthly/epm_table_grapher.php?t=epmt_5_3
[7] https://www.eia.gov/dnav/ng/ng_pri_sum_dcu_nus_a.htm
[8] https://www.eia.gov/dnav/pet/pet_pri_wfr_dcus_nus_m.htm

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

In their analysis to establish this standard in 2015, the California Energy Commission found the incremental cost for showerheads is zero because there is no cost premium for a compliant product.[1]

Estimated Immediate Cost Impact Justification (methodology and variables):

In their analysis to establish this standard in 2015, the California Energy Commission found the incremental cost for showerheads is zero because there is no cost premium for a compliant product.[1]

Estimated Life Cycle Cost Impact:

For a typical single family home which has roughly 2.2 showerheads, this proposal would save approximately 5,100 gallons of water per year and result in $1,170 in utility cost savings over the 10 year life of the fixture.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

To estimate the roughly $1,170 in life cycle cost savings, we assumed one showerhead would save 2,247 gallons of water per year resulting in 261 kWh of electricity savings and 13.4 therms/year of savings from a natural gas or oil water heater was made based on savings estimates from the appliance standards awareness program.[2] It was assumed that a typical single family home has roughly 2.2 showerheads.[3] Water and waste water prices were estimated at $11 per thousand gallons and the effective useful life of the showerhead was estimated to be 10 years.[4] It was assumed that 48% of water heaters were natural gas, 46% were electric and 6% were fuel oil based on the 2020 Residential Energy Consumption Survey.[5] Electricity was estimated to cost $0.15/kWh[6], natural gas was estimated at $1.42/therm[7] fuel oil was estimated at $3.06/therm[8] using average annual residential utility prices from the Energy Information Administration.

RP7-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: Shower users will stay in the shower longer, therefore there is no water savings. There is no data to support that there is a water savings. (10-0)

RP7-24

Individual Consideration Agenda

Comment 1:

IRC: TABLE P2903.2

Proponents: Edward R. Osann, Natural Resources Defense Council, Natural Resources Defense Council requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Residential Code

TABLE P2903.2 MAXIMUM FLOW RATES AND CONSUMPTION FOR PLUMBING FIXTURES AND FIXTURE FITTINGS [b]

PLUMBING FIXTURE OR FIXTURE FITTING	MAXIMUM FLOW RATE OR QUANTITY
Lavatory faucet	2.2 gpm at 60 psi
Shower head [a]	~~2.0~~ 2.5 gpm at 80 psi
Sink faucet	2.2 gpm at 60 psi
Water closet	1.6 gallons per flushing cycle

For SI: 1 gallon per minute = 3.785 L/m, 1 pound per square inch = 6.895 kPa.

a. A hand-held shower spray shall be considered to be a shower head. Where a shower compartment is served by multiple shower heads, the concurrent discharge of all shower heads controlled by a single valve shall not exceed the maximum flow rate.

b. Consumption tolerances shall be determined from referenced standards.

Reason: This public comment differs from the proposal as submitted by restoring the code's current maximum flow rate for shower heads of 2.5 gpm, but keeping the addition to the footnote that limits the concurrent flow from all shower heads controlled by a single valve to 2.5 gpm.

In disapproving the proposal as submitted, the committee raised a concern that people would take longer showers when using shower heads with lower maximum flow rates, and thus there would be no savings. However, this public comment removes the concern about lower flow rates entirely. The comment confines the proposal to ensuring that the code's current requirement (as well as similar federal, state, and local requirements) for the maximum flow rate for a shower head (2.5 ppm) is not bypassed with multi-head arrays operating simultaneously through a single valve to produce wasteful flows of 5 gpm or more. As modified by the public comment, this proposal is a common sense clarification to the code.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is a clarification, and imposes no additional costs of construction to achieve compliance.

Comment (CAH2)# 591

RP8-24

IRC: P2905.3

Proposed Change as Submitted

Proponents: Anthony Floyd, City of Scotsdale, City of Scottsdale (afloyd@scottsdaleaz.gov); Edward R. Osann, Natural Resources Defense Council, Natural Resources Defense Council (eosann@nrdc.org)

2024 International Residential Code

Revise as follows:

P2905.3 Hot water supply to fixtures. The *developed length* of *hot water* piping, from the source of the *hot water* to the fixtures that require *hot water*, shall not exceed ~~100 feet (30 480 mm)~~50 feet (15 240 mm) Water heaters and recirculating system piping shall be considered to be sources of hot water.

Reason: This change reduces the length of hot water supply line from the source of hot water to the fixtures unless part of a hot water recirculation system. The 50-foot limit is replicated from IPC Section 607.2. Hot water supply lines greater than 50 feet waste water (proportional to pipe size) while occupants wait for hot water to reach fixtures for bathing, washing and culinary purposes. Even though hot water supply lines are insulated, the hot water remaining in the lines between demand periods cools down. Limiting the length and consequent volume of heated water in the supply lines reduce the amount of wasted water and occupant waiting time.

Bibliography: WaterSense Guide for Efficient Hot Water Delivery Systems -https://www.epa.gov/sites/default/files/2017-01/documents/ws-homes-hot-water-distribution-guide.pdf

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

A hot water pump will be required where the hot water supply line exceeds 50 feet between the water heater and furthest fixture. The immediate cost of a recirculation pump range from $100 to $400 depending on size and control features.

Estimated Immediate Cost Impact Justification (methodology and variables):

Variables include length of hot water supply line between the water heater and the furthest fixture. Approximately 10 to 15 percent of the energy use associated with a hot water delivery system is wasted in distribution losses. The average home wastes more than 3,650 gallons of water per year waiting for hot water to arrive at the point of use. Annual energy and water savings will offset the upfront cost within 5 years.

RP8-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The cost to install a recirculation pump at the water heater is at least $800-$1000. The cost to the homeowner is greater. The IRC should not match what is in the IPC as the cost impact is unacceptable. There are other options that can be used. (10-0)

RP8-24

Individual Consideration Agenda

Comment 1:

IRC: SECTION 202 (New), P2905.3

Proponents: Edward R. Osann, Natural Resources Defense Council, Natural Resources Defense Council (eosann@nrdc.org); Anthony Floyd, City of Scottsdale, City of Scottsdale (afloyd@scottsdaleaz.gov) requests As Modified by Committee (AMC2)

Replace as follows:

2024 International Residential Code

Add new definition as follows:

PRINCIPAL SHOWER. The shower in a bathroom adjoining the largest bedroom. If no bathroom adjoins the largest bedroom. the shower in the largest bathroom is the principal shower.

Revise as follows:

P2905.3 Hot water supply to fixtures. The developed length of hot water piping, from the source of the hot water to the fixtures that require hot water, other than a principal shower, shall not exceed 100 feet (30 480 mm). The developed length of hot water piping, from the source of the hot water to a principal shower shall not exceed 50 feet (15 240 mm). Water heaters and recirculating system piping shall be considered to be sources of hot water.

Exception: A principal shower incorporated in an addition or repair shall be permitted to be connected to hot water piping with a developed length not greater than 100 feet.

Reason: As revised by this public comment, RP8-24 will be much narrower in scope while still providing substantial value to the home's residents. This comment maintains the code's current limitation on domestic hot water pipe length at 100 feet for all fixtures, except one: the primary shower, where the maximum hot water pipe length is reduced to 50 feet. To avoid ambiguity, a definition is added for "primary shower".

As noted in the proposal as introduced, limiting the length of domestic hot water piping reduces the amount of energy and water that is wasted as cold or tepid water is being purged while waiting for hot water to arrive. These benefits will accrue to residents over the life of the building. Focussing the new 50-foot limitation on the home's single primary shower will capture the lion's share of the benefits of the original proposal, while greatly reducing the likelihood that a hot water recirculation system will be installed. Note also that the 50-foot limit only applies to a primary shower in new construction, as repairs and additions are explicitly excluded. Thus, this requirement can be met at the design stage of a new home without adding hot water recirculation.

The revisions proposed in this public comment are responsive to concerns raised at the first committee hearing, namely that limiting hot water pipe length to 50 feet for all fixtures, including bar sinks, laundry trays, and powder rooms, etc., and all types of projects, including additions, would inevitably require the addition of a costly hot water recirculation system, which adds to costs and energy usage, obviating the cost-saving benefits of reduced energy and water use from the 50-foot limitation. So in response, the comment revises the proposal to limit its application to a primary shower, where purging is a significant and near-daily occurrence, and excludes repairs and additions from triggering the requirement. In this way, a new home's designer can accommodate the 50-foot pipe limit at the design stage, without incurring the cost of a recirculation system.

Available data supports a focus on reducing water purging at the shower. US EPA estimated in 2010 that per capita shower usage was 0.67 showers per day, which can be extrapolated to over 200 million showers nationwide each day. Consistent with this estimate, the Residential End Uses of Water Study 2 (2016) found that in single family homes, there are .66 showers per capita per day, or about 1.8 showers per household per day. Showers and faucets are the two largest uses of hot water. But while showers and faucets were found to use about the same amount of water overall, the share of hot water is higher in showers at 66% compared to faucets at 57%, resulting in higher hot water use for showers (18 gal/household/day) than for faucets (15 gphd). By zeroing in on the primary shower for reduced pipe length, this public comment will capture much of the savings intended by the original proposal without incurring the cost of a hot water recirculation system.

Long wait time for hot water to arrive for showering is a well-know consumer complaint. Without designers' attention to their DHW layouts, larger new homes can easily impose wait times of a minute or more on their new occupants. This can be illustrated by an example of a 100-foot run of copper L piping to a shower. Assuming the piping is 20 feet of 3/4 inch and 80 feet of 1/2 inch, a total of 1.47 gallons is entrained in the pipe run. Purging requires approximately twice this amount to be drawn before hot water for comfortable showering arrives, because after the standing water in the pipe is initially purged, the first draw of hot water from the water heater steadily loses heat until the pipe material itself heats up through its full 100-foot length. In this example, 2.94 gallons of water must be purged, and with a code-minumum showerhead flowing at 2.5 gpm, the resulting wait time is 1 minute and 10 seconds. If a high-efficincy showerhead is present, the wait time will be longer. Unless occupants take back-to-back showers, this waste of time, water, and energy will be repeated for every showring event over the life of the building. This proposal, as modified by this public comment, has the potential to cut such waste nearly in half.

Bibliography: US Environmental Protection Agency, WaterSense Specification for Showerheads Supporting Statement, March 4, 2010. https://www.epa.gov/watersense/product-background-materials#showerhead

US Environmental Protection Agency, WaterSense Guide for Efficient Hot Water Delivery Systems, July 24, 2014. https://www.epa.gov/sites/default/files/2017-01/documents/ws-homes-hot-water-distribution-guide.pdf

DeOreo et al, Residential End Uses of Water Version 2, Water Research Foundation, Report # 4309b, 2016.

IAPMO, Water Efficiency and Sanitation Standard for the Built Environment (WEStand) 2020, Table1003.7.1, Water Volume (oz/ft) For Distribution Piping Materials.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

The code change proposal can be met through design changes without adding to construction costs. Reduced pipe length may result in cost savings for materials and labor.

Estimated Immediate Cost Impact Justification (methodology and variables):

Potential construction cost savings depend on the materials specified for the job.

A reduction of up to 50 feet of pipe length in new construction would reduce material costs by at least the following:

- 50 feet of copper L at $3.52/ft = $176.00
- 50 feet of PEX B at 30c/ft = $15.00

Fewer elbows or other fittings would yield additional savings. Labor savings would be additional.

Source: www.homedepot.com. July 7, 2024.

Comment (CAH2)# 575

FG1-24

IFGC: 303.3

Proposed Change as Submitted

Proponents: Guy McMann, Jefferson County Colorado, Colorado Association of Plumbing and Mechanical Officials (CAPMO) (gmcmann@jeffco.us)

2024 International Fuel Gas Code

Revise as follows:

303.3 Prohibited locations. *Appliances* shall not be located in ~~sleeping rooms~~, bedrooms, bathrooms, toilet rooms, storage closets or surgical rooms, or in a space that opens only into such rooms or spaces, except where the installation complies with one of the following:

1. The *appliance* is a direct-vent *appliance* installed in accordance with the conditions of the listing and the manufacturer's instructions.
2. Vented room heaters, wall furnaces, vented decorative *appliances*, vented gas fireplaces, vented gas *fireplace* heaters and decorative *appliances* for installation in vented solid fuel-burning fireplaces are installed in rooms that meet the required volume criteria of Section 304.5.
3. A single wall-mounted unvented room heater is installed in a bathroom and such unvented room heater is equipped as specified in Section 621.6 and has an input rating not greater than 6,000 Btu/h (1.76 kW). The bathroom shall meet the required volume criteria of Section 304.5.
4. A single wall-mounted unvented room heater is installed in a bedroom and such unvented room heater is equipped as specified in Section 621.6 and has an input rating not greater than 10,000 Btu/h (2.93 kW). The bedroom shall meet the required volume criteria of Section 304.5.
5. The *appliance* is installed in a room or space that opens only into a bedroom or bathroom, and such room or space is used for no other purpose and is provided with a solid weather-stripped door equipped with an *approved* self-closing device. *Combustion air* shall be taken directly from the outdoors in accordance with Section 304.6.
6. A clothes dryer is installed in a residential bathroom or toilet room having a permanent opening with an area of not less than 100 square inches (0.06 m^2) that communicates with a space outside of a bedroom, bathroom, toilet room or storage closet.

Reason: 1. Replacing the words sleeping room with bedroom in the first paragraph of the code will align it with the exceptions. Nowhere in the exceptions is sleeping room used.

2. The question is, what is the difference between a sleeping room and a bedroom? The Miriam Webster dictionary defines a bedroom as: a room furnished with a bed and intended primarily for sleeping. There is no definition in Miriam Webster for sleeping room. A definition of sleeping area can be found in the Collins dictionary where a sleeping area is defined as: an area in a room or house where people can sleep but there is no definition of sleeping room. Law Insider has multiple citations for sleeping room from many different municipalities across the country. Most of the citations have differing opinions of what a sleeping room is or is not. In Chapter 2 of the IFGC, IMC, IBC or IRC sleeping room is not defined so anyone using the International Codes is left to figure out on their own what the term sleeping room encompasses. In summation, the words sleeping room are too vague for proper interpretation of what the code is trying to describe.

3. Sleeping room is a holdover from the 2003 IFGC Section 303.3 Prohibited locations code. There is no definition for sleeping room in Chapter 2 of the 2003 IFGC.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

There is no cost as this is editorial in nature.

FG1-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee agrees 9-1 that the sleeping room is different than a bedroom and the way the current proposal is written may leave room for more unintended consequences.

FG1-24

Individual Consideration Agenda

Comment 1:

Proponents: Guy McMann, Jefferson County Colorado, CAPMO (gmcmann@jeffco.us) requests As Submitted

Reason: Chapter 2 (Definitions) does not list the term sleeping rooms/room. With no definition, use of the term sleeping rooms/room can change the meaning of the technical requirements of 303.3 (Prohibited locations). For example, walking through a room with a fold-out couch, futon or Murphy style bed to get to a mechanical room could potentially make any mechanical room a prohibited location. Anyone wanting to properly apply the requirements of 303.3 is left to determine on their own what a sleeping room is, making it impossible to have a consensus of what a prohibited location is for homeowners, contractors and code officials.

IFGC 201.3 TERMS DEFINED IN OTHER CODES

Where terms are not defined in this code and are defined in the International Building Code, International Fire Code, International Mechanical Code or International Plumbing Code, such terms shall have meanings ascribed to them as in those codes.

The IBC, IFC, IMC, IPC and IECC have no definition for the term “sleeping room”.

IFGC 201.4 TERMS NOT DEFINED

Where terms are not defined through the methods authorized by this section, such terms shall have ordinarily accepted meanings such as the context implies.

Searching online for the term “sleeping room” multiple definitions from jurisdictions across the country can be found. For example,

1. Steamboat Springs, CO: Shall mean any room that has a bed, bunk beds, daybed or other furniture for sleeping, including, without limitation, a roll out couch or futon.

2. Kasson Township, MI: Sleeping room means space, other than a bedroom, used for overnight sleeping purposes.

3. Fayette, IA: Sleeping room means a room which has two working electrical outlets, an overhead light and a window to the outside.

4. El Paso County, CO: Pikes Peak Regional Building Department has an amendment to the 2021 IRC, Chapter 2 Definitions which states a sleeping room is a habitable space using primarily for sleeping purposes and containing a closet 16 inches or greater in depth.

Using these four examples it is apparent that sleeping room could be interpreted to be almost any room in a house, which could have the unintended consequence of making many mechanical rooms into a prohibited location. A contractor replacing a gas fired appliance who

has to walk through a room with a couch folded out into a bed might tell the homeowner the appliance is in a prohibited location. This assessment could encourage the homeowner to replace the appliance without obtaining a permit. Calling the room with the fold-out couch a sleeping room, a contractor might require the homeowner to make changes to the mechanical room such as

installing a self-closing gasketed door or to add another entrance. Any unnecessary changes such as these cost the homeowner for no other reason except that IFGC 303.3 has the term sleeping room in it. The same type of problem could occur when an inspector goes to a house to check a replacement appliance. The inspector might have to walk through a rec room that has a mattress on the floor and decide the mattress has made the rec room into a sleeping room and that the appliance is now installed in a prohibited location.

CAH1 COMMITTEE COMMENTS AND CONCERNS

It was mentioned by committee members and opponents to this proposed change that replacing sleeping room with bedroom would have unintended consequences by making the code less restrictive. I would argue keeping the term sleeping room has unintended consequences by making the code more difficult to properly enforce and goes against the stated purpose of the I Codes and Chapter 2, which is to maintain a consensus on the specific meaning of each term contained in the code. I would also argue that the IFGC is not in alignment with the other I codes because they do not reference sleeping room. It was also suggested at CAH1 that a definition should be added to the IFGC to clarify what a sleeping room is. Because of how ambiguous sleeping room is giving it a definition would be a very difficult task. An easier way to solve the problem is to remove sleeping rooms/room from 303.3 and replace it with bedrooms/bedroom. Why make a new definition for sleeping rooms/room when there is already an industry standard definition for bedroom? .

BENEFITS

1. Removing sleeping rooms/room from IFGC 303.3 and replacing it with bedrooms/bedroom provides better clarity of what is a prohibited location.

2. The purpose of each code cycle is to make the code easier to understand and more beneficial to anyone trying to properly apply the code.

3. Everyone knows what a bedroom is.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Comment (CAH2)# 388

FG4-24

IFGC: SECTION 202, SECTION 315 (New), 315.1 (New), 315.1.2 (New)

Proposed Change as Submitted

Proponents: Marcelo Hirschler, GBH International, GBH International (mmh@gbhint.com)

2024 International Fuel Gas Code

Delete without substitution:

~~**[M] NONCOMBUSTIBLE MATERIALS.** Materials that, where tested in accordance with ASTM E136, have not fewer than three of four specimens tested meeting all of the following criteria:~~

1. ~~The recorded temperature of the surface and interior thermocouples shall not at any time during the test rise more than 54ºF (30ºC) above the furnace temperature at the beginning of the test.~~
2. ~~There shall not be flaming from the specimen after the first 30 seconds.~~
3. ~~If the weight loss of the specimen during testing exceeds 50 percent, the recorded temperature of the surface and interior thermocouples shall not at any time during the test rise above the furnace air temperature at the beginning of the test, and there shall not be flaming of the specimen.~~

Add new text as follows:

SECTION 315
NONCOMBUSTIBLE MATERIALS

315.1 Testing. Noncombustible materials shall be those materials that comply with Section 703.3.1 of the International Building Code.

315.1.2 Inherently noncombustible materials. Inherently noncombustible materials, such as concrete and steel, shall not be required to be tested to be acceptable as noncombustible materials.

Reason: The so-called definition contained in the 2024 IFGC is said to be under the jurisdiction of the IMC (in accordance with the [M] in front of it). In fact it is not identical to the definition in the IMC, which reads: "Noncombustible material: a material that passes ASTM E136." Furthermore, the present definition in the IFGC is no longer consistent with the language contained in ASTM E136 and also addresses only one of the two options included in ASTM E136 for a material to be considered noncombustible. Finally, the "definition" in the IFGC is actually a "requirement" since it requires materials to meet certain criteria to be classified as a noncombustible material. ICC definitions should not contain requirements.

In the area of material regulation, materials that pass ASTM E136 have long been considered to be those that are noncombustible materials, and that concept is consistent with the flawed "definition" in the IFGC.

This proposal recommends including a correct requirement for what materials shall be considered noncombustible materials and it is to comply with the IBC section 703.3.1. A second proposed section states that a requirement for what is a noncombustible material does not mean that clearly noncombustible materials, such as steel, concrete, or masonry, need to be tested, for example to ASTM E136.

Note that ASTM E136 is one of the very few ASTM fire test standards that has acceptance criteria. The acceptance criteria are different from the theoretical definition of a noncombustible material.

If no requirement exists for what is a noncombustible material, experience indicates that some material manufacturers have claimed that their material is noncombustible when it simply exhibits improved fire performance. When searching the internet, multiple web sites offer materials or products that are alleged to be noncombustible when that claim is incorrect. There is often confusion in the public mind between how to consider a material that performs better than typical combustible materials, but is not enough for the material to be

considered noncombustible.

