PRINTED IN THE U.S.A.

TABLE OF CONTENTS

PAGE

INTRODUCTION

This publication contains the Comment Agenda for consideration at the Committee Action Hearings #2 (CAH #2) of the International Code Council on October 23rd – 31st at the Long Beach Convention Center, Long Beach, CA (see page 1). See page xl for the hearing schedule.

This publication contains information necessary for consideration of comments on the proposed code changes which have been considered at the ICC Committee Action Hearings #1 (CAH #1) held on April 7 -16, 2024, at the DoubleTree by Hilton in Orlando, FL. More specifically, this agenda addresses hearings on comments on proposed code changes to the *International Building Code (Egress, and Fire Safety), International Fire Code, International Fuel Gas Code, International Mechanical Code, International Plumbing Code, International Private Sewage and Disposal Code, International Residential Code (Mechanical and Plumbing), International Swimming Pool and Spa Code,* and *International Wildland Urban-Interface Code.*

AGENDA FORMAT

This Comment Hearing Agenda includes the Individual Consideration Agenda for comments to the code change proposals that comprise the 2024 Code Development Cycle.

The Individual Consideration Agenda is comprised of proposed changes*, which* received a comment in response to the Code Committee's action at the Committee Action Hearings #1.

Items on the Individual Consideration Agenda are published with information as originally published for the CAH #1 as well as the published hearing results. Following the hearing results is the reason that the item is on the Individual Consideration Agenda followed by the comments which were received.

Public testimony will follow the procedures given in *CP#28-05 Code Development* as published on page ix. Refer to the tentative hearing order on page xlii.

FLOOR MODIFICATIONS

With the implementation of the cdpACCESS online system, CP 28 was revised to reflect that floor modifications would be submitted electronically at the Committee Action Hearing #2 (CAH #2). The modifications in this hearing are specific to the comments submitted in response to the committee's action taken in CAH #1.

Those who are submitting a modification for consideration by the respective Code Development Committee are required to sign a Copyright Release in order to have their modification(s) considered (Section 4.3.5.5 of CP 28). This feature is built into cdpACCESS similar to the way the release is executed for the initial code change and public comment submittals.

Comments submitted in response to CAH #1 must be called to the floor during CAH#2 to be discussed and considered by the respective code development committee (CDC).

The Chair rules the modification in or out of order. Note that this is a procedural ruling to determine if the modification is to be permitted to be considered at the hearing. It is not a technical ruling. The ruling is final, with no challenge allowed.

The modification proponent is required to identify the specific text of the code change proposal that is being revised and the revision itself. In this way, it is very similar to the comment and public comment process and that is the way cdpACCESS was developed to process modifications.

Example:

Original code change proposal.
The original code change proposal requested the following change to Section 1506.2 of the IBC: (Note that the example is fictional.)

FS15-24-USER-MC1
803.1.1

Proponent: John West representing self

Revise as follows:

803.1.1 Interior wall and ceiling finish materials tested in accordance with NFPA 286. Interior wall and ceiling finish materials shall be classified in accordance with NFPA 286 and comply with Section 803.1.1.1. Materials complying with Section 803.1.1.1 shall be considered to also comply with the requirements of Class A.

Exception: Interior wall and ceiling finish materials qualified in accordance with Section 104.2.3 and approved by the code official.

Proposed modification:

A modification to the code change proposal is proposed:

1. To change “Interior wall and ceiling finish materials” to “Interior wall and ceiling finish systems.”
2. To remove “and approved by the code official” from the exception.

The cdpACCESS system will provide the text of the original code change proposal with the proposed change incorporated into the text. Using the cdpACCESS system, the proponent of the modification locates the original change in the system.

The proponent of the modification will need to manually install strikethrough (ex:” ~~delete~~) and underline (ex: add) formatting showing the additional revisions to the original proposal.

FS15-24-USER-MC1
FS15-24
803.1.1

Proponent: John West representing self

Revise as follows:

803.1.1 Interior wall and ceiling finish materials tested in accordance with NFPA 286. Interior wall and ceiling finish materials shall be classified in accordance with NFPA 286 and comply with Section 803.1.1.1. Materials complying with Section 803.1.1.1 shall be considered to also comply with the requirements of Class A.

Exception: Interior wall and ceiling finish ~~materials~~ systems qualified in accordance with Section 104..2.3 ~~and approved by the code official~~.

Among the benefits of using cdpACCESS to submit modifications are:

- Modification proponents will be able to access the system in advance of the hearings to develop their modification (see “Detailed Steps of the Modification Submission Process via cdpACCESS” on the following pages).
- Hard copies of the modification for distribution to the committee are not required.
- You can preview your modification at any time by downloading a pdf via cdpACCESS.

OVERVIEW OF THE MODIFICATION PROCESS (see CP28 Section 6.5.2 on page xxi)

1. Modification submitted electronically via cdpACCESS. As in the past, this submittal is required well in advance of the comment being brought to the floor.
2. The comment is brought to the floor by the Moderator.

IMPORTANT NOTE: ONCE A COMMENT IS BROUGHT TO THE FLOOR, ALL MODIFICATIONS MUST BE IN THE cdpACCESS SYSTEM. SEE NOTE 1.

3. Modification proponent suggests the modification from the floor at the hearing.
4. Modification posted to cdpACCESS for public viewing (including the hearing room via WiFi) and committee viewing.
5. Modification displayed on the screen in the hearing room.
6. Chair rules the modification in or out of order.
7. If ruled in order, testimony on the modification is initiated.

INDIVIDUAL CONSIDERATION AGENDA

The Individual Consideration Agenda for CAH #2 is comprised of proposals, which have comments. For each code, the proposed changes on the Individual Consideration Agenda shall be placed before the assembly for individual discussion and consideration of comments on each proposal by the committee only once called to the floor. Comments submitted in response to CAH #1, and their respective modifications, that are not called to the floor shall not be considered. The hearing order is found on page xlii and the agenda starts on page 1.

Code change proposals that only received comments in support without further modification of the committee action at CAH #1 are listed at the end of the agenda and will not be heard at CAH #2. These code changes will be placed on the consent agenda at the Public Comment Hearings with the committee recommendation from CAH #1.

ICC COMMITTEE ACTION HEARING (CAH #2) PROCESS

The hearing process will follow CP #28. The process is summarized as follows and will occur for each code noted in the hearing order (CP #28 sections noted):

1. At the start of each of the individual hearings for the respective code (see page xlii):
   - Requests to withdraw code changes
   - Requests to withdraw comments
   - Requests to revise the hearing order

2. The first code change on the hearing order brought to the floor for discussion will be identified. The moderator calls for any comments
   on the code change.
3. A comment from the monograph is brought forward from the floor. Discussion in support or opposition to the comment and rebuttal testimony are conducted. Once complete another comment may be brought forward and discussed as previous. Once complete, the moderator will ask the committee if there are any comments not discussed that they would like to call to the floor. Comments called to the floor by the committee will be discussed (in support or opposition and rebuttals). Once all comments have been heard along with any proposed modifications the moderator will turn the item over to the committee chair.
4. The committee chair asks the committee if there is a motion. If no motion the action of CAH #1 stands. Should there
   be a motion and a second a comment is discussed. Once discussion is complete the committee chair calls for a vote of the committee. The committee will vote. A simple majority vote is needed for a successful vote. Following the completion of the vote and any necessary reason statements, the committee chair will call for any further motions. This step will repeat until no further motions of the committee are called on this code change.
5. Repeat 2 – 4 for subsequent code changes

VIEW THE COMMITTEE ACTION HEARINGS (CAH #2) ON YOUR PC

The Committee Action Hearings (CAH #2) are scheduled to be “webcast”. Streaming video broadcast over the Internet will provide a gateway for all International Code Council members, the construction industry and other interested parties anywhere in the world to view and listen to the hearings. Logging on to the Internet broadcast will be as simple as going to the International Code Council web site, **www.iccsafe.org** and clicking on a link.

The hearings can be seen at no cost by anyone with Internet access. Minimum specifications for viewing the hearings are an Internet connection, sound card and Microsoft Windows Media Player. DSL, ISDN, Cable Modems or other leased-line connections are recommended for the best viewing experience. A dial-up modem connection will work, but with reduced video performance.

Past hearing videos are now posted following the hearings at http://hearingvideos.iccsafe.org/.

INTRODUCTION

This publication contains the Comment Agenda for consideration at the Committee Action Hearings #2 (CAH #2) of the International Code Council on October 23rd – 31st at the Long Beach Convention Center, Long Beach, CA (see page 1). See page xl for the hearing schedule.

This publication contains information necessary for consideration of comments on the proposed code changes which have been considered at the ICC Committee Action Hearings #1 (CAH #1) held on April 7 -16, 2024, at the DoubleTree by Hilton in Orlando, FL. More specifically, this agenda addresses hearings on comments on proposed code changes to the *International Building Code (Egress, and Fire Safety), International Fire Code, International Fuel Gas Code, International Mechanical Code, International Plumbing Code, International Private Sewage and Disposal Code, International Residential Code (Mechanical and Plumbing), International Swimming Pool and Spa Code,* and *International Wildland Urban-Interface Code.*

AGENDA FORMAT

This Comment Hearing Agenda includes the Individual Consideration Agenda for comments to the code change proposals that comprise the 2024 Code Development Cycle.

The Individual Consideration Agenda is comprised of proposed changes*, which* received a comment in response to the Code Committee's action at the Committee Action Hearings #1.

Items on the Individual Consideration Agenda are published with information as originally published for the CAH #1 as well as the published hearing results. Following the hearing results is the reason that the item is on the Individual Consideration Agenda followed by the comments which were received.

Public testimony will follow the procedures given in *CP#28-05 Code Development* as published on page ix. Refer to the tentative hearing order on page xlii.

FLOOR MODIFICATIONS

With the implementation of the cdpACCESS online system, CP 28 was revised to reflect that floor modifications would be submitted electronically at the Committee Action Hearing #2 (CAH #2). The modifications in this hearing are specific to the comments submitted in response to the committee's action taken in CAH #1.

Those who are submitting a modification for consideration by the respective Code Development Committee are required to sign a Copyright Release in order to have their modification(s) considered (Section 4.3.5.5 of CP 28). This feature is built into cdpACCESS similar to the way the release is executed for the initial code change and public comment submittals.

Comments submitted in response to CAH #1 must be called to the floor during CAH#2 to be discussed and considered by the respective code development committee (CDC).

The Chair rules the modification in or out of order. Note that this is a procedural ruling to determine if the modification is to be permitted to be considered at the hearing. It is not a technical ruling. The ruling is final, with no challenge allowed.

The modification proponent is required to identify the specific text of the code change proposal that is being revised and the revision itself. In this way, it is very similar to the comment and public comment process and that is the way cdpACCESS was developed to process modifications.

Example:

Original code change proposal.
The original code change proposal requested the following change to Section 1506.2 of the IBC: (Note that the example is fictional.)

FS15-24-USER-MC1
803.1.1

Proponent: John West representing self

Revise as follows:

803.1.1 Interior wall and ceiling finish materials tested in accordance with NFPA 286. Interior wall and ceiling finish materials shall be classified in accordance with NFPA 286 and comply with Section 803.1.1.1. Materials complying with Section 803.1.1.1 shall be considered to also comply with the requirements of Class A.

Exception: Interior wall and ceiling finish materials qualified in accordance with Section 104.2.3 and approved by the code official.

Proposed modification:

A modification to the code change proposal is proposed:

1. To change “Interior wall and ceiling finish materials” to “Interior wall and ceiling finish systems.”
2. To remove “and approved by the code official” from the exception.

The cdpACCESS system will provide the text of the original code change proposal with the proposed change incorporated into the text. Using the cdpACCESS system, the proponent of the modification locates the original change in the system.

The proponent of the modification will need to manually install strikethrough (ex:” ~~delete~~) and underline (ex: add) formatting showing the additional revisions to the original proposal.

FS15-24-USER-MC1
FS15-24
803.1.1

Proponent: John West representing self

Revise as follows:

803.1.1 Interior wall and ceiling finish materials tested in accordance with NFPA 286. Interior wall and ceiling finish materials shall be classified in accordance with NFPA 286 and comply with Section 803.1.1.1. Materials complying with Section 803.1.1.1 shall be considered to also comply with the requirements of Class A.

Exception: Interior wall and ceiling finish ~~materials~~ systems qualified in accordance with Section 104..2.3 ~~and approved by the code official~~.

Among the benefits of using cdpACCESS to submit modifications are:

- Modification proponents will be able to access the system in advance of the hearings to develop their modification (see “Detailed Steps of the Modification Submission Process via cdpACCESS” on the following pages).
- Hard copies of the modification for distribution to the committee are not required.
- You can preview your modification at any time by downloading a pdf via cdpACCESS.

OVERVIEW OF THE MODIFICATION PROCESS (see CP28 Section 6.5.2 on page xxi)

1. Modification submitted electronically via cdpACCESS. As in the past, this submittal is required well in advance of the comment being brought to the floor.
2. The comment is brought to the floor by the Moderator.

IMPORTANT NOTE: ONCE A COMMENT IS BROUGHT TO THE FLOOR, ALL MODIFICATIONS MUST BE IN THE cdpACCESS SYSTEM. SEE NOTE 1.

3. Modification proponent suggests the modification from the floor at the hearing.
4. Modification posted to cdpACCESS for public viewing (including the hearing room via WiFi) and committee viewing.
5. Modification displayed on the screen in the hearing room.
6. Chair rules the modification in or out of order.
7. If ruled in order, testimony on the modification is initiated.

INDIVIDUAL CONSIDERATION AGENDA

The Individual Consideration Agenda for CAH #2 is comprised of proposals, which have comments. For each code, the proposed changes on the Individual Consideration Agenda shall be placed before the assembly for individual discussion and consideration of comments on each proposal by the committee only once called to the floor. Comments submitted in response to CAH #1, and their respective modifications, that are not called to the floor shall not be considered. The hearing order is found on page xlii and the agenda starts on page 1.

Code change proposals that only received comments in support without further modification of the committee action at CAH #1 are listed at the end of the agenda and will not be heard at CAH #2. These code changes will be placed on the consent agenda at the Public Comment Hearings with the committee recommendation from CAH #1.

ICC COMMITTEE ACTION HEARING (CAH #2) PROCESS

The hearing process will follow CP #28. The process is summarized as follows and will occur for each code noted in the hearing order (CP #28 sections noted):

1. At the start of each of the individual hearings for the respective code (see page xlii):
   - Requests to withdraw code changes
   - Requests to withdraw comments
   - Requests to revise the hearing order

2. The first code change on the hearing order brought to the floor for discussion will be identified. The moderator calls for any comments
   on the code change.
3. A comment from the monograph is brought forward from the floor. Discussion in support or opposition to the comment and rebuttal testimony are conducted. Once complete another comment may be brought forward and discussed as previous. Once complete, the moderator will ask the committee if there are any comments not discussed that they would like to call to the floor. Comments called to the floor by the committee will be discussed (in support or opposition and rebuttals). Once all comments have been heard along with any proposed modifications the moderator will turn the item over to the committee chair.
4. The committee chair asks the committee if there is a motion. If no motion the action of CAH #1 stands. Should there
   be a motion and a second a comment is discussed. Once discussion is complete the committee chair calls for a vote of the committee. The committee will vote. A simple majority vote is needed for a successful vote. Following the completion of the vote and any necessary reason statements, the committee chair will call for any further motions. This step will repeat until no further motions of the committee are called on this code change.
5. Repeat 2 – 4 for subsequent code changes

VIEW THE COMMITTEE ACTION HEARINGS (CAH #2) ON YOUR PC

The Committee Action Hearings (CAH #2) are scheduled to be “webcast”. Streaming video broadcast over the Internet will provide a gateway for all International Code Council members, the construction industry and other interested parties anywhere in the world to view and listen to the hearings. Logging on to the Internet broadcast will be as simple as going to the International Code Council web site, **www.iccsafe.org** and clicking on a link.

The hearings can be seen at no cost by anyone with Internet access. Minimum specifications for viewing the hearings are an Internet connection, sound card and Microsoft Windows Media Player. DSL, ISDN, Cable Modems or other leased-line connections are recommended for the best viewing experience. A dial-up modem connection will work, but with reduced video performance.

Past hearing videos are now posted following the hearings at http://hearingvideos.iccsafe.org/.

PROPONENT REVIEW OF COMMENTS

While great care has been exercised in the publication of this document, there may be errata posted for the Comment Agenda. **Proponents are encouraged to carefully review their comments and email errata to dbroadnax@iccsafe.org by September 19, 2024 to be included in our published errata to the Committee Action Hearing Agenda (CAH #2) in order to be included in the agenda for consideration at the Committee Action Hearings (CAH #2).** Errata, if any, identified prior to the Committee Action Hearings (CAH #2) will be posted as updates to the Committee Action Hearing (CAH #2) Agenda on the ICC website here.
Users are encouraged to periodically review the ICC Website for updates to the 2024 Committee Action Hearing (CAH #2) Agenda.

EDITORIAL CODE CHANGES - CODE CORRELATION COMMITTEE

In a typical code change cycle, there are code change proposals that are considered strictly editorial. Section 5.4 of CP 28 (see below) establishes a process by which the Code Correlation Committee (CCC) considers such proposals.

5.4 Editorial Code Change Proposals. When a code change proposal is submitted that proposes an editorial or format change that, in the opinion of the Secretariat, does not affect the scope or application of the code, the proposal shall be submitted to the Code Correlation Committee who shall deem the code change proposal as editorial or send the proposal back to the Secretariat to be considered by the appropriate Committee. To be deemed editorial, such proposal shall require a majority vote of the Code Correlation Committee. Editorial proposals shall be published in the Code Change Agenda. Such proposals shall be added to the hearing agenda for consideration by the appropriate Committee upon written request to ICC by any individual. The deadline to submit such requests shall be 14 days prior to the first day of the First Committee Action Hearing (CAH #1). Code Correlation Committee proposals that are not added to a Committee hearing agenda shall be published in the next edition of the code with no further consideration.

Since a comment, by extension, is part of a code change proposal, ICC has applied the purpose and intent of Section 5.4 to comments. There are no comments submitted for CAH #2 in the current 2024 Group A Cycle that have been considered editorial.

2024 Group A Codes/Code Development Committees:

- IBC-E: IBC Egress provisions. Chapters 10 and 11.
- IBC-FS: IBC Fire Safety provisions. Chapters 7, 8, 9 (partial), 14 and 26. Majority of IBC Chapter 9 is maintained by the IFC. See Code Group Notes.
- IFC: The majority of IFC Chapter 10 is maintained by IBC-E. See Code Group Notes.
- IFGC
- IMC
- IPC
- IPSDC: Code changes heard by the IPC committee (combined IPC & IPSDC committee)
- IRC-M: IRC Mechanical provisions. Chapters 12 – 23 (code changes heard by the IRC - MP committee)
- IRC-P: IRC Plumbing provisions. Chapters 25 – 33 (code changes heard by the IRC – MP committee)
- ISPSC
- IWUIC: Code changes heard by the IFC committee (combined IFC & IWUIC committee)

2025 Group B Codes/Code Development Committees:

- Admin: Chapter 1 of all the I-Codes except the IgCC and IRC. Also includes the update of currently referenced standards in all of the 2021 Codes, except the IgCC. See Code Group Notes below for the IECC and the ICC PC.
- IBC-G: IBC General provisions. Chapters 3 – 6, 12, 13, 27 – 33.
- IBC-S: IBC Structural provisions. IBC Chapters 15 – 25 and IEBC structural provisions. See Code Group Notes.
- IEBC: IEBC Non-structural provisions. See Code Group Notes.
- IgCC: The administration provisions of Chapter 1 of the IgCC in order to provide for coordination with the other administrative provisions in the I-Codes. Additionally, Appendix M included as it is not included in ASHRAE Standard 189.1. Remainder of the code is based on the provisions of ASHRAE Standard 189.1 *Standard for the Design of High-Performance Green Buildings, Except Low-Rise Residential Buildings*.
- IPMC: Code changes heard by the IPM/ZC (combined IPMC & IZC code committee)
- IRC-B: IRC Building provisions. Chapters 1 – 10
- IZC: Code changes heard by the IPM/ZC (combined IPMC & IZC code committee)

Code Group Notes:

- Be sure to review the document entitled “2024/2025/2026 Group A and B Code Development Committee Responsibilities Matrix” (matrix) which has been posted. This identifies responsibilities which are different than Group A and B codes and committees which may impact the applicable code change cycle and resulting code change deadline. As an example, throughout Chapter 4 of the IBC (IBC- General), there are numerous sections which include the designation “[F]” which indicates that the provisions of the section are maintained by the IFC committee. Similarly, there are numerous sections in the IEBC which include the designation “[BS]”. These are structural provisions which will be heard by the IBC – Structural committee. The designations in the code are identified in the matrix.
- I-Code Chapter 1: Proposed changes to the provisions in Chapter 1 of the majority of the I-Codes are heard in Group B (see Admin above for exceptions). Be sure to review the brackets ([ ]) of the applicable code.
- Definitions. Be sure to review the brackets ([ ]) in Chapter 2 of the applicable code and the matrix to determine which committee will consider proposed changes to the definitions.
- ICC Performance Code (ICC PC): The 2027 edition of the ICC PC will be updated utilizing the ICC standards process. Click link for more information.
- International Energy Conservation Code (IECC) and Chapter 11 of the International Residential Code (IRC): The 2027 edition of the IECC and Chapter 11 of the IRC will be updated utilizing the ICC standards process. Click link for more information.

CP#28-05 – Code Development

Approved: 09/24/05 | **Revised:** 07/12/24

1.0 Introduction

1.1 Purpose of Council Policy: The purpose of this Council Policy is to prescribe the Rules of Procedure utilized in the continued development and maintenance of the International Codes (Codes).

1.2 Objectives: The ICC Code Development Process has the following objectives:

1.2.1 The timely evaluation and recognition of technological developments pertaining to construction regulations.

1.2.2 The open discussion of code change proposals by all parties desiring to participate.

1.2.3 The final determination of Code text by public officials actively engaged in the administration, formulation, implementation or enforcement of laws, ordinances, rules, or regulations relating to the public health, safety, and welfare and by honorary members.

1.2.4 The increased participation of all parties desiring to participate through an online submittal and voting process that includes opportunities for online collaboration.

1.3 Code Publication: The ICC Board of Directors (ICC Board) shall determine the title and the general purpose and scope of each Code published by the ICC.

1.3.1 Code Correlation: The provisions of all Codes shall be consistent with one another so that conflicts between the Codes do not occur. A Group A and Group B Code Development Committee Responsibilities Matrix identifies which Code shall be the primary document, and therefore which Code Development Committee shall be responsible for maintenance of the Code text where a given subject matter or Code text could appear in more than one Code. The Matrix shall be administered by the Code Correlation Committee as approved by the ICC Board and posted prior to the code change proposal deadline. Duplication of content or text between Codes shall be limited to the minimum extent necessary for practical usability of the Codes, as determined in accordance with Section 5.5.

1.4 Process Maintenance: The review and maintenance of the Code Development Process and these Rules of Procedure shall be by the ICC Board. The manner in which Codes are developed embodies core principles of the organization. One of those principles is that the final content of the Codes is determined by a vote of the governmental and honorary members in accordance with Sections 10.6 and 11. It is the policy of the ICC Board that there shall be no change to this principle without the affirmation of two-thirds of the governmental and honorary members responding.

1.5 Secretariat: The Chief Executive Officer shall assign a Secretariat for each of the Codes. All correspondence relating to code change proposals, comments to Committee action and public comments shall be addressed to the Secretariat. The Secretariat shall have the authority to facilitate unforeseen situations which arise in the implementation of this council policy. Staff shall maintain a record of such actions.

Council, and ICC staff shall, by an appropriate method, publish approved ICAs and ensure that approved ICAs are distributed with future sales of affected codes. ICAs shall be distributed as a separate document and shall not be incorporated into the text of a published code until such time that the ICA has been approved by the full code development process, following submittal as a proposal in accordance with Section 2.3.2.11.

2.3.2.9 Appeals. A decision of the Codes and Standards Council to approve an ICA shall be appealable to the ICC Board in accordance with CP#1 – Appeals.

2.3.2.10 Applicability. ICAs shall not be considered retroactive requirements.

2.3.2.11 Subsequent Processing. An approved ICA shall automatically become a code change proposal from the Codes and Standards Council in the following code cycle.

2.4 Code Development Record. The code development record shall include the official documents and records developed in support of the given code development cycle. This includes the following:

1. Code Change Agenda (Section 5.8)
2. Audio and video recording of both Committee Action Hearings for each code group (Sections 6.1 and 8.1)
3. Report of both Committee Action Hearings for each code group (Sections 6.7 and 8.5)
4. Public Comment Agenda (Section 9.6)
5. Public Comment Hearing results (Section 10.5.9.10)
6. Audio and video recording of the Public Comment Hearing (Section 10.0)
7. The Online Governmental Consensus Ballot (Section 11.3)
8. Final Action results (Section 13.4)
9. Errata to the documents noted above

The information resulting from online collaboration between interested parties shall not be part of the code development record.

3.0 Restructured Process Starting in 2024 (New)

3.1 Process: The 2027 I-Codes, and future editions, shall be developed utilizing a restructured code development process starting in 2024. The process includes the following key process steps:

YEAR ONE

- Code Group A code change proposals due (see Section 4.0)
- Code Group A First Committee Action Hearing (CAH #1) (see Section 6.0)
- Code Group A comments due on the action taken at CAH #1 (see Section 7.0)
- Code Group A Second Committee Action Hearing (CAH #2) (see Section 8.0)

YEAR TWO

- Code Group B code change proposals due (see Section 4.0)
- Code Group A public comments due (see Section 9.0)
- Code Group B First Committee Action Hearing (CAH #1) (see Section 6.0)
- Code Group B comments due on the action taken at CAH #1 (see Section 7.0)
- Code Group B Second Committee Action Hearing (CAH # 2) (see Section 8.0)

YEAR THREE

- Code Group B public comments due (see Section 9.0)

- Combined Code Group A & B Public Comment Hearing (see Section 10.0)
- Combined Code Group A & B Online Governmental Consensus Vote (see Section 11.0)

3.2 Schedule: A schedule of Code Groups, dates, locations and process steps with deadlines shall be posted a minimum of 120 days prior to the code change submittal deadline for Code Group A codes.

4.0 Submittal of Code Change Proposals

4.1 Intent: Any interested person, persons or group may submit a code change proposal which will be duly considered when in conformance to these Rules of Procedure.

4.2 Withdrawal of Proposal: A code change proposal may be withdrawn by the proponent (WP) at any time prior to membership action on the consent agenda at the Public Comment Hearing or prior to testimony on the code change proposal on the individual consideration agenda at the Public Comment Hearing. All actions on the code change proposal shall cease immediately upon the withdrawal of the code change proposal.

4.3 Form and Content of Code Change Submittals: Each code change proposal shall be submitted separately and shall be complete in-itself. Each submittal shall contain the following information:

4.3.1 Proponent: Each code change proposal shall include the name, title and email address of the proponent. Email addresses shall be published with the code change proposals unless the proponent otherwise requests on the submittal form.

4.3.1.1 If a group, organization or Committee submits a code change proposal, an individual with prime responsibility shall be indicated.

4.3.1.2 If a proponent submits a code change proposal on behalf of a client, group, organization or Committee, the name and email address of the client, group, organization, or Committee shall be indicated.

4.3.2 Code Reference: Each code change proposal shall relate to the applicable code sections(s) in the latest edition of the Code.

4.3.2.1 If more than one section in the Code is affected by a code change proposal, appropriate proposals shall be included for all such affected sections.

4.3.2.2 If more than one Code is affected by a code change proposal, appropriate proposals shall be included for all such affected Codes and appropriate cross referencing shall be included in the supporting information.

4.3.3 Multiple Code Change Proposals to a Code Section. A proponent shall not submit multiple code change proposals to the same code section. Where a proponent submits multiple code change proposals to the same section, the proposals shall be considered as incomplete proposals and processed in accordance with Section 5.3. This restriction shall not apply to code change proposals that attempt to address differing subject matter within a code section.

4.3.4 Text Presentation: The text of the code change proposal shall be presented in the specific wording desired with deletions shown struck out with a single line and additions shown underlined with a single line.

4.3.4.1 A charging statement shall indicate the referenced code section(s) and whether the code change proposal is intended to be an addition, deletion, or a revision to existing Code text.

4.3.4.2 Whenever practical, the existing wording of the text shall be preserved with

only such deletions and additions as necessary to accomplish the desired change.

4.3.4.3 Each code change proposal shall be in proper code format and terminology.

4.3.4.4 Each code change proposal shall be complete and specific in the text to eliminate unnecessary confusion or misinterpretation.

4.3.4.5 The proposed text shall be in mandatory terms.

4.3.5 Supporting Information: Each code change proposal shall include sufficient supporting information to indicate how the code change proposal is intended to affect the intent and application of the Code.

4.3.5.1 Purpose: The proponent shall clearly state the purpose of the code change proposal (e.g., clarify the Code; revise outdated material; substitute new or revised material for current provisions of the Code; add new requirements to the Code; delete current requirements, etc.).

4.3.5.2 Reasons: The proponent shall justify changing the current Code provisions, stating why the code change proposal is superior to the current provisions of the Code. Code change proposals which add or delete requirements shall be supported by a logical explanation which clearly shows why the current Code provisions are inadequate or overly restrictive, specifies the shortcomings of the current Code provisions and explains how such code change proposals will improve the Code.

4.3.5.3 Substantiation: The proponent shall substantiate the code change proposal based on technical information and substantiation. Substantiation provided which is reviewed in accordance with Section 5.2 and determined as not germane to the technical issues addressed in the code change proposal may be identified as such. The proponent shall be notified that the code change proposal is considered an incomplete proposal in accordance with Section 5.3 and the proposal shall be held until the deficiencies are corrected. The proponent shall have the right to appeal this action in accordance with CP#1 - Appeals. The burden of providing substantiating material lies with the proponent of the code change proposal. Supporting documentation may be provided via a link to a website provided by the proponent and included in the reason statement. The reason statement shall include the date the link was created. All substantiating material published by ICC is material that has been provided by the proponent and in so publishing ICC makes no representations or warranties about its quality or accuracy.