This proposal recommends including a correct requirement for what materials shall be considered noncombustible materials and that is that they need to comply with the IBC section 703.3.1. A second section states that a requirement for what is a noncombustible material does not mean that clearly noncombustible materials, such as steel, concrete, or masonry, need to be tested, for example to ASTM E136.

Equivalent proposals are being submitted to the IFC (by FCAC), the IPC, and the IMC, all of which use noncombustible materials.

Another proposal revises the definitions of "combustible material" in the IMC and IFGC to clarify that the whether a material is or is not noncombustible is the result of a classification. The IBC does not "define" a noncombustible material but contains requirements for such materials.

The language in section 703.3.1 of the IBC reads as follows:*703.3.1 Noncombustible materials. Materials required to be noncombustible shall be tested in accordance with ASTM E136. Alternately, materials required to be noncombustible shall be tested in accordance with ASTM E2652 using the acceptance criteria prescribed by ASTM E136.*

Exception: Materials having a structural base of noncombustible material as determined in accordance with ASTM E136, or with ASTM E2652 using the acceptance criteria prescribed by ASTM E136, with a surfacing of not more than 0.125 inch (3.18 mm) in thickness having a flame spread index not greater than 50 when tested in accordance with ASTM E84 or UL 723 shall be acceptable as noncombustible.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal simply moves a requirement (that is not consistent with the present edition of ASTM E136) into a place where the requirement can be enforced.

FG4-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee voted 10-4 to disapprove of the proposed code language. The committee suggests that a modification is needed for the inconsistency of the code language as submitted. This proposal recommends including a requirement for what materials shall be considered noncombustible materials, and that is that they need to comply with IBC Section 703.3.1. A second section states that a requirement for what is a noncombustible material does not mean that clearly noncombustible materials, such as steel, concrete, or masonry, need to be tested, for example, to ASTM E136.

FG4-24

Individual Consideration Agenda

Comment 1:

IFGC: SECTION 315, 315.1, 315.1.2

Proponents: Marcelo Hirschler, GBH International, GBH International (mmh@gbhint.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Fuel Gas Code

SECTION 315
NONCOMBUSTIBLE BUILDING MATERIALS

315.1 Testing. Noncombustible building materials shall be those materials that comply with Section 703.3.1 of the International Building Code.

Revise as follows:

315.1.2 ~~Inherently noncombustible materials~~ Testing not required. ~~Inherently noncombustible materials, such as concrete and steel,~~ The following building materials shall not be required to be tested to be acceptable as noncombustible building materials.

1. Steel,
2. concrete, containing no combustible aggregates or fibers,
3. masonry, containing no combustible aggregates or fibers,
4. glass (excluding plastic glazing),
5. 5xxx and 6xxx series aluminum alloys.

Reason: The so-called definition contained in the 2024 IFGC is said to be under the jurisdiction of the IMC (in accordance with the [M] in front of it). In fact it is not identical to the definition in the IMC, which reads: "Noncombustible material: a material that passes ASTM E136." Furthermore, the present definition in the IFGC is no longer consistent with the language contained in ASTM E136 and also addresses only one of the two options included in ASTM E136 for a material to be considered noncombustible. Finally, the "definition" in the IFGC is actually a "requirement" since it requires materials to meet certain criteria to be classified as a noncombustible material. ICC definitions should not contain requirements.

Several materials can claim to be inherently noncombustible, in many cases without it being truly valid. For example, any plastic or wood materials are always combustible. This issue is an important consideration for building materials (see several examples in the IFGC where there are requirements that are different depending on whether the materials are or are not noncombustible).

Some materials exist (often insulation materials) where it is not possible to determine without testing (normally to ASTM E136, as required in the IBC) whether they are truly noncombustible. For example, fiberglass insulation materials will always contain some combustible binder to be useful. The material can pass the ASTM E136 test (and be noncombustible) if it contains a small amount of binder but fail the test with larger amount of binder. That can only be determined by testing and is impossible to note visually.

It makes no sense to test steel, concrete or masonry (if they contain no combustible aggregates or fibers; this would have to be certified by the proponent). Therefore, as it has been shown by testing (and common sense) that testing steel, concrete or masonry to ASTM E136 is unnecessary, as they will pass the test they can be excluded from being required to be tested.

However, some new building materials are made with organic (such as foam plastics) components to lower the weight and make them easier to manipulate. In that case, it is unclear whether they are truly noncombustible materials, and they would need to be tested to know the answer for sure. That is why the requirement has been added that they contain no combustible aggregates or fibers.

Test results from at least two testing labs have been able to show that glass (whether ordinary glass or quartz) truly meets the requirements of ASTM E136 and is a noncombustible material. The same is not true for other glazing materials, which are typically plastic and are combustible; they must be excluded.

That brings up the question of aluminum. Typical building materials are, more often than not, alloys of aluminum and other metals. The Aluminum Association has published a report in Building Safety Journal (August 17th, 2020) where they discuss the “noncombustibility” of aluminum. It is of great interest that the 4 aluminum alloys that they tested “were selected for their widespread use in construction”.

Those alloys tested all passed the ASTM E136 test. However, the same report also states that “Aluminum, just like many comparable metals, is not combustible in any general application other than when it is specifically made to be.” That suggests that there may be some aluminum alloys that may or may not be noncombustible. After considerable debate and investigation of test reports, consensus was reached that most of the aluminum alloys used as building materials belong to the 6xxx series of alloys, with less than 1.2% magnesium, and the main ones (such as 6063, 6061, 6005) have all been tested for noncombustibility. In terms of sheet aluminum products, the series 5xxx alloys (such as 5052, 5083, 5005) are often used in construction, with higher levels if magnesium (the highest being 5083, which contains 4.9% magnesium). This product has also been tested and shown to be noncombustible. Therefore, consensus was reached that it is safe to include “5xxx and 6xxx series aluminum alloys” to the list of building materials that do not require testing to be considered noncombustible materials.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This will clarify that a number of materials are clearly noncombustible and will not require additional fire testing. If anything, this comment will decrease costs because less testing for non combustibility will be needed.

Comment (CAH2)# 107

FG11-24 Part I

IFGC: SECTION 202, SECTION 202 (New), 301.3.1 (New), 301.3.2 (New), 301.5, 634.1, 701.1, 705.5.4

Proposed Change as Submitted

Proponents: Andrew Bevis, Chair, Plumbing, Mechanical and Fuel Gas Code Action Committee (pmgcac@iccsafe.org)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE FUEL GAS CODE COMMITTEE. PART II WILL BE HEARD BY THE IFC CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Fuel Gas Code

Revise as follows:

FUEL GAS. A natural gas, manufactured gas, liquefied petroleum gas or mixtures of these gases including up to 5-percent hydrogen gas by volume.

Add new definition as follows:

HYDROGEN ADMIXTURE. Fuel gas to which hydrogen is blended or mixed by the fuel supplier or at the point of delivery greater than 5% and less than 95%.

Add new text as follows:

301.3.1 Appliances and equipment listed and labeled for use with hydrogen admixture. Appliances and equipment operating on hydrogen admixtures shall be listed and labeled for operation on the hydrogen admixture limits defined under Section 101.2.1.1.

301.3.2 Piping systems listed and labeled for use with hydrogen admixture. Piping systems and fuel gas system components shall be listed and labeled for the applicable hydrogen admixture limits.

Revise as follows:

301.5 Label information. A permanent factory-applied nameplate(s) shall be affixed to *appliances* on which shall appear in legible lettering, the manufacturer's name or trademark, the model number, serial number and, for *listed appliances*, the seal or mark of the testing agency. A label shall include the hourly rating in British thermal units per hour (Btu/h) (W); the type of fuel gas *approved* for use with the *appliance*; and the minimum *clearance* requirements.

634.1 Installation. The installation of gaseous hydrogen systems shall be in accordance with ~~the applicable requirements~~ Chapter 7 of this code, the *International Fire Code* ~~and~~ the *International Building Code* and NFPA 2.

701.1 Scope. The installation of *gaseous hydrogen systems* shall comply with this chapter, ~~and~~ Chapters 53 and 58 of the International Fire Code and NFPA 2. Compressed gases shall also comply with Chapter 50 of the International Fire Code for general requirements.

705.5.4 Placing equipment in operation. After the *piping* has been placed in operation, all *equipment* shall be purged in accordance with ~~Section 707.2~~ NFPA 2 and then placed in operation, as necessary.

Reason: FUEL GAS

Natural gas utilities are implementing projects to blend gaseous hydrogen into natural gas to reduce their systems and consumers' "carbon footprints." Hydrogen admixtures have raised questions of compatibility of these blends with existing appliances, equipment, and piping systems and components.

Following the submission of a request for interpretation, CSA Group standards Technical Committees were provided access to a range of test data from a variety of sources, and upon careful review and analysis, agree that natural gas containing up to and including 5% of Hydrogen is covered by testing with Test Gas A. The Request for Interpretation (RFI), and the position of the Technical Committees, have

been published here:https://www.csagroup.org/documents/Formal_Interpretations.pdf

As a result, PMG CAC sees no reason to add specifications for such blends in ANSI accredited standards. However, code officials using the ICC Codes would be aided in understanding through the definition of 'fuel gas' that such blends are covered through the revised definition.

HYDROGEN ADMIXTURE

The proposed definition is to address Hydrogen Admixtures in the IFGC. Currently provisions do not exist to address Hydrogen Admixtures and their ranges when introduced to natural gas. Chapter 7 of the IFGC regulates Gaseous Hydrogen Systems which are defined as being 95% or higher GH2. This definition will help address ranges of hydrogen admixtures from 6%-94%.

Section 301.3.1

This is one of several proposals that address the potential for hydrogen admixtures. This specific proposal is designed to clarify that Appliances which operate on hydrogen admixtures are treated the same way all other fuel burning appliances are considered. They need to be listed and labeled for the specific fuel mixture that is supplied. This section is applicable to the IRC Chapter 24 as well as the IFGC.

Section 301.3.2

This is one of several proposals that address the potential for hydrogen admixtures. This specific proposal is designed to clarify that all piping and components which are intended to carry hydrogen admixtures are treated the same way all other piping and system components are considered. They need to be listed and labeled for the specific fuel mixture that is being transported. This section is applicable to the IRC Chapter 24 as well as the IFGC.

Section 301.5This proposal updates the current word fuel to fuel gas to ensure correlation to the revised definition for fuel gas that includes up to 5% hydrogen admixture by volume. All other fuels in accordance with Section 301.1.1 shall be regulated by the International Mechanical Code.

Section [A]101.2.1 scopes gaseous hydrogen systems directly to Chapter 7 which is complete for the for the piping system. A direct link to NFPA 2 has been provided for additional provisions that standard provides for.

Section 701.1

Once the user gets to the IFC references they find pointers to NFPA 2. This provides for a direct linkage which is important for those jurisdictions that do not use the IFC for construction purposes.Section 705.5.4

The IFC relies on NFPA 2 for this requirement and this change provides for consistency, Section 707.2 is proposed to be modified to point to NFPA 2.

This proposal is submitted by the ICC Plumbing Mechanical Gas Code Action Committee (PMGCAC)

PMGCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 PMGCAC has held 26 virtual meetings open to any interested party. In addition, there were several virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the PMGCAC website at PMGCAC.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal is a clarification of different fuel types to address the trend towards blended fuels.

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee voted 10-0 to disapprove of this proposal. The committee justified the suggested code language as not feasible in its current form. A modification would have supported the approval of this change; however, the proposed code language does not allow for the inference of safety for existing appliances in use.

FG11-24 Part I

Individual Consideration Agenda

Comment 1:

IFGC: SECTION 202, 301.3.1, 301.3.2

Proponents: Andrew Bevis, Chair, Plumbing, Mechanical and Fuel Gas Code Action Committee (pmgcac@iccsafe.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Fuel Gas Code

FUEL GAS. A natural gas, manufactured gas, liquefied petroleum gas or mixtures of these gases including up to 5-percent hydrogen gas by volume.

HYDROGEN ADMIXTURE.
Fuel gas to which hydrogen is blended or mixed by the fuel supplier or at the point of delivery greater than 5% by volume ~~and less than 95%~~.

301.3.1 Appliances and equipment listed and labeled for use with hydrogen admixture. Appliances and equipment operating on hydrogen admixtures shall be listed and labeled for operation ~~on~~ within the hydrogen admixture limits defined under Section ~~101.2.1.1~~ 101.2.2.1.

Delete without substitution:

~~**301.3.2 Piping systems listed and labeled for use with hydrogen admixture.** Piping systems and fuel gas system components shall be listed and labeled for the applicable hydrogen admixture limits.~~

Reason: This As Modified proposal adds a new definition of fuel gas that includes blends of hydrogen up to and including 5%. It also adds new definition of hydrogen admixtures and includes admixes greater than 5% but not exceeding 20% by volume of hydrogen. In addition, it adds new requirements that appliances burning admixtures shall be listed and labeled for the specific hydrogen admixture gas/hydrogen composition. Lastly, it deletes requirements for piping and components to be listed and labeled for hydrogen admixtures.

It is the intent of this As Modified proposal is to enable Hydrogen Admixtures that do not exceed 20%. Current industry testing is yielding results that do not need to go up to 95% Hydrogen Admixtures but rather limits them to 20% hydrogen, at this time. This suggested modification will align the IFGC with current technology and testing.

Deletion of proposed 301.3.2 is consistent with current IFGC requirements for fuel gas piping and components. In the IFGC Listing and Labeling pertains to the appliance itself in Section 301.3. It then goes on, in Chapter 4, to require specific listings for specific materials (piping, fittings, flow controls, etc…).

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal is a clarification of different fuel types to address the trend towards blended fuels.

Comment (CAH2)# 326

Comment 2:

IFGC: SECTION 202

Proponents: Ted Williams, Natural Gas Direct, LLC, Natural Gas Direct, LLC (ngdllc@outlook.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Fuel Gas Code

FUEL GAS. A ~~Natural~~ natural gas(including natural gases with up to and including 5 percent hydrogen gas by volume)
, manufactured gas, liquefied petroleum gas or mixtures of these gases.
~~including up to 5 percent hydrogen gas by volume.~~

HYDROGEN ADMIXTURE.
~~Fuel gas to which hydrogen is blended or mixed by the fuel supplier or at the point of delivery greater than 5% and less than 95%.~~

Natural gas into which hydrogen is blended or mixed by the fuel supplier or at the point of delivery to concentrations greater than 5% by volume.

Reason: Testing and analysis of natural gases containing up to and including 5% hydrogen by volume, whether introduced through admixing (i.e., blending) or incidentally introduced to the gas supply from other sources, have shown that physical and combustion properties of these compositional changes to natural gases due to hydrogen do not alter or negatively affect the interchangeability of the baseline natural gas (without hydrogen) from the resulting admixtures. However, natural gas admixtures with concentrations greater than 5% by volume must be specifically identified as “hydrogen admixtures,” which would be consistent with international descriptions of natural gas/hydrogen admixtures. The definition of "fuel gas" is changed editorially to clarify that hydrogen admixing applies to natural gas blending with hydrogen, not the other fuel gases covered by the definition.

Upper bounds for these hydrogen admixtures of natural gas may be defined in terms of physical, combustion, or interchangeability limits, and since these effects on natural gas may become significant with respect to composition and added hydrogen, those limits need to be addressed in IFGC requirements as supported by available research and analysis. The revised definition for “fuel gas” and new definition for “hydrogen admixture,” together with the requirements proposed here, present a coherent way of including natural gas/hydrogen admixture coverage in the IFGC and are technically consistent with changes being proposed in other codes and standards.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

These changes to definitions will not affect cost of construction since the additional coverage of hydrogen admixtures do not require differences in specifications or materials from fuel gas systems or appliances and equipment.

Comment (CAH2)# 551

M2-24

IMC®: CHAPTER 2, SECTION 202, CHAPTER 4, SECTION 403, 403.3.2, 403.3.2.1, 403.3.2.3, TABLE 403.3.2.3

Proposed Change as Submitted

Proponents: Gayathri Vijayakumar, Steven Winter Associates, Inc., Steven Winter Associates, Inc. (gayathri@swinter.com); Dylan Martello, Steven Winter Associates, Inc., Steven Winter Associates, Inc. (dmartello@swinter.com)

2024 International Mechanical Code

CHAPTER 2
DEFINITIONS

SECTION 202
GENERAL DEFINITIONS

BALANCED VENTILATION SYSTEM. A ventilation system that simultaneously supplies outdoor air to and exhausts air from a space, where the mechanical supply airflow rate and the mechanical exhaust airflow rate are each within 10 percent of the average of the two airflow rates.

CHAPTER 4
VENTILATION

SECTION 403
MECHANICAL VENTILATION

403.3.2 Group R-2, R-3 and R-4 occupancies. The design of local exhaust systems and ventilation systems for outdoor air in Group R-2, R-3 and R-4 *occupancies* shall comply with Sections 403.3.2.1 through 403.3.2.5.

403.3.2.1 Outdoor air for dwelling units. An outdoor air ventilation system consisting of a mechanical exhaust system, supply system or combination thereof shall be installed for each *dwelling unit*. Local exhaust or supply systems, including outdoor air ducts connected to the return side of an air handler, are permitted to serve as such a system. The outdoor air ventilation system shall be designed to provide the required rate of outdoor air continuously during the period that the *building* is occupied. The minimum continuous outdoor airflow rate shall be determined in accordance with Equation 4-9.

$$Q_{OA} = 0.03A_{floor} + 7.5(N_{br} + 1)$$

where: Q_{OA} = outdoor airflow rate, cfm **(Equation 4-9)**

A_{floor} = conditioned floor area, ft^2

N_{br} = number of bedrooms; not to be less than one

Exceptions:

1. The outdoor air ventilation system is not required to operate continuously where the system has controls that enable operation for not less than 1 hour of each 4-hour period. The average outdoor airflow rate over the 4-hour period shall be not less than that prescribed by Equation 4-9.

2. The minimum mechanical ventilation rate determined in accordance with Equation 4-9 shall be reduced by 30 percent provided that both of the following conditions apply:

   2.1. A ducted system supplies *ventilation air* directly to each bedroom and to one or more of the following rooms:

      2.1.1. Living room.

      2.1.2. Dining room.

      2.1.3. Kitchen.

   2.2. The whole-house ventilation system is a *balanced ventilation system*.

Revise as follows:

403.3.2.3 Local exhaust. Local exhaust systems shall be provided in kitchens, bathrooms and toilet rooms and shall have the capacity to exhaust the minimum airflow rate determined in accordance with Table 403.3.2.3.

Exception: Where the outdoor air ventilation system is a *balanced ventilation system*, the minimum continuous kitchen exhaust rate shall be reduced to 25 cfm and the minimum continuous bathroom exhaust rate shall be reduced to 20 cfm.

TABLE 403.3.2.3 MINIMUM REQUIRED LOCAL EXHAUST RATES FOR GROUP R-2, R-3 AND R-4 OCCUPANCIES

AREA TO BE EXHAUSTED	EXHAUST RATE CAPACITY
Kitchens	100 cfm intermittent or 50 cfm continuous
Bathrooms and toilet rooms	50 cfm intermittent or 25 cfm continuous

For SI: 1 cubic foot per minute = 0.0004719 m^3/s.

Reason: There is an exception 2.2 allowed in 403.3.2.1 which is impractical for use since there isn't a corresponding exception in 403.3.2.3. In a balanced system, if you reduce the supply air, you must also allow for a reduction in the exhaust air flows. This proposal creates that needed exception. The attached excel file demonstrates that these lower proposed continuous exhaust values (25cfm/kitchen and 20 cfm/bath) make the exception 2.2 more feasible.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

There is no expected change in cost - maybe a cost decrease since it could reduce the capacity needed for the balanced ventilation system.

Attached Files

- **2027 IMC balanced dwelling unit ventilation examples.xlsx**
  https://www.cdpaccess.com/proposal/10566/30527/files/download/4344/

M2-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee voted to disapprove this proposal by a vote of 12-2. The committee's decision was based on proposed reductions that conflict with other provisions in the code that address exhaust air flows and values.

Individual Consideration Agenda

Comment 1:

IMC®: 403.3.2.3, TABLE 403.3.2.3

Proponents: Gayathri Vijayakumar, Steven Winter Associates, Inc., Steven Winter Associates, Inc. (gvijayakumar@swinter.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Mechanical Code

Revise as follows:

403.3.2.3 Local exhaust. Local exhaust systems shall be provided in kitchens, bathrooms and toilet rooms and shall have the capacity to exhaust the minimum airflow rate determined in accordance with Table 403.3.2.3.

Exception: Where the outdoor air ventilation system is a *balanced ventilation system*, the minimum continuous kitchen exhaust rate shall be reduced to 35 ~~25~~ cfm and the minimum continuous bathroom exhaust rate shall be reduced to 20 cfm.

TABLE 403.3.2.3 MINIMUM REQUIRED LOCAL EXHAUST RATES FOR GROUP R-2, R-3 AND R-4 OCCUPANCIES

AREA TO BE EXHAUSTED	EXHAUST RATE CAPACITY
Kitchens	100 cfm intermittent or 50 cfm continuous
Bathrooms and toilet rooms	50 cfm intermittent or 25 cfm continuous

For SI: 1 cubic foot per minute = 0.0004719 m^3/s.