4.3.5.4 Bibliography: The proponent shall submit a bibliography of any substantiating material submitted with the code change proposal. The bibliography shall be published with the code change proposal and the proponent shall make the substantiating materials available for review at the appropriate ICC office and during the public hearing. Supporting documentation may be provided via a link to a website provided by the proponent and included in the bibliography. The reason statement shall include the date the link was created.

4.3.5.5 Copyright Release: The proponent of code change proposals, floor modifications, comments to Committee action and public comments shall sign a copyright release developed and posted by ICC.

4.3.5.6 Cost Impact: The proponent of the code change proposal, floor modification, and comments shall provide a cost impact statement in accordance with Section 17.0.

in a standard manner by the Secretariat and be assigned separate, distinct, and consecutive numbers. The Secretariat shall coordinate related proposals submitted in accordance with Section 4.3.2 to facilitate the hearing process.

5.8 Code Change Agenda: All code change proposals shall be posted on the ICC website at least 30 days prior to the First Committee Action Hearing (CAH #1) on those proposals and shall constitute the agenda for the hearing. Any errata to the Code Change Agenda shall be posted on the ICC website as soon as possible. Code change proposals which have not been published in the original posting or subsequent errata shall not be considered.

6.0 First Committee Action Hearing (CAH #1)

6.1 Intent: The intent of the First Committee Action Hearing (CAH #1) is to permit interested parties to present their views including the cost and benefits on the code change proposals on the published agenda. The Committee will consider such comments as may be presented in the development of their action on the disposition of such code change proposals.

6.2 Code Development Committee: The Codes and Standards Council shall review all applications and make Committee appointment recommendations to the ICC Board. The Committees shall be appointed by the ICC Board. (See Section 1.6 for terminology).

6.2.1 Chairperson/Moderator: The Chairperson and Vice-Chairperson shall be selected by the Codes and Standards Council from the appointed members of the Committee. The ICC President shall appoint one or more Moderators who shall act as presiding officer for the Committee Action Hearing.

6.2.2 Conflict of Interest: A Committee member shall withdraw from and take no part in those matters with which the Committee member has an undisclosed financial, business or property interest. The Committee member shall not participate in any Committee discussion, or any Committee vote on the matter in which they have an undisclosed interest. A Committee member who is a proponent of a code change proposal shall not participate in any Committee discussion on the matter or any Committee vote. Such Committee member shall be permitted to participate in the floor discussion in accordance with Section 6.5 and Section 8.4.1 by stepping down from the dais.

6.2.3 Representation of Interest: Committee members shall not represent themselves as official or unofficial representatives of the ICC except at regularly convened meetings of the Committee.

6.2.4 Committee Composition: The Committee may consist of representation from multiple interests. A minimum of thirty-three and one-third percent (33.3%) of the Committee members shall be Regulators (General Interest category in accordance with CP#7 – Committees and Members).

6.3 Date and Location: The date and location of the Committee Action Hearing shall be announced not less than 60 days prior to the date of the hearing.

6.4 General Procedures: *The Robert's Rules of Order* shall be the formal procedure for the conduct of the Committee Action Hearing except as a specific provision of these Rules of Procedure may otherwise dictate. A quorum shall consist of a majority of the voting members of the Committee.

6.4.1 Chair Voting: The Chairperson of the Committee shall vote only when the vote cast will break a tie vote of the Committee.

6.4.2 Open Hearing: The Committee Action Hearing is an open hearing. Any interested

person may attend and participate in the floor discussion. Only Committee members may participate in the Committee action portion of the hearings (see Section 6.6). Participants shall not advocate a position on specific code change proposals with Committee members other than through the methods provided in this policy.

6.4.3 Presentation of Material at the Committee Action Hearing: Information to be provided at the hearing shall be limited to verbal presentations and modifications submitted in accordance with Section 6.5.2. Each individual presenting information at the hearing shall state their name and affiliation, and shall identify any entities or individuals they are representing in connection with their testimony. Audio-visual presentations are not permitted. Substantiating material submitted in accordance with Section 4.3.5.3 and other material submitted in response to a code change proposal shall be located in a designated area in the hearing room and shall not be distributed to the Committee at the public hearing.

6.4.4 Agenda Order: The Secretariat shall publish a Code Change Agenda for the Committee Action Hearing, placing individual code change proposals in a logical order to facilitate the hearing. Any public hearing attendee may move to revise the agenda order as the first order of business at the hearing, or at any time during the hearing except while another code change proposal is being discussed. Preference shall be given to grouping like subjects together, and for moving items back to a later position on the agenda as opposed to moving items forward to an earlier position.

6.4.4.1 Proponent Approval: A motion to revise the agenda order is considered in order unless the proponent(s) of the moved code change proposals are in attendance in the hearing room and object to the move. Where such objections are raised, the motion to revise the hearing order shall be ruled out of order by the Moderator. The ruling of the Moderator shall be final and not subject to a point of order in accordance with Section 6.4.8. The motion to change the hearing order is not debatable.

6.4.4.2 Revised Agenda Order Approved: A motion to revise the agenda order is subject to a 2/3 vote of those present.

6.4.5 Tabling: Tabling of code change proposals shall be permitted. The motion to table is considered in order unless the proponent(s) of the tabled code change proposals are in attendance at the hearing and object to the tabling. Where such objections are raised, the motion to table shall be ruled out of order by the Moderator. The ruling of the Moderator shall be final and not subject to a point of order in accordance with Section 6.4.8. The motion to table is not debatable.

The motion to table must identify one of the following as to the location in the agenda when or where the code change proposal(s) will be considered:

1. To a specific date and time within the timeframe of the Code Change Agenda for the code change proposals under consideration, or

2. To a specific location in the Code Change Agenda for the code change proposals under consideration.

6.4.5.1 Tabling approved: A motion to table is subject to a 2/3 vote of those present.

6.4.5.2 Tabled code change proposals back to the floor: The Moderator shall bring the tabled code change proposal(s) back to the floor at the applicable time/agenda location in accordance with Section 6.4.5 Items 1 or 2. The

testimony on the code change proposal shall resume at the point in the process where the tabling occurred.

6.4.6 Reconsideration: There shall be no reconsideration of a code change proposal after it has been voted on by the Committee in accordance with Section 6.6.

6.4.7 Time Limits: Time limits shall be established as part of the agenda for testimony on all code change proposals at the beginning of each hearing session. Each person testifying on a code change proposal shall be given equal time. In the interest of time and fairness to all hearing participants, the Moderator shall identify the time limits on debate at the beginning of the hearing. The Moderator shall have the authority to adjust time limits as necessary in order to complete the hearing agenda.

6.4.7.1 Time Keeping: Keeping of time for testimony by an individual shall be by an automatic timing device. Remaining time shall be evident to the person testifying. Interruptions during testimony shall not be tolerated. The Moderator shall maintain appropriate decorum during all testimony.

6.4.7.2 Proponent Testimony: The Proponent is permitted to waive an initial statement. The Proponent shall be permitted to have the amount of time that would have been allocated during the initial testimony period plus the amount of time that would be allocated for rebuttal. Where the code change proposal is submitted by multiple proponents, this provision shall permit only one proponent of the joint submittal to be allotted additional time for rebuttal.

6.4.8 Points of Order: Any person participating in the hearing may challenge a procedural ruling of the Moderator or the Chairperson. A majority vote of ICC Members in attendance shall determine the decision.

6.5 Floor Discussion: The Moderator shall place each code change proposal before the hearing for discussion by identifying the proposal and by regulating discussion as follows:

6.5.1 Discussion Order:

1. Support. The Moderator shall begin by asking the proponent and then others in support of the code change proposal for their comments.
2. Opposition. After discussion by those in support of a code change proposal, those opposed hereto, if any, shall have the opportunity to present their views.
3. Rebuttal in support. Those in support shall then have the opportunity to rebut points raised by those in opposition.
4. Rebuttal in opposition. Those in opposition shall then have the opportunity to respond to the rebuttal in support.

.

6.5.2 Modifications: Modifications to code change proposals may be suggested from the floor by any person participating in the hearing. The person proposing the modification, or his/her designee, is deemed to be the proponent of the modification.

6.5.2.1 Submission. All modifications shall be submitted electronically to the ICC Secretariat in a format determined by ICC unless determined by the Chairperson to be either editorial or minor in nature. The modification will be forwarded electronically to the members of the Committee during the hearing and will be projected on the screen in the hearing room.

6.5.2.2 Criteria. The Chairperson shall rule proposed modifications in or out of order before they are discussed on the floor. A proposed modification shall be

PROPONENT REVIEW OF COMMENTS

While great care has been exercised in the publication of this document, there may be errata posted for the Comment Agenda. **Proponents are encouraged to carefully review their comments and email errata to dbroadnax@iccsafe.org by September 19, 2024 to be included in our published errata to the Committee Action Hearing Agenda (CAH #2) in order to be included in the agenda for consideration at the Committee Action Hearings (CAH #2).** Errata, if any, identified prior to the Committee Action Hearings (CAH #2) will be posted as updates to the Committee Action Hearing (CAH #2) Agenda on the ICC website here.
Users are encouraged to periodically review the ICC Website for updates to the 2024 Committee Action Hearing (CAH #2) Agenda.

EDITORIAL CODE CHANGES - CODE CORRELATION COMMITTEE

In a typical code change cycle, there are code change proposals that are considered strictly editorial. Section 5.4 of CP 28 (see below) establishes a process by which the Code Correlation Committee (CCC) considers such proposals.

5.4 Editorial Code Change Proposals. When a code change proposal is submitted that proposes an editorial or format change that, in the opinion of the Secretariat, does not affect the scope or application of the code, the proposal shall be submitted to the Code Correlation Committee who shall deem the code change proposal as editorial or send the proposal back to the Secretariat to be considered by the appropriate Committee. To be deemed editorial, such proposal shall require a majority vote of the Code Correlation Committee. Editorial proposals shall be published in the Code Change Agenda. Such proposals shall be added to the hearing agenda for consideration by the appropriate Committee upon written request to ICC by any individual. The deadline to submit such requests shall be 14 days prior to the first day of the First Committee Action Hearing (CAH #1). Code Correlation Committee proposals that are not added to a Committee hearing agenda shall be published in the next edition of the code with no further consideration.

Since a comment, by extension, is part of a code change proposal, ICC has applied the purpose and intent of Section 5.4 to comments. There are no comments submitted for CAH #2 in the current 2024 Group A Cycle that have been considered editorial.

2024/2025/2026 ICC CODE DEVELOPMENT SCHEDULE

3/17/2 | Updated 3/5/24

STEP IN CODE DEVELOPMENT CYCLE	DATE		
	2024 – Group A Codes IBC – E, IBC – FS, IFC, IFGC, IMC, IPC, IPSDC, IRC – M, IRC – P, ISPSC, IWUIC	**2025 – Group B Codes Admin, IBC – G, IBC – S, IEBC, IgCC (Ch. 1 & App M), IPMC, IRC – B, IZC**	**2026 - Group A & B Codes Public Comments Posting, Public Comment Hearing, Online Governmental Consensus Vote**
DEADLINE FOR RECEIPT OF ONLINE APPLICATIONS FOR ALL CODE DEVELOPMENT COMMITTEES	June 1, 2023 (See Schedule Notes)		
cdpACCESS OPEN FOR CODE CHANGE SUBMITTALS	October 16, 2023 (Tentative)	October 15, 2024	
DEADLINE FOR cdpACCESS ONLINE RECEIPT OF CODE CHANGE PROPOSALS	January 8, 2024	January 10, 2025	
WEB POSTING OF "PROPOSED CHANGES TO THE I-CODES" (Monograph)	February 26, 2024	March 13, 2025	
COMMITTEE ACTION HEARING #1 (CAH #1)	April 7 – 16, 2024	April 27 – May 6, 2025	
cdpACCESS OPEN FOR COMMENT SUBMITTALS TO CAH #1 ACTION	May 16, 2024	June 3, 2025	
WEB POSTING OF "REPORT OF THE COMMITTEE ACTION HEARING #1"	May 16, 2024	June 3, 2025	
DEADLINE FOR cdpACCESS ONLINE RECEIPT OF COMMENTS ON CAH #1 ACTIONS	July 8, 2024	July 15, 2025	
WEB POSTING OF "COMMENTS TO CAH #1"	September 5, 2024	September 10, 2025	
COMMITTEE ACTION HEARING #2 (CAH #2)	October 23 – 31, 2024	October 22 - 30, 2025	
WEB POSTING OF "REPORT OF THE COMMITTEE ACTION HEARING #2"	December 2, 2024	November 25, 2025	

STEP IN CODE DEVELOPMENT CYCLE	DATE		
	2024 – Group A Codes IBC – E, IBC – FS, IFC, IFGC, IMC, IPC, IPSDC, IRC – M, IRC – P, ISPSC, IWUIC	**2025 – Group B Codes Admin, IBC – G, IBC – S, IEBC, IgCC (Ch. 1 & App M), IPMC, IRC – B, IZC**	**2026 - Group A & B Codes Public Comments Posting, Public Comment Hearing, Online Governmental Consensus Vote**
cdpACCESS OPEN FOR PUBLIC COMMENT SUBMITTALS FOR 2026 PCH	January 20, 2025 (Tentative)	November 25, 2025 (Tentative)	
DEADLINE FOR cdpACCESS ONLINE RECEIPT OF PUBLIC COMMENTS FOR 2026 PCH	March 14, 2025	January 5, 2026	
WEB POSTING OF "GROUP A & B PUBLIC COMMENT AGENDA"	See 2026	See 2026	March 4, 2026
COMBINED GROUP A & B PUBLIC COMMENT HEARING (PCH)	Combined Group A & B PCH in 2026	Combined Group A & B PCH in 2026	April 19 - 28, 2026
COMBINED GROUP A & B ONLINE GOVERNMENTAL CONSENSUS VOTING (OGCV) PERIOD	Combined Group A & B OGCV in 2026	Combined Group A & B OGCV in 2026	Starts approx. two - three weeks after the last day of PCH.
WEB POSTING OF GROUP A & B FINAL ACTION	See 2026	See 2026	Following Validation Committee certification and ICC Board confirmation.

Schedule Notes:

- This schedule introduces the restructured process starting in 2024 with two Committee Action Hearings (CAH #1 and CAH #2) for each Code Group in 2024 and 2025, followed by a combined Group A and B PCH and OGCV in 2026. Click here for more information.
- Code Development Committee applications: As noted above, the restructured process will include two CAH's for which the same committee members who presided at CAH #1 will also preside at CAH #2. Previous cycles required Code Development Committee members to preside at only a single CAH in the Spring of the given year. Please be sure to consider this when applying for a Code Development Committee position.
- The "cdpACCESS OPEN" steps noted as "(tentative)" reflect availability of the applicable codes in the cdpACCESS system.
- Web posting of the "Proposed Changes to the I-Codes", "Comments to CAH #1" and "Group A & B Public Comment Agenda" will be posted no later than scheduled. ICC will make every effort to post these documents earlier, subject to code change/comment/public comment volume and processing time.
- "Comment" vs "Public Comment": CP28 uses the term "comment" to indicate a submittal in response to CAH #1 action and "public comment" in response to a CAH #2 action to be considered at the PCH. See Sections 7.0 and 9.0 om CP28.

2024 Group A Codes/Code Development Committees:

- IBC-E: IBC Egress provisions. Chapters 10 and 11.
- IBC-FS: IBC Fire Safety provisions. Chapters 7, 8, 9 (partial), 14 and 26. Majority of IBC Chapter 9 is maintained by the IFC. See Code Group Notes.
- IFC: The majority of IFC Chapter 10 is maintained by IBC-E. See Code Group Notes.
- IFGC
- IMC
- IPC
- IPSDC: Code changes heard by the IPC committee (combined IPC & IPSDC committee)
- IRC-M: IRC Mechanical provisions. Chapters 12 – 23 (code changes heard by the IRC - MP committee)
- IRC-P: IRC Plumbing provisions. Chapters 25 – 33 (code changes heard by the IRC – MP committee)
- ISPSC
- IWUIC: Code changes heard by the IFC committee (combined IFC & IWUIC committee)

2025 Group B Codes/Code Development Committees:

- Admin: Chapter 1 of all the I-Codes except the IgCC and IRC. Also includes the update of currently referenced standards in all of the 2021 Codes, except the IgCC. See Code Group Notes below for the IECC and the ICC PC.
- IBC-G: IBC General provisions. Chapters 3 – 6, 12, 13, 27 – 33.
- IBC-S: IBC Structural provisions. IBC Chapters 15 – 25 and IEBC structural provisions. See Code Group Notes.
- IEBC: IEBC Non-structural provisions. See Code Group Notes.
- IgCC: The administration provisions of Chapter 1 of the IgCC in order to provide for coordination with the other administrative provisions in the I-Codes. Additionally, Appendix M included as it is not included in ASHRAE Standard 189.1. Remainder of the code is based on the provisions of ASHRAE Standard 189.1 *Standard for the Design of High-Performance Green Buildings, Except Low-Rise Residential Buildings*.
- IPMC: Code changes heard by the IPM/ZC (combined IPMC & IZC code committee)
- IRC-B: IRC Building provisions. Chapters 1 – 10
- IZC: Code changes heard by the IPM/ZC (combined IPMC & IZC code committee)

Code Group Notes:

- Be sure to review the document entitled “2024/2025/2026 Group A and B Code Development Committee Responsibilities Matrix” (matrix) which has been posted. This identifies responsibilities which are different than Group A and B codes and committees which may impact the applicable code change cycle and resulting code change deadline. As an example, throughout Chapter 4 of the IBC (IBC- General), there are numerous sections which include the designation “[F]” which indicates that the provisions of the section are maintained by the IFC committee. Similarly, there are numerous sections in the IEBC which include the designation “[BS]”. These are structural provisions which will be heard by the IBC – Structural committee. The designations in the code are identified in the matrix.
- I-Code Chapter 1: Proposed changes to the provisions in Chapter 1 of the majority of the I-Codes are heard in Group B (see Admin above for exceptions). Be sure to review the brackets ([ ]) of the applicable code.
- Definitions. Be sure to review the brackets ([ ]) in Chapter 2 of the applicable code and the matrix to determine which committee will consider proposed changes to the definitions.
- ICC Performance Code (ICC PC): The 2027 edition of the ICC PC will be updated utilizing the ICC standards process. Click link for more information.
- International Energy Conservation Code (IECC) and Chapter 11 of the International Residential Code (IRC): The 2027 edition of the IECC and Chapter 11 of the IRC will be updated utilizing the ICC standards process. Click link for more information.

CP#28-05 – Code Development

Approved: 09/24/05 | **Revised:** 07/12/24

1.0 Introduction

1.1 Purpose of Council Policy: The purpose of this Council Policy is to prescribe the Rules of Procedure utilized in the continued development and maintenance of the International Codes (Codes).

1.2 Objectives: The ICC Code Development Process has the following objectives:

1.2.1 The timely evaluation and recognition of technological developments pertaining to construction regulations.

1.2.2 The open discussion of code change proposals by all parties desiring to participate.

1.2.3 The final determination of Code text by public officials actively engaged in the administration, formulation, implementation or enforcement of laws, ordinances, rules, or regulations relating to the public health, safety, and welfare and by honorary members.

1.2.4 The increased participation of all parties desiring to participate through an online submittal and voting process that includes opportunities for online collaboration.

1.3 Code Publication: The ICC Board of Directors (ICC Board) shall determine the title and the general purpose and scope of each Code published by the ICC.

1.3.1 Code Correlation: The provisions of all Codes shall be consistent with one another so that conflicts between the Codes do not occur. A Group A and Group B Code Development Committee Responsibilities Matrix identifies which Code shall be the primary document, and therefore which Code Development Committee shall be responsible for maintenance of the Code text where a given subject matter or Code text could appear in more than one Code. The Matrix shall be administered by the Code Correlation Committee as approved by the ICC Board and posted prior to the code change proposal deadline. Duplication of content or text between Codes shall be limited to the minimum extent necessary for practical usability of the Codes, as determined in accordance with Section 5.5.

1.4 Process Maintenance: The review and maintenance of the Code Development Process and these Rules of Procedure shall be by the ICC Board. The manner in which Codes are developed embodies core principles of the organization. One of those principles is that the final content of the Codes is determined by a vote of the governmental and honorary members in accordance with Sections 10.6 and 11. It is the policy of the ICC Board that there shall be no change to this principle without the affirmation of two-thirds of the governmental and honorary members responding.

1.5 Secretariat: The Chief Executive Officer shall assign a Secretariat for each of the Codes. All correspondence relating to code change proposals, comments to Committee action and public comments shall be addressed to the Secretariat. The Secretariat shall have the authority to facilitate unforeseen situations which arise in the implementation of this council policy. Staff shall maintain a record of such actions.

1.6 Code Development Committee: The members of the respective Code Development Committee presiding over the hearings are appointed by the ICC Board in accordance with Section 6.2. The term "Committee" is used throughout this Council Policy to refer to Code Development Committee members.

1.7 Recording: Individuals requesting permission to record any meeting or hearing, or portion thereof, shall be required to provide the ICC with a release of responsibility disclaimer and shall acknowledge that ICC shall retain sole ownership of the recording, and that they have insurance coverage for liability and misuse of recording materials. Equipment and the process used to record shall, in the judgment of the ICC Secretariat, be conducted in a manner that is not disruptive to the meeting. The ICC shall not be responsible for equipment, personnel or any other provision necessary to accomplish the recording. An unedited copy of the recording shall be forwarded to ICC within 30 days of the meeting. Recordings shall not otherwise be copied, reproduced or distributed in any manner. Recordings shall be returned to ICC or destroyed upon the request of ICC.

1.8 Code of Ethics: Each individual participating in the ICC Code Development Process shall comply with the posted *ICC Code of Ethics.*

2.0 Code Development Cycle

2.1 Intent: The code development cycle shall consist of the complete consideration of code change proposals in accordance with the procedures herein specified, commencing with the deadline for submission of code change proposals (see Section 4.5) and ending with publication of the Final Action on the code change proposals (see Section 13.4).

2.2 New Editions: The ICC Board shall determine the schedule for publishing new editions of the Codes. Each new edition shall incorporate the results of the code development activity since the previous edition.

2.3 Interim Code Amendments: All revisions to the International Codes shall be processed in accordance with other sections of this Council Policy except for Emergency Actions by the ICC Board complying with Section 2.3.1 and Interim Critical Amendments (ICA) complying with Section 2.3.2.

2.3.1 Emergency Actions by the ICC Board: Emergency actions by the ICC Board are limited to those issues representing an immediate threat to health and safety that warrant a more timely response than allowed by the Code Development Process schedule.

2.3.1.1 Initial Request: A request for an emergency action shall be based upon perceived immediate threats to health and safety and shall be reviewed by the Codes and Standards Council for referral to the ICC Board for action with their analysis and recommendation.

2.3.1.2 Board and Member Action: In the event that the ICC Board determines that an emergency amendment to any Code or supplement thereto is warranted, the same may be adopted by the ICC Board. Such action shall require an affirmative vote of at least two-thirds of the ICC Board.

The ICC membership shall be notified within ten days after the ICC Boards' official action of any emergency amendment. At the next Annual Business Meeting, any emergency amendment shall be presented to the members for ratification by a majority of the Governmental Member Voting Representatives and Honorary Members present and voting.

All code revisions pursuant to these emergency procedures and the reasons for such corrective action shall be published as soon as practicable after ICC Board action. Such revisions shall be identified as an emergency amendment.

Emergency amendments to any Code shall not be considered as a retro-active requirement to the Code. Incorporation of the emergency amendment into the adopted Code shall be subjected to the process established by the adopting authority.

2.3.2 Interim Critical Amendments (ICA)

2.3.2.1 Submittal. Anyone may propose an ICA by providing the following information:

a) Name of submitter
b) Contact information
c) Submitters representation
d) Date
e) Relevant section(s) and code edition(s) under consideration
f) Proposed modifications with text changes identified using underlines for new text and strikethroughs for deleted text
g) A statement that substantiates the need for proposed changes and why the proposed submission is of such a critical nature in accordance with Section 2.3.2.3 that it cannot be left to be addressed during the next code development cycle.
h) Written endorsement of the proposed ICA by not less than two members of the Committee(s) responsible for maintaining the affected code section(s)

2.3.2.2 Preliminary Review. An ICA will only be processed if the Codes and Standards Council determines that the proposed ICA appears to be of a critical nature requiring prompt action based on the criteria specified in Section 2.3.2.3. If processed, the question of critical nature shall be further considered by the responsible Committee(s) and the Codes and Standards Council. The text of a proposed ICA shall be processed as submitted or shall be changed with the approval of the submitter. The Codes and Standards Council shall process their preliminary “critical nature” determination within 45 days of the ICA submission.

2.3.2.3 Determination of Critical Nature. Qualification for critical nature shall be based on one or more of the following factors:

a) The proposed ICA corrects an error or an omission that was overlooked during a regular code development process.
b) The proposed ICA resolves a conflict within an individual code or a conflict involving two or more ICC codes.
c) The proposed ICA mitigates a previously unknown hazard.

2.3.2.4 Committee. A proposed ICA that meets the provisions in Sections 2.3.2.2 and 2.3.2.3 shall be submitted to the Committee(s) responsible for the affected section(s) for a ballot and comment period of 30 calendar days. The Committee(s) shall be separately balloted on both the technical merit of the ICA and whether the ICA satisfies the critical nature criteria. Negative votes in the initial ballot, if any, shall require a reason statement and shall be circulated to the full Committee(s) to allow initial ballot votes to be changed.

A Committee recommendation for approval shall require an affirmative vote of at

least three-fourths of members who voted, on both technical merit and critical nature. The following shall be omitted from the three-fourths vote calculation:

a) Committee members who have abstained.
b) Committee members whose negative ballots do not include a statement conveying the reason for casting a negative vote.
c) Committee members who do not return their ballots prior to the announced ballot return deadline.

In addition to the three-fourths majority described above, the number of affirmative votes shall be not less than 50% of all Committee members who are eligible to vote. Committee members eligible to vote shall be the total number of individuals who are members of the Committee on the date of ballot distribution and shall not be adjusted based on abstentions or ballots that were not returned.

ICAs that achieve the required number of affirmative votes on both technical merit and critical nature are approved for further processing in accordance with Sections 2.3.2.5 through 2.3.2.9. ICAs that do not achieve the required number of affirmative votes on both technical merit and critical nature are rejected.

2.3.2.5 Publication of Proposed ICA for Comment. An ICA that is approved in accordance with Section 2.3.2.3 shall be published by ICC in appropriate media with a notice inviting the public to comment on the proposed ICA. The comment period shall be open for at least 30 calendar days from the date of posting of the notice. When a proposed ICA revises text that was changed in the most recent code development cycle, the ICA comment notice shall also be directly provided to submitters of proposals, comments to Committee action and public comments to the affected section in the most recent code development cycle.

2.3.2.6 Additional Committee Review. All comments shall be circulated to the responsible Committee(s) for a 30-calendar day ballot and comment period allowing an opportunity for Committee members to change votes taken prior to the comment period. If any votes are changed to negative, negative votes shall be circulated to the full Committee, followed by a final ballot following the voting procedures Section 2.3.2.4.

Approved ICAs shall be forwarded to the Codes and Standards Council with a staff report that includes all comments, ballots, Committee member comments on ballots and concurrence by staff on which code editions should be affected by the ICA.

2.3.2.7 Action of the Codes and Standards Council. The Codes and Standards Council shall review the material submitted in accordance with Section 2.3.2.6 at the next Codes and Standards Council meeting. Approval of an ICA shall require an affirmative vote of at least two-thirds of the Codes and Standards Council members who cast a vote at the meeting.

2.3.2.8 Effective Date and Publication. ICAs that are approved by the Codes and Standards Council shall become effective 30 calendar days after approval, or in the case of an appeal in accordance with Section 2.3.2.9, 30 calendar days after a decision by the ICC Board upholding a Codes and Standards Council decision to issue an ICA.

An ICA shall apply to code editions specified by the ICC Codes and Standards

Council, and ICC staff shall, by an appropriate method, publish approved ICAs and ensure that approved ICAs are distributed with future sales of affected codes. ICAs shall be distributed as a separate document and shall not be incorporated into the text of a published code until such time that the ICA has been approved by the full code development process, following submittal as a proposal in accordance with Section 2.3.2.11.

2.3.2.9 Appeals. A decision of the Codes and Standards Council to approve an ICA shall be appealable to the ICC Board in accordance with CP#1 – Appeals.

2.3.2.10 Applicability. ICAs shall not be considered retroactive requirements.

2.3.2.11 Subsequent Processing. An approved ICA shall automatically become a code change proposal from the Codes and Standards Council in the following code cycle.

2.4 Code Development Record. The code development record shall include the official documents and records developed in support of the given code development cycle. This includes the following:

1. Code Change Agenda (Section 5.8)
2. Audio and video recording of both Committee Action Hearings for each code group (Sections 6.1 and 8.1)
3. Report of both Committee Action Hearings for each code group (Sections 6.7 and 8.5)
4. Public Comment Agenda (Section 9.6)
5. Public Comment Hearing results (Section 10.5.9.10)
6. Audio and video recording of the Public Comment Hearing (Section 10.0)
7. The Online Governmental Consensus Ballot (Section 11.3)
8. Final Action results (Section 13.4)
9. Errata to the documents noted above

The information resulting from online collaboration between interested parties shall not be part of the code development record.

3.0 Restructured Process Starting in 2024 (New)

3.1 Process: The 2027 I-Codes, and future editions, shall be developed utilizing a restructured code development process starting in 2024. The process includes the following key process steps:

YEAR ONE

- Code Group A code change proposals due (see Section 4.0)
- Code Group A First Committee Action Hearing (CAH #1) (see Section 6.0)
- Code Group A comments due on the action taken at CAH #1 (see Section 7.0)
- Code Group A Second Committee Action Hearing (CAH #2) (see Section 8.0)

YEAR TWO

- Code Group B code change proposals due (see Section 4.0)
- Code Group A public comments due (see Section 9.0)
- Code Group B First Committee Action Hearing (CAH #1) (see Section 6.0)
- Code Group B comments due on the action taken at CAH #1 (see Section 7.0)
- Code Group B Second Committee Action Hearing (CAH # 2) (see Section 8.0)

YEAR THREE

- Code Group B public comments due (see Section 9.0)

- Combined Code Group A & B Public Comment Hearing (see Section 10.0)
- Combined Code Group A & B Online Governmental Consensus Vote (see Section 11.0)

3.2 Schedule: A schedule of Code Groups, dates, locations and process steps with deadlines shall be posted a minimum of 120 days prior to the code change submittal deadline for Code Group A codes.

4.0 Submittal of Code Change Proposals

4.1 Intent: Any interested person, persons or group may submit a code change proposal which will be duly considered when in conformance to these Rules of Procedure.

4.2 Withdrawal of Proposal: A code change proposal may be withdrawn by the proponent (WP) at any time prior to membership action on the consent agenda at the Public Comment Hearing or prior to testimony on the code change proposal on the individual consideration agenda at the Public Comment Hearing. All actions on the code change proposal shall cease immediately upon the withdrawal of the code change proposal.

4.3 Form and Content of Code Change Submittals: Each code change proposal shall be submitted separately and shall be complete in-itself. Each submittal shall contain the following information:

4.3.1 Proponent: Each code change proposal shall include the name, title and email address of the proponent. Email addresses shall be published with the code change proposals unless the proponent otherwise requests on the submittal form.

4.3.1.1 If a group, organization or Committee submits a code change proposal, an individual with prime responsibility shall be indicated.

4.3.1.2 If a proponent submits a code change proposal on behalf of a client, group, organization or Committee, the name and email address of the client, group, organization, or Committee shall be indicated.

4.3.2 Code Reference: Each code change proposal shall relate to the applicable code sections(s) in the latest edition of the Code.

4.3.2.1 If more than one section in the Code is affected by a code change proposal, appropriate proposals shall be included for all such affected sections.

4.3.2.2 If more than one Code is affected by a code change proposal, appropriate proposals shall be included for all such affected Codes and appropriate cross referencing shall be included in the supporting information.

4.3.3 Multiple Code Change Proposals to a Code Section. A proponent shall not submit multiple code change proposals to the same code section. Where a proponent submits multiple code change proposals to the same section, the proposals shall be considered as incomplete proposals and processed in accordance with Section 5.3. This restriction shall not apply to code change proposals that attempt to address differing subject matter within a code section.

4.3.4 Text Presentation: The text of the code change proposal shall be presented in the specific wording desired with deletions shown struck out with a single line and additions shown underlined with a single line.

4.3.4.1 A charging statement shall indicate the referenced code section(s) and whether the code change proposal is intended to be an addition, deletion, or a revision to existing Code text.

4.3.4.2 Whenever practical, the existing wording of the text shall be preserved with

only such deletions and additions as necessary to accomplish the desired change.

4.3.4.3 Each code change proposal shall be in proper code format and terminology.

4.3.4.4 Each code change proposal shall be complete and specific in the text to eliminate unnecessary confusion or misinterpretation.

4.3.4.5 The proposed text shall be in mandatory terms.

4.3.5 Supporting Information: Each code change proposal shall include sufficient supporting information to indicate how the code change proposal is intended to affect the intent and application of the Code.

4.3.5.1 Purpose: The proponent shall clearly state the purpose of the code change proposal (e.g., clarify the Code; revise outdated material; substitute new or revised material for current provisions of the Code; add new requirements to the Code; delete current requirements, etc.).

4.3.5.2 Reasons: The proponent shall justify changing the current Code provisions, stating why the code change proposal is superior to the current provisions of the Code. Code change proposals which add or delete requirements shall be supported by a logical explanation which clearly shows why the current Code provisions are inadequate or overly restrictive, specifies the shortcomings of the current Code provisions and explains how such code change proposals will improve the Code.

4.3.5.3 Substantiation: The proponent shall substantiate the code change proposal based on technical information and substantiation. Substantiation provided which is reviewed in accordance with Section 5.2 and determined as not germane to the technical issues addressed in the code change proposal may be identified as such. The proponent shall be notified that the code change proposal is considered an incomplete proposal in accordance with Section 5.3 and the proposal shall be held until the deficiencies are corrected. The proponent shall have the right to appeal this action in accordance with CP#1 - Appeals. The burden of providing substantiating material lies with the proponent of the code change proposal. Supporting documentation may be provided via a link to a website provided by the proponent and included in the reason statement. The reason statement shall include the date the link was created. All substantiating material published by ICC is material that has been provided by the proponent and in so publishing ICC makes no representations or warranties about its quality or accuracy.

4.3.5.4 Bibliography: The proponent shall submit a bibliography of any substantiating material submitted with the code change proposal. The bibliography shall be published with the code change proposal and the proponent shall make the substantiating materials available for review at the appropriate ICC office and during the public hearing. Supporting documentation may be provided via a link to a website provided by the proponent and included in the bibliography. The reason statement shall include the date the link was created.

4.3.5.5 Copyright Release: The proponent of code change proposals, floor modifications, comments to Committee action and public comments shall sign a copyright release developed and posted by ICC.

4.3.5.6 Cost Impact: The proponent of the code change proposal, floor modification, and comments shall provide a cost impact statement in accordance with Section 17.0.

4.4 Online Submittal: Each code change proposal and all substantiating information shall be submitted online via cdpACCESS. One copy of each proposed new referenced standard in electronic form shall be submitted to staff. Additional electronic copies may be requested when determined necessary by the Secretariat to allow such information to be distributed to the Committee. Where such additional copies are requested, it shall be the responsibility of the proponent to secure permission to post the proposed new reference standard on a secure ICC website for Committee viewing. In lieu of electronic copies, hard copies are acceptable.

4.5 Submittal Deadline: ICC shall establish and post the submittal deadline for each cycle in accordance with Section 3.2. The posting of the deadline shall occur no later than 120 days prior to the code change deadline. Each code change proposal shall be submitted online via cdpACCESS by the posted deadline. The submitter of a code change proposal is responsible for the proper and timely receipt of all pertinent materials by the Secretariat.

4.6 Referenced Standards: In order for a standard to be considered for reference or to continue to be referenced by the Codes, a standard shall meet the following criteria:

4.6.1 Code References:

4.6.1.1 The standard, including title and date, and the manner in which it is to be utilized shall be specifically referenced in the Code text.

4.6.1.2 The need for the standard to be referenced shall be established.

4.6.2 Standard Content:

4.6.2.1 A standard or portions of a standard intended to be enforced shall be written in mandatory language.

4.6.2.2 The standard shall be appropriate for the subject covered.

4.6.2.3 All terms shall be defined when they deviate from an ordinarily accepted meaning or a dictionary definition.

4.6.2.4 The scope or application of a standard shall be clearly described.

4.6.2.5 The standard shall not have the effect of requiring proprietary materials.

4.6.2.6 The standard shall not prescribe a proprietary agency for quality control or testing.

4.6.2.7 The test standard shall describe, in detail, preparation of the test sample, sample selection or both.

4.6.2.8 The test standard shall prescribe the reporting format for the test results. The format shall identify the key performance criteria for the element(s) tested.

4.6.2.9 The measure of performance for which the test is conducted shall be clearly defined in either the test standard or in Code text.

4.6.2.10 The standard shall not state that its provisions shall govern whenever the referenced standard is in conflict with the requirements of the referencing Code.

4.6.2.11 The preface to the standard shall announce that the standard is promulgated according to a consensus procedure.

4.6.3 New and Updated Standards with Text Revisions:

4.6.3.1 Code change proposals with corresponding changes to the Code text which include a reference to a proposed new standard, or a proposed update of an existing referenced standard shall comply with this section.

4.6.3.1.1 Proposed New Standards. In order for a new standard to be considered for reference by the Code, such standard shall be submitted in at least a consensus draft form in accordance with Section 4.4. If the proposed new standard is not submitted in at least consensus draft form, the code

change proposal shall be considered incomplete and shall not be processed. The code change proposal shall be considered at the First Committee Action Hearing (CAH #1) by the applicable Committee responsible for the corresponding proposed changes to the code text.

If the Committee action at the Second Committee Action Hearing (CAH #2) is either As Submitted or As Modified and the standard is not completed, the code change proposal shall automatically be placed on the Public Comment Agenda with the recommendation stating that in order for the public comment to be considered, the new standard shall be completed and readily available prior to the Public Comment Hearing. If the Committee action at the Second Committee Action Hearing (CAH #2) is Disapproval, further consideration on the Public Comment Agenda shall state that in order for the public comment to be considered, the new standard shall be completed and readily available prior to the Public Comment Hearing. See Section 10.5.6.1 for availability of new standards at the Public Comment Hearing.

4.6.3.1.2 Update of Existing Standards. Code change proposals which include technical revisions to the Code text to coordinate with a proposed update of an existing referenced standard shall include the submission of the proposed update to the standard in at least a consensus draft form in accordance with Section 4.4. If the proposed update of the existing standard is not submitted in at least consensus draft form, the code change proposal shall be considered incomplete and shall not be processed. The code change proposal, including the update of the existing referenced standard, shall be considered at the First Committee Action Hearing (CAH #1) by the applicable Committee responsible for the corresponding changes to the code text.

If the Committee action at the Second Committee Action Hearing (CAH #2) is either As Submitted or As Modified and the updated standard is not completed, the code change proposal shall automatically be placed on the Public Comment Agenda with the recommendation stating that in order for the public comment to be considered, the updated standard shall be completed and readily available prior to the Public Comment Hearing. If the Committee action at the Second Committee Action Hearing (CAH #2) is Disapproval, further consideration on the Public Comment Agenda shall state that in order for the public comment to be considered, the updated standard shall be completed and readily available prior to the Public Comment Hearing. See Section 10.5.6.1 for availability of updated standards at the Public Comment Hearing.

Updating of standards without corresponding code text changes shall be accomplished administratively in accordance with Section 5.6.

4.6.4 Standard Promulgation: The standard shall be developed and maintained through a consensus process such as ASTM or ANSI.

5.0 Processing of Code Change Proposals

5.1 Intent: The processing of code change proposals is intended to ensure that each proposal complies with these Rules of Procedure and that the resulting published code change proposal accurately reflects that proponent's intent.

5.2 Review: Upon receipt in the Secretariat's office, the code change proposals will be checked for compliance with these Rules of Procedure as to division, separation, form, language, terminology, supporting statements and substantiating data. Where a code change proposal consists of multiple

parts which fall under the maintenance responsibilities of different Committees, the Secretariat shall determine the Committee responsible for determining the Committee action in accordance with Section 6.6 and the Group A and Group B Code Development Committee Responsibilities Matrix (see Section 1.3.1).

5.3 Incomplete Code Change Proposals: When a code change proposal is submitted with incorrect format, without the required information or judged as not in compliance with these Rules of Procedure, the Secretariat shall notify the proponent of the specific deficiencies and the proposal shall be held until the deficiencies are corrected, with a final date set for receipt of a corrected submittal. If the Secretariat receives the corrected code change proposal after the final date, the proposal shall be held over until the next code development cycle. Where there are otherwise no deficiencies addressed by this section, a code change proposal that incorporates a new referenced standard shall be processed with an analysis of the referenced standard's compliance with the criteria set forth in Section 4.6.

5.4 Editorial Code Change Proposals. When a code change proposal is submitted that proposes an editorial or format change that, in the opinion of the Secretariat, does not affect the scope or application of the code, the proposal shall be submitted to the Code Correlation Committee who shall deem the code change proposal as editorial or send the proposal back to the Secretariat to be considered by the appropriate Committee. To be deemed editorial, such proposal shall require a majority vote of the Code Correlation Committee. Editorial proposals shall be published in the Code Change Agenda. Such proposals shall be added to the hearing agenda for consideration by the appropriate Committee upon written request to ICC by any individual. The deadline to submit such requests shall be 14 days prior to the first day of the First Committee Action Hearing (CAH #1). Code Correlation Committee proposals that are not added to a Committee hearing agenda shall be published in the next edition of the code with no further consideration.

5.5 Copy Editing Code Text: The Chief Executive Officer shall have the authority at all times to make editorial style and format changes to the Code text, or any approved changes, consistent with the intent, provisions and style of the Code. Such editorial style or format changes shall not affect the scope or application of the Code requirements.

5.6 Updating Standards Referenced in the Codes: Standards referenced by the Codes that do not require coordination with a code change proposal to the Code text shall be identified administratively by staff and considered by the Administrative Committee in accordance with these full procedures except that the deadline for availability of the updated standard and receipt by the Secretariat shall be December 1 of the third year of each code cycle. The published version of the new edition of the Code which references the standard will refer to the updated edition of the standard. If the standard is not available by the December 1st deadline, the edition of the standard as referenced by the newly published Code shall revert back to the reference contained in the previous edition and an errata to the Code issued. Multiple standards to be updated may be included in a single proposal.

5.6.1 Updating ICC Standards Referenced in the Codes. All standards developed by ICC and referenced by the Codes which are undergoing an update shall be announced by ICC to allow stakeholders to participate in the update process. Where the updated standard is completed and available by December 1 of the third year of the code cycle, the published version of the new edition of the Code which references the standard shall refer to the updated edition of the standard. If the standard is not available by the December 1st deadline, the edition of the standard as referenced by the newly published Code shall revert back to the reference contained in the previous edition and an errata to the Code issued.

5.7 Preparation: All code change proposals in compliance with these procedures shall be prepared

in a standard manner by the Secretariat and be assigned separate, distinct, and consecutive numbers. The Secretariat shall coordinate related proposals submitted in accordance with Section 4.3.2 to facilitate the hearing process.

5.8 Code Change Agenda: All code change proposals shall be posted on the ICC website at least 30 days prior to the First Committee Action Hearing (CAH #1) on those proposals and shall constitute the agenda for the hearing. Any errata to the Code Change Agenda shall be posted on the ICC website as soon as possible. Code change proposals which have not been published in the original posting or subsequent errata shall not be considered.

6.0 First Committee Action Hearing (CAH #1)

6.1 Intent: The intent of the First Committee Action Hearing (CAH #1) is to permit interested parties to present their views including the cost and benefits on the code change proposals on the published agenda. The Committee will consider such comments as may be presented in the development of their action on the disposition of such code change proposals.

6.2 Code Development Committee: The Codes and Standards Council shall review all applications and make Committee appointment recommendations to the ICC Board. The Committees shall be appointed by the ICC Board. (See Section 1.6 for terminology).

6.2.1 Chairperson/Moderator: The Chairperson and Vice-Chairperson shall be selected by the Codes and Standards Council from the appointed members of the Committee. The ICC President shall appoint one or more Moderators who shall act as presiding officer for the Committee Action Hearing.

6.2.2 Conflict of Interest: A Committee member shall withdraw from and take no part in those matters with which the Committee member has an undisclosed financial, business or property interest. The Committee member shall not participate in any Committee discussion, or any Committee vote on the matter in which they have an undisclosed interest. A Committee member who is a proponent of a code change proposal shall not participate in any Committee discussion on the matter or any Committee vote. Such Committee member shall be permitted to participate in the floor discussion in accordance with Section 6.5 and Section 8.4.1 by stepping down from the dais.

6.2.3 Representation of Interest: Committee members shall not represent themselves as official or unofficial representatives of the ICC except at regularly convened meetings of the Committee.

6.2.4 Committee Composition: The Committee may consist of representation from multiple interests. A minimum of thirty-three and one-third percent (33.3%) of the Committee members shall be Regulators (General Interest category in accordance with CP#7 – Committees and Members).

6.3 Date and Location: The date and location of the Committee Action Hearing shall be announced not less than 60 days prior to the date of the hearing.

6.4 General Procedures: *The Robert's Rules of Order* shall be the formal procedure for the conduct of the Committee Action Hearing except as a specific provision of these Rules of Procedure may otherwise dictate. A quorum shall consist of a majority of the voting members of the Committee.

6.4.1 Chair Voting: The Chairperson of the Committee shall vote only when the vote cast will break a tie vote of the Committee.

6.4.2 Open Hearing: The Committee Action Hearing is an open hearing. Any interested

person may attend and participate in the floor discussion. Only Committee members may participate in the Committee action portion of the hearings (see Section 6.6). Participants shall not advocate a position on specific code change proposals with Committee members other than through the methods provided in this policy.

6.4.3 Presentation of Material at the Committee Action Hearing: Information to be provided at the hearing shall be limited to verbal presentations and modifications submitted in accordance with Section 6.5.2. Each individual presenting information at the hearing shall state their name and affiliation, and shall identify any entities or individuals they are representing in connection with their testimony. Audio-visual presentations are not permitted. Substantiating material submitted in accordance with Section 4.3.5.3 and other material submitted in response to a code change proposal shall be located in a designated area in the hearing room and shall not be distributed to the Committee at the public hearing.

6.4.4 Agenda Order: The Secretariat shall publish a Code Change Agenda for the Committee Action Hearing, placing individual code change proposals in a logical order to facilitate the hearing. Any public hearing attendee may move to revise the agenda order as the first order of business at the hearing, or at any time during the hearing except while another code change proposal is being discussed. Preference shall be given to grouping like subjects together, and for moving items back to a later position on the agenda as opposed to moving items forward to an earlier position.

6.4.4.1 Proponent Approval: A motion to revise the agenda order is considered in order unless the proponent(s) of the moved code change proposals are in attendance in the hearing room and object to the move. Where such objections are raised, the motion to revise the hearing order shall be ruled out of order by the Moderator. The ruling of the Moderator shall be final and not subject to a point of order in accordance with Section 6.4.8. The motion to change the hearing order is not debatable.

6.4.4.2 Revised Agenda Order Approved: A motion to revise the agenda order is subject to a 2/3 vote of those present.

6.4.5 Tabling: Tabling of code change proposals shall be permitted. The motion to table is considered in order unless the proponent(s) of the tabled code change proposals are in attendance at the hearing and object to the tabling. Where such objections are raised, the motion to table shall be ruled out of order by the Moderator. The ruling of the Moderator shall be final and not subject to a point of order in accordance with Section 6.4.8. The motion to table is not debatable.

The motion to table must identify one of the following as to the location in the agenda when or where the code change proposal(s) will be considered:

1. To a specific date and time within the timeframe of the Code Change Agenda for the code change proposals under consideration, or

2. To a specific location in the Code Change Agenda for the code change proposals under consideration.

6.4.5.1 Tabling approved: A motion to table is subject to a 2/3 vote of those present.

6.4.5.2 Tabled code change proposals back to the floor: The Moderator shall bring the tabled code change proposal(s) back to the floor at the applicable time/agenda location in accordance with Section 6.4.5 Items 1 or 2. The

testimony on the code change proposal shall resume at the point in the process where the tabling occurred.

6.4.6 Reconsideration: There shall be no reconsideration of a code change proposal after it has been voted on by the Committee in accordance with Section 6.6.

6.4.7 Time Limits: Time limits shall be established as part of the agenda for testimony on all code change proposals at the beginning of each hearing session. Each person testifying on a code change proposal shall be given equal time. In the interest of time and fairness to all hearing participants, the Moderator shall identify the time limits on debate at the beginning of the hearing. The Moderator shall have the authority to adjust time limits as necessary in order to complete the hearing agenda.

6.4.7.1 Time Keeping: Keeping of time for testimony by an individual shall be by an automatic timing device. Remaining time shall be evident to the person testifying. Interruptions during testimony shall not be tolerated. The Moderator shall maintain appropriate decorum during all testimony.

6.4.7.2 Proponent Testimony: The Proponent is permitted to waive an initial statement. The Proponent shall be permitted to have the amount of time that would have been allocated during the initial testimony period plus the amount of time that would be allocated for rebuttal. Where the code change proposal is submitted by multiple proponents, this provision shall permit only one proponent of the joint submittal to be allotted additional time for rebuttal.

6.4.8 Points of Order: Any person participating in the hearing may challenge a procedural ruling of the Moderator or the Chairperson. A majority vote of ICC Members in attendance shall determine the decision.

6.5 Floor Discussion: The Moderator shall place each code change proposal before the hearing for discussion by identifying the proposal and by regulating discussion as follows:

6.5.1 Discussion Order:

1. Support. The Moderator shall begin by asking the proponent and then others in support of the code change proposal for their comments.
2. Opposition. After discussion by those in support of a code change proposal, those opposed hereto, if any, shall have the opportunity to present their views.
3. Rebuttal in support. Those in support shall then have the opportunity to rebut points raised by those in opposition.
4. Rebuttal in opposition. Those in opposition shall then have the opportunity to respond to the rebuttal in support.

.

6.5.2 Modifications: Modifications to code change proposals may be suggested from the floor by any person participating in the hearing. The person proposing the modification, or his/her designee, is deemed to be the proponent of the modification.

6.5.2.1 Submission. All modifications shall be submitted electronically to the ICC Secretariat in a format determined by ICC unless determined by the Chairperson to be either editorial or minor in nature. The modification will be forwarded electronically to the members of the Committee during the hearing and will be projected on the screen in the hearing room.

6.5.2.2 Criteria. The Chairperson shall rule proposed modifications in or out of order before they are discussed on the floor. A proposed modification shall be

ruled out of order if it:

1. changes the scope of the original code change proposal; or

2. is not readily understood to allow a proper assessment of its impact on the original code change proposal or the Code.

The ruling of the Chairperson on whether or not the modification is in or out of order shall be final and is not subject to a point of order in accordance with Section 6.4.8.

6.5.2.3 Testimony. When a modification is offered from the floor and ruled in order by the Chairperson, a specific floor discussion on that modification is to commence in accordance with the procedures listed in Section 6.5.1.

6.5.2.3.1 Time Limits: Time limits on testimony on a modification shall be in accordance with the following:

1. Support: 1 minute
2. Opposition: 1 minute
3. Rebuttal in support: 30 seconds
4. Rebuttal in opposition: 30 seconds

6.6 Committee Action: Following the floor discussion of each code change proposal, one of the following motions shall be made and seconded by members of the Committee:

1. Approve the code change proposal As Submitted (AS) or
2. Approve the code change proposal As Modified with specific modifications (AM), or
3. Disapprove the code change proposal (D)

Discussion on this motion shall be limited to Committee members. If a Committee member proposes a modification which had not been proposed during floor discussion, the Chairperson shall rule on the modification in accordance with Section 6.5.2.2. If a Committee member raises a matter of issue, including a proposed modification, which has not been proposed or discussed during the floor discussion, the Moderator shall suspend the Committee discussion and shall reopen the floor discussion for comments on the specific matter or issue. Upon receipt of all comments from the floor, the Moderator shall resume Committee discussion.

The Committee shall vote on each motion with the majority dictating the Committee's action. Committee action on each code change proposal shall be completed when one of the motions noted above has been approved. Each Committee vote shall be supported by a reason.

The ICC shall maintain a record of the hearing proceedings including the action on each code change proposal.

6.7 Report of the First Committee Action Hearing (CAH #1): The results of the First Committee Action Hearing (CAH #1), including Committee action and reason, shall be posted on the ICC website not less than 60 days prior to the Second Committee Action Hearing (CAH #2) , except as approved by the ICC Board.

7.0 Submittal of Comments to the First Committee Action Hearing (CAH #1) (New)

7.1 Intent: Any interested person, persons or group may submit a comment noting disagreement with the action taken at the First Committee Action Hearing (CAH #1). The comment process gives attendees at the Second Committee Action Hearing (CAH #2) an opportunity to consider

specific objections to the results of the First Committee Action Hearing (CAH #1) and more thoughtfully prepare for the discussion and comment consideration at the Second Committee Action Hearing (CAH #2).

7.1.1 Public Comment Hearing consideration: In order for a code change proposal to be considered for a further modification at the Public Comment Hearing, such proposal must have received a comment and been considered and acted upon at the Second Committee Action Hearing (CAH #2).

7.1.2 Proposed New Reference Standards and Standards Updates: Proposed new referenced standards and proposed updates of existing standards with coordinating text are limited to original code change submittals in accordance with Section 4.6.3. Comments proposing a new reference standard or a new proposed update of an existing standard with coordinating text shall not be permitted.

7.2 Deadline: The deadline for receipt of a comment to the results of the First Committee Action Hearing (CAH #1) shall be announced at the first hearing but shall not be less than 30 days subsequent to the availability of the Report of the First Committee Action Hearing (CAH #1) (see Section 6.7).

7.3 Withdrawal of Comment: A comment may be withdrawn by the commenter at any time prior to comment consideration of that comment at the Second Committee Action Hearing (CAH #2). A withdrawn comment shall not be subject to consideration at the second hearing. If the only comment to a code change proposal is withdrawn by the commenter prior to consideration at the Second Committee Action Hearing (CAH #2), such proposal will be considered as not acted upon at the second hearing and the proposal is not eligible for further modification consideration at the Public Comment Hearing in accordance with Section 7.1.1.

7.4 Form and Content of Comments: Any interested person, persons, or group may submit a public comment to the results of the First Committee Action Hearing (CAH #1) which will be considered when in conformance to these requirements. Each comment to a code change proposal shall be submitted separately and shall be complete in itself. Each comment shall contain the following information:

7.4.1 Comment: Each comment shall include the name, title, and email address of the commenter. Email addresses shall be published with the comments unless the commenter otherwise requests on the submittal form.

If a group, organization, or committee submits a comment, an individual with prime responsibility shall be indicated. If a comment is submitted on behalf a client, group, organization or committee, the name and email address of the client, group, organization or committee shall be indicated. The scope of the comment shall be consistent with the scope of the original code change proposal or the Committee action. Comments which are determined as not within the scope of the code change proposal or Committee action shall be identified as such. The commenter shall be notified that the comment is considered an incomplete comment in accordance with Section 7.5.1 and the comment shall be held until the deficiencies are corrected. A copyright release in accordance with Section 4.3.5.5 shall be provided with the comment.

7.4.2 Code Reference: Each comment shall include the code change proposal number.

7.4.3 Multiple comments to a code change proposal. A commentor shall not submit multiple comments to the same code change proposal. When a commentor submits multiple comments to the same code change proposal, the comments shall be considered as incomplete comments and processed in accordance with Section 7.5.1. This restriction shall not apply to comments that attempt to address differing subject

matter within a Code section.

7.4.4 Desired Action at the Second Committee Action Hearing (CAH #2): In order for a comment to be considered, the comment shall indicate the desired action at the Second Committee Action Hearing (CAH #2) as one of the following:

1. Approve the code change proposal As Submitted (AS), or

2. Approve the code change proposal As Modified by the Committee modification published in the Report of the First Committee Action Hearing (AMC #1) or a comment published in the Second Committee Action Hearing Agenda (AMC #2), or

3. Disapprove the code change proposal (D)

7.4.5 Supporting Information: The comment shall include a statement containing a reason and justification for the desired action on the code change proposal. Reasons and justification which are reviewed in accordance with Section 7.5 and determined as not germane to the technical issues addressed in the code change proposal or first Committee action may be identified as such. The commenter shall be notified that the comment is considered an incomplete comment in accordance with Section 7.5.1 and the comment shall be held until the deficiencies are corrected. The commenter shall have the right to appeal this action in accordance with CP#1 – Appeals. A bibliography of any substantiating material submitted with a comment shall be published with the comment and the substantiating material shall be made available at the Second Committee Action Hearing (CAH #2). Supporting documentation may be provided via a link to a website provided by the commenter and included in the reason statement and bibliography. The reason statement shall include the date the link was created. All substantiating material published by ICC is material that has been provided by the proponent and in so publishing ICC makes no representations or warranties about its quality or accuracy.

7.4.6 Cost Impact: The comment shall include a cost impact statement in accordance with Section 17.0.

7.4.7 Online submittal: Each comment and substantiating information shall be submitted online via cdpACCESS. Additional electronic copies may be requested when determined necessary by the Secretariat.

7.4.8 Submittal Deadline: ICC shall establish and post the submittal deadline for each cycle in accordance with Section 3.2. The posting of the deadline shall occur no later than 120 days prior to the comment deadline. Each comment shall be submitted online via cdpACCESS by the posted deadline. The submitter of a public comment is responsible for the proper and timely receipt of all pertinent materials by the Secretariat.

7.5 Review: The Secretariat shall be responsible for reviewing all submitted comments from an editorial and technical viewpoint similar to the review of code change proposals (see Section 5.2).

7.5.1 Incomplete Comment: When a comment is submitted with incorrect format, without the required information or judged as not in compliance with these Rules of Procedure, the comment shall not be processed. The Secretariat shall notify the commenter of the specific deficiencies and the comment shall be held until the deficiencies are corrected, or the comment shall be returned to the commenter with instructions to correct the deficiencies with a final date set for receipt of the corrected comment.

7.5.2 Duplications: On receipt of duplicate or parallel comments, the Secretariat may

consolidate such comments for Second Committee Action Hearing (CAH #2) comment consideration. Each commenter shall be notified of this action when it occurs.

7.5.3 Comments Received after Deadline: Comments received by the Secretariat after the deadline set for receipt shall not be published and shall not be considered as part of the Second Committee Action Hearing (CAH #2) consideration. This deadline shall not apply to comments submitted by the Code Correlation Committee. In order to correlate submitted comments with action taken at the First Committee Action Hearing (CAH #1) on code change proposals that did receive a comment, the Code Correlation Committee, in conjunction with staff processing of comments, shall review the submitted comments and submit the necessary comments in order to facilitate the coordination of code change proposals. Such review and submittal shall not delay the posting of the Second Committee Action Hearing (CAH #2) Agenda as required in Section 7.6.

7.6 Second Committee Action Hearing Agenda: The comments received to the First Committee Action Hearing (CAH #1) results on code change proposals shall constitute the Second Committee Action Hearing Agenda. The agenda shall be posted on the ICC website at least 30 days prior to the hearing. Any errata to the agenda shall be posted on the ICC website as soon as possible. Code change proposals and comments which have not been published in the original posting or subsequent errata shall not be considered.

8.0 Second Committee Action Hearing (CAH #2) (New)

8.1 Intent: The intent of the Second Committee Action Hearing (CAH #2) is to permit interested parties to present their views including cost and benefits on comments received to the action taken by the Committee at the First Committee Action Hearing (CAH #1). The Committee will consider such comments as may be presented in the development of their action on the disposition of such code change proposals prior to the public comment portion of the code development process in accordance with Section 9.0.

8.1.1 Code changes not receiving a comment: The Committee action on code changes that do not receive a comment shall be the action taken at the First Committee Action Hearing (CAH #1) and shall not be on the agenda for the Second Committee Action Hearing (CAH #2). Such code changes will not be eligible for further modification as part of public comment consideration (see Section 7.1.1)

8.2 Committee: The Committee shall be the same Committee that presided over the First Committee Action Hearing (CAH #1).

8.3 Date and Location: The date and location of the Second Committee Action Hearing (CAH #2) shall be announced not less than 60 days prior to the date of the hearing.