Reason: This public comment is in support of the proposed change to allow the lower local exhaust rates previously allowed in the IMC, but limiting the reduction only when used with balanced ventilations systems.

The ROCAH indicates that the decision to Disapprove was partly based on CAH testimony that implied there was a 'conflict with other provisions in the code'.

The section referenced in the testimony was 501.4 (Pressure equalization) and actually does not pose any 'conflict'.

The language in 501.4 referenced in the testimony is the same text as when the local exhaust rates were 25 / 20 cfm in 2021 IMC. If it did not pose a conflict then, it does not pose a conflict if the rates return to those same values in 2027 IMC.

The reason to allow the lower rates for balanced provides consistency with the 30% lower rates currently allowed for balanced systems. This PC increases the 25 cfm to 35 cfm to match the 30% reduction already allowed in Exception 2 of 403.3.2.1.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Possible decrease in cost compared to 2024 IMC requirement.

Comment (CAH2)# 243

M3-24

IMC®: SECTION 202 (New), CHAPTER 4, SECTION 405, 405.1, 405.2 (New)

Proposed Change as Submitted

Proponents: Jonathan Flannery, Pandemic Task Force Code Development Working Group, PTF CDWG (jflannery@aha.org)

2024 International Mechanical Code

Add new definition as follows:

BUILDING READINESS PLAN. A plan that documents the engineering controls that the facility mechanical systems will use for the facility to achieve its goals in non-normal mode.

CHAPTER 4
VENTILATION

SECTION 405
SYSTEMS CONTROL

405.1 General. Mechanical ventilation systems shall be provided with manual or automatic controls that will operate such systems whenever the spaces are occupied. Air-conditioning systems that supply required *ventilation air* shall be provided with controls designed to automatically maintain the required outdoor air supply rate during occupancy.

Add new text as follows:

405.2 Alternate Operation Capabilities. Where facilities are designed to operate in various modes in response to natural or manmade threat to/exposure of the building, the following shall be documented through an approved Building Readiness Plan (BRP). The BRP shall include the operations and maintenance (O&M) procedures involved in this operating mode, the mechanical equipment affected, final design drawings, critical asset inventory management plan, maintenance schedules, the maintenance requirements, frequencies, and establish a return to normal mode review period.

Reason: The Pandemic has demonstrated that it may be required to change operating mode of building mechanical ventilation systems under certain circumstances. These circumstances may include natural disasters such as forest fire, hurricane, pandemic, etc. or manmade such as terrorism, civil unrest, etc.

Building mechanical ventilation systems are now being built with different operating modes to reduce economic impact on the building and its occupant activities.

When such mode is created, they shall be documented for building operator to be aware of the capabilities available to operate the building.

The code does not mandate the need for alternative operating mode.

The ICC/NEHA Pandemic Task Force (PTF) was organized and tasked with researching the effects of the COVID-19 pandemic on the built environment and developing a roadmap and proposing needed resources – including guidelines, recommended practices, publications and updates to the International Codes® (I-Codes®) – that are necessary to overcome the numerous challenges that may be faced during future pandemics and to construct and manage safe, sustainable and affordable occupancy of the built environment. The ICC Pandemic Task Force Code Development Work Group (PTF CDWG) has conducted a comprehensive review of current code requirements as they relate to the prevention of the transmission of diseases and other serious health concerns and suggested revisions to current code requirements based on this assessment.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal documents alternate operational capabilities and does not impact construction.

M3-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee voted to disapprove this proposal by a vote of 10-4. The committee's decision was based on the proposal's unclear expectations and the proponents suggestion that this proposal is editorial in nature. The consensus of the committee is that the proposed code language may belong in the IPMC. Another reason is that the cost impact statement is not correct. There is a concern that the cost impact will be substantial if there is a need to install a system with increased ventilation.

M3-24

Individual Consideration Agenda

Comment 1:

IMC®: SECTION 202, SECTION 408 (New), 408.1 (New)

Proponents: Bernard Clement, Johnson Controls, ICC/NEHA Pandemic Task Force (PTF) (bernard.p.clement@jci.com); Julius Ballanco, P.E., JB Engineering and Code Consulting, P.C., Self (jbengineer@aol.com); Jonathan Flannery, ASHE/AHA, PTF CDWG (jflannery@aha.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Mechanical Code

BUILDING READINESS PLAN. A plan that documents the engineering controls that the facility mechanical systems will use for the facility to achieve its goals in ~~non-normal mode~~ response to natural or man-made emergencies.

Add new text as follows:

SECTION 408
SYSTEM DESIGN IN RESPONSE TO NATURAL OR MAN-MADE EXCEPTIONAL EVENT

408.1 General. Alternate Operation Capabilities. Where the ventilation system(s) in facilities are designed to operate in operationalize various alternate modes in response to natural or man-made emergencies anticipated to be over 96 hours threat to/exposure of the building, the registered design professional following shall document the alternate modes in the be documented through an approved Building Readiness Plan (BRP).The BRP shall include the emergency and related risk assessment, operations, and maintenance (O&M) procedures involved in this operating mode, the mechanical equipment affected, final design drawings, critical asset inventory management plan, maintenance schedules, the maintenance requirements, frequencies, and establish a return to

normal mode review period.

Reason: The changes to the original proposal address the concerns of the opponents and committee by:

1) Moving the proposal to a new section of Chapter 4 of the IMC.

2) Removed the term non-normal mode and modified the language to address emergencies anticipated to be over 96 hours. 96 hours is based on the current requirement by FEMA to address natural emergencies.

3) Removed the language regarding an approved BRP and added the language for a registered design professional

4) The PTF CDWG members and co-proponents agree with the committee that each condition will be unique. While this proposal does not require alternative modes to be implemented nor what or how those modes will be designed its requirement that these modes be documented in a usable plan will significantly assist owners in properly operating the alternative modes.

5) While the plan is about the operational alternative modes these are developed by the design engineer during the design process and need to be properly documented at this time such that the owner/operator can properly operate the system. Since this is a part of the design process it should be included within the IMC which governs the design of mechanical systems.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The decision to have various operational modes is not a requirement of this proposal. This proposal requires that if a building design includes alternate operational capabilities, these capabilities shall be documented in a building readiness plan (BRP). If an owner elects to have alternate modes of operations an operational sequence will be developed during the design process. This proposal only requires that this sequence be coordinated in a building readiness plan and since the sequence is already developed during the design process the cost of the plan will be negligible. Additionally, the plan does not require alternate modes to be implemented and any associated costs or savings with the implementation would be based on the owner's decision to implement the alternate modes and not the requirement to have a BRP.

Comment (CAH2)# 101

M5-24

IMC®: SECTION 202

Proposed Change as Submitted

Proponents: Andrew Bevis, Chair, Plumbing, Mechanical and Fuel Gas Code Action Committee (pmgcac@iccsafe.org)

2024 International Mechanical Code

Revise as follows:

BOILER.
A closed heating *appliance* intended to supply *hot water* or steam for space heating, processing or power purposes. Low-pressure boilers operate at pressures less than or equal to 15 pounds per square inch (psi) (103 kPa) for steam and 160 psi (1103 kPa) for water. High-pressure boilers operate at pressures exceeding those pressures. Multipurpose or combination boilers indirectly heat potable water through a heat exchanger.

WATER HEATER.
Any heating *appliance* or *equipment* other than a *boiler* that heats potable water and supplies such water to the potable *hot water* distribution system. Water heaters operate at pressures less than or equal to 150 pounds per square inch (psi) (1035 kPa) and 210°F (99°C). Multipurpose or combination water heaters provide space heating using the *hot water* supplied.

Reason: Clarify distinction between boilers and water heaters. Align with IMC 1002.2.2 which permits dual purpose water heaters using potable water hot water system, and IPC 608.17.3 which permits indirect heating of potable water by boilers.

The addition of water heater operating parameters provides distinction with the boiler definition which provides analogous parameters and aligns with the values in IPC 504.5.

These definitions are based on the appliance function which correlates to the standard(s) to which the appliance is listed. It is not uncommon for an appliance to be dual listed to as complying with more than one standard, and to be able to be configured for different uses. As an example, a commercial appliance may be simultaneously listed as conforming to a water heater standard, a boiler standard, and a pool and spa heater standard. The definition of this example appliance when installed would depend on how it is configured and utilized within the mechanical and plumbing system.

While some jurisdictions require compliance with ASME BPVC above certain vessel sizes and input capacities (e.g. 200,000 BTU/H input capacity and 120 gallon tank size), the distinction between a water heater and boiler is not dependent upon these parameters. The scope and requirements of the applicable product standards do not make these distinctions, and the function and requirements of the appliance within the mechanical and plumbing systems under scope of the IMC and IPC do not change based on these parameters.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal only clarifies the distinction between boilers and WHs .

M5-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: A committee vote of 8–6 disapproved the proposal. The committee reasoning is that the proposal needs work. There is currently a technical requirement in the definition. The committee would like to see this proposal again at CAH2.

Individual Consideration Agenda

Comment 1:

IMC®: SECTION 202

Proponents: Andrew Bevis, Chair, Plumbing, Mechanical and Fuel Gas Code Action Committee (pmgcac@iccsafe.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Mechanical Code

BOILER.
A closed heating *appliance* intended to supply *hot water* or steam for space heating, processing or power purposes. Low-pressure boilers operate at pressures less than or equal to 15 pounds per square inch (psi) (103 kPa) for steam and 160 psi (1103 kPa) for water. High-pressure boilers operate at pressures exceeding those pressures. ~~Multipurpose or combination boilers indirectly heat potable water through a heat exchanger.~~

WATER HEATER.
Any heating *appliance* or *equipment* other than a *boiler* that heats potable water and supplies such water to the potable *hot water* distribution system. Water heaters operate at pressures less than or equal to 150 pounds per square inch (psi) (1035 kPa) and 210°F (99°C). ~~Multipurpose or combination water heaters provide space heating using the *hot water* supplied.~~

Reason: Based on feedback from the committee and from AHRI members, this revised version of M5-24 removes the language regarding multi-purpose boilers and water heaters. (As a result, the boiler definition does not change from the current code.) The concern with this language was that it may not be aligned with products available in the marketplace.

The remaining language from the original M5-24 proposal was retained. The intent is to better draw a clearer distinction between water heaters and boilers to improve code usability. The addition of water heater operating parameters provides distinction with the boiler definition which provides analogous parameters and aligns with the values in IPC 504.5. These definitions are based on the appliance function which correlates to the standard(s) to which the appliance is listed. It is not uncommon for an appliance to be dual listed to as complying with more than one standard, and to be able to be configured for different uses. As an example, a commercial appliance may be simultaneously listed as conforming to a water heater standard, a boiler standard, and a pool and spa heater standard. The definition of this example appliance when installed would depend on how it is configured and utilized within the mechanical and plumbing system.

While some jurisdictions require compliance with ASME BPVC above certain vessel sizes and input capacities (e.g. 200,000 BTU/H input capacity and 120 gallon tank size), the distinction between a water heater and boiler is not dependent upon these parameters. The scope and requirements of the applicable product standards do not make these distinctions, and the function and requirements of the appliance within the mechanical and plumbing systems under scope of the IMC and IPC do not change based on these parameters.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The revised definitions clarifies existing requirements in the code.

Comment (CAH2)# 169

M7-24

IMC®: SECTION 202; IFGC: SECTION 202

Proposed Change as Submitted

Proponents: Marcelo Hirschler, GBH International, GBH International (mmh@gbhint.com)

2024 International Mechanical Code

Revise as follows:

COMBUSTIBLE MATERIAL. Any material not classified as a noncombustible material. ~~defined as noncombustible~~.

2024 International Fuel Gas Code

Revise as follows:

[M] COMBUSTIBLE MATERIAL. Any material not classified as a noncombustible material ~~defined as noncombustible~~.

Reason: ICC definitions should not contain requirements. The present IMC definition of "noncombustible material" does actually contain the requirement that the material passes ASTM E136. Therefore, this proposal recommends a change in language so that a combustible material is one that is not "classified" (rather than "defined") as a noncombustible material.

Section 703.3.1 of the IBC determines how to classify a material as noncombustible. If a material does not comply with those requirements it is not noncombustible. However,. the IBC does not define a material as noncombustible. This proposal addresses both the IMC and the IFGC definitions because the IFGC definition is shown as being under the responsibility of the IMC (as it is preceded by [M]).

Alternate proposals recommend that the IMC and IFGC replace their definitions of a noncombustible material by referencing section 703.3.1 of the IBC, and moving the requirements to be placed in Chapter 3, on general requirements.

IBC language:

703.3.1 Noncombustible materials. Materials required to be noncombustible shall be tested in accordance with ASTM E136. Alternately, materials required to be noncombustible shall be tested in accordance with ASTM E2652 using the acceptance criteria prescribed by ASTM E136.

Exception: Materials having a structural base of noncombustible material as determined in accordance with ASTM E136, or with ASTM E2652 using the acceptance criteria prescribed by ASTM E136, with a surfacing of not more than 0.125 inch (3.18 mm) in thickness having a flame spread index not greater than 50 when tested in accordance with ASTM E84 or UL 723 shall be acceptable as noncombustible.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This simply changes a definition.

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee voted 9-5 to disapprove this proposal. The committee's reasoning is that the proposal appears to conflict with the IBC in determining whether something is combustible or not.

M7-24

Individual Consideration Agenda

Comment 1:

IMC®: SECTION 202; IFGC: SECTION 202

Proponents: Marcelo Hirschler, GBH International, GBH International (mmh@gbhint.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Mechanical Code

Delete without substitution:

~~**COMBUSTIBLE MATERIAL.** Any material not classified as a noncombustible material. .~~

2024 International Fuel Gas Code

Delete without substitution:

~~**[M] COMBUSTIBLE MATERIAL.** Any material not classified as a noncombustible material .~~

Reason: The only definition of "combustible material" in the ICC codes is the one in the IMC/IFGC and it is misleading. ICC definitions should not contain requirements and the definition of "noncombustible material" in the IMC is a requirement and it is proposed to be replaced by another proposal/comment.
Deleting this definition does not conflict with the IBC (nor with any other ICC code) since the IBC does not define a "noncombustible material" but contains, in section 703, a requirement as to how to assess whether a material is noncombustible.

Companion proposals to the IMC and IFGC send the user of the codes to the IBC for what is a noncombustible material. By default, if a material is not noncombustible, it is combustible.

Section 703.3.1 of IBC 2024 states as follows:

703.3.1 Noncombustible materials. Materials required to be noncombustible shall be tested in accordance with ASTM E136. Alternately, materials required to be noncombustible shall be tested in accordance with ASTM E2652 using the acceptance criteria prescribed by ASTM E136.
Exception: Materials having a structural base of noncombustible material as determined in accordance with ASTM E136, or with ASTM E2652 using the acceptance criteria prescribed by ASTM E136, with a surfacing of not more than 0.125 inch (3.18 mm) in thickness having a flame spread index not greater than 50 when tested in accordance with ASTM E84 or UL 723 shall be acceptable as noncombustible.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

No cost impact as this simply deletes an unnecessary definition.

Comment (CAH2)# 194

M8-24

IMC®: SECTION 202 (New), 403.1, 403.3.2.1, 403.3.2.2 (New)

Proposed Change as Submitted

Proponents: Emily Toto, ASHRAE, ASHRAE (etoto@ashrae.org)

2024 International Mechanical Code

Add new definition as follows:

CORRIDOR. An enclosed *exit access* component that defines and provides a path of egress travel.

Revise as follows:

403.1 Ventilation system. Mechanical ventilation shall be provided by a method of supply air and return or *exhaust air*. ~~except that mechanical *ventilation air* requirements for Group R-2, R-3 and R-4 *occupancies* shall be provided by an exhaust system, supply system or combination thereof.~~The amount of supply air shall be approximately equal to the amount of return and *exhaust air*. The system shall not be prohibited from producing negative or positive pressure. The system to convey *ventilation air* shall be designed and installed in accordance with Chapter 6.

Exception: Systems that are designed and installed in accordance with Section 403.3.2.1 and Chapter 6.

403.3.2.1 Outdoor air for dwelling units. Where a *dwelling unit* of new construction opens to a corridor, *outdoor air* shall be mechanically supplied directly to the *dwelling unit.* For other *dwelling units*,~~An~~ outdoor air ~~ventilation system consisting of ashall be provided using a~~ mechanical exhaust system, mechanical supply system or combination thereof ~~shall be installed for each *dwelling unit*~~. Local exhaust or supply systems, including outdoor air ducts connected to the return side of an air handler, are permitted to serve as components of such a system.

~~The outdoor air ventilation system shall be designed to provide the required rate of outdoor air continuously during the period that the *building* is occupied. The minimum continuous outdoor airflow rate shall be determined in accordance with Equation 4-9.~~

$$Q_{OA} = 0.03A_{floor} + 7.5(N_{br} + 1)$$

~~(Equation 4-9)~~

~~where: Q_{OA} = outdoor airflow rate, cfm~~

~~A_{floor} = conditioned floor area, ft^2~~

~~N_{br} = number of bedrooms; not to be less than one~~

~~Exceptions:~~

1. ~~The outdoor air ventilation system is not required to operate continuously where the system has controls that enable operation for not less than 1 hour of each 4-hour period. The average outdoor airflow rate over the 4-hour period shall be not less than that prescribed by Equation 4-9.~~
2. ~~The minimum mechanical ventilation rate determined in accordance with Equation 4-9 shall be reduced by 30 percent provided that both of the following conditions apply:~~
   - 2.1. ~~A ducted system supplies *ventilation air* directly to each bedroom and to one or more of the following rooms:~~
     - 2.1.1. ~~Living room.~~
     - 2.1.2. ~~Dining room.~~
     - 2.1.3. ~~Kitchen.~~
   - 2.2. ~~The whole-house ventilation system is a *balanced ventilation system*.~~

Add new text as follows:

403.3.2.2 Outdoor air rate for dwelling units. The *dwelling unit's* outdoor air ventilation system shall be designed to provide the required rate of outdoor air continuously during the period that the *building* is occupied. The minimum continuous outdoor air rate shall be determined in accordance with Equation 4-9.

$$Q_{OA} = 0.03A_{floor} + 7.5(N_{br} + 1)$$

(Equation 4-9)

where: Q_{OA} = outdoor airflow rate, cfm

A_{floor} = conditioned floor area, ft^2

N_{br} = number of bedrooms; not to be less than one

Exceptions:

1. The outdoor air ventilation system is not required to operate continuously where the system has controls that enable operation for not less than 1 hour of each 4-hour period. The average outdoor airflow rate over the 4-hour period shall be not less than that prescribed by Equation 4-9.
2. The minimum *outdoor air* rate determined in accordance with Equation 4-9 shall be reduced by 30 percent provided that both of the following conditions apply:
   - 2.1. A ducted system supplies *outdoor air* directly to each bedroom and to one or more of the following rooms:
     - 2.1.1. Living room.
     - 2.1.2. Dining room.
     - 2.1.3. Kitchen.
   - 2.2. The *outdoor air* ventilation system is a *balanced ventilation system*.

Reason: Both ASHRAE 62.2 and the IMC require outdoor air to be provided to dwelling units. Research has demonstrated that a large percentage of the leakage area for attached dwelling units opening to enclosed corridors occurs across the corridor wall.[1] If an exhaust-only system is used to provide outdoor air for such units, we cannot realistically expect one unit of exhaust air to provide one unit of outdoor air. Increasing the exhaust airflow could potentially overcome the deficit, but this would also be expected to draw more air from the enclosed corridor, which is not permitted by IBC Section 1020.5 and IMC Section 601.2 (i.e., “Corridors shall not serve as supply, return, exhaust, relief or ventilation air ducts.”). To ensure that outdoor air is provided directly to dwelling units opening to corridors, 62.2 was recently amended to prohibit exhaust-only ventilation systems from providing the outdoor air required by the standard. Increasing the exhaust airflow rate could also draw more air from adjacent units. This proposal will align the IMC’s requirements for ventilation of dwelling units that open to a corridor with the requirements of ASHRAE 62.2. For clarity, this proposal cross-walks the IBC definition for corridor to the IMC. There is no need to reference an “enclosed corridor” because the enclosed nature is part of the proposed definition of corridor.

Bibliography: 1. Bohac D., and Sweeney L. 2020. Energy Code Field Studies: Low-Rise Multifamily Air Leakage Testing. Prepared by the Center for Energy and Environment, Ecotope, and The Energy Conservatory. Prepared for the U.S. Department of Energy Office of Energy Efficiency & Renewable Energy. https://www.energycodes.gov/sites/default/files/documents/LRMF_AirLeakageTesting_FinalReport_2020-07-06.pdf. [See Table 45, which shows average leakage to “common” area of 42% for 211 tightly- constructed dwelling units in 20 buildings of new construction located in 6 states. The report also notes, “for buildings in this study, “common areas” are made up almost completely of corridors and a few small rooms such as mechanical closets and elevator rooms. The 42% leakage did not include leakage around the door separating a dwelling unit from the corridor, which would have further increased this value.]