8.4 Hearing conduct: The Second Committee Action Hearing (CAH #2) shall be conducted in the same fashion as the First Committee Action Hearing (CAH #1) in accordance with Sections 6.2 through 6.4 and 6.6 and Section 8.4.1.

8.4.1 Floor discussion. Discussion on code change proposals being individually considered shall be in accordance with Sections 8.4.1.1 through 8.4.1.4:

8.4.1.1 Initial Discussion: The Committee action from the First Committee Action Hearing (CAH #1) shall be the basis of the initial discussion.

8.4.1.2 Introducing Comments: At any point during the initial floor discussion , a comment published in the CAH#2 Agenda may be called to the floor. Each subsequent comment called to the floor, if any, shall be individually discussed

before returning to the initial floor discussion. Comments in the CAH#2 agenda must be called to the floor for consideration.

8.4.1.3 Proponent testimony: The Proponent of a comment is permitted to waive an initial statement. The Proponent of the comment shall be permitted to have the amount of time that would have been allocated during the initial testimony period plus the amount of time that would be allocated for rebuttal. Where a comment is submitted by multiple proponents, this provision shall permit only one proponent of the joint submittal to waive an initial statement.

8.4.1.4 Modifications: Modifications to individual comments may be suggested from the floor by any person participating in the hearing, at any time during the floor discussion of the respective comment. The person proposing the modification, or his/her designee, is deemed to be the proponent of the modification. Modifications submission, criteria, testimony, and time limits shall comply with Sections 6.5.2.1 through 6.5.2.3.1

8.5 Report of the Second Committee Action Hearing (CAH #2): The results of the Second Committee Action Hearing (CAH #2), including Committee action and reason, shall be posted on the ICC website not less than 60 days prior to the Public Comment Hearing, except as approved by the ICC Board.

9.0 Submittal of Public Comments to the Second Committee Action Hearing (CAH #2)

9.1 Intent: The public comment process gives attendees at the Public Comment Hearing an opportunity to consider specific objections to the results of the Second Committee Action Hearing (CAH #2) for each code group and more thoughtfully prepare for the discussion for public comment consideration. The public comment process expedites the Public Comment Hearing by limiting the items discussed to consideration of items for which a public comment has been submitted. The Public Comment Hearing will be a combined hearing of both Code Group A and Code Group B code change proposals and public comments in accordance with Sections 3.0 and 10.0.

9.2 Deadline: The deadline for receipt of a public comment to the results of the Second Committee Action Hearing (CAH #2) shall be announced at the hearing but shall not be less than 30 days subsequent to the availability of the Report of the Second Committee Action Hearing (CAH #2) for the respective code group (see Section 8.5). The public comment deadline for Code Group A codes shall be early in the second year of the cycle and the public comment deadline for Code Group B codes shall be early in the third year of the cycle with specific dates posted in accordance with Section 3.2.

9.3 Withdrawal of Public Comment: A public comment may be withdrawn by the public commenter at any time prior to public comment consideration of that comment. A withdrawn public comment shall not be subject to public comment consideration. If the only public comment to a code change proposal is withdrawn by the public commenter prior to the vote on the consent agenda in accordance with Section 10.5.5, the proposal shall be considered as part of the consent agenda. If the only public comment to a code change proposal is withdrawn by the public commenter after the vote on the consent agenda in accordance with Section 10.5.5, the proposal shall continue as part of the individual consideration agenda in accordance with Section 10.5.6, however the public comment shall not be subject to public comment consideration.

9.4 Form and Content of Public Comments: Any interested person, persons, or group may submit a public comment to the results of the Second Committee Action Hearing (CAH #2) which will be considered when in conformance to these requirements. Each public comment to

a code change proposal shall be submitted separately and shall be complete in itself. Each public comment shall contain the following information:

9.4.1 Public comment: Each public comment shall include the name, title, and email address of the public commenter. Email addresses shall be published with the public comments unless the commenter otherwise requests on the submittal form.

If a group, organization, or Committee submits a public comment, an individual with prime responsibility shall be indicated. If a public comment is submitted on behalf a client, group, organization or Committee, the name and email address of the client, group, organization or Committee shall be indicated. The scope of the public comment shall be consistent with the scope of the original code change proposal or Committee action from the Second Committee Action Hearing (CAH #2). Public comments which are determined as not within the scope of the code change proposal or Committee action shall be identified as such. The public commenter shall be notified that the public comment is considered an incomplete public comment in accordance with Section 9.5.1 and the public comment shall be held until the deficiencies are corrected. A copyright release in accordance with Section 4.3.5.5 shall be provided with the public comment.

9.4.2 Code Reference: Each public comment shall include the code change proposal number.

9.4.3 Multiple public comments to a code change proposal. A proponent shall not submit multiple public comments to the same code change proposal. When a proponent submits multiple public comments to the same code change proposal, the public comments shall be considered as incomplete public comments and processed in accordance with Section 9.5.1. This restriction shall not apply to public comments that attempt to address differing subject matter within a code section.

9.4.4 Desired Final Action: In order for a public comment to be considered, the public comment shall indicate the desired Final Action as one of the following:

1. Approve the code change proposal As Submitted (AS), or
2. Approve the code change proposal As Modified by the Committee modification published in the Report of the First or Second Committee Action Hearing (AMC) or published in a public comment in the Public Comment Agenda (AMPC), or

3. Disapprove the code change proposal (D)

9.4.5 Supporting Information: The public comment shall include a statement containing a reason and justification for the desired Final Action on the code change proposal. Reasons and justification which are reviewed in accordance with Section 9.5 and determined as not germane to the technical issues addressed in the code change proposal or Committee action may be identified as such. The public commenter shall be notified that the public comment is considered an incomplete public comment in accordance with Section 9.5.1 and the public comment shall be held until the deficiencies are corrected. The public commenter shall have the right to appeal this action in accordance with CP#1 – Appeals. A bibliography of any substantiating material submitted with a public comment shall be published with the public comment and the substantiating material shall be made available at the Public Comment Hearing. Supporting documentation may be provided via a link to a website provided by the public commenter and included in the reason statement and bibliography. The reason statement shall include the date the link was created. All substantiating material published by ICC is material that has been provided by the proponent and in so publishing ICC makes no representations or warranties about its quality or accuracy.

9.4.6 Cost Impact: The public comment shall include a cost impact statement in accordance with section 17.0.

9.4.7 Online submittal: Each public comment and substantiating information shall be submitted online via cdpACCESS. Additional electronic copies may be requested when determined necessary by the Secretariat.

9.4.8 Submittal Deadline: ICC shall establish and post the submittal deadlines for Code Groups A and B in accordance with Section 3.2. The posting of the deadline shall occur no later than 120 days prior to the public comment deadlines. Each public comment shall be submitted online via cdpACCESS by the posted deadline. The submitter of a public comment is responsible for the proper and timely receipt of all pertinent materials by the Secretariat.

9.5 Review: The Secretariat shall be responsible for reviewing all submitted public comments from an editorial and technical viewpoint similar to the review of code change proposals (see Section 5.2).

9.5.1 Incomplete Public Comment: When a public comment is submitted with incorrect format, without the required information or judged as not in compliance with these Rules of Procedure, the public comment shall not be processed. The Secretariat shall notify the public commenter of the specific deficiencies and the public comment shall be held until the deficiencies are corrected, or the public comment shall be returned to the public commenter with instructions to correct the deficiencies with a final date set for receipt of the corrected public comment.

9.5.2 Duplications: On receipt of duplicate or parallel public comments, the Secretariat may consolidate such public comments for public comment consideration. Each public commenter shall be notified of this action when it occurs.

9.5.3 Public Comments Received after Deadline: Public comments received by the Secretariat after the deadline set for receipt shall not be published and shall not be considered as part of the public comment consideration. This deadline shall not apply to public comments submitted by the Code Correlation Committee. In order to correlate submitted public comments with action taken at the Second Committee Action Hearing (CAH #2) on code change proposals that did receive a public comment, the Code Correlation Committee, in conjunction with staff processing of public comments, shall review the submitted public comments and submit the necessary public comments in order to facilitate the coordination of code change proposals. Such review and submittal shall not delay the posting of the Public Comment Agenda as required in Section 9.6.

9.6 Public Comment Agenda: The First and Second Committee Action Hearing results on code change proposals that have not received a public comment and code change proposals from the Second Committee Action Hearing (CAH #2) which received public comments shall constitute the Public Comment Agenda. The Public Comment Agenda shall be posted on the ICC website at least 30 days prior the Public Comment Hearing. Any errata to the Public Comment Agenda shall be posted on the ICC website as soon as possible. Code change proposals and public comments which have not been published in the original posting or subsequent errata shall not be considered.

10.0 Public Comment Hearing

10.1 Intent: The Public Comment Hearing is the first of two steps to make a final determination on all code change proposals which have been considered in a code development cycle by a vote cast by eligible voters (see Section 12.0). The second step, which follows the Public Comment Hearing, is the Online Governmental Consensus Vote that is conducted in accordance with

Section 11.0. Code change proposals from Code Groups A and B considered at the Second Committee Action Hearing (CAH #2) in accordance with Section 8.1 are eligible for public comment consideration at the Public Comment Hearing and the Online Governmental Consensus Vote.

10.2 Date and Location: The date and location of the Public Comment Hearing shall be announced not less than 60 days prior to the date of the hearing.

10.3 Moderator: The ICC President shall appoint one or more Moderators who shall act as presiding officer for the Public Comment Hearing.

10.4 Public Comment Agenda: The Public Comment Consent Agenda shall be comprised of code change proposals which have not received a public comment. The agenda for public testimony and individual consideration shall be comprised of proposals which have a public comment (see Section 9.1).

10.5 Procedure: *The Robert's Rules of Order* shall be the formal procedure for the conduct of the Public Comment Hearing except as these Rules of Procedure may otherwise dictate.

10.5.1 Open Hearing: The Public Comment Hearing is an open hearing. Any interested person may attend and participate in the floor discussion.

10.5.2 Agenda Order: The Secretariat shall publish a Public Comment Agenda for the Public Comment Hearing, placing individual code change proposals and public comments in a logical order to facilitate the hearing. The proponents or opponents of any code change proposal or public comment may move to revise the agenda order as the first order of business at the public hearing, or at any time during the hearing except while another proposal is being discussed. Preference shall be given to grouping like subjects together and for moving items back to a later position on the agenda as opposed to moving items forward to an earlier position.

10.5.2.1 Proponent Approval: A motion to revise the agenda order is considered in order unless the proponent(s) of the moved code change proposals are in attendance at the hearing and object to the move. Where such objections are raised, the motion to revise the hearing order shall be ruled out of order by the Moderator. The ruling of the Moderator shall be final and not subject to a point of order in accordance with Section 6.4.8. The motion to change the hearing order is not debatable.

10.5.2.2 Revised Agenda Order Approved: A motion to revise the agenda order is subject to a 2/3 vote of those present.

10.5.3 Tabling: Tabling of code change proposals shall be permitted. The motion to table is considered in order unless the proponent(s) of the tabled code change proposals are in attendance at the hearing and object to the tabling. Where such objections are raised, the motion to table shall be ruled out of order by the Moderator. The ruling of the Moderator shall be final and not subject to a point of order in accordance with Section 6.4.8. The motion to table is not debatable.

The motion to table must identify one of the following as to the location in the agenda when or where the code change proposal(s) will be considered:

1. To a specific date and time within the timeframe of the Public Comment Agenda for the code change proposals under consideration, or
2. To a specific location in the Public Comment Agenda for the code change proposals under consideration.

10.5.3.1 Tabling approved: A motion to table is subject to a 2/3 vote of those present.

10.5.3.2 Tabled code change proposals back to the floor: The Moderator shall bring the tabled code change proposal(s) back to the floor at the applicable time/agenda location in accordance with Section 10.5.3 Items 1 or 2. The testimony on the code change proposal shall resume at the point in the process where the tabling occurred.

10.5.4 Presentation of Material at the Public Comment Hearing: Information to be provided at the hearing shall be limited to verbal presentations. Each individual presenting information at the hearing shall state their name and affiliation and shall identify any entities or individuals they are representing in connection with their testimony. Audio-visual presentations are not permitted. Substantiating material submitted in accordance with Section 9.4.5 and other material submitted in response to a code change proposal or public comment shall be located in a designated area in the hearing room.

10.5.5 Public Comment Consent Agenda: The Public Comment Consent Agenda (see Section 10.4) shall be placed before the assembly with a single motion for Final Action in accordance with the results of the First and Second Committee Action Hearings. When the motion has been seconded, the vote shall be taken with no testimony being allowed. A simple majority (50% plus one) based on the number of votes cast by eligible voters shall decide the motion. This action shall not be subject to the Online Governmental Consensus Vote following the Public Comment Hearing (see Section 11.0).

10.5.6 Public Comment Individual Consideration Agenda: Upon completion of the Public Comment Consent Agenda vote, all code change proposals not on the Public Comment Consent Agenda shall constitute the Public Comment Individual Consideration Agenda and be placed before the assembly for individual consideration of each item (see Section 10.4).

10.5.6.1 New Proposed Standard or Updated Standard Not Available. It is the responsibility of the proponent of the code change proposal to identify whether a new standard or updated standard (where the proposal includes coordinating text revisions) is available. Where the proposed new standard or the updated standard is not available in accordance with Section 4.6.3, the code change will not be considered on the Individual Consideration Agenda and the Final Action shall be Disapproval.

10.5.7 Reconsideration: There shall be no reconsideration of a code change proposal after it has been voted on in accordance with Section 10.5.9.

10.5.8 Time Limits: Time limits shall be established as part of the agenda for testimony on all code change proposals at the beginning of each hearing session. Each person testifying on a code change proposal shall be given equal time. In the interest of time and fairness to all hearing participants, the Moderator shall identify the time limits on debate at the beginning of the Public Comment Hearing. The Moderator shall have the authority to adjust time limits as necessary in order to complete the hearing agenda.

10.5.8.1 Time Keeping: Keeping of time for testimony by an individual shall be by an automatic timing device. Remaining time shall be evident to the person testifying. Interruptions during testimony shall not be tolerated. The Moderator shall maintain appropriate decorum during all testimony.

10.5.9 Discussion and Voting: Discussion and voting on code change proposals being individually considered shall be in accordance with the following procedures and the voting majorities in Section 10.6:

10.5.9.1 Proponent testimony: The Proponent of a public comment is permitted to

waive an initial statement. The Proponent of the public comment shall be permitted to have the amount of time that would have been allocated during the initial testimony period plus the amount of time that would be allocated for rebuttal. Where a public comment is submitted by multiple proponents, this provision shall permit only one proponent of the joint submittal to waive an initial statement.

10.5.9.2 Points of Order: Any person participating in hearing may challenge a procedural ruling of the Moderator. A majority vote of ICC Members in attendance shall determine the decision.

10.5.9.3 Eligible voters: Voting shall be limited to eligible voters in accordance with Section 12.0.

10.5.9.4 Allowable Final Action Motions: The only allowable motions for Final Action are Approval as Submitted (AS), Approval as Modified by the Committee from the First or Second Committee Action Hearing (AMC) or by one or more modifications published in the Public Comment Agenda (AMPC), and Disapproval (D).

10.5.9.5 Initial Motion: The Committee action from the Second Committee Action Hearing (CAH #2) shall be the initial motion considered.

10.5.9.6 Motions for Modifications: Whenever a motion under consideration is for Approval as Submitted or Approval as Modified, a subsequent motion and second for a modification published in the Public Comment Agenda may be made (see Section 9.4.4). Each subsequent motion for modification, if any, shall be individually discussed and voted before returning to the main motion. A two-thirds majority based on the number of votes cast by eligible voters shall be required for a successful motion on all modifications.

10.5.9.7 Voting: After dispensing with all motions for modifications, if any, and upon completion of discussion on the main motion, the Moderator shall then ask for the vote on the main motion. The vote on the main motion shall be taken electronically with the vote recorded and each vote assigned to the eligible voting member. In the event the electronic voting system is determined not to be used by ICC, a hand/standing count will be taken by the Moderator. If the motion fails to receive the majority required in Section 10.6, the Moderator shall ask for a new motion.

10.5.9.8 Subsequent Motion: If the initial motion is unsuccessful, a motion for either Approval as Submitted or Approval as Modified by one or more published modifications is in order. A motion for Disapproval is not in order. The vote on the main motion shall be taken electronically with the vote recorded and each vote assigned to the eligible voting member. In the event the electronic voting system is determined not to be used by ICC, a hand/standing count will be taken by the Moderator. If a successful vote is not achieved, Section 10.5.9.9 shall apply.

10.5.9.9 Failure to Achieve Majority Vote at the Public Comment Hearing. In the event that a code change proposal does not receive any of the required majorities in Section 10.6, the results of the Public Comment Hearing for the code change proposal in question shall be Disapproval. The vote count that will be reported as the Public Comment Hearing result will be the vote count on the main motion in accordance with Section 10.5.9.7.

10.5.9.10 Public Comment Hearing Results: The result and vote count on each code change proposal considered at the Public Comment Hearing shall be announced at the hearing. In the event the electronic voting system is not utilized and a hand/standing count is taken in accordance with Sections 10.5.9.7 and 10.5.9.8, the vote count will not be announced if an individual standing vote count is not taken. The results shall be posted and included in the Online Governmental Consensus Vote ballot (see Section 11.3).

10.5.9.10.1 Online Governmental Consensus Ballot Exceptions: Where Disapproval is the action at all three hearings in the code group cycle (First Committee Action Hearing (CAH #1), Second Committee Action Hearing (CAH #2) and the Public Comment Hearing), the Final Action on the code change proposal shall be Disapproval and the proposal shall not be placed on the Online Governmental Consensus Vote ballot.

10.6 Majorities for Public Comment Hearing Voting: The required voting majority for code change proposals individually considered shall be based on the number of votes cast by eligible voters at the Public Comment Hearing shall be in accordance with the following table.

Second Committee Action Hearing (CAH #2)	**Desired Final Action**		
	AS	**AMC/AMPC**	**D**
AS	Simple Majority	2/3 Majority	Simple Majority
AMC	2/3 Majority	Simple Majority to sustain the Committee Action (AMC) or; 2/3 Majority on each additional modification and 2/3 Majority on entire code change proposal for AMPC	Simple Majority
D	2/3 Majority	2/3 Majority	Simple Majority

11.0 Online Governmental Consensus Vote

11.1 Public Comment Hearing Results: The results from the Individual Consideration Agenda at the combined Code Group A and Code Group B Public Comment Hearing (see Sections 10.5.6 and 10.5.9.10) shall be the basis for the Online Governmental Consensus Vote. The ballot shall include the voting options in accordance with the following table (see Section 11.1.1 for exceptions):

Second Committee Action Hearing (CAH #2)	**Public Comment Hearing result and Voting Majority**	**Online Governmental Consensus Ballot and Voting Majority**	
AS	**AS:** Simple Majority	**AS:** Simple Majority	**D:** Simple Majority
	AMPC: 2/3 Majority	**AMPC:** 2/3 Majority	**D:** Simple Majority
	D: Simple Majority	**AS:** Simple Majority	**D:** Simple Majority
AMC	**AS:** 2/3 Majority	**AS:** 2/3 Majority	**D:** Simple Majority

	AMC: Simple Majority	**AMC:** Simple Majority	**D:** Simple Majority
	AMPC: 2/3 Majority	**AMPC:** 2/3 Majority	**D:** Simple Majority
	D: Simple Majority	**AM:** Simple Majority	**D:** Simple Majority
D	**AS:** 2/3 Majority	**AS:** 2/3 Majority	**D:** Simple Majority
	AMPC: 2/3 Majority	**AMPC:** 2/3 Majority	**D:** Simple Majority
	D: Simple Majority	**AS:** 2/3 Majority	**D:** Simple Majority

11.1.1 Online Governmental Consensus Ballot Exceptions: Where Disapproval is the action at all three hearings in the code group cycle (First Committee Action Hearing (CAH #1), Second Committee Action Hearing (CAH #2) and the Public Comment Hearing), the Final Action on the code change proposal shall be Disapproval and the proposal shall not be placed on the Online Governmental Consensus Vote ballot.

11.2 Online Governmental Consensus Vote Voter Statement: In order to vote on the Online Governmental Consensus Vote, the eligible voter is required to acknowledge the following in order to proceed to the ballot:

1. I am currently an employee or public official actively engaged either full or part time in the administration, formulation, implementation or enforcement of laws, ordinances, rules or regulations relating to the public health, safety and welfare, or have Honorary Member status.
2. I am participating in this ICC activity in compliance with the ICC Code of Ethics (see Section 1.8), and I will avoid any circumstance that could create the appearance of a conflict of interest or otherwise compromise professional integrity.
3. As an eligible voting member, I have done my due diligence to become an informed voter on the matters that I am voting on, or as a representative of an ICC Governmental Member, my vote is being directed by the Governmental Member.
4. I am aware that voter guides that seek to influence or recommend voter positions are not endorsed by the International Code Council, and I understand that I am under no obligation to vote in accordance with any such voter guides.
5. I will not vote on any code change that would provide me with a direct personal financial benefit.
6. I will not vote on any code change that would provide a direct financial benefit to any individual or company with which I have a business interest or relationship.

11.3 Online Governmental Consensus Vote Ballot: The ballot for each code change proposal considered at the Public Comment Hearing will include:

1. The Public Comment Hearing result and vote count.
2. The allowable Online Governmental Consensus Vote actions in accordance with Section 11.1.
3. Where the Public Comment Hearing result is As Submitted (AS) or Disapproval (D), the original code change proposal will be presented.
4. Where the Public Comment Hearing result is As Modified by the Committee (AMC) or As Modified by one or more Public Comments (AMPC), the original code change and approved modification(s) will be presented.
5. The Committee action taken at the First and Second Committee Action Hearings.
6. ICC staff identification of correlation issues.
7. For those who voted at the Public Comment Hearing, the ballot will indicate how they voted, unless an electronic vote count is not taken in accordance with Section 10.5.9.10.
8. An optional comment box to provide comments.

9. Access to the Public Comment Agenda which includes: the original code change, the report of the Committee action and the submitted public comments.
10. Access to the audio and video of the First and Second Committee Action and Public Comment Hearing proceedings.
11. Identification of the ballot period for which the online balloting will be open.

11.4 Voting process: Voting shall be limited to eligible voters in accordance with Section 12.0. Eligible voters are authorized to vote during the Public Comment Hearing and during the Online Governmental Consensus Vote; however, only the last vote cast will be included in the final vote tabulation. The ballot period will not be extended beyond the published period except as approved by the ICC Board.

11.4.1 Participation requirement: A minimum number of participants to conduct the Online Governmental Consensus Vote shall not be required unless the code change proposal(s) were not voted upon utilizing the electronic voting devices at the Public Comment Hearing and the resulting vote was not assigned to each eligible voting member in accordance with Sections 10.5.9.7 and 10.5.9.8. If this occurs, a minimum number of participants as determined by the ICC Board shall be required for those code change proposal(s) based on an assessment of the minimum number of votes cast during the entire Public Comment Hearing. The Online Governmental Consensus Vote shall determine the Final Action on the code change proposal(s) in accordance with Section 13.1.

12.0 Eligible Final Action Voters

12.1 Eligible Final Action Voters: Eligible Final Action voters include ICC Governmental Member Voting Representatives and Honorary Members in good standing who have been confirmed by ICC in accordance with the Electronic Voter Validation System. Such confirmations are required to be revalidated once each code development cycle. After initial validation, changes to the list of GMVRs for the remainder of the code development cycle shall be made in accordance with Section 12.2. Eligible Final Action voters in attendance at the Public Comment Hearing and those participating in the Online Governmental Consensus Vote shall have one vote per eligible voter on all Codes. Individuals who represent more than one Governmental Member shall be limited to a single vote.

12.2 Applications: Applications, whether new or renewed, for Governmental Membership must be received by the ICC at least 180 days prior to the Group A and B Public Comment Hearing in order for its designated representatives to be eligible to vote at the Group A and B Public Comment Hearing or Online Governmental Consensus Vote. Applications, whether new or updated, for Governmental Member Voting Representative status (validation) must be received by the Code Council 30 days prior to the commencement of the first day of the Code Group A and B Public Comment Hearing in order for any designated representative to be eligible to vote. An individual designated as a Governmental Member Voting Representative shall provide sufficient information to establish eligibility as defined in the ICC Bylaws. The Executive Committee of the ICC Board, in its discretion, shall have the authority to address questions related to eligibility.

13.0 Tabulation, Certification and Posting of Results

13.1 Tabulation and Validation: Following the closing of the online ballot period, the votes received will be combined with the vote tally at the Code Group A and B Public Comment Hearing to determine the final vote on the code change proposal. If a hand/standing count is utilized per Subsection 10.5.9.7 or 10.5.9.8, those votes of the Public Comment Hearing will not be combined with the online ballot. ICC shall retain a record of the votes cast and the results shall be certified by a validation Committee appointed by the ICC Board. The validation Committee shall report the results to the ICC Board, either confirming a valid voting process and result or

citing irregularities in accordance with Section 13.2.

13.2 Voting Irregularities: Where voting irregularities or other concerns with the Online Governmental Consensus Voting process which are material to the outcome or the disposition of a code change proposal(s) are identified by the Validation Committee, such irregularities or concerns shall be immediately brought to the attention of the ICC Board. The ICC Board shall take whatever action necessary to ensure a fair and impartial Final Action vote on all code change proposals, including but not limited to:

1. Set aside the results of the Online Governmental Consensus Vote and have the vote taken again.
2. Set aside the results of the Online Governmental Consensus Vote and declare the Final Action on all code change proposals to be in accordance with the results of the Public Comment Hearing.
3. Other actions as determined by the ICC Board.

13.3 Failure to Achieve Majority Vote: In the event a code change proposal does not receive any of the required majorities for Final Action in Section 11.1, the Final Action on the code change proposal in question shall be Disapproval.

13.4 Final Action Results: The Final Action on all code change proposals shall be published as soon as practicable after certification of the results. The results shall include the Final Action taken, including the vote tallies from both the Public Comment Hearing and Online Governmental Consensus Vote, as well as the required majority in accordance with Section 11.1. ICC shall maintain a record of individual votes for auditing purposes; however, the record shall not be made public. The exact wording of any resulting text modifications shall be made available to any interested party.

14.0 Code Publication

14.1 Next Edition of the Codes: The Final Action results on code change proposals shall be the basis for the subsequent edition of the respective Code.

14.2 Code Correlation: The Code Correlation Committee is authorized to resolve technical or editorial inconsistencies resulting from actions taken during the Code Development Process by making appropriate changes to the text of the affected code. The process to resolve technical or editorial inconsistencies shall be conducted in accordance with CP#44 – Code Correlation Committee.

15.0 Appeals

15.1 Right to Appeal: Any person may appeal an action or inaction in accordance with CP#1 – Appeals. Any appeal made regarding voter eligibility, voter fraud, voter misrepresentation or breach of ethical conduct must be supported by credible evidence and must be material to the outcome of the final disposition of a code change proposal(s).

The following actions are not appealable:

1. Variations of the results of the Code Group A and B Public Comment Hearing compared to the Final Action result in accordance with Section 13.4.
2. Denied requests to extend the voter balloting period in accordance with Section 11.4.
3. Lack of access to cdpACCESS to submit a code change proposal, to submit a comment to a Committee action, to submit a public comment or to vote.
4. Code Correlation Committee changes made in accordance with Section 14.2.

16.0 Violations

16.1 ICC Board Action on Violations: Violations of the policies and procedures contained in this Council Policy shall be brought to the immediate attention of the ICC Board for response and resolution. Additionally, the ICC Board may take any actions it deems necessary to maintain the integrity of the code development process.

17.0 Cost Impacts.

17.1 Cost Impact Statement Requirements. The proponent shall indicate one of the following regarding the cost impact of the code change proposal or the net cost impact of the code change proposal and comment submitted:

1. The code change proposal's estimated immediate cost impacts; or
2. The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction.

The proponent shall submit information which substantiates such assertion. This information will be considered by the Committee and will be included in the published code change proposal. Supporting documentation may be provided via a link to a website provided by the proponent and included in the cost substantiation statement. The cost substantiation statement shall include the date the link was created.

Any proposal submitted which does not include the requisite cost impact information shall be considered incomplete and shall not be processed.

1. The cost estimates provided shall be straightforward, allowing the Code Development Committee (CDC) members and eligible voting members, to rapidly assess their relative validity.
2. The cost estimates shall (a) have succinct information to allow the average person to understand how it was calculated (methodology), and (b) may provide reference for the publicly available data used (basis for variables).
3. The ICC may develop a cost impact guidance document to assist code change and comment submitters in complying effectively with the cost impact requirements.

WITHDRAWN CODE CHANGES

The following code change proposal was withdrawn subsequent to the Committee Action Hearings (CAH 2):

F278-24

Code change proposals withdrawn during the committee action hearing #2 are indicated as such in the 2024 Report of Committee Action Hearings (CAH #2). Any proposals withdrawn after CAH #1 and before the beginning of CAH #2 will be announced at the CAH #2 hearing.