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

$513

Estimated Immediate Cost Impact Justification (methodology and variables):

An entry-level supply fan serving a single unit would cost about $240 (retail pricing as of May 22, 2023 through www.supplyhouse.com). According to Gordian Mechanical Costs with RSMeans data, 6" insulated flex duct would cost about $10.29/linear foot (line 233346101940; price includes installed cost for material and labor with contractor O&P and builder markup of 10%). For 20 feet of duct (to carry the supply air from an exterior wall to a supply register above the dwelling unit entryway), the ductwork is estimated at $10.29*20 = $206. A supply register is $67: $33 for the part and $34 for labor, based on an average of two HVAC contractor estimates. This provides the combined cost of $240+$206+$67 = $513.

Estimated Life Cycle Cost Impact:

$961

Estimated Life Cycle Cost Impact Justification (methodology and variables):

Assumes the supply fan is replaced after 15 years and a discount factor of 3% for a net present value of $154, but the ductwork and register do not need to be replaced. Assumes filter replacement twice per year at $15 each, for a net present value of $294. Combining the immediate cost and replacement cost: $513 + $154+$294 = $961

Note, however, that IMC Section 601.2 prohibits corridors from serving as "ventilation air ducts." Because the corridor is not permitted to provide the required volume of outdoor air to the dwelling unit, it is incumbent on the designer to demonstrate that an exhaust-only system has been engineered to deliver the volume of outdoor air required. The additional system components needed to do so (e.g., dedicated outdoor air inlets, exhaust fan with higher ventilation capacity and larger ducting, improved air sealing of the dwelling unit to the corridor, etc.) and associated energy costs to operate them, would help to offset the incremental cost incurred for the supply system. For example, a study (2025-T24-Final-CASE-Report-MF-IAQ.pdf (title24stakeholders.com) found that compartmentalizing dwelling units to 0.3 cfm50/sf was approximately $450 and to 0.23 cfm50/sf was approximately $900, for an incremental sealing cost of $450 to reach the tightness required for exhaust-only systems to pull air through passive vents. (Although 0.23 cfm50/sf may not be tight enough, as discussed in Copy-of-Passive-vent-calculator-to-post-to-CARB-siteMACRO.xlsm (live.com). Assuming four passive vents at $50 each ($25 per vent, $25 for labor), an exhaust-only system has an immediate cost of approximately $450 + 4 x $50 = $650, similar to the supply-only system. Furthermore, exhaust-only systems introduce unfiltered particulate matter which can worsen IAQ, and drafts which cause discomfort to occupants.

M8-24

Public Hearing Results (CAH1)

Committee Action: **As Modified by Committee**

Committee Modification:

403.3.2.1 Outdoor air for dwelling units. Where a *dwelling unit* of new construction opens to a ~~corridor~~ *corridor*, *outdoor air* shall be mechanically supplied directly to the *dwelling unit*. For other *dwelling units*, ~~outdoor air~~ *outdoor air* shall be provided using a mechanical ~~exhaust system~~ *exhaust system*, mechanical supply system or combination thereof. Local exhaust or supply systems, including ~~outdoor air~~ *outdoor air* ducts connected to the return side of an air handler, are permitted to serve as components of such a system.

403.3.2.2 *Outdoor air* rate for *dwelling units.* The *dwelling unit's* ~~outdoor air~~ *outdoor air* ventilation system shall be designed to provide the required rate of ~~outdoor air~~ *outdoor air* continuously during the period that the *building* is occupied. The minimum continuous ~~outdoor air~~ *outdoor air* rate shall be determined in accordance with Equation 4-9.

(Equation 4-9)

where:

Q_{OA} = ~~outdoor air~~*outdoor air* rate, cfm

A_{floor} = conditioned floor area, ft^2

N_{br} = number of bedrooms; not to be less than one

Exceptions:

1. The ~~outdoor air~~ *outdoor air* ventilation system is not required to operate continuously where the system has controls that enable operation for not less than 1 hour of each 4-hour period. The average ~~outdoor air~~*outdoor air* rate over the 4-hour period shall be not less than that prescribed by Equation 4-9.
2. The minimum *outdoor air* rate determined in accordance with Equation 4-9 shall be reduced by 30 percent provided that both of the following conditions apply:
   2.1. A ducted system supplies *outdoor air* directly to each bedroom and to one or more of the following rooms:
      2.1.1. Living room.
      2.1.2. Dining room.
      2.1.3. Kitchen.
   2.2. The *outdoor air* ventilation system is a *balanced ventilation system*.

Committee Reason: By a vote of 14-0, the committee voted to approve the proposal with modifications. The committee justifies the proposal and modification with the reasoning that the proposal aligns the code language among the I codes. With the approval of this proposal as modified, the ventilation standards for dwelling units facing a corridor will align with ASHRAE 62.2. To provide clarity, this suggestion correlates the IBC definition of a corridor to the IMC. Since the enclosed aspect is included in the suggested corridor definition, there is no need to reference an "enclosed corridor."

M8-24

Individual Consideration Agenda

Comment 1:

IMC®: SECTION 202, 403.1, 403.3.2.1, 403.3.2.2

Proponents: Emily Toto, ASHRAE, ASHRAE (etoto@ashrae.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Mechanical Code

CORRIDOR. An enclosed *exit access* component that defines and provides a path of egress travel.

403.1 Ventilation system. Mechanical ventilation shall be provided by a method of supply air and return or *exhaust air.* The amount of supply air shall be approximately equal to the amount of return and *exhaust air*. The system shall not be prohibited from producing negative or positive pressure. The system to convey *ventilation air* shall be designed and installed in accordance with Chapter 6.

Exception: Systems that are designed and installed in accordance with Section 403.3.2.1 and Chapter 6.

403.3.2.1 Outdoor air for dwelling units. Where a *dwelling unit* ~~of new construction~~ opens to a *corridor*, *outdoor air* shall be mechanically supplied ~~directly~~ to the *dwelling unit* through ducts or other equipment that terminate within the *dwelling unit*. For other *dwelling units,*

outdoor air shall be provided using a mechanical *exhaust system*, mechanical supply system or combination thereof. Local exhaust or supply systems, including *outdoor air* ducts connected to the return side of an air handler, are permitted to serve as components of such a system.

403.3.2.2 Outdoor air rate for dwelling units. The *dwelling unit's outdoor air* ventilation system shall be designed to provide the required rate of *outdoor air* continuously during the period that the *building* is occupied. The minimum continuous *outdoor air* rate shall be determined in accordance with Equation 4-9.

$$Q_{OA} = 0.03A_{floor} + 7.5(N_{br} + 1)$$

where: Q_{OA} = *outdoor air* rate, cfm **(Equation 4-9)**

A_{floor} = conditioned floor area, ft^2

N_{br} = number of bedrooms; not to be less than one

Exceptions:

1. The o*utdoor air* ventilation system is not required to operate continuously where the system has controls that enable operation for not less than 1 hour of each 4-hour period. The average *outdoor air* rate over the 4-hour period shall be not less than that prescribed by Equation 4-9.
2. The minimum *outdoor air* rate determined in accordance with Equation 4-9 shall be reduced by 30 percent provided that both of the following conditions apply:
   2.1. A ducted system supplies *outdoor air* directly to each bedroom and to one or more of the following rooms:
      2.1.1. Living room.
      2.1.2. Dining room.
      2.1.3. Kitchen.
   2.2. The *outdoor air* ventilation system is a *balanced ventilation system*.

Reason: The reason for the proposed changes are:

1) We do not need to refer to “a dwelling unit of new construction,” since the code is all about new construction, and the requirements for existing dwelling units are contained in 102.4 (additions, alterations, and repairs) and in the Existing Building Code.

2) To provide more precise language about how supply air is to be provided.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

These suggestions for improving the language of M8 were provided through discussions at PMGCAC meetings after CAH #1. They are intended only to provide clarification and do not change the cost impact provided in our first proposal. The original cost impact statement is copied below.

Original cost impact (increase):
Estimated Immediate Cost Impact:
$513

Estimated Immediate Cost Impact Justification (methodology and variables):
An entry-level supply fan serving a single unit would cost about $240 (retail pricing as of May 22, 2023 through www.supplyhouse.com). According to Gordian Mechanical Costs with RSMeans data, 6” insulated flex duct would cost about $10.29/linear foot (line 233346101940; price includes installed cost for material and labor with contractor O&P and builder markup of 10%). For 20 feet of duct (to carry the supply air from an exterior wall to a supply register above the dwelling unit entryway), the ductwork is estimated at $10.29*20 = $206. A supply register is $67: $33 for the part and $34 for labor, based on an average of two HVAC contractor estimates. This provides the combined cost of $240+$206+$67 = $513.

Estimated Life Cycle Cost Impact:
$961

Estimated Life Cycle Cost Impact Justification (methodology and variables):
Assumes the supply fan is replaced after 15 years and a discount factor of 3% for a net present value of $154, but the ductwork and register do not need to be replaced. Assumes filter replacement twice per year at $15 each, for a net present value of $294. Combining the immediate cost and replacement cost: $513 + $154+$294 = $961.

Note, however, that IMC Section 601.2 prohibits corridors from serving as “ventilation air ducts.” Because the corridor is not permitted to provide the required volume of outdoor air to the dwelling unit, it is incumbent on the designer to demonstrate that an exhaust-only system has been engineered to deliver the volume of outdoor air required. The additional system components needed to do so (e.g., dedicated outdoor air inlets, exhaust fan with higher ventilation capacity and larger ducting, improved air sealing of the dwelling unit to the corridor, etc.) and associated energy costs to operate them, would help to offset the incremental cost incurred for the supply system. For example, a study (2025-T24-Final-CASE-Report-MF-IAQ.pdf (title24stakeholders.com) found that compartmentalizing dwelling units to 0.3 cfm50/sf was approximately $450 and to 0.23 cfm50/sf was approximately $900, for an incremental sealing cost of $450 to reach the tightness required for exhaust-only systems to pull air through passive vents. (Although 0.23 cfm50/sf may not be tight enough, as discussed in Copy-of-Passive vent-calculator-to-post-to-CARB-siteMACRO.xlsm (live.com). Assuming four passive vents at $50 each ($25 per vent, $25 for labor), an exhaust-only system has an immediate cost of approximately $450 + 4 x $50 = $650, similar to the supply-only system. Furthermore, exhaust-only systems introduce unfiltered particulate matter which can worsen IAQ, and drafts which cause discomfort to occupants.

Comment (CAH2)# 298

Comment 2:

IMC®: 403.3.2.1

Proponents: Greg Johnson, Johnson & Associates Consulting Services, National Multifamily Housing Council (gjohnsonconsulting@gmail.com) requests As Modified by Committee (AMC2)

Further modify as follows:

2024 International Mechanical Code

Revise as follows:

403.3.2.1 Outdoor air for dwelling units. Where a *dwelling unit* ~~of new construction~~ opens to a *corridor*, one or more *ducts* shall supply *outdoor air* ~~shall~~ be ~~mechanically supplied directly~~ to the *dwelling unit*. For other *dwelling units, outdoor air* shall be provided using a mechanical *exhaust system*, mechanical supply system or combination thereof. Local exhaust or supply systems, including *outdoor air* ducts connected to the return side of an air handler, are permitted to serve as components of ~~such a~~ *ventilation* systems.

Reason: M8 is too prescriptive. There is no reason that the fan or fans moving outdoor air for corridor adjacent dwelling unit ventilation need to be located such that outdoor air is pushed into the unit versus located to pull outdoor air into the unit. What matters is that sufficient volume of outdoor air is ducted to the unit to mitigate potential draws from the corridor. Note that the building code prohibition on using corridors as plenums is intended to mitigate fire and smoke spread in a fire event. Until that fire event, any air movement between the dwelling unit and corridor has no significance. Ducting and appropriate fire resistive construction of penetrations and joints will address the fire event.

Also note that a parallel proposal to change ASHRAE 62.2 is being introduced at ASHRAE to remove this overly prescriptive requirement.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

More design flexibility in fan location and selection should tend to reduce construction costs, but specific configurations of mechanical systems are difficult to anticipate to quantify potential benefits.

Estimated Immediate Cost Impact Justification (methodology and variables):

Variables would be the size and layout of of the affected dwelling units as well as the design of the ventilation systems serving those units. Given those variables it is impossible to estimate a specific cost reduction.

Estimated Life Cycle Cost Impact:

N/A

Estimated Life Cycle Cost Impact Justification (methodology and variables):

N/A

Comment (CAH2)# 198

M9-24

IMC®: SECTION 202 (New), 1104.2, 1106.3, 1106.4

Proposed Change as Submitted

Proponents: Emily Toto, ASHRAE, ASHRAE (etoto@ashrae.org)

2024 International Mechanical Code

Add new definition as follows:

EFFECTIVE DISPERSAL VOLUME. The volume of a space or connected spaces in which leaked *refrigerant* will disperse.

EFFECTIVE DISPERSAL VOLUME CHARGE (EDVC). The maximum *refrigerant* charge permitted for an *effective dispersal volume.*

Revise as follows:

1104.2 Machinery room. Except as provided in Sections 1104.2.1 and 1104.2.2, all components containing the refrigerant shall be located either outdoors or in a *machinery room* where the quantity of refrigerant in an independent circuit of a *refrigeration system* exceeds both of the following:

1. T ~~t~~he amounts shown in Table 1103.1 , and
2. The effective dispersal volume charge as calculated in accordance with ASHRAE 15.

For refrigerant blends not listed in Table 1103.1, the same requirement shall apply ~~where the amount for any blend component exceeds that indicated in Table 1103.1~~ for each~~that~~ component. ~~This~~These requirements shall also apply where the combined amount of the blend components exceeds a limit of 69,100 parts per million (ppm) by volume. *Machinery rooms* required by this section and containing only Group A1 or B1 refrigerants shall be constructed and maintained in accordance with Section 1105. ~~for Group A1 and B1 refrigerants and in accordance with Sections 1105 and 1106 for Group A2, B2, A3 and B3 refrigerants.~~ *Machinery rooms* required by this section and containing any Group A2, B2, A3, or B3 flammable refrigerants shall be constructed and maintained in accordance with Sections 1105 and 1106. *Machinery rooms* required by this section, containing any Group A2L or B2L flammable refrigerants and containing no Group A2, B2, A3, or B3 flammable refrigerants, shall be constructed and maintained in accordance with Section 1105 and Section 1106.4.1 through 1106.4.3.

Exceptions:

1. *Machinery rooms* are not required for *listed equipment* and *appliances* containing not more than 6.6 pounds (3 kg) of refrigerant, regardless of the refrigerant's safety classification, where installed in accordance with the *equipment's* or *appliance's* listing and the *equipment* or *appliance* manufacturer's installation instructions.
2. Piping in compliance with Section 1107 is allowed in other locations to connect components installed in a *machinery room* with those installed outdoors.

1106.3 Class 2 and 3 refrigerants. Where any flammable refrigerants of Groups A2, A3, B2 and B3 are used, the *machinery room* shall conform to the Class I, Division 2, *hazardous location* classification requirements of NFPA 70.

1106.4 Group A2L and B2L refrigerants. *Machinery rooms* ~~for~~containing any Group A2L ~~and~~or B2L refrigerants and containing no refrigerants of Group A2, A3, B2, or B3 shall comply with Sections 1106.4.1 through 1106.4.3.

Reason: This proposal harmonizes with Addendum q to ASHRAE 15-2019. The latest published language of ASHRAE 15-2022 was used as the basis for this update. The revisions clarify which requirements apply in cases where a machinery room contains refrigerants from multiple safety groups. The revisions also refer to ASHRAE 15 for EDVC calculations, with the updated requirements for refrigerant charge quantity limits, for determination of when a machinery room is required.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal will have no impact on the cost of construction. These changes for clarity are largely editorial in nature to better align the IMC with ASHRAE 15.

M9-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee voted 7–6 against the proposal, with one member abstaining. The committee argues that the idea is improper since it does not clarify how to parcel out sections of the code. The committee is especially concerned about flammability and dangerous areas.

M9-24

Individual Consideration Agenda

Comment 1:

IMC®: SECTION 202 (New), SECTION 202, 1104.2, 1106.3, 1106.4

Proponents: Emily Toto, ASHRAE, ASHRAE (etoto@ashrae.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Mechanical Code

Add new definition as follows:

CONNECTED SPACES (REFRIGERATION). Two or more spaces connected by natural ventilation, a ducted air distribution system, or mechanical ventilation.

EFFECTIVE DISPERSAL VOLUME.
The volume of a space or ~~connected spaces~~*connected spaces* in which leaked *refrigerant* will disperse.

EFFECTIVE DISPERSAL VOLUME CHARGE (EDVC).
The maximum *refrigerant* charge permitted for an *effective dispersal volume.*

1104.2 Machinery room. Except as provided in Sections 1104.2.1 and 1104.2.2, all components containing the refrigerant shall be located either outdoors or in a *machinery room* where the quantity of refrigerant in an independent circuit of a *refrigeration system* exceeds both of the following:

1. The amounts shown in Table 1103.1, and
2. The effective dispersal volume charge as calculated in accordance with ASHRAE 15.

For refrigerant blends not listed in Table 1103.1, the same requirement shall apply for each component. These requirements shall also apply where the combined amount of the blend components exceeds a limit of 69,100 parts per million (ppm) by volume. *Machinery rooms* required by this section and containing only Group A1 or B1 refrigerants shall be constructed and maintained in accordance with Section 1105. *Machinery rooms* required by this section and containing any Group A2, B2, A3, or B3 flammable refrigerants shall be

constructed and maintained in accordance with Sections 1105 and 1106. *Machinery rooms* required by this section, containing any Group A2L or B2L flammable refrigerants and containing no Group A2, B2, A3, or B3 flammable refrigerants, shall be constructed and maintained in accordance with Section 1105 and Section 1106.4.1 through 1106.4.3.

Exceptions:

1. *Machinery rooms* are not required for *listed equipment* and *appliances* containing not more than 6.6 pounds (3 kg) of refrigerant, regardless of the refrigerant's safety classification, where installed in accordance with the *equipment's* or *appliance's* listing and the *equipment* or *appliance* manufacturer's installation instructions.
2. Piping in compliance with Section 1107 is allowed in other locations to connect components installed in a *machinery room* with those installed outdoors.

1106.3 Class 2 and 3 refrigerants. Where any flammable refrigerants of Groups A2, A3, B2 and B3 are used, the *machinery room* shall conform to the Class I, Division 2, *hazardous location* classification requirements of NFPA 70.

1106.4 Group A2L and B2L refrigerants. *Machinery rooms* containing any Group A2L or B2L refrigerants and containing no refrigerants of Group A2, A3, B2, or B3 shall comply with Sections 1106.4.1 through 1106.4.3.

Reason: In response to feedback from the Technical Committee, the definition of connected spaces is added for clarity. The effective dispersal volume for refrigeration systems is determined in accordance with ASHRAE Standard 15.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal will have no impact on the cost of construction. These changes for clarity are largely editorial in nature and better align the IMC with ASHRAE 15.

Comment (CAH2)# 203

M11-24

IMC®: SECTION 202 (New), 1104.5 (New)

Proposed Change as Submitted

Proponents: Emily Toto, ASHRAE, ASHRAE (etoto@ashrae.org)

2024 International Mechanical Code

Add new definition as follows:

GROUP CONTROLLER. An electrical or electronic control system that monitors and responds to multiple distinct inputs from two or more appliances or refrigeration machinery units.

Add new text as follows:

1104.5 Group Controller Requirements. Utilization of a group controller for multiple refrigeration systems serving the same space or connected spaces shall comply with the following:

1. The refrigerant detection system for each refrigeration system shall provide a signal to notify the group controller when mitigation actions are required in accordance with ASHRAE 15.
2. Where a group controller determines that a signal comes from one or more specific refrigeration systems, it shall be permitted for the group controller to specify which refrigeration systems activate or deactivate mitigation actions in accordance with ASHRAE 15. Where a group controller cannot determine the specific source of a signal, the group controller shall require all of the refrigeration systems serving the same space or connected spaces to activate mitigation actions in accordance with ASHRAE 15.

Reason: This code change proposal is for correlation with proposed revisions within Addendum t, ASHRAE 15-2022. Addendum t has undergone three Publication Public Reviews (PPRs) and is expected to be published in advance of the Technical Committee meetings. The requirements around group controllers contained within Addendum t are vital for data center applications, and detail how group controllers interact with refrigeration system mitigation strategies.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

These changes will have no impact on the cost of construction. Use of a group controller is optional for refrigeration systems.

M11-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee voted to disapprove this proposal with a vote of 8-6. The reasoning given is that addendum T has not been approved and that the proponent needs to develop a more suitable cost impact statement.

M11-24

Individual Consideration Agenda

Comment 1:

IMC®: SECTION 202, 1104.5

Proponents: Emily Toto, ASHRAE, ASHRAE (etoto@ashrae.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Mechanical Code

GROUP CONTROLLER.
An electrical or electronic control system that monitors and responds to ~~multiple~~ distinct inputs from two or more appliances or refrigeration machinery units.