2024 COMMITTEE ACTION (CAH #2) HEARING SCHEDULE

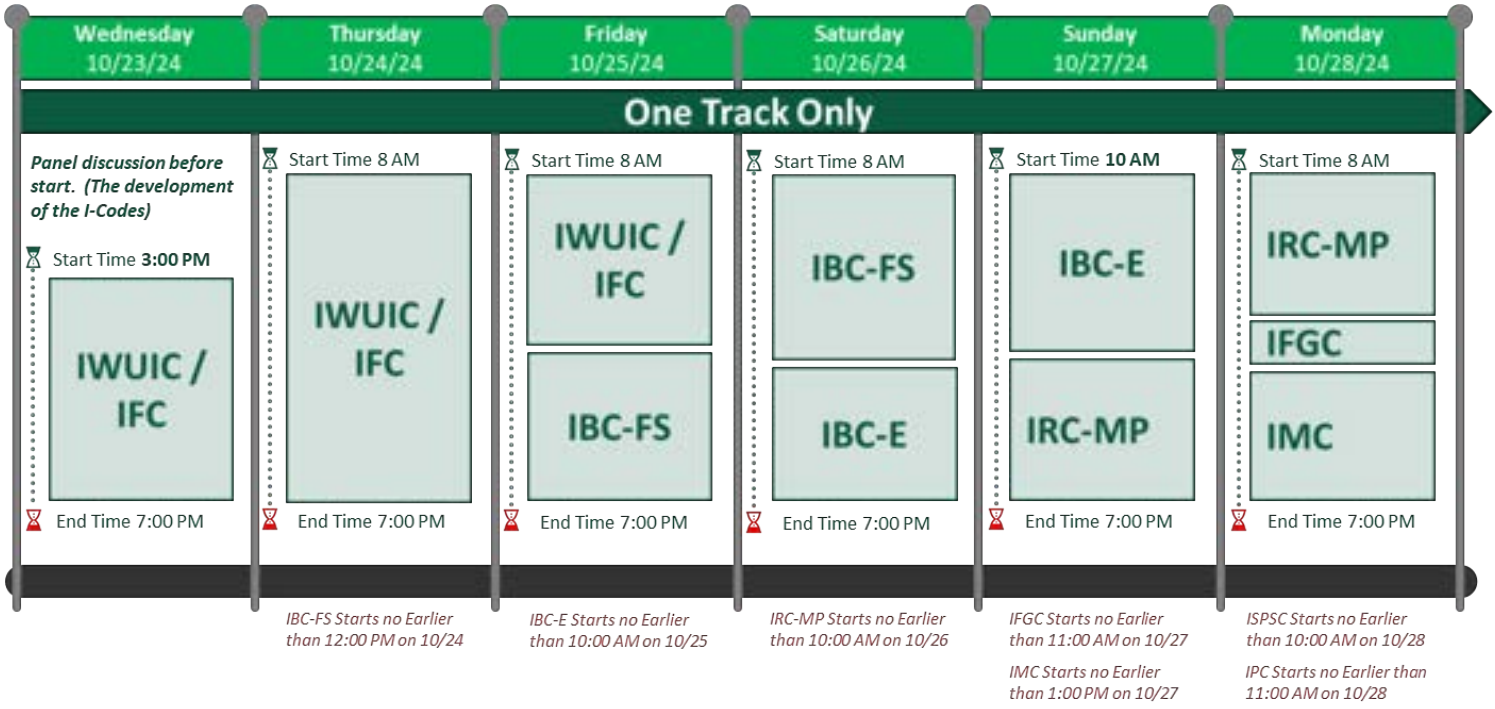
October 23rd – 31st

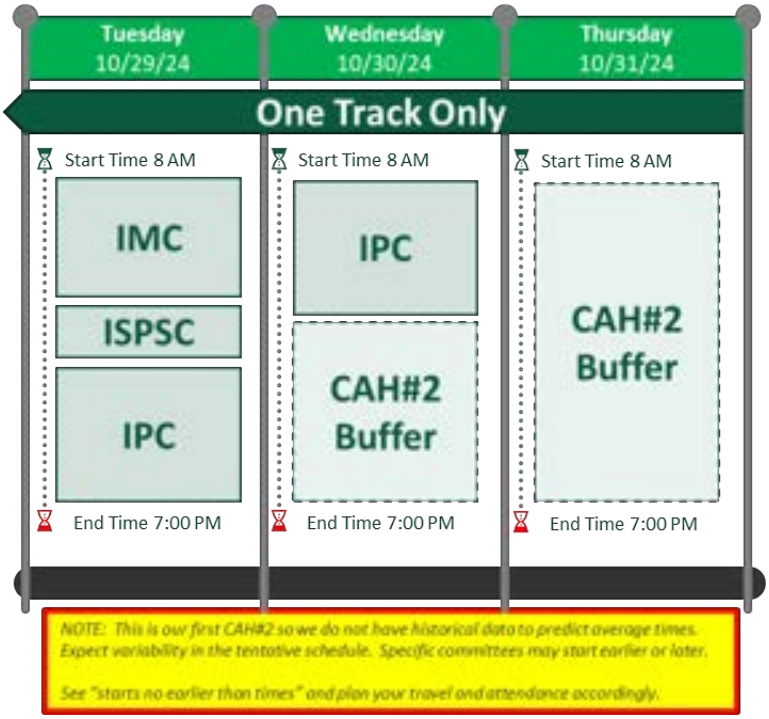
Long Beach Convention Center, Long Beach, CA

This year the code action hearings will start with a panel discussion 3:00 PM (Pacific Time) October 23, 2024. This will allow for Membership Council meetings to be held prior to the start of the hearings and CAH attendees to participate in the panel discussion event.

The hearings will be conducted in-person only. The hearings will be streamed live for individuals wishing to watch them online (note this is a watch only option).

Unless noted by "Start no earlier than…" each Code Committee will begin immediately upon completion of the hearings for the prior Committee. This includes moving a Committee forward or back from the day indicated based on hearing progress. The actual start times for the various Committees are not stipulated because of uncertainties in hearing progress. The schedule anticipates that the hearings will finish on the date indicated in the schedule provided below. This may require going beyond the scheduled finish time.





Committee	*Starts no earlier than information*
IBC-E	10 AM (Pacific Time) on 10/25
IBC-FS	12 PM (Pacific Time) on 10/24
IFC	First Committee at CAH#2
IFGC	11 AM (Pacific Time) on 10/27
IMC	1 PM (Pacific Time) on 10/27
IPC	11 AM (Pacific Time) on 10/28
IRC-MP	10 AM (Pacific Time) on 10/26
ISPSC	10 AM (Pacific Time) on 10/28

Important Notes

1. Comments to CAH#1 Code change agenda to be posted on or before September 5, 2024.
2. Hearing times may be modified at the discretion of the Chair based on hearing progress.
3. Morning and afternoon breaks will be announced. A lunch break is planned. A dinner break is not planned. The hearings are scheduled to adjourn for dinner and resume the next day, unless otherwise necessary to complete the agenda.
4. Because of uncertainties in hearing progress, the start time indicated as “Start No Earlier than [8 AM or 12:00 PM]” is conservatively estimated and is not intended to be a hearing progress target.
5. Consult the hearing order in the posted code change agenda for:
   a. Comments to CAH#1 for Code changes to be heard by a Committee other than the Committee under which the code change is designated.
   b. Comments to CAH#1 for Code changes comprised of multiple parts where each part is heard by a different Committee.
   c. Comments to CAH#1 for Code changes to the definitions to determine the applicable Committee who will hear the change to the definition for the respective code.

TENTATIVE HEARING ORDER
FOR EACH INDIVIDUAL CONSIDERATION AGENDA

The following is the tentative order in which the proposed changes to the code will be discussed at the public hearings. Code changes to be heard out of numerical order or to be heard with a different code designation are indented. Be sure to review the cross index on page xliv for code change which affect codes other than those under their respective code change number prefix.

2024 GROUP A ICC CODE DEVELOPMENT CYCLE
CROSS INDEX OF PROPOSED CODE CHANGES ON THE COMMITTEE ACTION AGENDA (CAH #2) FOR INDIVIDUAL CONSIDERATION

Some of the proposed code changes include sections that are outside of the scope of the chapters or the code listed in the table of 2024-2026 Staff Secretaries on page xiii. This is done in order to facilitate coordination among the International Codes which is one of the fundamental principles of the International Codes.

Listed in this cross index are proposed code changes that include sections of codes or codes other than those listed on page ix. For example, IEBC Section 1508.1 is proposed for revision in code change F217-24 Part II which is to be heard by the IBC Means of Egress committee. It is therefore identified in this cross index. In some instances, there are other subsections that are revised by an identified code change that is not included in the cross index.

This information is provided to assist users in locating all of the proposed code changes that would affect a certain section or chapter. For example, to find all of the proposed code changes that would affect Chapter 4 of the IBC, review the proposed code changes in the portion of the monograph for the IBC (listed with a F prefix) then review this cross reference for Chapter 4 of the IBC for proposed code changes published in other code change groups. While care has been taken to be accurate, there may be some omissions in this list.

Letter prefix: Each proposed change number has a letter prefix that will identify where the proposal is published. The letter designations for proposed changes and the corresponding publications are as follows:

PREFIX	**PROPOSED CHANGE GROUP (see monograph table of contents for location)**
E	International Building Code - Means of Egress
F	International Fire Code
FG	International Fuel Gas Code
FS	International Building Code - Fire Safety
G	International Building Code – General
M	International Mechanical Code
P	International Plumbing Code
PSD	International Private Sewage Disposal Code
S	International Building Code – Structural
SP	International Swimming Pool and Spa Code
WUIC	International Wildland-Urban Interface Code

2024 COMMENTS TO THE RESULTS OF CAH #1
PROPOSED CHANGES TO THE 2024 INTERNATIONAL CODES

WUIC3-24

IWUIC: 403.4

Proposed Change as Submitted

Proponents: Kevin Scott, KH Scott & Associates LLC, self (khscottassoc@gmail.com)

2024 International Wildland Urban Interface Code

Revise as follows:

403.4 Marking of roads. *Approved* signs or other *approved* notices shall be provided ~~and maintained for access roads and *driveways* to identify such roads and prohibit the obstruction thereof~~ to identify access roads. Approved signs shall be provided to prohibit the obstruction of access roads and driveways serving more than one building or structure. Required signs and notices shall be maintained and legible.

Reason: This proposal is intended to clarify this section, and indicate that it is not required to provide signs at driveways.

This current section contains several requirements in one sentence:

1. Signs identifying access roads and driveways
2. Signs to prohibit obstruction of access roads and driveways
3. Maintenance of signs.

This proposal splits the components apart and modifies it so that:

1. Signs are required to identify access roads. Signs identifying driveways are not required.
2. Signs are required to prohibit obstruction of access roads. Such signs are not required for driveways unless they serve more than one building or structure.
3. The required signs and notices must be legible and maintained.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

This proposal will reduce the cost by eliminating the requirements for signs on driveways, and "NO OBSTRUCTION" signs on driveways serving individual structures. The cost per project is estimated to be $100.

Estimated Immediate Cost Impact Justification (methodology and variables):

The cost is based on the purchase of an average of two 4 x 4 redwood posts, paint and labor.

WUIC3-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee stated that the reasons for the disapproval of the proposal were: The intent is correct, but there is a conflict between the use of the defined term driveways and the number that is associated with it. In addition, there was objection to the use of the term structure in the requirement. (Vote: 11-2)

Individual Consideration Agenda

Comment 1:

IWUIC: 403.4, 403.4.1, 403.5 (New), 403.5.1 (New), 403.6, 403.5

Proponents: Kevin Scott, KH Scott & Associates LLC, self (khscottassoc@gmail.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Wildland Urban Interface Code

403.4 Marking of roads. *Approved* signs ~~or other *approved* notices~~ shall be provided and maintained to identify access roads. ~~Approved signs shall be provided to prohibit the obstruction of access roads and driveways serving more than one building or structure. Required signs and notices shall be maintained and legible.~~

403.4.1 Sign construction. Road identification signs and supports shall be of noncombustible materials. Signs shall have minimum 4-inch-high (102 mm) reflective letters with $^{1}/_{2}$-inch (12.7 mm) stroke on a contrasting 6-inch-high (152 mm) sign. Road identification signage shall be mounted at a height of 7 feet (2134 mm) from the road surface to the bottom of the sign.

Add new text as follows:

403.5 Obstruction of access roads. Access roads shall not be obstructed in any manner, including the parking of vehicles. The minimum widths and clearances established in Section 403.3 shall be maintained at all times.

403.5.1 Marking. Where required by the code official, approved signs or other approved notices or markings shall be provided for access roads to prohibit the obstruction thereof. The signs or markings shall be maintained and be replaced or repaired when necessary to provide adequate visibility.

Revise as follows:

403.6 Address ~~markers~~identification. ~~Buildings shall have a permanently posted address, which~~New and existing buildings shall be provided with approved address identification. The address identification shall be legible and placed in a position that is visible from the street or road fronting the property. Address identification characters shall contrast with their background. Address numbers shall be Arabic numbers or alphabetical letters. Numbers shall not be spelled out. Each character shall be not less than 4 inches (102 mm) high with a minimum stroke width of 1/2 inch (12.7 mm). Where the address identification is located on the building and cannot be viewed from the access road, a monument, pole or other sign shall be placed at each *driveway* entrance and be visible from both directions of travel along the road to identify the building. In all cases, the address shall be posted at the beginning of construction and shall be maintained thereafter, and the address shall be visible and legible from the road on which the address is located.

~~403.5~~ 403.8 Marking of fire protection equipment. Fire protection equipment and fire hydrants shall be clearly identified in a manner *approved* by the *code official* to prevent obstruction.

Reason: This item was disapproved at CAH 1 for lack of specifics on signs and coordination between the driveway and access road requirements. This comments has taken those issues into account.

Section 403.4 is confusing because its title is “marking of roads”, but the first sentence states the requirements apply to roads and driveways. To provide clarity, the section is revised to address access roads because driveway provisions are included in Section 403.2.

The first sentence of Section 403.4 has been revised to reinsert the requirement to maintain access road signs. The second sentence is added to specify when the installation of road signs must occur and correlates with the road sign requirements in IFC Section

505.2. Section 403.4.1 contains the specifications for road signs in the WUI areas. The requirement to not obstruct the access roads is relocated from the second sentence in Section 403.4 to new Section 403.5. This new section correlates with IFC Section 503.4.

Section 403.5.1 is the relocated provision for signs from the third sentence in Section 403.4. This section has also been revised to correlate with language in IFC Section 503.3. Even though the language in the IFC is specific to obstruction of fire lanes, the concept is the same. The current language in the IWUIC allows the code official to require signs as needed to prohibit obstruction of access roads, and the language in the IFC allows the code official to require signs as needed to prohibit obstruction of fire lanes.

Section 403.6 is retitled Address identification and revised. The revised text is consistent with IBC Section 502.1 and IFC Section 505.1 and states that the address requirement applies to new and existing buildings, because both the IFC and the IBC apply to new and existing buildings. The lettering requirements are included to match the IFC/IBC.

Section 403.5 is relocated to 403.8 since it did not fit within the requirements for access road signs.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

This proposal will reduce the cost by eliminating the requirements for signs on driveways, and "NO OBSTRUCTION" signs on driveways serving individual structures.

Estimated Immediate Cost Impact Justification (methodology and variables):

The cost per project is estimated to be $100.

Comment (CAH2)# 696

WUIC11-24

IWUIC: G101.3.1

Proposed Change as Submitted

Proponents: Pierson Stoecklein, Frontline Wildfire Defense

2024 International Wildland Urban Interface Code

Delete without substitution:

~~**G101.3.1 Exterior sprinkler systems.** Currently, there is no nationally accepted standard for the design and installation of exterior fire sprinkler systems. Interior sprinkler systems are regulated by nationally recognized standards that have specific requirements. However, exterior sprinkler systems lack such uniformity. What is generally proposed is a type of sprinkler system, placed on the roofs or eaves of a building, whose primary purpose is to wet down the roof. These types of systems can be activated either manually or automatically. However, the contemporary thought on exterior sprinkler systems is that if the roof classification is of sufficient fire resistance, exterior sprinklers are of little or no value. Another option and alternative with exterior sprinklers is to use them to improve the relative humidity and fuel moisture in the *defensible space*. In this case, the exterior sprinkler is not used to protect the structure as much as it attempts to alter the fuel situation. However, studies do not support the idea that merely spraying water into the air in the immediate vicinity of a rapidly advancing wildland-urban fire does much good. Clearly, irrigation systems that keep plants healthy and fire-resistive plants that resist convection and radiated heat can accomplish the same purpose.~~

Reason: Outdated and inaccurate.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposed modifications incorporate an exterior wildfire sprinkler system into the code as optional equipment that can be installed on a structure at the discretion of the owner/s and the local code official. Because installation is not mandated, nor do the proposed modifications alter any construction requirements, the proposed modifications have no cost impact.

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee stated that the reason for the disapproval of the proposal was that if something is being proposed to be deleted completely out of an appendix because there are specific issues with it, updated information related to the exterior sprinkler systems should be presented in the reason statement. (Vote: 13-0)

Individual Consideration Agenda

Comment 1:

IWUIC: G101.3.1

Proponents: Kevin Scott, KH Scott & Associates LLC, self (khscottassoc@gmail.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Wildland Urban Interface Code

Revise as follows:

G101.3.1 Exterior wildfire sprinkler systems. Exterior wildfire sprinkler systems are designed to protect the structure and adjacent defensible space from flying embers. Exterior wildfire sprinkler systems consist of piping and devices arranged to discharge water, or a fire-extinguishing agent, on the exterior surfaces of a structure and the adjacent defensible space to pre-wet, hydrate and inhibit ignition from flying embers. Currently, there is no national standard for the design and installation of exterior wildfire sprinkler systems, however, there have been numerous installations which have proven their effectiveness in protecting against flying embers. A typical exterior wildfire sprinkler system has distribution piping with discharge devices located along the roof ridges and eaves, and possibly additional devices that are landscape mounted. These systems can be activated either manually or automatically. The advantages of exterior wildfire sprinkler systems is they increase the fuel moisture within the defensible space, and wet furniture, appliances, toys, etc. that the property owner has located within the defensible space. The IWUIC regulates the structure and permanent components within the defensible space, but there are many transient items that move in and out of the defensible space which are not regulated, especially at a residential structure. In those instances, the exterior wildfire sprinkler system is not only protecting the structure, it also alters the entire fuel load within the defensible space by wetting the furniture, umbrellas and any other items placed there by the homeowner.
Studies have shown that flying embers can travel miles ahead of the flame front during a wildfire. Exterior wildfire sprinkler systems are very effective in mitigating the ignition from these embers. Exterior wildfire sprinkler systems are not designed to fight the flame front as it crosses the property line and direct flame contact hits the structure; however, their effectiveness in protecting against flying embers has been clearly demonstrated.

Reason: The original proposal indicated that the language in the appendix was outdated and therefore should be deleted. While it is outdated, it should not be deleted, but rather updated. This comment intends to update the language regarding exterior wildfire sprinkler systems.

Exterior wildfire sprinkler systems have been used for several years and have been proven successful. These systems are not successful in combatting the actual flame front, however, they are extremely successful in mitigating the impact of flying embers. Flying embers can travel for miles in front of the flame front during a wildfire. These embers land on structures, decks or furniture and ignite those materials well ahead of the flame front and can cause a tremendous strain on fire resources.

The Insurance Institute for Business and Home Safety (IBHS) stated in a March 12, 2019 article that "During wildfires, as many as 90% of homes and buildings damaged or destroyed were first ignited by embers or other fires set by embers, and not the main wildland fire front. Yet many home and business owners do not take practical, affordable steps to help reduce the risk posed by these flying embers."

Exterior wildfire sprinkler systems are not required, but they are available, and they are installed. Providing the little bit of guidance in the appendix for the code user will be a benefit when the issue arises.

Bibliography: https://ibhs.org/ibhs-news-releases/embers-cause-up-to-90-of-home-business-ignitions-during-wildfire-events/

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

There is no cost impact because nothing is required.

Comment (CAH2)# 668

WUIC12-24

IWUIC: SECTION 405, 405.1, 405.2, 405.3, 405.4, 602.3 (New), 602.3.1 (New), 602.3.2 (New)

Proposed Change as Submitted

Proponents: Crystal Sujeski, CAL FIRE/Office of the State Fire Marshal (crystal.sujeski@fire.ca.gov); Cary Yballa, Central County Fire Department, Cal FPO (cyballa@ccfd.org); Darcy Davidson, Carlsbad Fire Department, California Fire Prevention Officers (darcy.davidson@carlsbadca.gov); Kevin Scott, KH Scott & Associates LLC, self (khscottassoc@gmail.com)

2024 International Wildland Urban Interface Code

Revise as follows:

SECTION ~~405~~ 602
FIRE PROTECTION PLANS

~~**405.1**~~ **602.1 General.** ~~Where required by the *code official*, a *fire protection plan* shall be prepared.~~
The code official is authorized to require the owner or owner's authorized agent to provide a fire protection plan. The fire protection plan shall be prepared to determine the acceptability of fire protection and life safety measures designed to mitigate wildfire hazards presented for the property under consideration.

The fire protection plan shall be prepared by a registered design professional, qualified landscape architect, qualified fire safety specialist or similar specialist acceptable to the code official and shall analyze the wildfire risk of the building, project, premises or region to recommend necessary changes.

The code official is authorized to require a preliminary fire protection plan prior to the submission of a final fire protection plan.

~~**405.2**~~ **602.2 Content~~s~~.** ~~The plan shall be based on a site-specific wildfire risk assessment that includes considerations of location, topography, aspect, flammable vegetation, climatic conditions and fire history. The plan shall address water supply, access, building ignition and fire-resistance factors, fire protection systems and equipment, *defensible space* and vegetation management.~~
The fire protection plan shall be based on a project-specific wildfire hazard assessment that includes considerations of location, topography, aspect, climatic and fire history.

The plan shall identify conformance with all applicable wildfire protection regulations.

The plan shall address fire department access, egress, road and address signage, water supply, and the applicable building codes and standards for wildfire safety. The plan shall identify mitigation measures to address the project's specific wildfire risk and shall include the information required in Sections 602.3 through 602.3.2.

Delete without substitution:

~~**405.3 Cost.** The cost of *fire protection plan* preparation and review shall be the responsibility of the applicant.~~

~~**405.4 Plan retention.** The *fire protection plan* shall be retained by the *code official*.~~

Add new text as follows:

602.3 Project information. . The final fire protection plan shall be reviewed and approved prior to start of construction.

602.3.1 Preliminary fire protection plan. When a preliminary fire protection plan is submitted, it shall include, at a minimum, the following:

1. Total size of the project.
2. Information on the adjoining properties on all sides, including current land uses, and if known, existing structures and densities, planned construction, natural vegetation, environmental restoration plans, roads and parks.
3. A map with all project boundary lines, property lines, slope contour lines, proposed structure foundation footprints, and proposed roads and driveways. The map shall identify project fuel modification zones and method of identifying the fuel modification zone boundaries.

602.3.2 Final fire protection plan. Final fire protection plan shall include items listed in Section 602.3.1 and the following:

1. A map identifying all proposed plants in the fuel modification zones with a legend that includes a symbol for each proposed plant species. The plan shall include specific information on each species proposed, including but not limited to:
   1.1. The plant life-form
   1.2. The scientific and common name
   1.3. The expected height and width for mature growth
2. Identification of irrigated and non-irrigated zones.
3. Requirements for vegetation reduction around emergency access and evacuation routes.
4. Identification of points of access for equipment and personnel to maintain vegetation in common areas.
5. Legally binding statements regarding community responsibility for maintenance of fuel modification zones.
6. Legally binding statements to be included in covenants, conditions and restrictions regarding property owner responsibilities for vegetation maintenance.

Reason: This proposal accomplishes two goals: 1) to relocate the Fire Protection Plan requirements to an appropriate location, and 2) enhance the provisions for the fire protection plan to provide guidance to those developing the fire protection plan.

The scope for Chapter 4 states that the chapter contains regulations for water supply and access. The Fire Protection Plan, currently in Section 405, does not fit under either of the Chapter 4 categories. Chapter 6 contains general requirements for fire protection. The provisions for a Fire Protection Plan fit more appropriately in Chapter 6, so they are mover to Section 602.

The California State Fire Marshal's office (SFM) workgroup 2020 was assembled to take on the task of creating a statewide approach for requiring a fire protection plan for any property under consideration to mitigate the wildfire hazards that may exist. This proposal is being submitted to the IWUIC, because the overall response from the design community has been positive. Nationwide consistency leads to further success in application of the code.

The proposal sets a framework for the elements of a fire protection plan to include. This proposal is a baseline of what a general plan shall consist of for evaluating the associated risks with a property and its location within a wildland-urban interface area. A proposed fire protection plan shall be approved before the start of any construction. This will ensure compliance with the requirements in this code. The enforcement of the protection plan starts at the beginning. The Fire Protection Plan is a document that can be referred to at any stage of a project.

Often, a preliminary Fire Protection Plan is submitted to help move a project along and save money for the owner during the different phases of construction. The preliminary Fire Protection Plan sets the groundwork and foundation for the boundaries of the project. This information is vital for planning departments and for cost analysis to be considered early on.

A final Fire Protection Plan includes all the requirements of the preliminary plan with the added landscaping details that may not have been completed in the early phase of a project. The code official will now have a complete document of the project and the planned fire protection to ensure the safety of the community, neighbors, and first responders. These documents and information will help first responders pre-plan for an incident.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The choice to require a fire protection plan is at the discretion of the code official. The design professional will typically incorporate any design criteria in the project cost. This is already a typical practice.

WUIC12-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee stated that the reasons for the disapproval of the proposal were: The noted concerns were about the "qualified" person requirement and that these requirements should be in an appendix as recommended planning guidance. Furthermore, there were issues within the language of the preliminary and final lists regarding the application to different situations and locations. The desire to see the cost impact on this requirement in areas outside of California. (Vote: 11-2)

WUIC12-24

Individual Consideration Agenda

Comment 1:

IWUIC: SECTION 602, 602.1

Proponents: Adria Smith, CSG Engineers, California Fire Prevention Officers (adrias@csgengr.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Wildland Urban Interface Code

SECTION 602
FIRE PROTECTION PLANS

602.1 General. The code official is authorized to require the owner ~~or owner's authorized agent~~ to provide a fire protection plan. The fire protection plan shall be prepared to determine the acceptability of fire protection and life safety measures designed to mitigate wildfire hazards presented for the property under consideration.
The fire protection plan shall be prepared by a registered design professional, ~~qualified~~ approved landscape architect, ~~qualified~~ approved fire safety specialist or similar specialist ~~acceptable to the code official~~ and shall analyze the wildfire risk of the building, project, premises or region to recommend necessary changes.

The code official is authorized to require a preliminary fire protection plan prior to the submission of a final fire protection plan.

Reason: This proposal was disapproved by the committee as there were questions regarding the qualified professional. We are changing qualified to approved as well as deleting the owner's authorized agent as it is already defined in the code. There was also discussion among the committee to move this to an appendix, however, we feel this is reasonable to be placed in the body of the code for

consistency purposes among jurisdictions that have high fire areas.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal adds clarification, details and an enhancement to what is currently in the IWUIC. There is no related construction cost, however, there may be a cost borne by the applicant to have the plan developed depending on the scope of the project.

Comment (CAH2)# 543

WUIC13-24

IWUIC: 501.1

Proposed Change as Submitted

Proponents: Milad Shabanian, Insurance Institute for Business & Home Safety (mshabanian@ibhs.org); T. Eric Stafford, Insurance Institute for Business and Home Safety (testafford@charter.net)

2024 International Wildland Urban Interface Code

Revise as follows:

501.1 Scope. Buildings and structures shall be constructed in accordance with the *International Building Code* and this code. **Exceptions:**

1. Accessory structures ~~not exceeding 120 square feet (11 m^2) in floor area~~ and agricultural buildings ~~where~~ located ~~not less than~~ 50 feet (15 240 mm) or more from buildings containing habitable spaces are not required to comply with this code.
2. ~~Agricultural buildings not less than 50 feet (15 240 mm) from buildings containing habitable spaces.~~

Reason: Based on the current language, detached accessory structures can essentially be categorized into four groups. These groups are illustrated in Figure 1:

- Group A: Detached accessory structures with a floor area of 120 sq ft and less, located less than 50 feet of the primary structure.
- Group B: Detached accessory structures with a floor area greater than 120 sq ft, located less than 50 feet of the primary structure.
- Group C: Detached accessory structures with a floor area of 120 sq ft and less, located 50 feet or more from the primary structure.
- Group D: Detached accessory structures with a floor area greater than 120 sq ft, located at 50 feet or more from the primary structure.

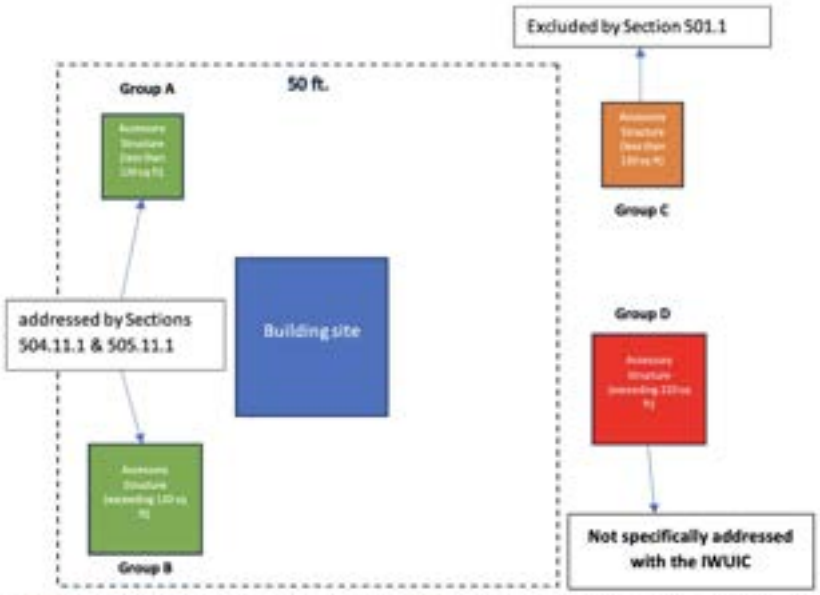

Figure 1. Detached accessory structures condition in 2024 IWUIC Scope.

Section 501.1 exempts Group C from the IWUIC, but all other structures must comply with the IBC and the IWUIC. Furthermore, Sections 504.11 and 505.11 of the IWUIC specifically address Group A and Group B detached accessory structures. Sections 504.11 and 505.11 require exterior walls of detached accessory structures located less than 50 feet from a building containing habitable space to be constructed consistent with the required construction of the exterior walls of primary structure. Group D (located 50 feet or more from the primary building and a floor area exceeding 120 square feet) is not specifically addressed by the IWUIC. The lack of specificity could lead

to uncertainty regarding the construction of Group D detached accessory structures. A strict reading of the charging paragraph of Section 501.1, would necessitate compliance with all the requirements detailed in both the IBC and the IWUIC for Group D structures. This would mean that Group D structures would have to meet all the requirements related to ignition resistance class 1 or 2, resulting in construction that is more stringent than Group A and B structures even though Group D structures pose a much lower risk. This is counterintuitive.