1104.5 Group Controller Requirements. Utilization of a *group controller* for multiple *refrigeration systems* serving the same space or connected spaces shall comply with the following:

1. The refrigerant detection system for each *refrigeration system* shall provide a signal to notify the *group controller* when mitigation actions are required in accordance with ASHRAE 15.
2. Where a *group controller* determines that a signal comes from one or more specific *refrigeration systems*, it shall be permitted for the *group controller* to specify which *refrigeration systems* activate or deactivate mitigation actions in accordance with ASHRAE 15.
3. Where a *group controller* cannot determine the specific source of a signal, the *group controller* shall require all of the *refrigeration systems* serving the same space or connected spaces to activate mitigation actions in accordance with ASHRAE 15.
4. A *group controller* shall not deactivate mitigation actions where a refrigerant detection system outputs a signal to require *refrigerant* detector replacement.

Reason: We are submitting this comment based on the latest requirements from ASHRAE 15-2022 Addendum t, which is now published. These requirements are vital for data center applications where it is important to have group controllers for refrigerant system mitigation actions.

Bibliography: ANSI/ASHRAE Addendum t to ANSI/ASHRAE Standard 15, Safety Standard for Refrigeration Systems.
Published online at:

https://www.ashrae.org/file%20library/technical%20resources/standards%20and%20guidelines/standards%20addenda/15_2022_t_202

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal addresses how data center controls should be operating. It is unlikely to require new equipment because data centers are already equipped with extensive control systems due to the importance of monitoring. Under current requirements, controls are going to exist - for example - to ensure that every cooling unit can be regulated simultaneously through the building management system (BMS) in response to server loads throughout the day. Hence, this proposal would only require some programming changes to have the BMS to do one more thing than it already does, e.g., to increase airflow of a specific unit or units if there is a leak event.

Comment (CAH2)# 206

M18-24

IMC®: 307.2.1.1; IPC: [M] 314.2.1.1

Proposed Change as Submitted

Proponents: James Richardson, City of Columbus (Ohio), City of Columbus (Ohio) (jarichardson@columbus.gov)

2024 International Mechanical Code

Revise as follows:

307.2.1.1 Condensate discharge. Condensate drains shall not directly connect to any plumbing drain, waste or vent pipe. Condensate drains shall not discharge into a plumbing fixture other than a floor sink, floor drain, trench drain, mop sink, hub drain, standpipe, utility sink or laundry sink. ~~Condensate drain connections to a lavatory wye branch tailpiece or to a bathtub overflow pipe shall not be considered as discharging to a plumbing fixture.~~ Condensate drains shall be installed in accordance with Section 802.1.5 of the International Plumbing Code. Except where discharging to grade outdoors, the point of discharge of condensate drains shall be located within the same occupancy, tenant space or dwelling unit as the source of the condensate.

2024 International Plumbing Code

Revise as follows:

[M] 314.2.1.1 Condensate discharge. Condensate drains shall not directly connect to any plumbing drain, waste or vent pipe. Condensate drains shall not discharge into a plumbing fixture other than a floor sink, floor drain, trench drain, mop sink, hub drain, standpipe, utility sink or laundry sink. ~~Condensate drain connections to a lavatory wye branch tailpiece or to a bathtub overflow pipe shall not be considered as discharging to a plumbing fixture.~~ Condensate drains shall be installed in accordance with Section 802.1.5.Except where discharging to grade outdoors, the point of discharge of condensate drains shall be located within the same occupancy, tenant space or dwelling unit as the source of the condensate.

Reason: This proposal is intended to correct an issue that was created by an approved proposal in the IMC. The IMC should never dictate what fixtures are permitted to receive waste or to supersede requirements already in place in the IPC. The allowance by the IMC to connect condensate discharge to a lavatory tailpiece or a bathtub overflow, this proposal was intended to get around requirements in the IPC. The IPC provides all direction necessary to deal with waste discharge including condensate. The stricken language allows for condensate discharge to connect to lavatory tailpiece as well as bathtub overflow connections, these are the two primary fixture to experience blockages due to hair clogs. Striking the language will prevent unintended flooding that would result from such a clog. A blockage wouldn't need to be a complete blockage, it would only need to be sufficient to keep the drain from keeping up with the4 condensate discharge produced by the equipment. Adding "**Condensate drains shall be installed in accordance with IPC 802.1.5."** provides a more correct path for compliance with the requirements in the IPC.

Bibliography: See reason statement.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Condensate disposal is already required, if anything this proposal will eliminate potential costs associated to damage that could be the result of the portion removed.

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee voted to disapprove of this proposal with a vote of 8-5. The reasoning given is that this drain type should be installed in accordance with the IPC. The adoption of the proposed code language would be an issue in multi-unit dwellings where tailpieces are regularly used for purposes such as condensation.

M18-24

Individual Consideration Agenda

Comment 1:

IPC: [M] 314.2.1.1; IMC®: 307.2.1.1

Proponents: James Richardson, City of Columbus (Ohio), City of Columbus (Ohio) (jarichardson@columbus.gov) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Plumbing Code

[M] 314.2.1.1 Condensate discharge. Condensate drains shall not directly connect to any plumbing drain, waste or vent pipe. Condensate drains shall not discharge into a plumbing fixture other than a floor sink, floor drain, trench drain, mop sink, hub drain, standpipe, utility sink or laundry sink. ~~Condensate drain connections to a lavatory wye branch tailpiece or to a bathtub overflow pipe shall not be considered as discharging to a plumbing fixture.~~Condensate drains shall be installed in accordance with Section 802.1.5. Except where discharging to grade outdoors, the point of discharge of condensate drains shall be located within the same *occupancy*, tenant space or *dwelling unit* as the source of the condensate.

2024 International Mechanical Code

307.2.1.1 Condensate discharge. Condensate drains shall not directly connect to any plumbing drain, waste or vent pipe. Condensate drains shall not discharge into a plumbing fixture other than a floor sink, floor drain, trench drain, mop sink, hub drain, standpipe, utility sink or laundry sink. ~~Condensate drain connections to a lavatory wye branch tailpiece or to a bathtub overflow pipe shall not be considered as discharging to a plumbing fixture.~~Condensate drains shall be installed in accordance with Section 802.1.5 of the International Plumbing Code. Except where discharging to grade outdoors, the point of discharge of condensate drains shall be located within the same *occupancy*, tenant space or *dwelling unit* as the source of the condensate.

Reason: This proposal is intended to correct an issue that was created by an approved proposal in the IMC. The IMC should never dictate what fixtures are permitted to receive waste or to supersede requirements already in place in the IPC. The allowance by the IMC to connect condensate discharge to a lavatory tailpiece or a bathtub overflow, this proposal was intended to get around requirements in the IPC. The IPC provides all direction necessary to deal with waste discharge including condensate. The stricken language allows for condensate discharge to connect to lavatory tailpiece as well as bathtub overflow connections, these are the two primary fixture to experience blockages due to hair clogs. Striking the language will prevent unintended flooding that would result from such a clog. A blockage wouldn't need to be a complete blockage, it would only need to be sufficient to keep the drain from keeping up with the4 condensate discharge produced by the equipment. Adding "Condensate drains shall be installed in accordance with IPC 802.1.5." provides a more correct path for compliance with the requirements in the IPC. Proposal P119-24, which was approved in CAH #1, clearly puts the authority within the plumbing code to deal with this waste. 802.1.5 Non-potable clear-water waste. Where devices and equipment such as process tanks, filters, drips, and boilers, plumbing appliances, or other mechanical equipment discharge non-potable water to the building drainage system, the discharge shall be through an indirect waste pipe by means of an air break or an air gap to an approved waste receptor.

Bibliography: See reason statement.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Condensate disposal is already required, if anything this proposal will eliminate potential costs associated to damage that could be the result of the current code.

Comment (CAH2)# 397

M21-24

IMC®: SECTION 202, SECTION 313 (New), 313.1 (New), 313.2 (New)

Proposed Change as Submitted

Proponents: Marcelo Hirschler, GBH International, GBH International (mmh@gbhint.com)

2024 International Mechanical Code

Delete without substitution:

~~**NONCOMBUSTIBLE MATERIAL.** A material that passes ASTM E136.~~

Add new text as follows:

SECTION 313
NONCOMBUSTIBLE MATERIALS

313.1 Testing. Noncombustible materials shall be those materials that comply with Section 703.3.1 of the International Building Code.

313.2 Inherently noncombustible materials. Inherently noncombustible materials, such as concrete and steel, shall not be required to be tested to be acceptable as noncombustible materials.

Reason: The definition contained in the 2024 IMC is actually a requirement rather than a definition and ICC definitions should not contain requirements.

In the area of material regulation, materials that pass ASTM E136 have long been considered to be those that are noncombustible materials, and that concept is consistent with the definition presently in the IMC but that "definition" is actually a requirement, which should be moved out of Chapter 2. Chapter 3 is the chapter for general requirements.

Note that ASTM E136 is one of the very few ASTM fire test standards that has acceptance criteria. The acceptance criteria are different from the theoretical definition of a noncombustible material.

Unless a requirement exists, experience indicates that some material manufacturers have claimed that their material is noncombustible when it simply exhibits improved fire performance. When searching the internet, multiple web sites offer materials or products that are alleged to be noncombustible when that claim is incorrect. There is often a confusion in the public mind when considering a material that performs better than typical combustible materials, but should not be considered noncombustible.

This proposal recommends including a correct requirement for what materials shall be considered noncombustible materials and it is to comply with the IBC section 703.3.1. A second section states that a requirement for what is a noncombustible material does not mean that clearly noncombustible materials, such as steel, concrete, or masonry, need to be tested, for example to ASTM E136.

Equivalent proposals are being submitted to the IFC (by FCAC), the IPC, and the IFGC, all of which use noncombustible materials.

Another proposal revises the definitions of "combustible material" in the IMC and IFGC to clarify that the whether a material is or is not noncombustible is the result of a classification. The IBC does not "define" a noncombustible material but contains requirements for such materials.

The language in section 703.3.1 of the IBC reads as follows:

703.3.1 Noncombustible materials. Materials required to be noncombustible shall be tested in accordance with ASTM E136. Alternately, materials required to be noncombustible shall be tested in accordance with ASTM E2652 using the acceptance criteria prescribed by ASTM E136.

Exception: Materials having a structural base of noncombustible material as determined in accordance with ASTM E136, or with ASTM E2652 using the acceptance criteria prescribed by ASTM E136, with a surfacing of not more than 0.125 inch (3.18 mm) in thickness having a flame spread index not greater than 50 when tested in accordance with ASTM E84 or UL 723 shall be acceptable as noncombustible.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This simply moves a requirement from a definition into a section where it can be actually applied, without changing the content.

M21-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee voted for disapproval 14-0. The proponent recommended this proposal for disapproval with a goal to correct the proposal and bring it back to be heard during CAH2.

M21-24

Individual Consideration Agenda

Comment 1:

IMC®: SECTION 202, SECTION 313, 313.1, 313.2

Proponents: Marcelo Hirschler, GBH International, GBH International (mmh@gbhint.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Mechanical Code

.

SECTION 313
NONCOMBUSTIBLE BUILDING MATERIALS

313.1 Testing. Noncombustible building materials shall be those materials that comply with Section 703.3.1 of the International Building Code.

Revise as follows:

313.2 ~~Inherently noncombustible materials~~ Testing not required. ~~Inherently noncombustible materials, such as concrete and steel,~~ The following building materials shall not be required to be tested to be acceptable as noncombustible building materials.

1. Steel,

2. Concrete, containing no combustible aggregates or fibers,

3. Masonry, containing no combustible aggregates or fibers,
4. Glass (excluding plastic glazing),
5. 5xxx and 6xxx series aluminum alloys.

Reason: As explained with the original proposal, the IMC definition is actually a requirement which is something that should not be included in ICC definitions. This change sends the requirements to the IBC where the testing requirements are included and takes them out of the definitions section.

Several materials can claim to be inherently noncombustible, in many cases without it being truly valid. For example, any plastic or wood materials are always combustible. This issue is an important consideration for building materials (see for example chapter 6 of the IMC where requirements are different depending on whether the materials are or are not noncombustible.

Some materials exist (often insulation materials) where it is not possible to determine without testing (normally to ASTM E136, as required in the IBC) whether they are truly noncombustible. For example, fiberglass insulation materials will always contain some combustible binder to be useful. The material can pass the ASTM E136 test (and be noncombustible) if it contains a small amount of binder but fail the test with larger amount of binder. That can only be determined by testing and is impossible to note visually.

It makes no sense to test steel, concrete or masonry (if they contain no combustible aggregates or fibers; this would have to be certified by the proponent. Therefore, as it has been shown by testing (and common sense) that testing steel, concrete or masonry to ASTM E136 is unnecessary, as they will pass the test they can be excluded from being required to be tested.

However, some new building materials are made with organic (such as foam plastics) components to lower the weight and make them easier to manipulate. In that case, it is unclear whether they are truly noncombustible materials, and they would need to be tested to know the answer for sure. That is why the requirement has been added that they contain no combustible aggregates or fibers.

Test results from at least two testing labs have been able to show that glass (whether ordinary glass or quartz) truly meets the requirements of ASTM E136 and is a noncombustible material. The same is not true for other glazing materials, which are typically plastic and are combustible; they must be excluded.

That brings up the question of aluminum. Typical building materials are, more often than not, alloys of aluminum and other metals. The Aluminum Association has published a report in Building Safety Journal (August 17th, 2020) where they discuss the “noncombustibility” of aluminum. It is of great interest that the 4 aluminum alloys that they tested “were selected for their widespread use in construction”. Those alloys tested all passed the ASTM E136 test. However, the same report also states that “Aluminum, just like many comparable metals, is not combustible in any general application other than when it is specifically made to be.” That suggests that there may be some aluminum alloys that may or may not be noncombustible. After considerable debate and investigation of test reports, consensus was reached that most of the aluminum alloys used as building materials belong to the 6xxx series of alloys, with less than 1.2% magnesium, and the main ones (such as 6063, 6061, 6005) have all been tested for noncombustibility. In terms of sheet aluminum products, the series 5xxx alloys (such as 5052, 5083, 5005) are often used in construction, with higher levels if magnesium (the highest being 5083, which contains 4.9% magnesium). This product has also been tested and shown to be noncombustible. Therefore, consensus was reached that it is safe to include “5xxx and 6xxx series aluminum alloys” to the list of building materials that do not require testing to be considered noncombustible materials.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This simply sends the user to the IBC for information on noncombustible materials and is consistent with what the requirements are now, in the definition.

Comment (CAH2)# 108

M22-24

IMC®: 401.1, 401.2, SECTION 403, 403.1, 403.3, 403.3.1, 403.3.2, 403.3.2.1, 403.3.2.2, 403.3.2.3, TABLE 403.3.2.3

Proposed Change as Submitted

Proponents: Mike Moore, Stator LLC, Broan-NuTone (mmoore@statorllc.com)

2024 International Mechanical Code

401.1 Scope. This chapter shall govern the ventilation of spaces within a *building* intended to be occupied. Mechanical exhaust systems, including exhaust systems serving clothes dryers and cooking *appliances*; hazardous exhaust systems; dust, stock and refuse conveyor systems; subslab soil exhaust systems; smoke control systems; energy recovery ventilation systems and other systems specified in Section 502 shall comply with Chapter 5.

Revise as follows:

401.2 Ventilation required. ~~Every occupied space shall be ventilated by natural means in accordance with Section 402 or by mechanical means in accordance with Section 403.~~ *Dwelling units* complying with the air leakage requirements of the *International Energy Conservation Code* or ASHRAE 90.1 shall be ventilated by mechanical means in accordance with Section 403. Ambulatory care facilities and Group I-2 *occupancies* shall be ventilated by mechanical means in accordance with Section 407. Enclosed parking garages shall be ventilated by mechanical means in accordance with Section 404. Every other occupied space shall be ventilated by natural means in accordance with Section 402 or by mechanical means in accordance with Section 403.

SECTION 403
MECHANICAL VENTILATION

Revise as follows:

403.1 Ventilation system. Mechanical ventilation shall be provided by a method of supply air and return or *exhaust air* except that mechanical *ventilation air* requirements for *dwelling units* in Group R-2, R-3 and R-4 *occupancies* shall be provided by an exhaust system, supply system or combination thereof. The amount of supply air shall be approximately equal to the amount of return and *exhaust air*. The system shall not be prohibited from producing negative or positive pressure. The system to convey *ventilation air* shall be designed and installed in accordance with Chapter 6.

403.3 Outdoor air and local exhaust airflow rates. *Dwelling units* in Group R-2, R-3 and R-4 occupancies ~~three stories and less in height above grade plane~~ shall be provided with outdoor air and local exhaust in accordance with Section 403.3.2. Other spaces within *buildings* intended to be occupied shall be provided with outdoor air and local exhaust in accordance with Section 403.3.1.

Exceptions:

1. Enclosed parking garages complying with Section 404.
2. Spaces in ambulatory care facilities and Group I-2 occupancies complying with Section 407.

403.3.1 Spaces other than dwelling units in Group R-2, R-3, and R-4 occupancies~~Other buildings intended to be occupied~~. The design of local exhaust systems and ventilation systems for outdoor air for spaces ~~*occupancies*~~other than *dwelling units* in Group~~s~~ R-2, R-3 and R-4 occupancies shall comply with Sections 403.3.1.1 through 403.3.1.4.

403.3.2 Dwelling units in Group R-2, R-3 and R-4 occupancies. The design of local exhaust systems and ventilation systems for outdoor air for *dwelling units* in Group R-2, R-3 and R-4 *occupancies* shall comply with Sections 403.3.2.1 through 403.3.2.5.

403.3.2.1 Outdoor air for dwelling units. An outdoor air ventilation system consisting of a mechanical exhaust system, supply system or

combination thereof shall be installed for each *dwelling unit*. Local exhaust or supply systems, including outdoor air ducts connected to the return side of an air handler, are permitted to serve as such a system. The outdoor air ventilation system shall be designed to provide the required rate of outdoor air continuously during the period that the building is occupied. The minimum continuous outdoor airflow rate shall be determined in accordance with Equation 4-9.

$$Q_{OA} = 0.03A_{floor} + 7.5(N_{br} + 1)$$

where: Q_{OA} = outdoor airflow rate, cfm **(Equation 4-9)**

A_{floor} = conditioned floor area, ft^2

N_{br} = number of bedrooms; not to be less than one

Exceptions:

1. The outdoor air ventilation system is not required to operate continuously where the system has controls that enable operation for not less than 1 hour of each 4-hour period. The average outdoor airflow rate over the 4-hour period shall be not less than that prescribed by Equation 4-9.
2. The minimum mechanical ventilation rate determined in accordance with Equation 4-9 shall be reduced by 30 percent provided that both of the following conditions apply:
   2.1. A ducted system supplies *ventilation air* directly to each bedroom and to one or more of the following rooms:
      2.1.1. Living room.
      2.1.2. Dining room.
      2.1.3. Kitchen.
   2.2. The ~~whole-house~~ <u>outdoor air</u> ventilation system is a *balanced ventilation system*.

Delete without substitution:

~~**403.3.2.2 Outdoor air for other spaces.** Corridors and other common areas within the conditioned space shall be provided with outdoor air at a rate of not less than 0.06 cfm per square foot [0.0003 $m^3/(s \times m^2)$] of floor area.~~

Revise as follows:

~~**403.3.2.3**~~ <u>**403.3.2.2**</u> **Local exhaust.** Local exhaust systems shall be provided in kitchens, bathrooms and toilet rooms and shall have the capacity to exhaust the minimum airflow rate determined in accordance with Table 403.3.2.~~3~~<u>2</u>.

TABLE ~~403.3.2.3~~ <u>403.3.2.2</u> MINIMUM REQUIRED LOCAL EXHAUST RATES FOR <u>DWELLING UNITS IN</u> GROUP R-2, R-3 AND R-4 OCCUPANCIES

AREA TO BE EXHAUSTED	EXHAUST RATE CAPACITY
Kitchens	100 cfm intermittent or 50 cfm continuous
Bathrooms and toilet rooms	50 cfm intermittent or 25 cfm continuous

For SI: 1 cubic foot per minute = 0.0004719 m^3/s.

Reason: These modifications are needed to clarify ventilation requirements for sleeping units, dwelling units, and other spaces within Group R-2, R-3, and R-4 occupancies. A summary of the results of the proposed modifications is as follows:

1. All dwelling units in Group R-2, R-3, and R-4 occupancies shall comply with Section 403.3.2. This is consistent with the prior IMC cycle's action on proposal M19-21.

2. Where provided with mechanical ventilation, all spaces other than dwelling units in Group R-2, R-3, and R-4 occupancies shall comply with Section 403.3.1 (this is meant to parallel the scope divisions of ASHRAE 62.2 and ASHRAE 62.1), with the exception of enclosed parking garages, ambulatory care facilities, and Group I-2 occupancies are addressed elsewhere.

Section 403.3.2 should be restricted to dwelling units because it is based on ASHRAE 62.2 (whose scope is restricted to dwelling units) and is poorly equipped to address spaces in Group R-2, R-3, and R-4 occupancies that are not dwelling units (e.g., dormitory sleeping

units, public bathrooms, public laundry rooms, exercise rooms, meeting rooms, etc.). There is currently a subsection to address outdoor air requirements for "corridors and other common areas" within Section 403.3.2, but it is not clear how to apply this section to the myriad of spaces that are better addressed in Section 403.3.1.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal primarily clarifies existing requirements for ventilation.

M22-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee voted 14-0 in disapproval of this proposal. The committee argues that, contrary to the proponent's suggestions, this proposal does not make clear the current ventilation requirements.

M22-24

Individual Consideration Agenda

Comment 1:

IMC®: SECTION 202 (New), 401.2, SECTION 403, 403.1, 403.3, 403.3.1, TABLE 403.3.1.1, 403.3.2, 403.3.2.1, 403.3.2.2, 403.3.2.3, TABLE 403.3.2.3

Proponents: Mike Moore, Stator LLC, The Home Ventilating Institute (mmoore@statorllc.com); Gayathri Vijayakumar, Steven Winter Associates, Inc., Steven Winter Associates, Inc. (gvijayakumar@swinter.com) requests As Modified by Committee (AMC2)

Replace as follows:

2024 International Mechanical Code

Add new definition as follows:

CORRIDOR. An enclosed exit access component that defines and provides a path of egress travel.

PRIVATE GARAGE. A building or portion of the building in which motor vehicles used by the owner or tenants of the building or buildings on the premises are stored or kept, without provisions for repairing or servicing such vehicles for profit.

401.2 Ventilation required. ~~Every occupied space shall be ventilated by natural means in accordance with Section 402 or by mechanical means in accordance with Section 403.~~ *Dwelling units* complying with the air leakage requirements of the *International Energy Conservation Code* or ASHRAE 90.1 shall be ventilated by mechanical means in accordance with Section 403. Ambulatory care facilities and Group I-2 *occupancies* shall be ventilated by mechanical means in accordance with Section 407. Enclosed parking garages shall be ventilated by mechanical means in accordance with Section 403. Every other occupied space shall be ventilated by natural means in accordance with Section 402 or by mechanical means in accordance with Section 403.

Exception: Ventilation by mechanical means shall not be required for an enclosed *private garage* serving a single *dwelling unit*.

SECTION 403
MECHANICAL VENTILATION

403.1 Ventilation system. Mechanical ventilation shall be provided by a method of supply air and return or *exhaust air* ~~except that mechanical *ventilation air* requirements for Group R-2, R-3 and R-4 *occupancies* shall be provided by an exhaust system, supply system or combination thereof.~~The amount of supply air shall be approximately equal to the amount of return and *exhaust air*. The system shall not be prohibited from producing negative or positive pressure. The system to convey *ventilation air* shall be designed and installed in accordance with Chapter 6.

Exception: Systems that are designed and installed in accordance with Section 403.3.2.1 and Chapter 6.

403.3 Outdoor air and local exhaust airflow rates. *Dwelling units* in Group R-2, R-3 and R-4 *occupancies* ~~three stories and less in height above grade plane~~ shall be provided with ~~outdoor air~~ *outdoor air* and local exhaust in accordance with Section 403.3.2. Other spaces within *buildings* intended to be occupied shall be provided with ~~outdoor air~~ *outdoor air* and local exhaust in accordance with Section 403.3.1.

403.3.1 Spaces other than dwelling units in Group R-2, R-3, and R-4 occupancies ~~**Other buildings intended to be occupied.**~~ The design of local exhaust systems and *outdoor air* ventilation systems ~~for outdoor air~~ for spaces ~~*occupancies*~~ other than *dwelling units* in Group~~s~~ R-2, R-3, and R-4 *occupancies* shall comply with Sections 403.3.1.1 through 403.3.1.4.

TABLE 403.3.1.1 MINIMUM VENTILATION RATES

Portions of table not shown remain unchanged.

Repair garages, enclosed public parking garages[b,d], enclosed *private garages* serving multiple *dwelling units*[b]	—	—	—	0.75

b. Mechanical exhaust required and the recirculation of air from such spaces is prohibited. Recirculation of air that is contained completely within such spaces shall not be prohibited (see Section 403.2.1, Item 3).

d. Ventilation systems in enclosed public parking garages shall comply with Section 404.

403.3.2 Dwelling units in Group R-2, R-3 and R-4 occupancies. The design of local exhaust systems and *outdoor air* ventilation systems for ~~outdoor air~~ *dwelling units* in Group R-2, R-3 and R-4 *occupancies* shall comply with Sections 403.3.2.1 through 403.3.2.5.

403.3.2.1 Outdoor air for dwelling units. An *outdoor air* ventilation system shall be installed and shall comply with the following:1. For a *dwelling unit* opening to a *corridor*, *outdoor air* shall be mechanically supplied to the *dwelling unit* through ducts or other equipment that terminate within the *dwelling unit*.2. In Climate Zones 6 through 8, for a *dwelling unit* in a *building* not more than 3 stories in height above grade plane, the *outdoor air* ventilation system shall be a *balanced ventilation system* in compliance with the residential provisions of the *International Energy Conservation Code*. 3. For a *dwelling unit* not addressed by Item 1 or Item 2, *outdoor air* shall be provided using ~~An outdoor air ventilation system consisting of~~ a mechanical ~~exhaust system~~ *exhaust system*, supply system or combination thereof ~~shall be installed for each *dwelling unit*~~. Local exhaust or supply systems, including ~~outdoor air~~ *outdoor air* ducts connected to the return side of an air handler, are permitted to serve as components of such a system. ~~The outdoor air ventilation system shall be designed to provide the required rate of outdoor air continuously during the period that the *building* is occupied. The minimum continuous outdoor airflow rate shall be determined in accordance with Equation 4-9.~~

$$Q_{OA} = 0.03A_{floor} + 7.5(N_{br} + 1)$$

~~(Equation 4-9)~~

where: ~~Q_{OA} = outdoor airflow rate, cfm A_{floor} = conditioned floor area, ft^2 N_{br} = number of bedrooms; not to be less than one~~

~~Exceptions:~~

1. ~~The outdoor air ventilation system is not required to operate continuously where the system has controls that enable operation for not less than 1 hour of each 4-hour period. The average outdoor airflow rate over the 4-hour period shall be not less than that prescribed by Equation 4-9.~~
2. ~~The minimum mechanical ventilation rate determined in accordance with Equation 4-9 shall be reduced by 30 percent provided that both of the following conditions apply:~~
   - 2.1. ~~A ducted system supplies *ventilation air* directly to each bedroom and to one or more of the following rooms:~~
     - 2.1.1. ~~Living room.~~
     - 2.1.2. ~~Dining room.~~
     - 2.1.3. ~~Kitchen.~~
   - 2.2. ~~The whole-house ventilation system is a *balanced ventilation system*.~~

403.3.2.2 Outdoor air ~~for other spaces~~ flow rate for dwelling units. ~~Corridors and other common areas within the conditioned space shall be provided with outdoor air at a rate of not less than 0.06 cfm per square foot [0.0003 m^3/(s × m^2)] of floor area.~~ The *dwelling unit's outdoor air* ventilation system shall be designed to provide the required rate of *outdoor air* continuously during the period that the *building* is occupied. The minimum continuous *outdoor air* flow rate shall be determined in accordance with Equation 4-9.

$$Q_{OA} = 0.03A_{floor} + 7.5(N_{br} + 1)$$

(Equation 4-9)

where: Q_{OA} = *outdoor air* flow rate, cfm A_{floor} = conditioned floor area, ft^2 N_{br} = number of bedrooms; not to be less than one

Exceptions:

1. The *outdoor air* ventilation system is not required to operate continuously where the system has controls that enable operation for not less than 1 hour of each 4-hour period. The average *outdoor air* flow rate over the 4-hour period shall be not less than that prescribed by Equation 4-9.
2. The minimum mechanical ventilation rate determined in accordance with Equation 4-9 shall be reduced by 30 percent provided that both of the following conditions apply:
   - 2.1. A ducted system supplies *outdoor air* directly to each bedroom and to one or more of the following rooms:
     - 2.1.1. Living room.
     - 2.1.2. Dining room.
     - 2.1.3. Kitchen.
   - 2.2. The *outdoor air* ventilation system is a *balanced ventilation system*.

403.3.2.3 Local exhaust. Local exhaust systems shall be provided in kitchens, ~~bathrooms~~ *bathrooms*, and ~~toilet rooms~~ *toilet rooms* and shall have the capacity to exhaust the minimum airflow rate determined in accordance with Table 403.3.2.3.

TABLE 403.3.2.3 MINIMUM REQUIRED LOCAL EXHAUST RATES FOR DWELLING UNITS IN GROUP R-2, R-3 AND R-4 OCCUPANCIES

AREA TO BE EXHAUSTED	EXHAUST RATE CAPACITY
Kitchens	100 cfm intermittent or 50 cfm continuous
~~Bathrooms~~ *Bathrooms* and ~~toilet rooms~~ *toilet rooms*	50 cfm intermittent or 25 cfm continuous

For SI: 1 cubic foot per minute = 0.0004719 m^3/s.

Reason: These modifications are needed to clarify ventilation requirements for dwelling units and other spaces within Group R-2, R-3, and R-4 occupancies. Additionally, based on direction received from the mechanical committee at CAH#1, this proposal has been combined with M28 and the committee's action on M8, M14, and M30. The committee requested that such an omnibus proposal be developed to better align with their actions on these interrelated proposals. In an effort to develop consensus, this proposal has been shared with all parties who opposed M28 at the first committee hearings; no negative feedback was received.

A summary of the results of the public comment version of this proposal is as follows:

1. All dwelling units in Group R-2, R-3, and R-4 occupancies shall comply with Section 403.3.2. This is consistent with the prior IMC cycle's action on proposal M19-21.

2. Where provided with mechanical ventilation, all spaces other than dwelling units in Group R-2, R-3, and R-4 occupancies shall comply with Section 403.3.1 (this is meant to parallel the scope divisions of ASHRAE 62.2 and ASHRAE 62.1), with the exception of ambulatory care facilities and Group I-2 occupancies, which are addressed in Section 407.

3. To align with ASHRAE 62.2 and action taken by the committee at CAH#1 on M8, outdoor air shall be mechanically supplied to dwelling units opening to a corridor in Groups R-2, R-3, and R-4 occupancies.

4. To align with IBC Section 406.6.2 and action taken by the committee at CAH#1 on M14, enclosed private garages serving multiple dwelling units are required to have mechanical ventilation in accordance with IMC Section 403.

5. To align with Section 403.3.2.1 of the IECC-R and action taken by the committee at CAH#1 on M30, require a *balanced ventilation system* for low-rise dwelling units in Climate Zones 6, 7, and 8.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The change proposal is editorial in nature or is a clarification of existing requirements and has no cost impact on the cost of construction. The exception is the inclusion of the language from M8, the cost impact for which is located within that proposal.

2024 International Mechanical Code

CHAPTER 4
VENTILATION

SECTION 403
MECHANICAL VENTILATION

Revise as follows:

403.3 Outdoor air and local exhaust airflow rates. Group R-2, R-3 and R-4 *occupancies* ~~three stories and less in height above grade plane~~ shall be provided with outdoor air and local exhaust in accordance with Section 403.3.2. Other *occupancies* ~~*buildings* intended to be occupied~~ shall be provided with outdoor air and local exhaust in accordance with Section 403.3.1.

403.3.1 Other buildings intended to be occupied. The design of local exhaust systems and ventilation systems for outdoor air for *occupancies* other than Groups R-2, R-3 and R-4 shall comply with Sections 403.3.1.1 through 403.3.1.4.

Revise as follows:

TABLE 403.3.1.1 MINIMUM VENTILATION RATES

Portions of table not shown remain unchanged.

OCCUPANCY CLASSIFICATION	OCCUPANT DENSITY #/1000 FT^2 [a]	PEOPLE OUTDOOR AIRFLOW RATE IN BREATHING ZONE, R_p CFM/PERSON	AREA OUTDOOR AIRFLOW RATE IN BREATHING ZONE, R_aCFM/FT^2 [a]	EXHAUST AIRFLOW RATE CFM/FT^2 [a]
Hotels, motels, and resorts ~~and dormitories~~				
Bathrooms/toilet—private[g]	—	—	—	25/50[f]
Kitchens - private[b]	—	—	—	50/100[f]
Bedroom/living room	10	5	0.06	—
Conference/meeting	50	5	0.06	—
~~Dormitory sleeping areas~~	~~20~~	~~5~~	~~0.06~~	—
Gambling casinos	120	7.5	0.18	—
Laundry rooms, central	10	5	0.12	—
~~Laundry rooms within dwelling units~~	~~10~~	~~5~~	~~0.12~~	—
Lobbies/prefunction	30	7.5	0.06	—
Multipurpose assembly	120	5	0.06	—
~~Private dwellings, single and multiple~~				
~~Garages, common for multiple units[b]~~	—	—	—	~~0.75~~
~~Kitchens[b]~~	—	—	—	~~50/100[f]~~
~~Living areas[c]~~	~~Based on number of bedrooms. First bedroom, 2; each additional bedroom, 1~~	~~0.35 ACH but not less than 15 cfm/person~~	—	—
~~Toilet rooms and bathrooms[g]~~	—	—	—	~~25/50[f]~~

For SI: 1 cubic foot per minute = 0.0004719 m^3/s, 1 ton = 908 kg, 1 cubic foot per minute per square foot = 0.00508 $m^3/(s \times m^2)$, °C = [(°F) – 32]/1.8, 1 square foot = 0.0929 m^2.

a. Based on net occupiable floor area.

b. Mechanical exhaust required and the recirculation of air from such spaces is prohibited. Recirculation of air that is contained completely within such spaces shall not be prohibited (see Section 403.2.1, Item 3).

c. Spaces unheated or maintained below 50°F are not covered by these requirements unless the occupancy is continuous.

d. Ventilation systems in enclosed parking garages shall comply with Section 404.

e. Rates are per water closet , urinal or adult changing station. The higher rate shall be provided where the exhaust system is designed to operate intermittently. The lower rate shall be permitted only where the exhaust system is designed to operate continuously while occupied.

f. Rates are per room unless otherwise indicated. The higher rate shall be provided where the exhaust system is designed to operate intermittently. The lower rate shall be permitted only where the exhaust system is designed to operate continuously while occupied.

g. Mechanical exhaust is required and recirculation from such spaces is prohibited. For occupancies other than science laboratories, where there is a wheel-type energy recovery ventilation (ERV) unit in the exhaust system design, the volume of air leaked from the exhaust airstream into the outdoor airstream within the ERV shall be less than 10 percent of the outdoor air volume. Recirculation of air that is contained completely within such spaces shall not be prohibited (see Section 403.2.1, Items 2 and 4).

h. For nail salons, each manicure and pedicure station shall be provided with a source capture system capable of exhausting not less than 50 cfm per station. Exhaust inlets shall be located in accordance with Section 502.20. Where one or more required source capture systems operate continuously during occupancy, the exhaust rate from such systems shall be permitted to be applied to the exhaust flow rate required by Table 403.3.1.1 for the nail salon.

i. Outpatient facilities to which the rates apply are freestanding birth centers, urgent care centers, neighborhood clinics and physicians' offices, Class 1 imaging facilities, outpatient psychiatric facilities, outpatient rehabilitation facilities and outpatient dental facilities.

j. The requirements of this table provide for acceptable IAQ. The requirements of this table do not address the airborne transmission of airborne viruses, bacteria and other infectious contagions.

k. These rates are intended only for outpatient dental clinics where the amount of nitrous oxide is limited. They are not intended for dental operatories in institutional buildings where nitrous oxide is piped.

l. The occupiable floor area in warehouses shall not include the floor area of self-storage units, floor areas under rack storage or designated palletized storage floor areas.

403.3.2 Group R-2, R-3 and R-4 occupancies. The design of local exhaust systems and ventilation systems for outdoor air in Group R-2, R-3 and R-4 *occupancies* shall comply with Sections 403.3.2.1 through 403.3.2.5.

Revise as follows:

403.3.2.1 Outdoor air for dwelling units and sleeping units. An outdoor air ventilation system consisting of a mechanical exhaust system, supply system or combination thereof shall be installed for each *dwelling unit* and *sleeping unit*. Local exhaust or supply systems, including outdoor air ducts connected to the return side of an air handler, are permitted to serve as such a system. The outdoor air ventilation system shall be designed to provide the required rate of outdoor air continuously during the period that the *building* is

occupied. The minimum continuous outdoor airflow rate shall be determined in accordance with Equation 4-9.

$$Q_{OA} = 0.03A_{floor} + 7.5(N_{br} + 1)$$

where: Q_{OA} = outdoor airflow rate, cfm **(Equation 4-9)**

A_{floor} = conditioned floor area, ft^2

N_{br} = number of bedrooms; not to be less than one

Exceptions:

1. The outdoor air ventilation system is not required to operate continuously where the system has controls that enable operation for not less than 1 hour of each 4-hour period. The average outdoor airflow rate over the 4-hour period shall be not less than that prescribed by Equation 4-9.
2. The minimum mechanical ventilation rate determined in accordance with Equation 4-9 shall be reduced by 30 percent provided that both of the following conditions apply:
   2.1. A ducted system supplies *ventilation air* directly to each bedroom and to one or more of the following rooms:
      2.1.1. Living room.
      2.1.2. Dining room.
      2.1.3. Kitchen.
   2.2. The ~~whole-house~~ outdoor air ventilation system is a *balanced ventilation system*.

403.3.2.2 Outdoor air and local exhaust for other spaces. Spaces other than *dwelling units* and *sleeping units* shallcomply with Sections 403.3.1.1 through 403.3.1.4~~Corridors and other common areas within the conditioned space shall be provided with outdoor air at a rate of not less than 0.06 cfm per square foot [0.0003 $m^3/(s \times m^2)$] of floor area~~.

403.3.2.3 Local exhaust for dwelling units and sleeping units. Local exhaust systems shall be provided in kitchens, bathrooms and toilet rooms and shall have the capacity to exhaust the minimum airflow rate determined in accordance with Table 403.3.2.3.

TABLE 403.3.2.3 MINIMUM REQUIRED LOCAL EXHAUST RATES FOR GROUP R-2, R-3 AND R-4 OCCUPANCIES

AREA TO BE EXHAUSTED	EXHAUST RATE CAPACITY
Kitchens	100 cfm intermittent or 50 cfm continuous
Bathrooms and toilet rooms	50 cfm intermittent or 25 cfm continuous

For SI: 1 cubic foot per minute = 0.0004719 m^3/s.

Revise as follows:

403.3.2.4 System controls. Where provided within a *dwelling unit*or *sleeping unit*, controls for outdoor air ventilation systems shall include text or a symbol indicating the system's function.

403.3.2.5 Ventilating equipment. Fans providing exhaust or outdoor air shall be *listed* and *labeled* to provide the minimum required air flow in accordance with ANSI/AMCA 210-ANSI/ASHRAE 51.

Reason: For Residential Group R-2, R-3 and R-4, 2024 IMC made an important change to have the same ventilation and exhaust requirements, regardless of building height.

However, it is not clear by the charging language in R403.3 and R403.3.1 what ventilation requirements are if the building exceeds 3 stories. It seems that R403.3.2 is intended to apply to all R-2, R-3 and R-4, regardless of building height, so this proposal makes that intent more explicit.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal is not intended to change stringency of requirements, but rather clarify the current requirements for all the occupancies within a multifamily building, regardless of building height.

M28-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee voted 14-0 to disapprove of the proposal. The committee reasoning is that the proponent does not explicitly make it clear in the charging language in R403.3 and R403.3.1 what the ventilation requirements are if the building exceeds 3 stories. The committee suggests that the proponent work on the proposal and resubmit it to be heard at the CAH2.

M28-24

Individual Consideration Agenda

Comment 1:

IMC®: CHAPTER 4, SECTION 403, 403.3, 403.3.2

Proponents: Gayathri Vijayakumar, Steven Winter Associates, Inc., Steven Winter Associates, Inc. (gvijayakumar@swinter.com) requests As Modified by Committee (AMC2)

Replace as follows:

2024 International Mechanical Code

CHAPTER 4
VENTILATION

SECTION 403
MECHANICAL VENTILATION

Revise as follows:

403.3 Outdoor air and local exhaust airflow rates. Group R-2, R-3, and R-4 *occupancies* ~~three stories and less in height above grade plane~~ shall be provided with outdoor air and local exhaust in accordance with Section 403.3.2. Other *buildings* intended to be occupied shall be provided with outdoor air and local exhaust in accordance with Section 403.3.1.

403.3.2 Group R-2, R-3 and R-4 occupancies. The design of local exhaust systems and ventilation systems for outdoor air in Group R-2, R-3 and R-4 *occupancies* shall comply with Sections 403.3.2.1 through 403.3.2.5.

Reason: I submitted the original code change proposal to complete a code change proposal that was successful in 2024 IMC (which removed the 3 story language in 403.3.2).

This comment replaces the original code change proposal (M-28). It now just contains the same strikeout in 403.3 as was struck in

403.3.2 in the previous cycle.
This creates alignment with 403.3.1 and 403.3.2. Without this edit, there are no charging requirements for Group R-2, R-3, or R-4 occupancies greater than 3 stories, since they are not within the scope of either 403.3.1 or 403.3.2.

While the other changes originally proposed would provide better clarity in this section, those are being submitted as a separate comment and this is submitted as the "back-up" if that fails.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Editorial. Trying to maintain the intent from the prior code cycle that all Group R-2, R-3 and R-4 occupancies are required to meet 403.3.2.

Comment (CAH2)# 246

THIS PROPOSAL WILL BE HEARD BY THE IFC CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

2024 International Mechanical Code

Revise as follows:

[F] 502.4 ~~Stationary storage battery~~ Energy storage systems. ~~Stationary storage battery~~ Energy storage systems (ESS) shall be regulated and ventilated in accordance with Section 1207.6.1 of the International Fire Code and the general requirements of this chapter.