504.11 Detached accessory structures. Detached accessory structures located less than 50 feet (15 240 mm) from a building containing habitable space shall have exterior walls constructed with materials approved for not less than 1-hour fire-resistance-rated construction, heavy timber, log wall construction, or constructed with approved noncombustible materials or fire-retardant-treated wood on the exterior side. The fire-retardant-treated wood shall be labeled for exterior use and meet the requirements of Section 2303.2 of the International Building Code.

504.11.1 Underfloor areas. Where the detached structure is located and constructed so that the structure or any portion thereof projects over a descending slope surface greater than 10 percent, the area below the structure shall have underfloor areas enclosed to within 6 inches (152 mm) of the ground, with exterior wall construction in accordance with Section 504.5 or underfloor protection in accordance with Section 504.6.

Exception: The enclosure shall not be required where the underside of exposed floors and exposed structural columns, beams and supporting walls are protected as required for exterior 1-hour *fire-resistance-rated construction* or *heavy timber construction* or fire-retardant-treated wood on the exterior side. The fire-retardant-treated wood shall be labeled for exterior use and meet the requirements of Section 2303.2 of the *International Building Code*.

Figure 2. Detached accessory structures requirements for IR Construction classes 1.

To address this issue, the proposed language recommends exempting all detached accessory structures located more than 50 feet away from a habitable building from the scope of IWUIC. This suggestion is supported by the findings of structure separation experiments conducted by the IBHS and NIST. These experiments indicate that when the separation distance between structures exceeds 50 feet, the risk of conflagration and structure ignition is significantly lower [1-3]. Chapter 7A of the California Building Code also includes similar requirements in Section 710A.3 (Figure 3) and this change will align these two codes from this perspective [4].

> ***710A.3 Where required.*** *Miscellaneous structures that require a permit, and accessory buildings of any size, when separated from an applicable building on the same lot by a distance of less than 3 feet (914 mm), shall comply with Section 710A.3.1. Accessory buildings that are greater than 120 square feet (11.15 m²), when separated from an applicable building on the same lot by a distance of 3 feet (914 mm) or more but less than 50 feet (15 240 mm) shall comply with Section 710A.3.2.*
>
> *When required by the enforcing agency, miscellaneous structures that require a permit, and accessory buildings that are 120 square feet (11.15 m²) or less, when separated from an applicable building on the same lot by a distance of 3 feet (914 mm) or more but less than 50 feet (15 240 mm), shall comply with either Section 710A.3.4 or Section 710A.3.3, respectively.*
>
> *No requirements shall apply to accessory buildings or miscellaneous structures when located 50 feet (15 240 mm) or more from an applicable building on the same lot.*

Figure 3. 2022 California Building Code, Chapter 7A, Section 710A, Accessory Buildings and Miscellaneous Structures [4].

4. 2022 California Building Code, California code of regulation, Title 24, Part 2 (Volumes 1 & 2) with Jan 2023 Errata, Section 710A.3.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

$0 or less. This proposed code change provides clarity for detached accessory structures with floor areas exceeding 120 square feet and located 50 feet or more from the main building. Existing language currently requires these detached accessory structures to comply with the IWUIC. This proposed code change will exclude these structures from these requirements. Consequently, detached accessory structures exceeding 120 square feet in floor area and located more than 50 feet away from the main building will no longer need to comply with all the stipulated conditions of IR Class 1 or 2.

Estimated Immediate Cost Impact Justification (methodology and variables):

This will result in a decrease in the cost of construction for detached accessory structures that have a floor area exceeding 120 square feet and are located 50 feet or more from a building containing habitable space.

WUIC13-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee stated that the reasons for the disapproval of the proposal were: The proposal does not take into account accessory structure fire loading above 120 square feet and no technical substantiation was given for how that affects the wildfire hazard to buildings next to it within the 50-foot range. Also, there was concern that this is based on experience in California. However, the experience in California seems to also call for the defensible space around the structures, which does not get addressed in the proposal. Additional concern was noted about striking the 120 square feet area that could require an automatic sprinkler system for certain structures over 120 square feet in area required by the building code and those structures could pose a risk to the wildland. Finally, there was a little concern with the definition of accessory structure regarding the specific text of “occupancy other than a habitable building.” (Vote: 13-0)

WUIC13-24

Individual Consideration Agenda

Comment 1:

IWUIC: 501.1

Proponents: Milad Shabanian, Insurance Institute for Buisness & Home Safety (mshabanian@ibhs.org); T. Eric Stafford, Insurance Institute for Business and Home Safety (testafford@charter.net) requests As Modified by Committee (AMC2)

Further modify as follows:

2024 International Wildland Urban Interface Code

Revise as follows:

501.1 Scope. Buildings and structures shall be constructed in accordance with the *International Building Code* and this code. **Exceptions:** Accessory structures and agricultural buildings located 50 feet (15 240 mm) or more from buildings containing habitable spaces are not required to comply with this chapter ~~code~~.

Reason: This comment addresses the committee's concerns regarding original language. During CAH#1, an opponent argued that this language would disrupt the enforcement of defensible space requirements for structures and create issues with sprinkler system requirements. This is while the only intention is to clarify that the exception only applied to the "construction" of detached accessory structures in WUI areas as the 2024 IWUIC is not specifically clear on this. The committee recommended deleting the final part of the exception and ending it at "containing habitable spaces." to remove the confusion caused by "comply with this code". However, removing the last part of the proposed change could introduce additional confusion about what specifically these structures are being exempted from. The new language in this comment clarifies that detached accessory structures that are located 50 feet or more from a building containing habitable space, are not required to comply with the construction criteria in Chapter 5 of the IWUIC.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

$0 or less.

Estimated Immediate Cost Impact Justification (methodology and variables):

This proposed code change provides clarity for detached accessory structures with floor areas exceeding 120 square feet and located 50 feet or more from the main building. Existing language currently requires these detached accessory structures to comply with the IWUIC. This proposed code change will exclude these structures from these requirements. Consequently, detached accessory structures exceeding 120 square feet in floor area and located more than 50 feet away from the main building will no longer need to comply with all the stipulated conditions of IR Class 1 or 2. This will result in a decrease in the cost of construction for detached accessory structures that have a floor area exceeding 120 square feet and are located 50 feet or more from a building containing habitable space.

IWUIC: SECTION 202, 501.4 (New), 501.4.1 (New), 501.4.2 (New), 503.2.1, ASTM Chapter 07 (New)

Proposed Change as Submitted

Proponents: Robert Marshall, FCAC, FCAC (fcac@iccsafe.org)

2024 International Wildland Urban Interface Code

Delete without substitution:

~~**NONCOMBUSTIBLE**. As applied to building construction material means a material that, in the form in which it is used, is either one of the following:~~

1. ~~Material of which no part will ignite and burn when subjected to fire. Any material conforming to ASTM E136 shall be considered noncombustible within the meaning of this section.~~
2. ~~Material having a structural base of noncombustible material as defined in Item 1 above, with a surfacing material not over 1/8 inch (3.2 mm) thick, which has a flame spread index of 50 or less. Flame spread index as used herein refers to a flame spread index obtained according to tests conducted as specified in ASTM E84 or UL 723.~~

~~"Noncombustible" does not apply to surface finish materials. Material required to be noncombustible for reduced clearances to flues, heating appliances or other sources of high temperature shall refer to material conforming to Item 1. No material shall be classified as noncombustible that is subject to increase in combustibility or flame spread index, beyond the limits herein established, through the effects of age, moisture or other atmospheric condition.~~

Add new text as follows:

501.4 Noncombustibility tests. The tests indicated in Section 501.4.1 shall serve as criteria for acceptance of building materials. The term noncombustible does not apply to the flame spread characteristics of interior finish or trim materials. A material shall not be classified as a noncombustible building construction material if it is subject to an increase in combustibility or flame spread beyond the limitations herein established through the effects of age, moisture or other atmospheric conditions.

501.4.1 Testing. Materials required to be noncombustible shall be tested in accordance with ASTM E136 and pass the test. Alternately, materials required to be noncombustible shall be tested in accordance with ASTM E2652 using the acceptance criteria prescribed by ASTM E136. **Exception:** Materials having a structural base of noncombustible material as determined in accordance with ASTM E136, or with ASTM E2652 using the acceptance criteria prescribed by ASTM E136, with a surfacing of not more than 0.125 inch (3.18 mm) in thickness having a flame spread index not greater than 50 when tested in accordance with ASTM E84 or UL 723 shall be acceptable as noncombustible.

501.4.2 Additional requirements. The term noncombustible does not apply to surface finish materials. Material required to be noncombustible for reduced clearances to flues, heating appliances or other sources of high temperature shall refer to material conforming to the requirements of ASTM E136.

Revise as follows:

503.2.1 Noncombustible material. Material shall comply with the requirements for noncombustible materials in Section 501.4 ~~definition of *noncombustible* materials in Section 202~~.

Add new standard(s) as follows:

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box C700
West Conshohocken, PA 19428-2959

E2652-2018	Test Method for Assessing Combustibility of Materials Using a Tube Furnace with a Cone-shaped Airflow Stabilizer, at 750°C

Reason: FCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and early 2024 the FCAC has held several virtual meetings and one in-person meeting open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the **FCAC Website**

It has been a recent practice in ICC codes that definitions should not contain requirements but just concepts. This proposal does exactly that.

This proposal deletes the definition of noncombustible from section 202 of the IWUIC and adds the exact requirements for noncombustibility from section 703 of the IBC into a new section. This makes the requirements for noncombustible materials consistent with those in the IBC (with the same language). Additionally, this proposal retains the added requirements from the IWUIC regarding surface finish materials and materials close to flues or heating appliances.

This proposal is also consistent with other ICC codes and with the requirements of ASTM E136. Note that materials can be noncombustible in accordance with ASTM E136 and yet exhibit some limited flaming.

This proposal also deletes a definition with requirements and incorporates the requirements into the section of the code that deals with Special Building Construction Regulations (Chapter 5) in the General section.This proposal also revises section 503.2.1 that sends the code user to section 202 for the “requirements” got noncombustible materials, now sending the user to the new section 501.4

Comment: Since neither “flues, heating appliances and sources of high temperature” nor “interior finish” are regulated by the IWUIC, a simpler solution would be not to add proposed new section 501.4.2.

See the following from other ICC codes.

1. The IBC does not have a definition for noncombustible material but section 703.3 states as shown below, which is exactly what this proposal does. It is based on

2. The IRC defines as follows: “NONCOMBUSTIBLE MATERIAL. A material that passes ASTM E136.”

3. The IFC does not have a definition.

4. The IMC defines as follows: “NONCOMBUSTIBLE MATERIAL. A material that passes ASTM E136.”

If a material is tested to ASTM E136 it will pass the test requirements even if it ignites (a bit) and has some burning and some mass loss (see the actual language below). Therefore, saying (as the IWUIC says now in item 1) that “no part will ignite or burn” is inconsistent with many materials that pass ASTM E136.

Two different pieces of equipment are used to pass ASTM E136. The first one (now called Option A) is the equipment that was always in ASTM E136. The second one, called Option B, uses the equipment in ASTM E2652 but the acceptance criteria are the same for both pieces of equipment and are in section 15 of ASTM E136. The language from the IBC and ASTM E136 is shown below.

IBC section 703 states as follows (and a change will be proposed to add the words "and pass the test"):

703.3 Noncombustibility tests. The tests indicated in Section 703.3.1 shall serve as criteria for acceptance of building materials as set forth in Sections 602.2, 602.3 and 602.4 in Types I, II, III and IV construction. The term “noncombustible” does not apply to the *flame spread* characteristics of *interior finish* or *trim* materials. A material shall not be classified as a noncombustible building construction material if it is subject to an increase in combustibility or *flame spread* beyond the limitations herein established through the effects of age, moisture or other atmospheric conditions.

703.3.1 Noncombustible materials. Materials required to be noncombustible shall be tested in accordance with ASTM E136. Alternately, materials required to be noncombustible shall be tested in accordance with ASTM E2652 using the acceptance criteria prescribed by ASTM E136.

Exception: Materials having a structural base of noncombustible material as determined in accordance with ASTM E136, or with ASTM E2652 using the acceptance criteria prescribed by ASTM E136, with a surfacing of not more than 0.125 inch (3.18 mm) in thickness having a flame spread index not greater than 50 when tested in accordance with ASTM E84 or UL 723 shall be acceptable as noncombustible.

ASTM E136 states as follows when it requires that a material pass the test:15. Report

15.1 Report the material as passing the test if at least three of the four test specimens tested meet the individual test specimen criteria detailed either in 15.2 or in 15.3. The three individual test specimens do not need to meet the same individual test specimen criteria.

15.2 If the weight loss of an individual test specimen is 50 % or less, that test specimen is considered as having met the individual test specimen criteria when all the criteria in 15.2.1 through 15.2.3 are met:

15.2.1 For the duration of the test, the recorded temperature of the surface thermocouple does not rise more than 30 °C (54 °F) above the stabilized furnace temperature established at T2 prior to the test.

15.2.2 For the duration of the test, the recorded temperature of the interior thermocouple does not rise more than 30 °C (54 °F) above the stabilized furnace temperature established at T2 prior to the test.

15.2.3 There is no flaming from the test specimen after the first 30 s.

15.3 If the weight loss of an individual test specimen exceeds 50 %, that test specimen is considered as having met the individual test specimen criteria when all the criteria in 15.3.1 through 15.3.3 are met:

15.3.1 For the duration of the test, the recorded temperature of the surface thermocouple does not rise above the stabilized furnace temperature established at T2 prior to the test.

15.3.2 For the duration of the test, the recorded temperature of the interior thermocouple does not rise above the stabilized furnace temperature established at T2 prior to the test.

15.3.3 There is no flaming from the test specimen at any time during the test.

15.4 Report whether the apparatus for Option A or the apparatus for Option B was used.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal will not have any cost impact. It simply moves a definition with requirements into an appropriate section in the chapter that deals with materials.

WUIC16-24

Public Hearing Results (CAH1)

Committee Action: **As Modified by Committee**

Committee Modification:
2024 International Wildland Urban Interface Code

501.4.1 Testing.
Materials required to be noncombustible shall ~~be tested in accordance with~~pass ASTM E136~~ and pass the test~~. Alternately, materials required to be noncombustible shall be tested in accordance with ASTM E2652 ~~using~~ and meet the acceptance criteria prescribed by ASTM E136.

Exception: Materials having a structural base of noncombustible material as determined in accordance with ASTM E136, or with ASTM E2652 using the acceptance criteria prescribed by ASTM E136, with a surfacing of not more than 0.125 inch (3.18 mm) in thickness having a flame spread index not greater than 50 when tested in accordance with ASTM E84 or UL 723 shall be acceptable as noncombustible.

Committee Reason: The committee stated that the reason for the approval of the modification was that it clarifies the testing criteria better. The committee stated that the reasons for the approval of the proposal with the modification were: The proposal deletes the definition that contains technical requirements in it and then relocates the requirements for noncombustible materials that are consistent with the IBC with the same language into new sections in Chapter 5. Additionally, it also retains the added requirements from the WUIC regarding surface finish, materials, and materials close to the flues and heating appliances. (Vote: 13-0)

WUIC16-24

Individual Consideration Agenda

Comment 1:

IWUIC: 503.2.1, 501.4, 501.4.1, 501.4.2

Proponents: Milad Shabanian, Insurance Institute for Business & Home Safety, Insurance Institute for Business & Home Safety (mshabanian@ibhs.org); T. Eric Stafford, Insurance Institute for Business and Home Safety (testafford@charter.net) requests As Modified by Committee (AMC2)

Further modify as follows:

2024 International Wildland Urban Interface Code

503.2.1 Noncombustible material. Material shall comply with the requirements for noncombustible materials in Section 503.2.1.1 ~~501.4~~.

~~**501.4**~~ **503.2.1.1 Noncombustibility tests.** The tests indicated in Section503.2.1.1.1 ~~501.4.1~~ shall serve as criteria for acceptance of building materials. The term noncombustible does not apply to the flame spread characteristics of interior finish or trim materials. A material shall not be classified as a noncombustible building construction material if it is subject to an increase in combustibility or flame spread beyond the limitations herein established through the effects of age, moisture or other atmospheric conditions.

~~**501.4.1**~~ **503.2.1.1.1 Testing.** Materials required to be noncombustible shall pass ASTM E136. Alternately, materials required to be noncombustible shall be tested in accordance with ASTM E2652 and meet the acceptance criteria prescribed by ASTM E136.

Exception: Materials having a structural base of noncombustible material as determined in accordance with ASTM E136, or with ASTM E2652 using the acceptance criteria prescribed by ASTM E136, with a surfacing of not more than 0.125 inch (3.18 mm) in thickness having a flame spread index not greater than 50 when tested in accordance with ASTM E84 or UL 723 shall be acceptable as noncombustible.

~~**501.4.2**~~ **503.2.1.1.2 Additional requirements.** The term noncombustible does not apply to surface finish materials. Material required to be noncombustible for reduced clearances to flues, heating appliances or other sources of high temperature shall refer to material conforming to the requirements of ASTM E136.

Reason: This comment is intended to bring more uniformity to the various building materials referenced in the IWUIC. The change only moves the Noncombustibility test requirements of noncombustible (NC) materials from Section 501 (General) to Section 503 (Ignition Resistant Construction and Material) to improve consistency within the code. Currently, the IWUIC is the only I-Code that lists some material's and assembly's requirements in a General Section, while other materials and assemblies are listed in Section 503. This inconsistency has caused significant confusion among code users. Providing a reference to noncombustible materials in Section 503.2.1

with a pointer to Section 501.4 complicates the code, especially for new users. This concern was raised in the first action committee hearing. The proponents of WUIC16-24 argue that a "noncombustible material" is a generic type of concept that is used in different sections of different chapters, therefore, it should be located in the general section of code. According to a review performed by IBHS, there is no other instance within any of the other I-Codes supporting this argument. Additionally, the original proposal as written, would add "testing requirements" for noncombustible materials in the general section of Chapater 5 and the reference to "noncombustible materials" would remain in Section 503.

As part of its mission to enhance community resiliency and safety, the Insurance Institute for Business and Home Safety (IBHS), launched the Wildfire Prepared (WFP) Home designation in 2022. To receive this designation, homeowners must provide information about their homes and construction materials. The IBHS product team reviews these requests and addresses technical questions. During this process, it became evident that ordinary homeowners and new code users are particularly confused around noncombustible materials and where they are required. WUIC16-24, without this proposed comment, will add to this confusion by sending users to another location for what qualifies as a noncombustible material. This comment does not proposing any technical change. It simply relocates the requirements for noncombustible materials to section 503, which is the appropriate place for building material and assemblies.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal relocates a construction material to a more appropriate section and refines the code language to ensure its seamless integration in the new location without proposing any technical changes resulting in no cost impact.

2024 International Wildland Urban Interface Code

Delete without substitution:

~~**501.3 Fire-resistance-rated construction.** Where this code requires 1-hour *fire-resistance-rated construction*, the fire-resistance rating of building elements, components or assemblies shall be determined in accordance with the test procedures set forth in ASTM E119 or UL 263.~~ ~~**Exceptions:**~~

1. ~~The fire-resistance rating of building elements, components or assemblies based on the prescriptive designs prescribed in Section 721 of the International Building Code.~~
2. ~~The fire-resistance rating of building elements, components or assemblies based on the calculation procedures in accordance with Section 722 of the International Building Code.~~

Revise as follows:

SECTION 503
~~IGNITION-RESISTANT~~ CONSTRUCTION AND ~~MATERIAL~~ MATERIALS

503.1 General. Buildings and structures hereafter constructed, modified or relocated into or within *wildland-urban interface areas* shall meet the construction requirements in accordance with Table 503.1. Class 1, Class 2 or Class 3, ignition-resistant construction shall be in accordance with Sections 504, 505 and 506, respectively. Materials required for the ignition-resistant construction classes ~~to be ignition-resistant materials~~ shall comply with the requirements of ~~Section 503.2~~this section.

503.2 Ignition-resistant building material. Ignition-resistant building materials shall comply with any one of the requirements in Section 503.2.1 through 503.2.4.

503.2.1 Noncombustible material. Material shall comply with the definition of *noncombustible* materials in Section 202.

503.2.2 Fire-retardant-treated wood. Fire-retardant-treated wood shall be identified for exterior use and shall meet the requirements of Section 2303.2 of the *International Building Code*.

503.2.3 Fire-retardant-treated wood roof coverings. Roof assemblies containing fire-retardant-treated wood shingles and shakes shall comply with the requirements of Section 1505.6 of the *International Building Code* and shall be classified as Class A roof assemblies as required in Section 1505.2 of the *International Building Code*.

503.2.4 Ignition-resistant building material. Material shall be tested on the front and back faces in accordance with the extended ASTM E84 or UL 723 test, for a total test period of 30 minutes, or with the ASTM E2768 test. The materials shall bear identification showing the fire test results. Panel products shall be tested with a ripped or cut longitudinal gap of $^{1}/_{8}$ inch (3.2 mm). The materials, when tested in accordance with the test procedures set forth in ASTM E84 or UL 723 for a test period of 30 minutes, or with ASTM E2768, shall comply with Sections 503.2.4.1 through 503.2.4.3. **Exception:** Materials composed of a combustible core and a noncombustible exterior

covering made from either aluminum at a minimum 0.019 inch (0.48 mm) thickness or corrosion-resistant steel at a minimum 0.0149 inch (0.38 mm) thickness shall not be required to be tested with a ripped or cut longitudinal gap.

503.2.4.1 Flame spread. The material shall exhibit a flame spread index not exceeding 25.

503.2.4.2 Flame front. The material shall exhibit a flame front that does not progress more than 10 feet 6 inches (3200 mm) beyond the centerline of the burner at any time during the test.

503.2.4.3 Weathering. Ignition-resistant building materials shall maintain their performance in accordance with this section under conditions of use. The materials shall meet the performance requirements for weathering (including exposure to temperature, moisture and ultraviolet radiation) contained in Sections 503.2.4.3.1 through 503.2.4.3.3, as applicable to the materials and conditions of use.

503.2.4.3.1 Evaluation requirements for weathering. Fire-retardant-treated wood, wood-plastic composite materials and plastic lumber materials shall be evaluated after weathering in accordance with Method A "Test Method for Accelerated Weathering of Fire-Retardant-Treated Wood for Fire Testing" in ASTM D2898.

503.2.4.3.2 Wood-plastic composite materials. Wood-plastic composite materials shall also demonstrate acceptable fire performance after weathering by the following procedure: first testing in accordance with ASTM E1354 at an incident heat flux of 50 kW/m^2 in the horizontal orientation, then weathering in accordance with ASTM D7032 and then retesting in accordance with ASTM E1354 and exhibiting an increase of no more than 10 percent in peak rate of heat release when compared to the peak heat release rate of the nonweathered material.

503.2.4.3.3 Plastic lumber materials. Plastic lumber materials shall also demonstrate acceptable fire performance after weathering by the following procedure: first testing in accordance with ASTM E1354 at an incident heat flux of 50 kW/m^2 in the horizontal orientation, then weathering in accordance with ASTM D6662 and then retesting in accordance with ASTM E1354 and exhibiting an increase of no more than 10 percent in peak rate of heat release when compared to the peak heat release rate of the nonweathered material.

Add new text as follows:

503.3 Fire-resistance-rated construction. Where this code requires 1-hour fire-resistance-rated construction, the fire-resistance rating of building elements, components or assemblies shall be determined in accordance with the test procedures set forth in ASTM E119 or UL 263 for exposure from the exterior side of the assembly **Exceptions:**

1.	The fire-resistance rating of building elements, components or assemblies based on the prescriptive designs prescribed in Section 721 of the *International Building Code* for exposure from the exterior side of the assembly.
2.	The fire-resistance rating of building elements, components or assemblies based on the calculation procedures in accordance with Section 722 of the *International Building Code* for exposure from the exterior side of the assembly.

Reason: This proposal relocates a construction method to a more appropriate section and refines the code language to ensure its seamless integration in the new location. In the 2024 IWUIC, Section 501.3, onwhich addresses the qualification of fire-resistance-rated construction, is located in Section 501, the general section of Chapter 5. Typically, these general sections focus primarily on the scope and purpose of each chapter. Listing construction methods within Section 501 is not consistent with the other general sections of the IWUIC. For clarification purposes, this proposal relocates Section 501.3 to new Section 503.3. Section 503 is specifically dedicated to matters related to construction and materials. The title of section 503 is proposed to be changed from ignition-resistant construction and material to construction and material to construction and materials. The charging paragraph in Section 503.1 has been refined to ensure that the relocation of Section 501.3 to new Section 503.3 will be correlated with this relocation.

Background

In 2012, Section 501.3 was introduced to IWUIC as part of WUIC2-9/10 [1]. Then, in 2015, exceptions 1 and 2 were incorporated into this section via a proposal brought forth by WUIC1-13 [2].

Bibliography:

1. Marcelo M. Hirschler, GBH International, representing American Fire Safety Council, WUIC2–09/10, https://www.iccsafe.org/wp-content/uploads/IWUIC1.pdf

2. Jason Thompson, National Concrete Masonry Association, representing Masonry Alliance for Codes and Standards, WUIC1-13, https://www.iccsafe.org/wp-content/uploads/11-IWUIC.pdf

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This code change proposal is strictly a clarification. Relocating existing Section 501.3 to new Section 503.3 pertaining to construction and material will not result in a technical changes to the code. As a result, the proposal will not have an impact on construction costs, either positively or negatively.

WUIC18-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee stated that the reason for the disapproval of the proposal was that although the change relocates the requirements to the right section, there is some work that needs to be done based upon the proponent's request to bring it back to the committee. (Vote: 12 -0)

WUIC18-24

Individual Consideration Agenda

Comment 1:

IWUIC: SECTION 503, 503.1, 501.3

Proponents: Milad Shabanian, Insurance Institute for Buisness & Home Safety (mshabanian@ibhs.org); T. Eric Stafford, Insurance Institute for Business and Home Safety (testafford@charter.net) requests As Modified by Committee (AMC2)

Replace as follows:

2024 International Wildland Urban Interface Code

Revise as follows:

SECTION 503
~~IGNITION-RESISTANT~~ CONSTRUCTION AND MATERIAL

503.1 General. Buildings and structures hereafter constructed, modified or relocated into or within *wildland-urban interface areas* shall meet the construction requirements in accordance with Table 503.1. Class 1, Class 2 or Class 3, ignition-resistant construction shall be in accordance with Sections 504, 505 and 506, respectively. Materials required to be ~~ignition-resistant materials~~ *ignition-resistant building materials* shall comply with the requirements of Section 503.2. Where this code requires fire-resistance rated construction, fire-resistance

ratings shall be determined in accordance with Section 503.4.

~~**501.3**~~ **503.4 Fire-resistance-rated construction.** Where this code requires ~~1 hour~~ *fire-resistance-rated construction*, the fire-resistance rating of building elements, components or assemblies shall be determined in accordance with the test procedures set forth in ASTM E119 or UL 263. **Exceptions:**

1. The fire-resistance rating of building elements, components or assemblies based on the prescriptive designs prescribed in Section 721 of the International Building Code.
2. The fire-resistance rating of building elements, components or assemblies based on the calculation procedures in accordance with Section 722 of the International Building Code.

Reason: In addition to the reason provided for original code change proposal this comment tries to address two issues:

This comment deletes an unnecessary term used in charging paragraph of section 501.3 referring to 1 hour fire resistance rated construction, and adds a sentence to charging paragraph of Section 503.1, change the proposed section number to 503.4 and aligns this change with WUIC17-24 which got approved in CAH#1.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This code change proposal is strictly a clarification. Relocating existing Section 501.3 to new Section 503.3 pertaining to construction and material will not result in a technical changes to the code. As a result, the proposal will not have an impact on construction costs, either positively or negatively.

Comment (CAH2)# 52

WUIC20-24

IWUIC: TABLE 503.1

Proposed Change as Submitted

Proponents: Robert Marshall, FCAC, FCAC (fcac@iccsafe.org)

2024 International Wildland Urban Interface Code

Revise as follows:

TABLE 503.1 IGNITION-RESISTANT CONSTRUCTION CLASSIFICATION[a]

DEFENSIBLE SPACE[ea]	FIRE HAZARD SEVERITY					
	Moderate Hazard		High Hazard		Extreme Hazard	
	Water Supply[b]		Water Supply[b]		Water Supply[b]	
	Conforming[ab]	Nonconforming[ec]	Conforming[ab]	Nonconforming[ec]	Conforming[ab]	Nonconforming[ec]
Less than required by Table 603.2	IRClass 2	IRClass 1	IRClass 1	IR 1 N.C. Rated[d]	IR 1 N.C. Class 1[d]	Not PermittedNP
ConformingComplies with Table 603.2	IRClass 3	IRClass 2	RIClass 2	IRClass 1	IRClass 1	IR 1 N.C.Class 1[d]
1.5 × Conforming150% or more of distance required in Table 603.2	Not Required NR	IRClass 3	IRClass 3	IRClass 2	IRClass 2	IRClass 1

NP = Not Permitted; NR = Not Required; Class 1 = Ignition-resistant construction in accordance with Section 504; Class 2 = Ignition-resistant construction in accordance with Section 505; Class 3 = Ignition-resistant construction in accordance with Section 506.

a. ~~Access shall be in accordance with Section 403.~~ Distance of defensible space provided on all sides of structure as required in Table 603.2.

b. ~~Subdivisions shall have a conforming water supply in accordance with Section 402.1.~~ A conforming water supply complying with Section 404.

~~IR 1 = Ignition-resistant construction in accordance with Section 504.~~

~~IR 2 = Ignition-resistant construction in accordance with Section 505.~~

~~IR 3 = Ignition-resistant construction in accordance with Section 506.~~

~~N.C. = Exterior walls shall have a fire-resistance rating of not less than 1 hour and the exterior surfaces of such walls shall be noncombustible. Usage of log wall construction is allowed.~~

c. ~~Conformance based on Section 603.~~ A nonconforming water supply is any water system or source that does not comply with Section 404, including situations where there is no water supply for structure protection or fire suppression.

d. ~~Conformance based on Section 404.~~ In addition to Class 1 construction, the exterior walls shall comply with any of the following:

1. Exterior walls having a fire-resistance rating of 1 hour or more with a noncombustible exterior wall covering.
2. Exterior walls constructed of heavy timber members.
3. Exterior walls of log wall construction.

~~e. A nonconforming water supply is any water system or source that does not comply with Section 404, including situations where there is no water supply for structure protection or fire suppression.~~

Reason: FCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and early 2024 the FCAC has held several virtual meetings and one in-person meeting open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the **FCAC Website**

This proposal intends to clarify the application of Table 503.1.