Delete without substitution:

~~[F] 502.5 Ventilation of battery systems in cabinets.~~ ~~Stationary storage battery systems installed in cabinets shall be provided with ventilation in accordance with Section 502.4.~~

Reason: The terminology "battery storage systems" is outdated. This proposed change updates the language to utilize the current terminology found throughout the ICC code books - Energy Storage Systems (ESS). This change also removes section 502.5, as it is redundant - section 502.4 covers all ESS, including ones in cabinets.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposed change is editorial only - changing terminology and removing redundant provisions.

M37-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: This proposal was disapproved based upon the action on F4-24. (Vote 14-0)

M37-24

Individual Consideration Agenda

Comment 1:

IMC®: [F] 502.4

Proponents: Jeanne Rice, NYSDOS (jeanne.rice@dos.ny.gov); Chad Sievers, NYS, NYS DOS (chad.sievers@dos.ny.gov); Kevin Duerr-Clark, NYS DOS, NYS DOS (kevin.duerr-clark@dos.ny.gov); Stephen Van Hoose, NYS DOS, NYS DOS (stephen.vanhoose@dos.ny.gov); China Clarke, New York State Dept of State, Manager Technical Support Unit (china.clarke@dos.ny.gov) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Mechanical Code

[F] 502.4 Electrochemical energy storage systems. Electrochemical energy storage systems (ESS) shall be regulated and ventilated in accordance with Section 1207.6.1 of the International Fire Code and the general requirements of this chapter.

Reason: This modification incorporates committee comments on the original proposal - specifically, that the language as originally proposed was too broad and electrical energy should be specified. The modification changes the language to specify electrochemical energy storage systems, which conforms to the definitions included in the IBC and IFC, which include both battery and capacitor storage systems..

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This modification simply changes the terminology slightly, and does not change any code provisions.

Comment (CAH2)# 455

M39-24

IMC®: 504.2, 504.2.1 (New)

Proposed Change as Submitted

Proponents: Tony Crimi, A.C. Consulting Solutions Inc., International Firestop Council (tcrimi@sympatico.ca)

2024 International Mechanical Code

Revise as follows:

504.2 Exhaust penetrations. Where a clothes dryer exhaust duct penetrates a non-fire-resistance rated wall or ceiling membrane, the annular space shall be sealed with noncombustible material, *approved* fire caulking or a noncombustible dryer exhaust duct wall receptacle. ~~Ducts that exhaust clothes dryers shall not penetrate or be located within any fireblocking, draftstops or any wall, floor/ceiling or other assembly required by the *International Building Code* to be fire-resistance rated, unless such duct is constructed of galvanized steel or aluminum of the thickness specified in Section 603.4 and the fire-resistance rating is maintained in accordance with the *International Building Code.*~~ *Fire dampers*, *combination fire/smoke dampers* and any similar devices that will obstruct the exhaust flow shall be prohibited in clothes dryer exhaust ducts.

Add new text as follows:

504.2.1 Ducts penetrating fire resistance rated assemblies, fireblocks or draftstops. Ducts that exhaust clothes dryers shall not penetrate or be located within any fireblocking, draft stopping or any wall, floor/ceiling or other assembly required by the *International Building Code* to be fire-resistance rated, unless it complies with one of the following:

1. The duct is constructed of galvanized steel or aluminum of the thickness specified in Section 603.4 and the fire-resistance rating of any wall, floor/ceiling or other assembly required by the International Building Code to be fire- resistance rated is*maintained in accordance with Chapter 7 of the International Building Code.*
2. Ducts that are continuously covered on all sides from the point at which the duct penetrates the membrane of a wall or ceiling to the outlet terminal with a classified, listed and labeled system specifically evaluated for such purpose, in accordance with nationally recognized standards. The required fire resistance-rating shall be equal to the fire-resistance rating of the assembly being penetrated.

Reason: This proposal does several things. First, it reformats the paragraph and separates the individual criteria for better clarity. It also better differentiates the requirements based on whether the wall or ceiling is fire resistance rated, or not. Lastly, the proposal provides an additional option for ducts that penetrate fire resistance rated walls and floors. Third-party certification organizations like UL and Intertek provide listing and labelling services for fire-resistant duct systems using a variety of nationally recognized Standards and applicable ICC-ES criteria. These Listings have been in the marketplace for many years and have proven their effectiveness.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal adds an additional option for protection of ducts. It does not remove any existing provisions or mandate additional costs.

M39-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee voted to disapprove of this proposal 12-2. The committee's reasoning was that the proponent only referenced the nationally recognized standards without being specific.

M39-24

Individual Consideration Agenda

Comment 1:

IMC®: 504.2, 504.2.1

Proponents: Tony Crimi, A.C. Consulting Solutions Inc., International Firestop Council (tcrimi@sympatico.ca) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Mechanical Code

504.2 Exhaust penetrations. Where a clothes dryer exhaust duct penetrates a non-fire-resistance rated wall or ceiling membrane, the annular space shall be sealed with noncombustible material, *approved* fire caulking or a noncombustible dryer exhaust duct wall receptacle. ~~Ducts that exhaust clothes dryers shall not penetrate or be located within any fireblocking, draftstops or any wall, floor/ceiling or other assembly required by the *International Building Code* to be fire-resistance rated, unless such duct is constructed of galvanized steel or aluminum of the thickness specified in Section 603.4 and the fire-resistance rating is maintained in accordance with the *International Building Code.*~~ *Fire dampers*, *combination fire/smoke dampers* and any similar devices that will obstruct the exhaust flow shall be prohibited in clothes dryer exhaust ducts.

504.2.1 Ducts penetrating fire resistance rated assemblies, fireblocks or draftstops. Ducts that exhaust clothes dryers shall not penetrate or be located within any fireblocking, draft stopping or any wall, floor/ceiling or other assembly required by the *International Building Code* to be fire-resistance rated, unless it complies with one of the following:

1. The duct is constructed of galvanized steel or aluminum of the thickness specified in Section 603.4 and the fire-resistance rating of any wall, floor/ceiling or other assembly required by the International Building Code to be fire- resistance rated is*maintained in accordance with Chapter 7 of the International Building Code.*
2. Ducts that are continuously covered on all sides from the point at which the duct penetrates the membrane of a wall or ceiling to the outlet terminal with a classified, listed and labeled system specifically evaluated for such purpose, tested ~~in accordance with nationally recognized standards.~~ using the standard time-temperature curve of ASTM E119 or UL 263. The required fire resistance-rating shall be equal to the fire-resistance rating of the assembly being penetrated.

Reason: During CAH#1, the committee indicated that the reason for disapproval was that the proposal was not specific enough because it did not reference a test Standard to be used. This updated text includes a specific reference to ASTM E119 and UL 263. This fire exposure has been used to evaluate the ability of a duct system to resist the spread of fire between vertical or horizontal compartments for many years.

Bibliography: [1]ASTM E2816-20a, Standard Test Methods for Fire Resistive Metallic HVAC Duct Systems.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal adds an additional option for protection of ducts. It does not remove any existing provisions or mandate additional costs.

M40-24

IMC®: 506.3 (New), ASTM Chapter 15 (New)

Proposed Change as Submitted

Proponents: Tony Crimi, A.C. Consulting Solutions Inc., International Firestop Council (tcrimi@sympatico.ca)

2024 International Mechanical Code

Add new text as follows:

506.3.1 Special inspection and test requirements. Commercial kitchen grease ducts serving Type I hoods conforming to the provisions of Section 506.3.11 that are listed and labeled to the requirements of 506.3.11.2 or 506.3.11.3 shall undergo special inspection by an approved agency in accordance with ASTM WK70806.

Add new standard(s) as follows:

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box C700
West Conshohocken, PA 19428

ASTM WK70806 Standard Practice for On-Site Inspection of Fire Resistive Duct Systems

Reason: Commercial kitchen operations are consistently one of the leading causes of non-residential fires reported in the United States. Until recently, there has been no document produced in the industry that is a consensus of the manufacturers, installation contractors, and inspection agencies. The new ASTM Standard is a key document that provides a standard set of procedures for inspecting and reporting on the installed fire resistive duct systems. At the time of submission, the ASTM WK70806*, Standard Practice for On-Site Inspection of Fire Resistive Duct Systems* had not been published, but has gone through the full ASTM process and is awaiting final publication.

This Standard Practice provides a means to verify compliance of the installed fire resistive duct system to the inspection document, and requires all information contained in the inspection document to be submitted to the Authorizing Authority having jurisdiction. It establishes procedure to inspect products and systems, including methods for field verification and inspection.

Bibliography: ASTM WK70806, Standard Practice for On-Site Inspection of Fire Resistive Duct Systems, ASTM International, 100 Barr Harbor Drive, West Conshohocken, PA 19428.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

There are multiple jurisdictions that already require commercial grease duct inspections. The estimated cost is lower for instances where multiple duct inspections could be coordinated in the same time period, or for projects of low complexity. For those jurisdictions that already require duct inspection, the anticipated costs would be much lower as this proposal would be a replacement of existing requirements rather than an additional item.

Estimated Immediate Cost Impact Justification (methodology and variables):

For jurisdictions that do not currently require fire-resistant duct inspections, the anticipated cost increase for this proposal is between $1000 to $1500 per duct system inspected.

M40-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee voted to disapprove of the proposal 12-2. The committee's reasoning is that this proposal does not establish procedures to inspect products and systems, including methods for field verification and inspection.

M40-24

Individual Consideration Agenda

Comment 1:

IMC®: 506.3.1, ASTM Chapter 15 (New)

Proponents: Tony Crimi, A.C. Consulting Solutions Inc., International Firestop Council (tcrimi@sympatico.ca) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Mechanical Code

506.3.1 Special inspection and test requirements. Commercial kitchen grease ducts serving Type I hoods conforming to the provisions of Section 506.3.11 that are listed and labeled to the requirements of 506.3.11.2 or 506.3.11.3 shall undergo special inspection by an approved agency in accordance with ASTM ~~WK70806~~ E3385..

Add new standard(s) as follows:

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box C700
West Conshohocken, PA 19428

E3385-24 Standard Practice for On-Site Inspection of Fire Resistive Duct Systems

Reason: During CAH#1, the Committee stated that the proposal does not establish procedures to inspect products and systems, including methods for field verification and inspection. However, referencing this new Standard Practice will establish those procedures. The scope of the practice states:1.1 This practice covers a standard set of procedures for inspecting and reporting on the installed fire resistive duct systems.1.2 This practice establishes procedures to inspect products and systems, including methods for field verification and inspection.1.3 This practice provides an inspector and inspection body, various methods to verify that required systems have been installed in accordance with the inspection document.

The Standard is a key document that provides a standard set of procedures for inspecting and reporting on the installed fire resistive duct systems and does provide a means to verify compliance of the installed fire resistive duct system to the inspection document.

At the time of submission to CAH#1, the Standard had been fully balloted, but ASTM had not assign a Standard number. The only change to this proposal is to update the number of the Standard to the published version. No other technical changes were made to what was reviewed in ASTM WK70806.

Cost Impact: Increase

Estimated Immediate Cost Impact:

There are multiple jurisdictions that already require commercial grease duct inspections. The estimated cost is lower for instances where multiple duct inspections could be coordinated in the same time period, or for projects of low complexity. For those jurisdictions that already require duct inspection, the anticipated costs would be much lower as this proposal would be a replacement of existing requirements rather than an additional item.

Estimated Immediate Cost Impact Justification (methodology and variables):

For jurisdictions that do not currently require fire-resistant duct inspections, the anticipated cost increase for this proposal is between $1000 to $1500 per duct system inspected.

Comment (CAH2)# 433

NOTE: M44-24 PART I DID NOT RECEIVE A COMMENT (CAH2) AND IS REPRODUCED FOR INFORMATIONAL PURPOSES ONLY

M44-24 Part I

IMC®: 513.1

Proposed Change as Submitted

Proponents: Jonathan Roberts, UL Solutions, UL Solutions (jonathan.roberts@ul.com)

2024 International Mechanical Code

Revise as follows:

513.1 General. Energy and heat recovery ventilation systems shall be installed in accordance with this section. Where required for purposes of energy conservation, energy and heat recovery ventilation systems shall also comply with the *International Energy Conservation Code* . Ducted energy and heat recovery ventilators shall be *listed* and *labeled* in accordance with UL 1812. Nonducted energy and heat recovery ventilators shall be *listed* and *labeled* in accordance with UL 1815.

Reason: The common industry terms for the equipment covered by these requirements are “Energy Recovery Ventilators (ERVs)” and “Heat Recovery Ventilators (HRVs)”. The primary difference is that ERVs have moisture permeable heat exchangers to facilitate both sensible and latent heat transfer between the air streams. HRV’s have nonpermeable heat exchangers, and thus only facilitate sensible heat transfer. Both ERVs and HRVs are in scope of the referenced standards. This proposal aligns the code terminology with industry, the IECC, and the IRC to improve clarity. This clarifies that safety requirements always apply independently of energy conservation requirements of IECC. This clarifies that this section does not mandate installation, but provides requirements where installed.

Correlates IRC with mechanical code requirements (Section 514). Chapter 11 of IRC contains energy efficiency related requirements for this equipment (see N1103.6.1), however the main body of code does not contain safety requirements for this equipment.

This equipment is becoming more common in construction. M1301.1 already requires that equipment not covered by this code refer to the IMC. This equipment is covered by 514.1 of the IMC. By also adding these requirements into the body of the IRC, it assists the user in applying code requirements.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Editorial, clarifies existing requirements in the IMC, and also incorporates the updated text into the IRC for ease of use.

For the IRC: E3403.3 already requires listing of electrical equipment, while this proposal clarifies the specific listing standards. IRC M1301.1 points to the IMC for requirements for equipment not covered, and the IMC already includes these requirements. Additionally the IRC, Section M1302.1, requires appliances regulated by the IRC be listed and labeled for the application.

Public Hearing Results (CAH1)

Committee Action: **As Modified by Committee**

Committee Modification:
513.1 General.

Energy recovery ventilators (ERVs) and heat recovery ~~ventilation systems~~ ventilators (HRVs) shall be installed in accordance with this section. Where required for purposes of energy conservation, ~~energy and heat recovery ventilation systems~~ ERVS and HRVs shall also comply with the *International Energy Conservation Code* . Ducted ~~energy and heat recovery ventilators~~ ERVs and HRVs shall be *listed* and *labeled* in accordance with UL 1812. Nonducted ~~energy and heat recovery ventilators~~ ERVs and HRVs shall be *listed* and *labeled* in accordance with UL 1815.

Committee Reason: The committee voted to approve this proposal as modified by 14-0. The proposal further clarifies the relationship between energy and heat recovery ventilation systems. The IRC approved this proposal previously.

M44-24 Part I

M44-24 Part II

IRC: SECTION M1905 (New), M1905.1 (New), UL Chapter 44 (New)

Proposed Change as Submitted

Proponents: Jonathan Roberts, UL Solutions, UL Solutions (jonathan.roberts@ul.com)

2024 International Residential Code

Add new text as follows:

SECTION M1905
ENERGY AND HEAT RECOVERY VENTILATION SYSTEMS

M1905.1 General. Energy and heat recovery ventilation systems shall be installed in accordance with this section. Where required for purposes of energy conservation, energy and heat recovery ventilation systems shall also comply with Chapter 11. Ducted energy and heat recovery ventilators shall be *listed* and *labeled* in accordance with UL 1812. Nonducted energy and heat recovery ventilators shall be listed and labeled in accordance with UL 1815.

Add new standard(s) as follows:

UL

UL LLC
333 Pfingsten Road
Northbrook, IL 60062

1812-2013	Ducted Heat Recovery Ventilators - with revisions through May 3, 2022
1815-2012	Nonducted Heat Recovery Ventilators - with revisions December 7, 2021

Reason: The common industry terms for the equipment covered by these requirements are “Energy Recovery Ventilators (ERVs)” and “Heat Recovery Ventilators (HRVs)”. The primary difference is that ERVs have moisture permeable heat exchangers to facilitate both sensible and latent heat transfer between the air streams. HRV’s have nonpermeable heat exchangers, and thus only facilitate sensible heat transfer. Both ERVs and HRVs are in scope of the referenced standards. This proposal aligns the code terminology with industry, the IECC, and the IRC to improve clarity. This clarifies that safety requirements always apply independently of energy conservation requirements of IECC. This clarifies that this section does not mandate installation, but provides requirements where installed.

Correlates IRC with mechanical code requirements (Section 514). Chapter 11 of IRC contains energy efficiency related requirements for this equipment (see N1103.6.1), however the main body of code does not contain safety requirements for this equipment.

This equipment is becoming more common in construction. M1301.1 already requires that equipment not covered by this code refer to the IMC. This equipment is covered by 514.1 of the IMC. By also adding these requirements into the body of the IRC, it assists the user in applying code requirements.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Editorial, clarifies existing requirements in the IMC, and also incorporates the updated text into the IRC for ease of use.

For the IRC: E3403.3 already requires listing of electrical equipment, while this proposal clarifies the specific listing standards. IRC M1301.1 points to the IMC for requirements for equipment not covered, and the IMC already includes these requirements. Additionally the IRC, Section M1302.1, requires appliances regulated by the IRC be listed and labeled for the application.

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee voted to disapprove this proposal with a vote of 6-3. The committee argued that the 1st sentence of the proposal failed to meet the code requirements and does not properly list the specific area of the section.

M44-24 Part II

Individual Consideration Agenda

Comment 1:

IRC: M1905.1, M1905.2 (New), M1905.3 (New), UL Chapter 44

Proponents: Jonathan Roberts, UL Solutions, UL Solutions (jonathan.roberts@ul.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Residential Code

Revise as follows:

M1905.1 General. Energy recovery ventilators (ERVs) and heat recovery ventilators (HRVs) ~~ventilation systems~~ shall be installed in accordance with this section. ~~Where required for purposes of energy conservation, energy and heat recovery ventilation systems shall also comply with Chapter 11. Ducted energy and heat recovery ventilators shall be *listed* and *labeled* in accordance with UL 1812. Nonducted energy and heat recovery ventilators shall be listed and labeled in accordance with UL 1815.~~

Add new text as follows:

M1905.2 Installation. ERVs and HRVs shall be installed in accordance with the manufacturer's installation instructions. Where required for purposes of energy conservation, ERVs and HRVs shall also comply with Chapter 11.

M1905.3 Equipment listings. Ducted ERVs and HRVs shall be *listed* and *labeled* in accordance with UL 1812. Nonducted ERVs and HRVs shall be *listed* and *labeled* in accordance with UL 1815.

UL

UL LLC
333 Pfingsten Road
Northbrook, IL 60062

1812-2013	Ducted Heat Recovery Ventilators - with revisions through May 3, 2022
1815-2012	Nonducted Heat Recovery Ventilators - with revisions December 7, 2021

Reason: The original proposal has been adjusted based on committee feedback in CAH1 regarding editorial formatting. The original proposal referenced "this section" but the requirements were formatted as a single paragraph. This public comment shows a reformatting as a proper section, which improves code usability and addresses the editorial concerns. It also incorporates the changes from floor modification M44-24 Part II-Roberts MP2 to clarify ERV/HRV terminology. A reference to the manufacturer's installation instructions was added under M1905.2 to clarify the installation requirements.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Editorial, clarifies existing requirements. E3403.3 already requires listing of electrical equipment, while this proposal clarifies the specific listing standards. Additionally, IRC M1301.1 points to the IMC for requirements for equipment not covered, and the IMC already includes these requirements.

Comment (CAH2)# 481

NOTE: M47-24 PART I DID NOT RECEIVE A COMMENT (CAH2) AND IS REPRODUCED FOR INFORMATIONAL PURPOSES ONLY

M47-24 Part I

IMC®: 603.9.1 (New), UL Chapter 15 (New)

Proposed Change as Submitted

Proponents: Jonathan Roberts, UL Solutions, UL Solutions (jonathan.roberts@ul.com)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE MECHANICAL CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-MP CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Mechanical Code

Add new text as follows:

603.9.1 Collars and sleeves. Nonmetallic collars and sleeves used to join or attach flexible air ducts and air connectors shall be *listed* and *labeled* in accordance with UL 181C

Add new standard(s) as follows:

UL

UL LLC
333 Pfingsten Road
Northbrook, IL 60062-2096

181C-2020 Outline of Investigation for Non-Metal Joining Accessories for Flexible Air Ducts and Air Connectors

Reason: UL 181C, Outline of Investigation for Non-Metal Joining Accessories for Flexible Air Ducts and Air Connectors, was developed to evaluate non-metal accessories, such as collars and sleeves, used to join or attach flexible air ducts and air connectors that comply with the requirements of UL 181, Factory-Made Air Ducts and Air Connectors.

As defined in UL 181C, a collar is a non-metal accessory used to join flexible air ducts and air connectors at their terminations to other portions of the air duct system. A sleeve is defined as a non-metal accessory used to join sections of flexible air ducts or air connectors.

The requirements for these collars and sleeves include all the applicable requirements that would be applied to factory-made air ducts (UL 181) and discrete products within plenums (UL 2043).