IR 1 through IR 3 are replaced with Class 1 through Class 3. This is consistent with the terminology in the charging section, Section 503.1, and Sections 504, 505 and 506.

Nonconforming and conforming under defensible space is clarified as to what the conformance is referencing—the width of defensible space, or the distance from the structure.

The “IR 1 N.C.” term is replaced with “rated”. Footnote d specifies that rated construction consists of Class 1 ignition-resistant construction and the protection of the exterior walls is increased to one of the 3 options in Footnote d.

For additional clarification, the designation “NP” is intended to mean that any construction in areas with these risk factors is not permitted.

The designation “NR” is intended to mean that ignition resistant construction is not required for exterior walls. All other applicable requirements still apply.

There are three separate code changes dealing with IWUIC Table 503.1. Attached PDF shows the end goal for Table 503.1.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal is an editorial clairification that does not impact cost. See also the proponent’s reason statement.

WUIC20-24

Public Hearing Results (CAH1)

Committee Action: **As Modified by Committee (AMC1)**

Committee Modification:
2024 International Wildland Urban Interface Code
Revise as follows:

TABLE 503.1 ~~IGNITION-RESISTANT~~ WUI CONSTRUCTION CLASSES ~~CLASSIFICATION~~

DEFENSIBLE SPACE[a]	FIRE HAZARD SEVERITY					
	Moderate Hazard		High Hazard		Extreme Hazard	
	Water Supply		Water Supply		Water Supply	
	Conforming[b]	Nonconforming[c]	Conforming[b]	Nonconforming[c]	Conforming[b]	Nonconforming[c]
Less than required by Table 603.2	Class 2	Class 1	Class 1	~~Rated~~ Class 1[d]	Class 1[d]	NP
Complies with Table 603.2	Class 3	Class 2	Class 2	Class 1	Class 1	Class 1[d]
150% or more of distance required in Table 603.2	NR	Class 3	Class 3	Class 2	Class 2	Class 1

	NP = Not Permitted; NR = Not Required; Class 1 = ~~Ignition-resistant~~ construction in accordance with Section 504; Class 2 = ~~Ignition-resistant~~ construction in accordance with Section 505; Class 3 = ~~Ignition-resistant~~ construction in accordance with Section 506.
a.	Distance of defensible space provided on all sides of structure as required in Table 603.2.
b.	A conforming water supply complying with Section 404.
c.	A nonconforming water supply is any water system or source that does not comply with Section 404, including situations where there is no water supply for structure protection or fire suppression.
d.	In addition to Class 1 construction, the exterior walls shall comply with any of the following: 1. Exterior walls having a fire-resistance rating of 1 hour or more with a noncombustible exterior wall covering. 2. Exterior walls of heavy timber construction ~~constructed of heavy timber members~~. 3. Exterior walls of log wall construction.

Committee Reason: The committee stated that the reason for the approval of first modification was that it was appropriate to change the terminology from heavy timber member to heavy timber construction. The committee stated that the reason for the approval of the second modification was that it deleted ignition resistance in the footnotes and in the title. The committee stated that the reasons for the approval of the proposal with the modifications were: It clarifies the intent by replacing ignition resistant IR 1 through 3 with Class 1 through 3, making it now consistent with the charging section of Section 503.1 and Sections 504, 505 and 506. (Vote: 13-0)

WUIC20-24

Individual Consideration Agenda

Comment 1:

IWUIC: TABLE 503.1

Proponents: Stephen Skalko, Stephen V. Skalko, P.E. & Associates LLC, Masonry Alliance for Codes and Standards (svskalko@svskalko-pe.com) requests As Modified by Committee (AMC2)

Further modify as follows:

2024 International Wildland Urban Interface Code

TABLE 503.1 WUI CONSTRUCTION CLASSES

DEFENSIBLE SPACE[a]	FIRE HAZARD SEVERITY					
	Moderate Hazard		High Hazard		Extreme Hazard	
	Water Supply		Water Supply		Water Supply	
	Conforming[b]	Nonconforming[c]	Conforming[b]	Nonconforming[c]	Conforming[b]	Nonconforming[c]
Less than required by Table 603.2	Class 2	Class 1	Class 1	Class 1[d]	Class 1[d]	NP
Complies with Table 603.2	Class 3	Class 2	Class 2	Class 1	Class 1	Class 1[d]
150% or more of distance required in Table 603.2	NR	Class 3	Class 3	Class 2	Class 2	Class 1

DEFENSIBLE SPACE	FIRE HAZARD SEVERITY					
	Moderate Hazard		High Hazard		Extreme Hazard	
	Water Supply		Water Supply		Water Supply	
	Conforming	Nonconforming	Conforming	Nonconforming	Conforming	Nonconforming

NP = Not Permitted; NR = Not Required; Class 1 = Construction in accordance with Section 504; Class 2 = Construction in accordance with Section 505; Class 3 = Construction in accordance with Section 506.

a. Distance of defensible space provided on all sides of structure as required in Table 603.2.

b. A conforming water supply complying with Section 404.

c. A nonconforming water supply is any water system or source that does not comply with Section 404, including situations where there is no water supply for structure protection or fire suppression.

d. In addition to Class 1 construction, the exterior walls shall comply with any of the following:

1. Exterior walls having a fire-resistance rating of 1 hour or more with a noncombustible exterior wall covering.
2. Exterior walls of heavy timber construction <u>having a fire resistance rating of 1-hour or more</u>.
3. Exterior walls of log wall construction <u>having a fire resistance rating of 1-hour or more</u>.

Reason: Since walls of heavy timber construction and log walls are listed as equivalent alternatives to a 1-hour fire rated wall with a noncombustible exterior wall covering, it is implied they would also meet the 1-hour fire resistance. For consistency this change makes clear all three types of walls should have a fire resistance rating of 1-hour or more.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Since heavy timber walls and log walls are considered equivalent alternate exceptions to a 1-hour fire rated wall with noncombustible exterior wall covering, one has to assume these walls also need to have at least a 1-hour fire resistance. Clarifying this in the code will not increase costs.

Comment (CAH2)# 524

WUIC22-24

IWUIC: 402.2.2, 404.1, 503.1, TABLE 503.1

Proposed Change as Submitted

Proponents: Robert Marshall, FCAC, FCAC (fcac@iccsafe.org)

2024 International Wildland Urban Interface Code

Revise as follows:

402.2.2 Water supply. Individual structures hereafter constructed or relocated into or within *wildland-urban interface areas* shall be provided with a ~~conforming~~ water supply in accordance with Section 404. **Exception~~s~~:**

1. ~~Structures constructed to meet the requirements for the class of ignition-resistant construction specified in Table 503.1 for a nonconforming water supply.~~
2. ~~2~~ 1. Buildings containing only private garages, carports, sheds and agricultural buildings with a floor area of not more than 600 square feet (56 m^2).

404.1 General. ~~Where provided in order to qualify as a conforming water supply for the purpose of Table 503.1 or as required for new subdivisions in accordance with Section 402.1.2, an~~ An *approved* water source shall have an adequate water supply for the use of the fire protection service to protect buildings and structures from exterior fire sources or to suppress structure fires within the *wildland-urban interface area* of the jurisdiction in accordance with this section. **Exception:** Buildings containing only private garages, carports, sheds and agricultural buildings with a floor area of not more than 600 square feet (56 m^2).

503.1 General. Buildings and structures hereafter constructed, modified or relocated into or within *wildland-urban interface areas* shall meet the construction requirements in accordance with Table 503.1. Class 1, Class 2 or Class 3, ignition-resistant construction shall be in accordance with Sections 504, 505 and 506, respectively. Materials required to be ignition-resistant building materials shall comply with the requirements of Section 503.2.

TABLE 503.1 IGNITION-RESISTANT CONSTRUCTION~~[a]~~

Portions of table not shown remain unchanged.

DEFENSIBLE SPACE~~[c]~~[a]	FIRE HAZARD SEVERITY					
	Moderate Hazard		High Hazard		Extreme Hazard	
	~~Water Supply[b]~~		~~Water Supply[b]~~		Water Supply[b]	
	~~Conforming[d]~~	~~Nonconforming[e]~~	~~Conforming[d]~~	~~Nonconforming[e]~~	~~Conforming[d]~~	~~Nonconforming[e]~~
Nonconforming	IR 2	~~IR 1~~	IR 1	~~IR 1~~ ~~N.C.~~	IR 1 N.C.	~~Not Permitted~~
Conforming	IR 3	~~IR 2~~	IR 2	~~IR 1~~	IR 1	~~IR 1~~ ~~N.C.~~
1.5 × Conforming	Not Required	~~IR 3~~	IR 3	~~IR 2~~	IR 2	~~IR 1~~

~~a. Access shall be in accordance with Section 403.~~

IR 1 = Ignition-resistant construction in accordance with Section 504; IR 2 = Ignition-resistant construction in accordance with Section 505; IR 3 = Ignition-resistant construction in accordance with Section 506.

~~b.~~ ~~Subdivisions shall have a conforming water supply in accordance with Section 402.1.~~

~~IR 1 =~~ ~~Ignition-resistant construction in accordance with Section 504.~~

~~IR 2 =~~ ~~Ignition-resistant construction in accordance with Section 505.~~

~~IR 3 =~~ ~~Ignition-resistant construction in accordance with Section 506.~~

N.C. = Exterior walls shall have a fire-resistance rating of not less than 1 hour and the exterior surfaces of such walls shall be noncombustible. Usage of log wall construction is allowed.

~~c~~ a. Conformance based on Section 603.

~~d.~~ ~~Conformance based on Section 404.~~

~~e.~~ ~~A nonconforming water supply is any water system or source that does not comply with Section 404, including situations where there is no water supply for structure protection or fire suppression.~~

Reason: FCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and early 2024 the FCAC has held several virtual meetings and one in-person meeting open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the **FCAC Website**

The footnote reference to Section 403 (Access) is removed as not necessary. Compliance with Section 403 is required and a footnote "pointer" is redundant.

The footnote reference to Section 404 (Water Supply) is deleted in accordance with deletion of the Water Supply references in the TableWater supply in accordance with Section 404 should be provided for all new construction. As a tool for fire suppression and structure hazard mitigation during a WUI fire, firefighters may not be available to protect structures, so in that instance water supply would not reduce the fire risks or be an effective mitigation. Removing water supply puts the emphasis for protection of structures from wildland fire onto the constriction of the building to be ignition resistant and the defensible space.

There are three separate code changes dealing with IWUIC Table 503.1. The PDF attached shows the end goal for Table 503.1.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

Chapter 5 and Table 503.1 are the requirements for newly built structures and subdivisions in areas regulated by the IWUIC. Accordingly, a compliant water supply should always be provided or addressed through approved alternative methods or materials as allowed by the code. The application of this Table as currently written allows for a reduction in required IR Construction materials when the water supply complies with what is already required by this code,

The cost of construction will be increased based on this proposal as compared to the cost reduction (allowance) that is currently provided. That cost will be based on the difference of IR 3 construction vs. IR 2 or IR 2 vs IR1.

Summarized from ChatGPT: The cost of adding fire mains for a subdivision can vary widely depending on several factors such as the size of the subdivision, the existing infrastructure, local building codes and regulations, terrain, distance to the nearest water source, and the type of fire suppression system being installed. This provides a general estimate. Installing fire mains typically involves laying underground water pipes to supply water for firefighting purposes. Costs may include excavation, piping materials, valves, hydrants, backflow prevention devices, labor, permits, engineering/design fees, and any necessary road or sidewalk repairs.

The cost of installing fire mains for a subdivision could range from $50,000 to $200,000 or more per mile of pipe, depending on various

factors. Based upon the information obtained from ChatGPT an estimate of cost per structure has been developed. This estimate assumes a relatively straightforward installation with minimal obstacles. So assuming a subdivision of 20 house subdivision with generous spacing is about .1 mile distance. $5000-$20,000 for the subdivision based upon that distance. For each home an overall cost of $250-$1000 per structure. However, since they will have a conforming water supply as currently shown in the table they will not be required to upgrade the ignition resistant construction type.

It's important to note that these costs can vary significantly based on local conditions, regulations, and specific project requirements.

Estimated Immediate Cost Impact Justification (methodology and variables):

The cost of construction will be increased based on this proposal as compared to the cost reduction (allowance) that is currently provided. That cost will be based on the difference of IR 3 construction vs. IR 2 or IR 2 vs IR1. That cost would typically not exceed 1-2% of overall construction cost, but is variable based on the size of the building and the choice of building materials chosen to comply.

WUIC22-24

Public Hearing Results (CAH1)

Errata: This proposal includes published errata https://www.iccsafe.org/wp-content/uploads/2024-Group-A-Consolidated-Monograph-Updates.pdf

Committee Action: **Disapproved**

Committee Reason: The committee stated that the reasons for the disapproval of the proposal were: The action taken on WUIC21 that added the IR 3 requirement with a 1.5 conforming defensible space in a moderate hazard location. The concern over the requirements for existing buildings and homes. It was noted that the non-conforming column would be useful to the code official in challenging situations when you are building in a location that has an existing infrastructure. Additionally, the impact on existing homes that could put a homeowner in a situation where they may never be able to do a renovation or do anything on their own because they cannot comply with the water supply requirements. (Vote: 9-4)

WUIC22-24

Individual Consideration Agenda

Comment 1:

IWUIC: 402.2.2, 404.1, 503.1, TABLE 503.1

Proponents: Robert Marshall, FCAC, FCAC (fcac@iccsafe.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Wildland Urban Interface Code

Revise as follows:

402.2.2 Water supply. Individual structures ~~hereafter~~ newly constructed ~~or relocated into or~~ within *wildland-urban interface areas* shall be provided with a water supply in accordance with Section 404. **Exception:**

1. Buildings containing only private garages, carports, sheds and agricultural buildings with a floor area of not more than 600 square feet (56 m^2).

404.1 General. An *approved* water source shall have an adequate water supply for the use of the fire protection service to protect buildings and structures from exterior fire sources or to suppress structure fires within the *wildland-urban interface area* of the jurisdiction in accordance with this section. **Exception:** Buildings containing only private garages, carports, sheds and agricultural buildings with a floor area of not more than 600 square feet (56 m^2).

Revise as follows:

503.1 General. New ~~Buildings~~ buildings and structures ~~hereafter~~ constructed~~, modified or relocated into or~~ within *wildland-urban interface areas* shall meet the construction requirements in accordance with Table 503.1. Class 1, Class 2 or Class 3, ignition-resistant construction shall be in accordance with Sections 504, 505 and 506, respectively. Materials required to be ignition-resistant building materials shall comply with the requirements of Section 503.2.

TABLE 503.1 IGNITION-RESISTANT CONSTRUCTION

DEFENSIBLE SPACE[a]	FIRE HAZARD SEVERITY		
	Moderate Hazard	High Hazard	Extreme Hazard
			Water Supply[b]
Nonconforming	IR 2	IR 1	IR 1 N.C.
Conforming	IR 3	IR 2	IR 1
1.5 × Conforming	Not Required	IR 3	IR 2

.

IR 1 = Ignition-resistant construction in accordance with Section 504; IR 2 = Ignition-resistant construction in accordance with Section 505; IR 3 = Ignition-resistant construction in accordance with Section 506.

.

N.C. = Exterior walls shall have a fire-resistance rating of not less than 1 hour and the exterior surfaces of such walls shall be noncombustible. Usage of log wall construction is allowed.

a. Conformance based on Section 603.

Reason: The only change was to the language regarding existing structures to make it clear that the the original change was only applicable to new construction. These changes to the original proposal address the committee's comments.

FCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and early 2024 the FCAC has held several virtual meetings and one in-person meeting open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the **FCAC Website**.

Cost Impact: Increase

Estimated Immediate Cost Impact:

The need for a sanctioned water supply will increase the cost of construction.

Estimated Immediate Cost Impact Justification (methodology and variables):

Will vary depending on the size and type of water supply.

Estimated Life Cycle Cost Impact:

n/a

Estimated Life Cycle Cost Impact Justification (methodology and variables):

n/a

Comment (CAH2)# 255

WUIC23-24

IWUIC: TABLE 503.1

Proposed Change as Submitted

Proponents: Kevin Scott, KH Scott & Associates LLC, self (khscottassoc@gmail.com)

2024 International Wildland Urban Interface Code

Revise as follows:

TABLE 503.1 IGNITION-RESISTANT CONSTRUCTION[a]

DEFENSIBLE SPACE[c]	FIRE HAZARD SEVERITY					
	Moderate Hazard		High Hazard		Extreme Hazard	
	Water Supply[b]		Water Supply[b]		Water Supply[b]	
	Conforming[d]	Nonconforming[e]	Conforming[d]	Nonconforming[e]	Conforming[d]	Nonconforming[e]
Nonconforming	IR 2	IR 1	IR 1	IR 1 N.C.	IR 1 N.C.	Not Permitted
Conforming	IR 3	IR 2	IR 2	IR 1	IR 1	IR 1 N.C.
~~1.5 × Conforming~~	~~Not Required~~	~~IR 3~~	~~IR 3~~	~~IR 2~~	~~IR 2~~	~~IR 1~~

a. Access shall be in accordance with Section 403.

b. Subdivisions shall have a conforming water supply in accordance with Section 402.1.

IR 1 = Ignition-resistant construction in accordance with Section 504.

IR 2 = Ignition-resistant construction in accordance with Section 505.

IR 3 = Ignition-resistant construction in accordance with Section 506.

N.C. = Exterior walls shall have a fire-resistance rating of not less than 1 hour and the exterior surfaces of such walls shall be noncombustible. Usage of log wall construction is allowed.

c. Conformance based on Section 603.

d. Conformance based on Section 404.

e. A nonconforming water supply is any water system or source that does not comply with Section 404, including situations where there is no water supply for structure protection or fire suppression.

Reason: This proposal eliminates the last row in Table 503.1. The deleted row only applies where a structure provides a defensible space distance that is 150% or more of a conforming defensible space. Section 503.1 states that the requirements in Table 503.1 only apply to new construction or new structures. Therefore, existing structures which may not have any ignition-resistant construction are not affected by this table.

But for new construction, this provision is at minimum vague and confusing; and then it creates a situation which is nearly impossible to properly enforce for the life of the structure. The provision in the table is based on 150% times a conforming defensible space, and Footnote c directs the user to Section 603. However, this is not clear whether the provision applies to defensible space being 150% of the width required in Table 603.2; or if it means the trees within the defensible space are separated 150% of the distance required in Section 603.2.2; or both.

As far as enforcing this provision for the life of the structure, consider Structure X in the WUI. Structure X is located in the Moderate

Hazard area with a conforming water supply. Structure X provides a 150% increase in the distances required in both Table 603.2 and Section 603.2.2, so at the time of construction ignition-resistant building materials are not required. This design complies with Table 503.1 at the time of construction. Three years later, the code official is conducting an inspection of the area for maintenance of the defensible space. The code official will not be aware of the fact that the structure was required to maintain a 45' defensible space, so the code official will require the 30' defensible space requirement similar to all other structures in the Moderate Hazard area.

The only way to determine whether an owner must provide 150% of defensible space is to go back to the original plans and research the applicable code at the time of construction, then determine if the construction of the structure complies or not. While this is a valid avenue for enforcement, we all know that this amount of effort will not be put into every inspection. In fact, I would not be surprised if it is not put into **any** inspection. Most likely, the inspector will simply require the conforming distance as he/she did on every adjacent neighbor. In this fashion, it is an easier inspection; it looks acceptable; and the inspector moves on to next property.

Each year during the spring and early summer, a single WUI inspector can perform hundreds of inspections daily. If the information for a specific lot is not readily available, the provision will be lost. In doing so, the structure now should have been constructed of Class 3 ignition-resistant construction.

Additionally, Structure A is located in the Moderate Hazard area, but was allowed to be constructed with no ignition-resistant construction, not even a fire-resistance-rated roof. The rating of the roof covering is required for Classes 1, 2 and 3 ignition-resistant construction, but Dwelling A did not have to comply since 150% of the defensible space was provided. It is a frequent occurrence that structures are ignited ahead of the fire front by burning embers pushed ahead of the fire and landing on the rooftop. But Dwelling A does not have a rated roof. The 45' defensible space protects from radiant heat and direct flame impingement. The roof is not protected, and Dwelling A is lost when the roof ignites from burning embers.

Some may argue that Dwelling A will be saved because there is a conforming water supply. However, even the best water supply is of no benefit when there are no firefighters available to utilize it. When there are multiple structures needing protection, the Incident Commander will decide where to deploy the firefighters because there are more structures than firefighters and fire engines. Structure A has a 45' defensible space, while others only have the required 30' distance. It is likely that it will be decided that Structure A is less vulnerable because of the increased defensible space and firefighters will be sent to other structures. The water supply does not improve the survivability of Structure A at all in this case.

The concept to allow credit for 150% of the defensible space is flawed and difficult to maintain throughout the life of the structure. The entire row and this allowance should be removed from the code.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

This proposal will increase the cost of construction, but only for structures which would have benefited from providing the 150% increase in the defensible space requirements. However, the construction increase will be offset by the one-third reduction in labor for annual pruning and trimming of the vegetation within the defensible space. Utilizing ignition-resistant construction materials will increase the construction cost for the exterior walls, deck and roof by 15%

- Exterior walls: For typical wood-framed exterior walls with standard materials such as 2x4 or 2x6 studs, plywood or OSB sheathing, house wrap, siding (vinyl, wood, or fiber cement), insulation, and interior drywall, the cost can range from $15 to $30 per square foot of wall area. Therefore resulting in an increase ranging from $1.5 dollars to $3.00 a square foot.
- Decks: The cost of building a deck can vary widely based on factors such as size, materials (pressure-treated wood, composite decking, etc.), design complexity, and site conditions. On average, the cost of building a deck can range from $20 to $50 per square foot. Therefore, resulting in an increase ranging from $2.0 dollars to $5.00 a square foot.
- Roofs: Roofing costs depend on factors such as the type of roofing material (asphalt shingles, metal, tile, etc.), roof slope, complexity of the roof design, and regional labor rates. On average, the cost of roofing can range from $3 to $10 per square foot for materials and installation. Therefore, resulting in an increase ranging from $0.30 dollars to $1.00 a square foot.

Estimated Immediate Cost Impact Justification (methodology and variables):

The cost estimates for exterior walls, decks and roofs were obtained from ChatGPT.

Public Hearing Results (CAH1)

Errata: This proposal includes published errata https://www.iccsafe.org/wp-content/uploads/2024-Group-A-Consolidated-Monograph-Updates.pdf

Committee Action: **Disapproved**

Committee Reason: The committee stated that the reason for the disapproval of the proposal was the desire to retain the 1.5 conforming defensible space row in the table, which was noted to be a viable construction option. (Vote: 9-4)

WUIC23-24

Individual Consideration Agenda

Comment 1:

Proponents: Kevin Scott, KH Scott & Associates LLC, self (khscottassoc@gmail.com) requests As Submitted

Reason: This code change should be approved as submitted.

Even though there are other proposals that affect this table, if they are not approved, this proposal should be approved. If those other proposals are approved and this line is deleted elsewhere, then that is acceptable. But do not let this row remain in the table in the code. It is an enforcement nightmare.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Comment (CAH2)# 717

WUIC26-24

IWUIC: 503.2.4

Proposed Change as Submitted

Proponents: David Bueche, Hoover Treated Wood Products (dbueche@frtw.com)

2024 International Wildland Urban Interface Code

Revise as follows:

503.2.4 Ignition-resistant building material. Material shall be tested on the front and back faces in accordance with the extended ASTM E84 or UL 723 test, for a total test period of 30 minutes, or with the ASTM E2768 test. The materials shall bear identification showing the fire test results. Panel products shall be tested with a ripped or cut longitudinal gap of $^{1}/_{8}$ inch (3.2 mm). The materials, when tested in accordance with the test procedures set forth in ASTM E84 or UL 723 for a test period of 30 minutes, or with ASTM E2768, shall comply with Sections 503.2.4.1 through 503.2.4.3. The use of paints, coating, stains, or other surface treatments is not an approved method of protection as required in this section. **Exception:** Materials composed of a combustible core and a noncombustible exterior covering made from either aluminum at a minimum 0.019 inch (0.48 mm) thickness or corrosion-resistant steel at a minimum 0.0149 inch (0.38 mm) thickness shall not be required to be tested with a ripped or cut longitudinal gap.

Reason: Efforts are being made by manufacturers seeking approval for painted, coated, stains, or other surface-treated wood that require continuous maintenance in lieu of ignition-resistant building materials. This proposed addition will clarify that paints, coating, stains, and other types of products with vulnerable surface coatings are not approved for use as ignition-resistant building materials in the wildland-urban interface (WUI).

This language already exists in the International Building Code in Section 2303.2.2 for fire-retardant-treated wood (FRTW), which is one of the categories of ignition-resistant building materials in IWUIC (503.2.2). It is also in the 2021 IRC, Section R802.1.5.2. This language is in NFPA 1140 Standard for Wildland Fire Protection for FRTW and is also in Chapters 7A and 23 of the California Building Code.

Finally, note that the required testing referenced in 503.2#1 would require ignition-resistant building materials to undergo the same testing as FRTW.

Adding this proposed language to 503.2 adds clarity and conformity to codes affecting WUI communities and ensures that any ignition-resistant material will perform as well as FRTW.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The code is silent on use of coatings and clarification is important.

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee stated that the reasons for the disapproval of the proposal were: The opposition to adding a prohibition in the code for these methods. There is no technical substantiation provided in the reason statement and it is being proposed to be added to the wrong section. (Vote: 12-1)

Individual Consideration Agenda

Comment 1:

IWUIC: 503.2, 503.2.2, 503.2.5 (New), 503.2.4.1, 503.2.4.2, 503.2.5.3 (New); IBC: [BF] 2303.2.3

Proponents: Marcelo Hirschler, GBH International, GBH International (mmh@gbhint.com); David Bueche, Hoover Treated Wood Products, Hoover Treated Wood Products (dbueche@frtw.com) requests As Modified by Committee (AMC2)

Replace as follows:

2024 International Wildland Urban Interface Code

503.2 Ignition-resistant building material. Ignition-resistant building materials shall comply with any one of the requirements in Section 503.2.1 through 503.2.5 ~~503.2.4~~.

503.2.2 Fire-retardant-treated wood. Fire-retardant-treated wood shall be identified for exterior use and shall meet the requirements of Section 2303.2 of the *International Building Code*.

Add new text as follows:

503.2.5 Fire-retardant coated wood. Material shall be tested on the front and back faces in accordance with the extended ASTM E84 or UL 723 test, for a total test period of 30 minutes, or with the ASTM E2768 test. The material shall bear identification showing the fire test results. The material, when tested in accordance with the test procedures set forth in ASTM E84 or UL 723 for a test period of 30 minutes, or with ASTM E2768, shall comply with Sections 503.2.5.1 through 503.2.5.3.

503.2.5.1 Flame spread. The fire-retardant coated wood material shall exhibit a flame spread index not exceeding 25, on both the front and back faces.

503.2.5.2 Flame front. The fire-retardant-coated wood material shall exhibit a flame front that does not progress more than 10 feet 6 inches (3200 mm) beyond the centerline of the burner at any time during the test, on both the front and back faces.

Add new text as follows:

503.2.5.3 Weathering. The fire-retardant coated wood material shall demonstrate that there is no change in performance under conditions of use by the following procedure. The fire-retardant coated wood material shall be evaluated before and after weathering (including exposure to temperature, moisture and ultraviolet radiation) in accordance with Method A “Test Method for Accelerated Weathering of Fire-Retardant-Treated Wood for Fire Testing” in ASTM D2898 and both tests shall meet the performance requirements of Sections 503.2.5.1 and of 503.2.2.

2024 International Building Code

[BF] 2303.2.3 Other means during manufacture. For wood products impregnated with chemicals by other means during manufacture, the treatment shall be an integral part of the manufacturing process of the wood product. The treatment shall provide permanent protection to all surfaces of the wood product. The use of paints, coating, stains or other surface treatments is not an *approved* method of protection as required in this section.

Reason: The key issue that this comment addresses is that any fire-retardant coated wood material intended for use as an ignition resistant building material in the code must be able to provide the appropriate fire protection before and after weathering, something that

the present code does not provide.

During the discussion of the proposal four issues were raised as the reason the proposal was disapproved, as follows. First, it was pointed out that the new sentence proposed for addition to section 503.2.4 should not have been added into that section but should have been added to section 503.2.2. Adding the proposed new sentence to Section 503.2.2 is unnecessary as that section (on FRTW) refers directly to IBC section 2303.2. One of the subsections of IBC 2303.2 is section 2303.2.2 which states as shown in the next paragraph, so that it includes already the proposed new language.

"IBC 2303.2.2 Other means during manufacture. For wood products impregnated with chemicals by other means during manufacture, the treatment shall be an integral part of the manufacturing process of the wood product. The
treatment shall provide permanent protection to all surfaces of the wood product. The use of paints, coating, stains or other surface treatments is not an approved method of protection as required in this section."

Second, it was pointed out that weathering is essential for any ignition resistant building material and that the code only includes weathering for fire-retardant-treated wood, plastic lumber and wood-plastic composite, but not for fire-retardant coated wood. This comment adds a section specifically for fire-retardant coated wood and that new section (503.2.5) includes the requirements to meet the fire test and the requirements for weathering, similar to the requirements for weathering of fire-retardant-treated wood.

Third, it was pointed out that a prohibition for the use of fire-retardant coated materials would disallow future progress, in spite of the fact that evidence was presented (including information regarding a study by NIST (NIST Technical Note 2094, "Effect of Fire-Retardant Coatings and Accelerated-Weathering on the Flammability of Wood-Based Materials in Wildland-Urban Interface (WUI) Communities", by Laura Dubrulle, Mauro Zammarano, and Rick D. Davis; May 12th, 2020, https://doi.org/10.6028/NIST.TN.2094) that none of the existing wood coating materials exhibit sufficient permanence to be able to be used when exposed to the normal weather conditions in WUI areas (including rain). The NIST report is attached.

Fourth, it was pointed out that materials for use in the IWUIC code are all materials intended for use when exposed to the weather (including rain), so that permanence under exposure conditions is essential.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This clarifies that all ignition resistant building materials for use in the IWUIC areas must be equally dealt with in terms of weathering.