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This does not increase of decrease cost. This does not mandate the use of these collars and sleeves. This is providing an alternative to existing methods for connecting flexible air ducts and air connectors. The proposal sets the base safety and performance requirements if these nonmetallic collars and sleeves are used.

Listing for heat pump heaters regulated by this section of the code is currently required by this code, so there is no cost impact. The proposal is a simple editorial revision to the correct (current) product standard.

M47-24 Part I

Public Hearing Results (CAH1)

Committee Action: **As Modified by Committee**

Committee Modification:
603.9.1 Collars and sleeves.

Nonmetallic collars and sleeves used to join or attach flexible air ducts and air connectors shall be *listed* and *labeled* in accordance with UL 181C.
Exception: Collars that are a component of a listed *appliance*.

Committee Reason: The committee voted 14-0 to approve of this proposal as modified. The proposal recognizes that an installed collar has already been tested per the manufacturer's outline of investigation for specific fire tests on collars and sleeves supplied for fire ducts. The purpose of UL 181C, the Outline of Investigation for Non-Metal Joining Accessories for Flexible Air Ducts and Air Connectors, is to assess non-metal accessories, like sleeves and collars, used to join or attach flexible air ducts and air connectors that meet UL 181 specifications. As described in UL 181C, a collar is a non-metal accessory that connects flexible air ducts and air connections to other system parts at their termination. Any non-metal attachment used to link segments of flexible air ducts or air connectors is called a sleeve.

M47-24 Part I

M47-24 Part II

IRC: M1601.1.1, UL Chapter 44 (New)

Proposed Change as Submitted

Proponents: Jonathan Roberts, UL Solutions, UL Solutions (jonathan.roberts@ul.com)

2024 International Residential Code

Revise as follows:

M1601.1.1 Above-ground duct systems. Above-ground *duct systems* shall conform to the following:

1. *Equipment* connected to *duct systems* shall be designed to limit discharge air temperature to not greater than 250°F (121°C).
2. Factory-made ducts shall be *listed* and *labeled* in accordance with UL 181 and installed in accordance with the manufacturer's instructions.
3. Nonmetallic collars and sleeves used to join or attach flexible air ducts, shall be *listed* and *labeled* in accordance with UL 181C
4. Fibrous glass duct construction shall conform to the *SMACNA Fibrous Glass Duct Construction Standards or NAIMA Fibrous Glass Duct Construction Standards.*

~~4~~ 5. Field-fabricated and shop-fabricated metal and flexible duct constructions shall conform to the *SMACNA HVAC Duct Construction Standards—Metal and Flexible* except as allowed by Table M1601.1.1. Galvanized steel shall conform to ASTM A653.

~~5~~ 6. The use of gypsum products to construct return air ducts or plenums is permitted, provided that the air temperature does not exceed 125°F (52°C) and exposed surfaces are not subject to condensation.

~~6~~ 7. *Duct systems* shall be constructed of materials having a *flame spread index* of not greater than 200.

~~7~~ 8. Stud wall cavities and the spaces between solid floor joists to be used as air plenums shall comply with the following conditions:

- ~~7~~ 8.1. These cavities or spaces shall not be used as a plenum for supply air.
- ~~7~~ 8.2. These cavities or spaces shall not be part of a required fire-resistance-rated assembly.
- ~~7~~ 8.3. Stud wall cavities shall not convey air from more than one floor level.
- ~~7~~ 8.4. Stud wall cavities and joist-space plenums shall be isolated from adjacent concealed spaces by tight-fitting *fireblocking* in accordance with Section R302.11. *Fireblocking* materials used for isolation shall comply with Section R302.11.1.
- ~~7~~ 8.5. Stud wall cavities in the outside walls of building envelope assemblies shall not be utilized as air plenums.
- ~~7~~ 8.6. Building cavities used as plenums shall be sealed.

~~8~~ 9. Volume dampers, equipment and other means of supply, return and exhaust air adjustment used in system balancing shall be provided with access.

Add new standard(s) as follows:

UL

UL LLC
333 Pfingsten Road
Northbrook, IL 60062

181C-2020 Outline of Investigation for Non-Metal Joining Accessories for Flexible Air Ducts and Air Connectors

Reason: UL 181C, Outline of Investigation for Non-Metal Joining Accessories for Flexible Air Ducts and Air Connectors, was developed to evaluate non-metal accessories, such as collars and sleeves, used to join or attach flexible air ducts and air connectors that comply with the requirements of UL 181, Factory-Made Air Ducts and Air Connectors.

As defined in UL 181C, a collar is a non-metal accessory used to join flexible air ducts and air connectors at their terminations to other portions of the air duct system. A sleeve is defined as a non-metal accessory used to join sections of flexible air ducts or air connectors.

The requirements for these collars and sleeves include all the applicable requirements that would be applied to factory-made air ducts (UL 181) and discrete products within plenums (UL 2043).

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This does not increase of decrease cost. This does not mandate the use of these collars and sleeves. This is providing an alternative to existing methods for connecting flexible air ducts and air connectors. The proposal sets the base safety and performance requirements if these nonmetallic collars and sleeves are used.

Listing for heat pump heaters regulated by this section of the code is currently required by this code, so there is no cost impact. The proposal is a simple editorial revision to the correct (current) product standard.

M47-24 Part II

Public Hearing Results (CAH1)

Committee Action: **As Modified by Committee**

Committee Modification: 2024 International Residential Code

M1601.1.1 Above-ground duct systems. Above-ground *duct systems* shall conform to the following:

1. *Equipment* connected to *duct systems* shall be designed to limit discharge air temperature to not greater than 250°F (121°C).
2. Factory-made ducts shall be *listed* and *labeled* in accordance with UL 181 and installed in accordance with the manufacturer's instructions.
3. Where ~~N~~nonmetallic collars and sleeves are used to join or attach flexible air ducts, they shall be *listed* and *labeled* in accordance with UL 181C
4. Fibrous glass duct construction shall conform to the *SMACNA Fibrous Glass Duct Construction Standards or NAIMA Fibrous Glass Duct Construction Standards.*
5. Field-fabricated and shop-fabricated metal and flexible duct constructions shall conform to the *SMACNA HVAC Duct Construction Standards—Metal and Flexible* except as allowed by Table M1601.1.1. Galvanized steel shall conform to ASTM A653.
6. The use of gypsum products to construct return air ducts or plenums is permitted, provided that the air temperature does not exceed 125°F (52°C) and exposed surfaces are not subject to condensation.
7. *Duct systems* shall be constructed of materials having a *flame spread index* of not greater than 200.

8. Stud wall cavities and the spaces between solid floor joists to be used as air plenums shall comply with the following conditions:

    8.1. These cavities or spaces shall not be used as a plenum for supply air.

    8.2. These cavities or spaces shall not be part of a required fire-resistance-rated assembly.

    8.3. Stud wall cavities shall not convey air from more than one floor level.

    8.4. Stud wall cavities and joist-space plenums shall be isolated from adjacent concealed spaces by tight-fitting *fireblocking* in accordance with Section R302.11. *Fireblocking* materials used for isolation shall comply with Section R302.11.1.

    8.5. Stud wall cavities in the outside walls of building envelope assemblies shall not be utilized as air plenums.

    8.6. Building cavities used as plenums shall be sealed.

9. Volume dampers, equipment and other means of supply, return and exhaust air adjustment used in system balancing shall be provided with access.

Committee Reason: The committee approved this proposal as modified with a vote of 8-1. The committee reasons that this proposal adds another option for installers to use. The modification clarifies when it is mandatory or not.

M47-24 Part II

Individual Consideration Agenda

Comment 1:

IRC: M1601.1.1

Proponents: Mike Moore, Stator LLC, Broan-NuTone (mmoore@statorllc.com) requests As Modified by Committee (AMC2)

Further modify as follows:

2024 International Residential Code

M1601.1.1 Above-ground duct systems. Above-ground *duct systems* shall conform to the following:

1. *Equipment* connected to *duct systems* shall be designed to limit discharge air temperature to not greater than 250°F (121°C).
2. Factory-made ducts shall be *listed* and *labeled* in accordance with UL 181 and installed in accordance with the manufacturer's instructions.
3. Where nonmetallic collars and sleeves are used to join or attach flexible air ducts, they shall be *listed* and *labeled* in accordance with UL 181C. **Exception:** Collars that are a component of a *listed appliance.*
4. Fibrous glass duct construction shall conform to the *SMACNA Fibrous Glass Duct Construction Standards or NAIMA Fibrous Glass Duct Construction Standards.*
5. Field-fabricated and shop-fabricated metal and flexible duct constructions shall conform to the *SMACNA HVAC Duct Construction Standards—Metal and Flexible* except as allowed by Table M1601.1.1. Galvanized steel shall conform to ASTM A653.
6. The use of gypsum products to construct return air ducts or plenums is permitted, provided that the air temperature does not exceed 125°F (52°C) and exposed surfaces are not subject to condensation.

7. *Duct systems* shall be constructed of materials having a *flame spread index* of not greater than 200.
8. Stud wall cavities and the spaces between solid floor joists to be used as air plenums shall comply with the following conditions:
    8.1. These cavities or spaces shall not be used as a plenum for supply air.
    8.2. These cavities or spaces shall not be part of a required fire-resistance-rated assembly.
    8.3. Stud wall cavities shall not convey air from more than one floor level.
    8.4. Stud wall cavities and joist-space plenums shall be isolated from adjacent concealed spaces by tight-fitting *fireblocking* in accordance with Section R302.11. *Fireblocking* materials used for isolation shall comply with Section R302.11.1.
    8.5. Stud wall cavities in the outside walls of building envelope assemblies shall not be utilized as air plenums.
    8.6. Building cavities used as plenums shall be sealed.
9. Volume dampers, equipment and other means of supply, return and exhaust air adjustment used in system balancing shall be provided with access.

Reason: The committee voted 14-0 to approve this same exception to Part 1 of this proposal, based on the rationale that collars that are a component of a listed appliance are already addressed by the fire testing required in accordance with the appliance's safety listing. For consistency, the same exception should be applied to Part 2 of this proposal.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposed exception clarifies that the requirement does not apply to collars that are a component of a listed appliance. There is no effect on the cost of construction.

Comment (CAH2)# 745

M50-24

IMC®: CHAPTER 6, SECTION 608, 608.1, CHAPTER 15, 15 SMACNA, SMACNA Chapter 15 (New)

Proposed Change as Submitted

Proponents: Eli Howard, SMACNA, SMACNA (ehoward@smacna.org)

2024 International Mechanical Code

CHAPTER 6
DUCT SYSTEMS

SECTION 608
BALANCING

Revise as follows:

608.1 Balancing. Air distribution, ventilation and exhaust systems shall be provided with means to adjust the system to achieve the design airflow rates and shall be balanced by an *approved* method in accordance with SMACNA HVAC Systems Testing, Adjusting, and Balancing Manual, or equivalent.. *Ventilation air* distribution shall be balanced by an *approved* method in accordance with SMACNA HVAC Systems Testing, Adjusting, and Balancing Manual, or equivalent. and such balancing shall verify that the air distribution system is capable of supplying and exhausting the airflow rates required by Chapter 4.

CHAPTER 15
REFERENCED STANDARDS

Revise as follows:

SMACNA

Sheet Metal and Air Conditioning Contractors' National Association, Inc.
4201 Lafayette Center Drive
Chantilly, VA 20151-1219

2023 HVAC SYSTEMS TESTING, ADJUSTING & BALANCING, FOURTH EDITION

Reason: Balancing is currently required by the IMC, and this document would provide proper procedures for compliance to the code requirements.

Bibliography: SMACNA HVAC Testing, Adjusting & Balancing Manual 4th edition 2023.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Balancing of HVAC Systems is currently required by the IMC, and this would just provide a specific standard of procedure to follow.

M50-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee voted 9-4 to disapprove of this proposal. The committee believes that more thought needs to go into the arrangement of the proposed code language.

M50-24

Individual Consideration Agenda

Comment 1:

IMC®: SECTION 608, 608.1, RESNET (New)

Proponents: Eli Howard, SMACNA, SMACNA (ehoward@smacna.org); Mike Moore, Stator LLC, The Home Ventilating Institute (mmoore@statorllc.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Mechanical Code

SECTION 608
BALANCING

Revise as follows:

608.1 Balancing. Air distribution, ventilation and exhaust systems shall be provided with means to adjust the system to achieve the design airflow rates and shall be balanced by an *approved* method in accordance with the SMACNA HVAC Systems Testing, Adjusting, and Balancing Manual, ANSI/RESNET/ICC 380 or equivalent. ~~*Ventilation air* distribution shall be balanced by an *approved* method in accordance with SMACNA HVAC Systems Testing, Adjusting, and Balancing Manual, or equivalent. and such balancing~~ Balancing shall verify that the air distribution system is capable of supplying and exhausting the airflow rates required by Chapter 4.

RESNET

Residential Energy Services Network
P.O. Boc 4561
Oceanside, CA 92052-4561
United States

ANSI/RESNET/ICC 380-2022 Standard for Testing Airtightness of Building, Dwelling Unit and Sleeping Unit Enclosures; Airtightness of Heating and Cooling Air Distribution Systems, and Airflow of Mechanical Ventilation Systems

Reason: Based on Committee Action in CAH1, this has been modified to address those comments in accordance with the SMACNA HVAC Systems Testing, Adjusting, and Balancing Manual, ANSI/RESNET/ICC 380 or equivalent.

Bibliography: SMACNA HVAC Testing, Adjusting & Balancing Manual 4th edition 2023

ANSI/RESNET/ICC 380-2019 Standard for Testing Airtightness of Building, Dwelling Unite, and Sleeping Unit Enclosures: Airtightness of Heating and Colling Air Distribution Systems: and Airflow of Mechanical Systems

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The IMC clearly mandates balancing of the HVAC Systems via Section 608.1 but does not provide the accepted Industry Standards to accomplish this requirement. The inclusion of the SMACNA & ANSI/RESNET/ICC standards provides the industry accepted methods for

the adequate balancing of HVAC Systems.

Comment (CAH2)# 648

M51-24

IMC®: 801.20

Proposed Change as Submitted

Proponents: Abraham MURRA, Abraham Murra Consulting, Abraham Murra Consulting

2024 International Mechanical Code

Revise as follows:

801.20 Plastic vent joints. Plastic pipe and fittings used to vent *appliances* shall be installed in accordance with the *appliance* manufacturer's installation instructions and with the installation instructions of the manufacturer of the venting pipe and fittings.

Reason: As part of the certification process, venting piping systems must include installation instructions, as required by UL 1738. Therefore, the proposed new text is making users of the IMC, including tradespersons, aware that the pipe and fittings used for venting must be installed in accordance with the installation instructions of the piping manufacturer.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposal only adds a statement for clarity.

M51-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee voted 9-5 to disapprove of this code proposal. The installation per UL 1738 is being proposed. The committee argues that this provision is between the manufacturer of the pipe and the manufacturer of the appliances.

M51-24

Individual Consideration Agenda

Comment 1:

Proponents: Michael Cudahy, PPFA Plastic Pipe and Fittings Association, PPFA Plastic Pipe and Fittings Association (mikec@cmservices.com) requests As Submitted

Reason: PPFA believes it is reasonable for this code to give pipe and fitting manufactures input on how their products are used in this application. Not all materials are suited and some instructions may be useful.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Comment 2:

Proponents: Abraham MURRA, Abraham Murra Consulting, Abraham Murra Consulting requests As Submitted

Reason: The committee reason for disapproving proposal M51-24 indicated that the vent installation is a matter between the manufacturer of the pipe and the manufacturer of the appliance. However, there is no relationship between the appliance and pipe manufacturers. Current practice is that the appliance manufacturer specifies the vent material when in fact they have no expertise in the manufacture and application of venting products and assume no liability for such products —venting products are manufactured by pipe and fittings manufacturers—.
The intent of the original M51 proposal was to require that the venting products be installed in accordance with the instructions of the manufacturer with the expertise for such products, which is of course the pipe and fittings manufacturer.
It is also important to note that there was no mention of UL 1738 in the original M51 proposal; UL 1738 was only mentioned in the supporting rationale.
We request that proposal M51-24 be approved as submitted.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

M63-24

IMC®: 1101.1.1

Proposed Change as Submitted

Proponents: Emily Toto, ASHRAE, ASHRAE (etoto@ashrae.org)

2024 International Mechanical Code

Revise as follows:

1101.1.1 Refrigerants other than ammonia. *Refrigeration systems* using a refrigerant other than ammonia shall comply with this chapter, ASHRAE 15 and the *International Fire Code*. *Refrigeration systems* containing carbon dioxide as the refrigerant shall also comply with IIAR CO2 or be part of listed and labeled equipment.

Reason: The scope of IIAR CO2 specifically excludes “Listed equipment or systems.” There are many listed refrigeration systems using carbon dioxide as the refrigerant. Field erected systems may also be evaluated by NRTLs to existing industry safety standards, such as UL 60335-2-40, UL 60335-2-89, and UL 471.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This change is only meant to address an inconsistency in order to maintain the intent of the scope.

M63-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee voted 13-1 to disapprove of this proposal. The committee's reasoning is that there is no need to add this proposed code language to this section of the IMC.

M63-24

Individual Consideration Agenda

Comment 1:

IMC®: 1101.1.1

Proponents: Emily Toto, ASHRAE, ASHRAE (etoto@ashrae.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Mechanical Code

1101.1.1 Refrigerants other than ammonia. *Refrigeration systems* using a refrigerant other than ammonia shall comply with this

chapter, ASHRAE 15 and the *International Fire Code*. Where not listed and labeled, ~~*P*~~*refrigeration systems* containing carbon dioxide as the refrigerant shall also comply with IIAR CO2~~ or be part of listed and labeled equipment~~.

Reason: As written, the language in 1101.1.1 prohibits the use of listed CO2 systems, as the scope of IIAR CO2 excludes listed systems and equipment. Therefore, no listed equipment complies with IIAR CO2, and can not be installed based on the existing language. The proposed language is intended to correct this conflict.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposed change is simply to correctly distinguish between what is covered by the i-codes and ASHRAE 15 in contrast to IIAR CO2. It does not change anything about installation requirements that were not already established.

Comment (CAH2)# 299

M64-24

IMC®: TABLE 1103.1

Proposed Change as Submitted

Proponents: Emily Toto, ASHRAE, ASHRAE (etoto@ashrae.org)

2024 International Mechanical Code

Revise as follows:

CHEMICAL REFRIGERANT	FORMULA	CHEMICAL NAME OF BLEND	REFRIGERANT SAFETY GROUP CLASSIFICATION	AMOUNT OF REFRIGERANT PER OCCUPIED SPACE						OEL	(F) DEGREES OF HAZARD
				RCL			LFL				
				~~lb/MCf~~ 1000 ft	ppm	g/m	~~lb/MCf~~ 1000 ft	ppm	g/m	ppm	
R-1270	$CH_3CH=CH_2$	Propene (propylene)	A3	0.11	1,000	1.7	—	—	—	500	1-4-1
R-1336mzz(E)	$CF_3CHCHCF_3$	trans 1,1,1,4,4,4-hexafluoro-2- butene	A1	3.0	7,200	48	—	—	—	400	
R-1336mzz(Z)	$CF_3CHCHCF_3$	cis-1,1,1,4,4,4-hexaflouro-2-butene	A1	5.2	13,000	84	—	—	—	500	—

For SI: 1 pound = 0.454 kg, 1 cubic foot = 0.0283 m^3.

a. Degrees of hazard are for health, fire, and reactivity, respectively, in accordance with NFPA 704.

b. Reduction to 1-0-0 is allowed if analysis satisfactory to the code official shows that the maximum concentration for a rupture or full loss of refrigerant charge would not exceed the IDLH, considering both the refrigerant quantity and room volume.

c. Class I ozone depleting substance; prohibited for new installations.

d. Occupational Exposure Limit based on the OSHA PEL, ACGIH TLV-TWA, the TERA WEEL or consistent value on a time-weighed average (TWA) basis (unless noted C for ceiling) for an 8 hr/d and 40 hr/wk.

e. LFL is based on WCF @ 73.4°F (23°C) unless otherwise noted.

f. WCFF LFL @ 140°F (60°C).

g. WCFF LFL @ 73.4°F (23°C).

h. WCF LFL @ 212°F (100°C).

Reason: The Refrigerant Classifications (except Degrees of Hazard) are determined by ASHRAE SSPC 34 and published in ASHRAE Standard 34. This proposal seeks to update the refrigerant table with the new refrigerants added to Standard 34 since the last code cycle. The reasons for the additions of new refrigerants can be found at https://www.ashrae.org/standards-research--technology/standards-addenda. All proposed changes are either incorporated into ASHRAE Standard 34-2022 or the published addenda to ASHRAE Standard 34-2022 located at the link above.

Bibliography: ASHRAE Standard 34-2022, Addenda a, b, c, d, e, f, g, h, j, k, m, ac, ah to ASHRAE Standard 34-2022 - https://www.ashrae.org/standards-research--technology/standards-addenda

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Updating the table of refrigerants that could be used in systems does not add labor or material costs because the choice of refrigerant is up to the owner and designer.

M64-24

Public Hearing Results (CAH1)

Committee Action: **As Modified by Committee**

Committee Modification:
International Mechanical Code