Comment (CAH2)# 66

WUIC27-24

IWUIC: SECTION 202 (New), 504.2, 504.2.1 (New), 504.8, 505.2, 505.2.1 (New), 505.8, 506.2, 506.2.1 (New), 506.5 (New), NFPA (New), UL Chapter 07 (New)

Proposed Change as Submitted

Proponents: Robert Marshall, FCAC, FCAC (fcac@iccsafe.org)

2024 International Wildland Urban Interface Code

Add new definition as follows:

EXTERIOR GLAZED DOOR. An operable opening in the building envelope that contains fixed glazing.

Revise as follows:

504.2 Roof assembly. Roofs shall have a *roof assembly* that complies with a Class A rating when tested in accordance with ASTM E108 or UL 790. For *roof assemblies* where the profile allows a space between the *roof covering* and *roof deck*, the space at the eave ends shall be fire-stopped to preclude entry of flames or embers or have one layer of 72-pound (32.4 kg) mineral-surfaced, nonperforated cap sheet complying with ASTM D3909 installed over the combustible *roof deck*. **Exceptions:**

1. Class A *roof assemblies* include those with coverings of brick, masonry or an exposed concrete *roof deck*.
2. Class A *roof assemblies* also include ferrous or copper shingles or sheets, metal sheets and shingles, clay or concrete roof tile or slate installed on noncombustible decks or ferrous, copper or metal sheets installed without a *roof deck* on noncombustible framing.
3. Class A *roof assemblies* include minimum 16 oz/sq ft (0.0416 kg/m^2) copper sheets installed over combustible *roof decks*.

Add new text as follows:

504.2.1 Skylights. Skylights, including tubular daylighting devices and sloped glazing shall comply with Section 504.8.

Revise as follows:

504.8 Exterior glazing. Exterior windows, window walls and *exterior glazed doors* ~~glazed door~~ having a glazed area of 25 percent or greater of the door area, windows within exterior doors, and skylights shall be ~~tempered glass,~~ one of the following:
1. Multilayered ~~*multilayered*~~ *glazed panels* containing at least one tempered pane or dome~~.~~; or
2. Glass ~~glass~~ block units; or
3. Have ~~have~~ a minimum fire protection rating of ~~not less than~~ 20 minutes when tested in accordance with NFPA 257 or UL 9, and shall be exempt from the hose stream test.

505.2 Roof assembly. Roofs shall have a *roof assembly* that complies with not less than a Class A rating when tested in accordance with ASTM E108 or UL 790, or an *approved noncombustible roof covering*. For *roof assemblies* where the profile allows a space between the *roof covering* and *roof deck*, the space at the eave ends shall be fire-stopped to preclude entry of flames or embers, or have one layer of cap sheet complying with ASTM D3909 installed over the combustible *roof deck*.

Add new text as follows:

505.2.1 Skylights. Skylights, including tubular daylighting devices and sloped glazing shall comply with section 505.8.

Revise as follows:

505.8 Exterior glazing. Exterior windows, window walls and ~~glazed doors~~ *exterior glazed doors* having 25 percent or greater of the door area, windows within exterior doors, and skylights shall be ~~tempered glass,~~ one of the following:
1. *Multilayered ~~multilayered~~ glazed panels containing at least one tempered panel or dome~~,~~ ; or*
2. Glass ~~glass~~ block units; or
3. Have ~~have~~ a fire protection rating of ~~not less than~~ 20 minutes when tested in accordance with NFPA 257 or UL 9, and shall be exempt from the hose stream test..

506.2 Roof assembly. Roofs shall have a *roof assembly* that complies with not less than a Class B rating when tested in accordance with ASTM E108 or UL 790 or an *approved noncombustible roof covering*. For *roof assemblies* where the profile allows a space between the *roof covering* and *roof deck*, the space at the eave ends shall be fire-stopped to preclude entry of flames or embers, or have one layer of cap sheet complying with ASTM D3909 installed over the combustible *roof deck*.

Add new text as follows:

506.2.1 Skylights. Skylights, including tubular daylighting devices and sloped glazing shall comply with section 506.5.

506.5 Exterior Glazing. Exterior windows, window walls and e*xterior glazed doors* having a glazed area of 25 percent or greater of the door area, windows within exterior doors, and skylights shall be one of the following:

1. *Multilayered glazed panels* contain at least one tempered pane; or
2. Glass block units; or
3. Have a minimum fire protection rating of 20 minutes when tested in accordance with NFPA 257 or UL 9, and shall be exempt from the hose stream test.

Add new standard(s) as follows:

NFPA

National Fire Protection Association
1 Batterymarch Park
Quincy, MA 02169-7471

257-2022 Standard on Fire Test for Window and Glass Block Assemblies

UL

UL LLC
333 Pfingsten Road
Northbrook, IL 60062-2096

9-2009 Fire Tests of Window Assemblies, with Revisions through March 2020

Reason: This proposal provides a definition for “exterior glazed door” to clearly explain this is an exterior door with fixed glazing, commonly referred to as a door lite. Within the Class fire-ignition requirements, the minimum percentage of glazing that would trigger certain requirements is then provided in the sections 504.8, 505.8 and 506.8. Fixed glazing relates to the glazing itself and does not imply that the door is not operable. Further, a glazed door includes various types of doors, including sliding glass doors, side hinged doors, or folding door systems.

In all WUI classes of construction, this proposed requires a least one pane of tempered glass, which has been shown to be effective in the performance to resist fire intrusion. It also adds the NFPA 257 and UL 9 when testing to the fire protection rating but for exempting the hose stream test, which is also exempted in the IBC. The markings to determine NFPA or UL compliance are found within the IBC. The proposal then adds the same exterior glazing requirements Class 3 WUI construction, which currently has no exterior glazing requirements.

The remaining editorial changes are intended to provide needed clarity to prevent misinterpretations of what is required. Those changes are as follows:

1. Adds a pointer under roof assembly for skylights, tubular daylighting devices and sloped glazing, in order to prevent any confusion that

these products fall under roof assembly compliance.

2. Makes formatting edits to the exterior glazing sections so it is clear that one of the three options must be chosen.

FCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and early 2024 the FCAC has held several virtual meetings and one in-person meeting open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the **FCAC Website**

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

Eliminating the option of allowing single-pane tempered that has been in the IWUIC since 2003, will increase costs for manufacturers shifting to provide multilayered glazed panels with at least one tempered pane. Multilayered glazed panels are readily available in the industry and being installed to meet other code requirements. However, this proposal will increase the cost per lite of glass (minimum of on tempered pane); and, when that cost is aggregated to the overall cost of the window, it is estimated to be at least 20% more than annealed glass and the actual cost depends on the size and complexity of the fenestration project.

Based upon a typical window size and a house with 20 windows and a typical cost range of $700-$1,000 per installed window, this would be about a $2,800-$4,000 total increase.

Further, multilayered glazed panels (i.e. insulating glazing), with at least one tempered pane is a makeup that is not designed for meeting full safety glazing requirements in hazardous locations. This new makeup for the IWUIC is available from only some manufacturers that have been meeting California Code requirements for the last five California code cycles.

The proposal provides for options to meet the exterior glazing requirements laid out. If the NFPA or UL testing option is chosen, there will be an increase in cost associated with this testing because it is not currently a common approach that manufacturers utilize.

Estimated Immediate Cost Impact Justification (methodology and variables):

The above cost estimate was determined from: https://www.forbes.com/home-improvement/windows/floor-to-ceiling-windows-cost/

For manufacturers who have not been manufacturing product for California requirements, the cost will be higher to comply with multilayered glazed panels with at least one tempered pane than for those manufacturers who have been producing this product at a greater rate for California compliance.

One of the options to meet the exterior glazing requirements will be an increase in cost for manufacturers to proceed with the testing to either the UL or NFPA standard; however, many may choose to utilize the other options that are currently in the IWUIC, eliminating that cost increase.

WUIC27-24

Public Hearing Results (CAH1)

Errata: This proposal includes published errata https://www.iccsafe.org/wp-content/uploads/2024-Group-A-Consolidated-Monograph-Updates.pdf

Committee Action: **Disapproved**

Committee Reason: The committee stated that the reason for the disapproval of the proposal was the need for additional revisions to be made including the referenced standards in the modifications. (Vote: 12-0)

WUIC27-24

Individual Consideration Agenda

Comment 1:

IWUIC: SECTION 202, 504.2.1 (New), 504.8, 505.2.1, 505.8, 506.2.1, 506.5 (New), NFPA (New), UL Chapter 07 (New)

Proponents: Robert Marshall, FCAC, FCAC (fcac@iccsafe.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Wildland Urban Interface Code

Revise as follows:

~~EXTERIOR~~ GLAZED DOOR. An ~~operable opening in the building envelope that contains fixed glazing.~~exterior door having a glazed area of 25 percent or greater of the door.

Add new text as follows:

504.2.1 Skylights. Skylights, including tubular daylighting devices and sloped glazing shall comply with Section 504.8.

Revise as follows:

504.8 Exterior glazing. Exterior windows, window walls, ~~and *exterior glazed doors* having a glazed area of 25 percent or greater of the door area~~, windows within exterior doors, and skylights shall be one of the following:

1. Multilayered *glazed panels* containing at least one tempered pane
2. Glass block units
3. Have a minimum fire door or fire window fire protection rating of not less than 20 minutes when tested without the hose stream test in accordance with NFPA 252, UL 10B, or UL 10C, or in accordance with NFPA 257 or UL9, as appropriate.

1. ~~Multilayered *glazed panels* containing at least one tempered pane or dome; or~~
2. ~~Glass block units; or~~
3. ~~Have a minimum fire protection rating of 20 minutes when tested in accordance with NFPA 257 or UL 9, and shall be exempt from the hose stream test..~~

505.2.1 Skylights. Skylights, including tubular daylighting devices and sloped glazing shall comply with section 505.8.

505.8 Exterior glazing. Exterior windows, window walls, ~~and *exterior glazed doors* having 25 percent or greater of the door area~~, windows within exterior doors, and skylights shall be one of the following:

1. Multilayered *glazed panels* containing at least one tempered pane
2. Glass block units

3. Have a fire door or fire window fire protection rating of not less than 20 minutes when tested without the hose stream test in accordance with NFPA 252, UL 10B, or UL 10C, or in accordance with NFPA 257 or UL9, as appropriate.

~~1. *Multilayered glazed panels containing at least one tempered panel or dome* ; or~~

~~2. Glass block units; or~~

~~3. Have a fire protection rating of 20 minutes when tested in accordance with NFPA 257 or UL 9, and shall be exempt from the hose stream test..~~

506.2.1 Skylights. Skylights, including tubular daylighting devices and sloped glazing shall comply with section 506.5.

Add new text as follows:

506.5 Exterior Glazing. Exterior windows, window walls, *glazed doors* , windows within exterior doors, and skylights shall comply with one of the following:

1. *Multilayered glazed panels* containing at least one tempered pane
2. Glass block units
3. Have a minimum fire door or fire window fire protection rating of not less than 20 minutes when tested without the hose stream test in accordance with NFPA 252, UL 10B, or UL 10C, or in accordance with NFPA 257 or UL9, as appropriate.

Add new standard(s) as follows:

252-2022	Standard Methods of Fire Tests of Door Assemblies
257-2022	Standard on Fire Test for Window and Glass Block Assemblies

UL

UL LLC
333 Pfingsten Road
Northbrook, IL 60062-2096

9-2009	Fire Tests of Window Assemblies, with Revisions through March 2020
10A - 2009	Tin Clad Fire Doors—with Revisions through July 20, 2018
10B-2008	Fire Tests of Door Assemblies—with Revisions through May 2020

Reason: The Committee disapproved this proposal because of the need for additional revisions, including several technical deficiencies in the fire test standards referenced in the original proposal. This Public Comment corrects those deficiencies.

First, the definition is updated to align how "glazed door" is defined in the industry and in other codes, including the CA code. Having the 25% included is core to the definition, as it makes it clear that if less than that, it is not a glazed door.

The original proposal only referenced NFPA 257, the fire test applicable to fire windows, when it should have also referenced NFPA 252 for fire doors. Additionally, the original proposal inaccurately provided for NFPA 257 fire testing without the hose stream test when NFPA 257 does not permit testing without the hose stream portion of the test.

This Public Comment adds reference to NFPA 252, the test for fire doors, which permits testing without the hose stream, and it corrects the inaccurate hose stream reference to NFPA 257. Finally, the Public Comment includes reference to the correct alternate UL test standards for both NFPA 252 and NFPA 257.

FCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and early 2024 the FCAC has held several virtual meetings and one in-person meeting open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the **FCAC Website**.

Cost Impact: Increase

Estimated Immediate Cost Impact:

Eliminating the option of allowing single-pane tempered that has been in the IWUIC since 2003, will increase costs for manufacturers shifting to provide multilayered glazed panels with at least one tempered pane. Multilayered glazed panels are readily available in the industry and being installed to meet other code requirements. However, this proposal will increase the cost per lite of glass (minimum of on tempered pane); and, when that cost is aggregated to the overall cost of the window, it is estimated to be at least 20% more than annealed glass and the actual cost depends on the size and complexity of the fenestration project. Based upon a typical window size and a house with 20 windows and a typical cost range of $700-$1,000 per installed window, this would be about a $2,800-$4,000 total increase. Further, multilayered glazed panels (i.e. insulating glazing), with at least one tempered pane is a makeup that is not designed for meeting full safety glazing requirements in hazardous locations. This new makeup for the IWUIC is available from only some manufacturers that have been meeting California Code requirements for the last five California code cycles. The proposal provides for options to meet the exterior glazing requirements laid out. If any of the NFPA or UL testing options are chosen, there will be an increase in cost associated with this testing because it is not currently a common approach that manufacturers utilize.

Estimated Immediate Cost Impact Justification (methodology and variables):

The above cost estimate was determined from: https://www.forbes.com/home-improvement/windows/floor-to-ceiling-windows-cost/ For manufacturers who have not been manufacturing product for California requirements, the cost will be higher to comply with multilayered glazed panels with at least one tempered pane than for those manufacturers who have been producing this product at a greater rate for California compliance. One of the options to meet the exterior glazing requirements will be an increase in cost for manufacturers to proceed with the testing to any of the UL or NFPA standards; however, many may choose to utilize the other options that are currently in the IWUIC, eliminating that cost increase.

Comment (CAH2)# 267

Comment 2:

IWUIC: 504.2.1, 505.2.1, 506.2.1

Proponents: Aaron Phillips, Asphalt Roofing Manufacturers Association (ARMA), Asphalt Roofing Manufacturers Association (aphillips@asphaltroofing.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Wildland Urban Interface Code

504.2.3 ~~504.2.1~~ Skylights. Skylights, including tubular daylighting devices and sloped glazing shall comply with Section 504.8.

505.2.3 ~~505.2.1~~ Skylights. Skylights, including tubular daylighting devices and sloped glazing shall comply with section 505.8.

506.2.3 ~~506.2.1~~ Skylights. Skylights, including tubular daylighting devices and sloped glazing shall comply with section 506.5.

Reason: ARMA's interest in this proposal is the addition of pointers for skylights into roof assembly Sections 504.2, 505.2, and 506.2. The reason statement of the original proposal indicates the pointers are added "to prevent any confusion that these products fall under roof assembly compliance." However, making the pointer the first subsection within the Roof Assembly section calls attention to skylights

rather than reducing confusion. This comment moves the new skylight pointers to be the last subsection in the Roof Assembly sections. Doing so reduces the implication that skylights are the most important subsection.

Note that the renumbered subsections are shown as "point 3." This is to coordinate with WUIC30-24, which was approved as modified during the first Committee Action Hearing. WUIC30-24 adds a new subsection "point 2" in 504.2, 505.2, and 506.2. The intention is for the skylight pointer subsections to be the last sections within the respective Roof Assembly sections.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This comment rearranges sections without making any technical changes. There will be no impact on the cost of construction.

2024 International Wildland Urban Interface Code

Add new definition as follows:

GLAZED DOOR. Exterior door having a glazed area of 25 percent or greater of the area of the door.

Add new text as follows:

504.2.1 Skylights. Skylights, including tubular daylighting devices and sloped glazing shall comply with Section 504.8

Revise as follows:

504.8 Exterior glazing. Exterior windows, window walls and glazed doors, windows within exterior doors, and skylights shall be one of the following:~~tempered glass, *multilayered glazed panels*, glass block or have a fire protection rating of not less than 20 minutes.~~

1. *Multilayered glazed panels* containing at least one tempered pane.
2. Glass block units.
3. Have a fire protection rating of not less than 20 minutes when tested in accordance with NFPA 257 or UL 9, and shall be exempt from the hose stream test.

Add new text as follows:

505.2.1 Skylights. Skylights, including tubular daylighting devices and sloped glazing shall comply with Section 505.8

Revise as follows:

505.8 Exterior glazing. Exterior windows, window walls and *glazed doors*, windows within exterior doors, and skylights shall be one of the following: ~~tempered glass, *multilayered glazed panels*, glass block or have a fire protection rating of not less than 20 minutes.~~

1. *Multilayered glazed panels* containing at least one tempered pane.
2. Glass block units.
3. Have a fire protection rating of not less than 20 minutes when tested in accordance with NFPA 257 or UL 9, and shall be exempt from the hose stream test.

Add new text as follows:

506.2.1 Skylights. Skylights, including tubular daylighting devices and sloped glazing shall comply with Section 506.5.

506.5 Exterior glazing. Exterior windows, window walls and *glazed doors*, windows within exterior doors, and skylights shall be one of the following:

1. *Multilayered glazed panels* containing at least one tempered pane.

2. Glass block units.

3. Have a fire protection rating of not less than 20 minutes when tested in accordance with NFPA 257 or UL 9, and shall be exempt from the hose stream test.

257--22 Standard on Fire Test for Window and Glass Block Assemblies

UL

UL LLC
333 Pfingsten Road
Northbrook, IL 60062-2096

9--2009 Fire Tests of Window Assemblies--with Revisions through March 2020

Reason: This proposal adds a definition for a glazed door in order to provide needed clarity and consistency in what is considered a glazed door, for the purposes of the exterior glazing requirements found in Class 1 and 2, as well as the new Class 3 requirements being proposed. This definition stems from the California Code.

In Class 1 and 2 ignitition-resistant construction, this proposed change eliminates a single pane tempered glass, which has been shown to not be as effective in fire barrier performance. It also adds the NFPA 257 Standard on Fire Test for Window and Glass Block Assemblies and UL 9 Fire Tests of Window Assemblies Standard when testing to the fire protection rating, but for exempting the hose stream test that is included in both standards. The hose stream test is also exempted in section 716.2.5.3 of the IBC. The markings to determine NFPA or UL compliance are found within the IBC, as both of these standards are already referenced and utilized in the IBC.

The proposal then adds the same revised exterior glazing requirements for Class 1 and 2 to Class 3 ignitition-resistant construction, which currently has no exterior glazing requirements. These Class revisions stem from the California Building and Residential Code and requirements in their Wildland Urban Interface Chapter.

The remaining changes are intended to provide needed clarity to prevent misinterpretations of what is required. Those changes are as follows:

- Adds a new subsection under Class 1, 2 and 3 roof assembly sections for skylights, tubular daylighting devices and sloped glazing. This pointer is to prevent any confusion that these products fall under roof assembly compliance.
- Makes formatting edits to the exterior glazing sections so it is clear that ONE of the now three options must be chosen.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

Eliminating the option of allowing single-pane tempered that has been in the IWUIC sine 2003, will increase the costs for manufacturers shifting to provide multilayered glazed panels with at least one tempered pane. However, multilayered glazed panels are readily available in the industry and being installed to meet other code requirements. This proposal will increase the cost per lite of glass (minimum of one tempered pane); and, when that cost is aggregated to the overall cost of the window, it is estimated to be at least 20% more than annealed glass and the actual cost depends on the size and complexity of the fenestration project.

Based upon a typical window size and a house with 20 windows and a typical cost range of $700-$1,000 per installed window, this would be about a $2,800-$4,000 total increase.

Further, multilayered glazed panels (i.e. insulating glazing), with at least one tempered pane is a makeup that is not designed for meeting full safety glazing requirements in hazardous locations. This new makeup for the IWUIC is available from only some manufacturers that have been meeting California Code requirements for the last five California code cycles.

The proposal provides for options to meet the exterior glazing requirements laid out. If the NFPA standard or UL standard testing option is chosen, there will be an increase in cost associated with this testing because it is not currently a common approach that manufacturers utilize.

Estimated Immediate Cost Impact Justification (methodology and variables):

The above cost estimate was determined from: https://www.forbes.com/home-improvement/windows/floor-to-ceiling-windows-cost/

For manufacturers who have not been manufacturing product for California requirements, the cost will be higher to comply with multilayered glazed panels with at least one tempered pane than for those manufacturers who have been producing this product at a greater rate for California compliance.

One of the options to meet the exterior glazing requirements will be an increase in cost for manufacturers to proceed with the testing to either the UL 9 or NGPA 257 standard; however, many may choose to utilize the other options that are currently in the IWUIC, eliminating that cost increase.

Reason: The Committee disapproved this proposal because of several technical deficiencies in the fire test standards referenced in the original proposal. This Public Comment corrects those deficiencies.

The original proposal only referenced NFPA 257, the fire test applicable to fire windows, when it should have also referenced NFPA 252 for fire doors. Additionally, the original proposal inaccurately provided for NFPA 257 fire testing without the hose stream test when NFPA 257 does not permit testing without the hose stream portion of the test.This Public Comment adds reference to NFPA 252, the test for fire doors, which permits testing without the hose stream, and it corrects the inaccurate hose stream reference to NFPA 257. Finally, the Public Comment includes reference to the correct alternate UL test standards for both NFPA 252 and NFPA 257.

Cost Impact: Increase

Estimated Immediate Cost Impact:

Eliminating the option of allowing single-pane tempered that has been in the IWUIC since 2003, will increase costs for manufacturers shifting to provide multilayered glazed panels with at least one tempered pane. Multilayered glazed panels are readily available in the industry and being installed to meet other code requirements. However, this proposal will increase the cost per lite of glass (minimum of on tempered pane); and, when that cost is aggregated to the overall cost of the window, it is estimated to be at least 20% more than annealed glass and the actual cost depends on the size and complexity of the fenestration project. Based upon a typical window size and a house with 20 windows and a typical cost range of $700-$1,000 per installed window, this would be about a $2,800-$4,000 total increase. Further, multilayered glazed panels (i.e. insulating glazing), with at least one tempered pane is a makeup that is not designed for meeting full safety glazing requirements in hazardous locations. This new makeup for the IWUIC is available from only some manufacturers that have been meeting California Code requirements for the last five California code cycles. The proposal provides for options to meet the exterior glazing requirements laid out. If any of the NFPA or UL testing options are chosen, there will be an increase in cost associated with this testing because it is not currently a common approach that manufacturers utilize.

Estimated Immediate Cost Impact Justification (methodology and variables):

The above cost estimate was determined from: https://www.forbes.com/home-improvement/windows/floor-to-ceiling-windows-cost/

For manufacturers who have not been manufacturing product for California requirements, the cost will be higher to comply with multilayered glazed panels with at least one tempered pane than for those manufacturers who have been producing this product at a greater rate for California compliance. One of the options to meet the exterior glazing requirements will be an increase in cost for manufacturers to proceed with the testing to any of the UL or NFPA standards listed; however, many may choose to utilize the other options that are currently in the IWUIC, eliminating that cost increase.

Comment (CAH2)# 228

Comment 2:

IWUIC: 504.2.1, 505.2.1, 506.2.1

Proponents: Aaron Phillips, Asphalt Roofing Manufacturers Association (ARMA), Asphalt Roofing Manufacturers Association (aphillips@asphaltroofing.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Wildland Urban Interface Code

504.2.3 ~~**504.2.1**~~ **Skylights.** Skylights, including tubular daylighting devices and sloped glazing shall comply with Section 504.8

505.2.3 ~~**505.2.1**~~ **Skylights.** Skylights, including tubular daylighting devices and sloped glazing shall comply with Section 505.8

506.2.3 ~~**506.2.1**~~ **Skylights.** Skylights, including tubular daylighting devices and sloped glazing shall comply with Section 506.5.

Reason: ARMA's interest in this proposal is the addition of pointers for skylights into roof assembly Sections 504.2, 505.2, and 506.2. The reason statement of the original proposal indicates the pointers are added "to prevent any confusion that these products fall under roof assembly compliance." However, making the pointer the first subsection within the Roof Assembly section calls attention to skylights rather than reducing confusion. This comment moves the new skylight pointers to be the last subsection in the Roof Assembly sections. Doing so reduces the implication that skylights are the most important subsection.

Note that the renumbered subsections are shown as "point 3." This is to coordinate with WUIC30-24, which was approved as modified during the first Committee Action Hearing. WUIC30-24 adds a new subsection "point 2" in 504.2, 505.2, and 506.2. The intention is for the skylight pointer subsections to be the last sections within the respective Roof Assembly sections.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This comment rearranges sections without making any technical changes. There will be no impact on the cost of construction.

Comment (CAH2)# 285

WUIC36-24

IWUIC: SECTION 202 (New), 504.5, 504.5.1 (New), 504.5.2 (New), 504.5.1

Proposed Change as Submitted

Proponents: Milad Shabanian, Insurance Institute for Business & Home Safety (mshabanian@ibhs.org); T. Eric Stafford, Insurance Institute for Business and Home Safety (testafford@charter.net)

2024 International Wildland Urban Interface Code

Add new definition as follows:

EXTERIOR SURFACES. Weather-exposed surfaces.

EXTERIOR WALL. A wall, bearing or nonbearing, that is used as an enclosing wall for a building, other than a fire wall, and that has a slope of 60 degrees (1.05 rad) or greater with the horizontal plane.

Revise as follows:

504.5 Exterior walls. Where defensible space conforms to the provisions of Section 603, exterior~~Exterior~~ walls of buildings or structures shall be constructed in accordance with Section 504.5.1 or Section 504.5.2.
Where defensible space does not conform to the provisions of Section 603, exterior walls of buildings or structures shall be constructed in accordance with Section 504.5.1 and Section 504.5.2.

Flashing shall be applied in accordance with Section 504.5.3. ~~one of the following methods:~~

1. ~~Materials *approved* for not less than 1-hour *fire-resistance-rated construction* on the exterior side.~~
2. ~~*Approved noncombustible* materials.~~
3. ~~Heavy timber or *log wall construction*.~~
4. ~~Fire-retardant-treated wood on the exterior side. The fire-retardant-treated wood shall be labeled for exterior use and meet the requirements of Section 2303.2 of the International Building Code.~~
5. ~~Ignition-resistant materials complying with Section 503.2 on the exterior side.~~

~~Such material shall extend from the top of the foundation to the underside of the roof sheathing.~~

Add new text as follows:

504.5.1 Exterior wall assemblies. Exterior wall assemblies of buildings or structures shall have a minimum of 1-hour fire-resistance-rating, rated for exposure on the exterior side in accordance with Section 501.3.
The exposed bottom edge of combustible sheathing shall be protected with noncombustible building material with a minimum assigned protection time of 40 minutes, or the sheathing shall be inset to rest directly on the foundation.

Exception: The bottom edge of exposed combustible sheathing is permitted to be covered with corrosion-resistant metal flashing provided there is an air gap of at least 1 inch between the metal flashing and the bottom edge of the combustible sheathing. Both legs of the flashing shall be attached a maximum of 6 inches (152.4 mm) on center.

504.5.2 Exterior surfaces. The exterior surfaces shall be constructed in accordance with one or more of the followings:

1. Approved noncombustible materials complying with Section 503.2.1.

2. Fire-retardant-treated wood complying with Section 503.2.2.

3. Ignition-resistant building materials complying with Section 503.2.4.

Revise as follows:

~~**504.5.1**~~ **504.5.3 Flashing.** A minimum of 6 inches (152 mm) of metal flashing or noncombustible material applied vertically on the exterior of the wall shall be installed at the ground, decking and roof intersections.

Reason: Table 503.1 requires the use of Ignition Resistant Construction Class 1 (IR1) in situations where defensible space is nonconforming. In such scenarios during a wildfire, the exterior walls of the structure may be exposed to embers, radiation heat, and direct flame exposures. Accordingly, the exterior wall assembly needs to provide a minimum resistance against these exposures. intermediate-scale, and full-scale experiments performed at the IBHS Research Center illustrate that the current requirements do not provide the needed resistance against wildfire exposures. Section 504.5 provides 5 alternatives for construction of exterior walls:

1. Materials approved for not less than 1-hour fire-resistance-rated (FRR) construction on the exterior side.
2. Approved noncombustible materials.
3. Heavy timber or log wall construction.
4. Fire-retardant-treated wood on the exterior side. The fire-retardant-treated wood shall be labeled for exterior use and meet the requirements of Section 2303.2 of the International Building Code.
5. Ignition-resistant materials complying with Section 503.2 on the exterior side. According to section 503.2 ignition-resistant materials include the followings: noncombustible, FRTW and IR building materials.

There is a notable inconsistency in the current alternatives for exterior walls of this class of construction, particularly in terms of resistance against fire impingement and flame spread. The first method permits 1-hour FRR construction when tested in accordance with ASTM E119 or UL 263. In this test the wall assembly is tested without a siding material, and it is possible to have 1-hour FRR wall assembly with different combustible siding materials and different rates of flame spread on the exterior surface. Therefore, there is significant risk of fire spreading to other sections of the building, including eaves, roofs, and openings (vents, windows, doors), with less restrictive fire resistance requirements. Figure 1 displays a moment captured during the wind-driven fire spread tests conducted at the IBHS research center at the separation distance of 20 ft. The "source structure" comprises metal and wooden sheds containing 15, 6-A wood cribs (UL 711 standard cribs). The “target structure” is a one-and-a-half-story residential structure featuring an open eave, double-pane tempered windows, and a one-hour-rated exterior wall. The cladding consists of a combination of combustible engineered wood siding material on left side and fiber cement panels on the right. Both structures face a nominal wind speed of 35 mph, and the thermal impact on the target building is observed using heat flux gauges, thermocouples, and cameras. As can be seen in Figure 1, about 10 minutes after a point ignition inside the shed, the target building ignited and within the next few seconds, the fire could spread on the surface causing severing damage to the eaves, vents, and windows. The test was terminated after a minute due to safety reasons. In this test the target structure had 1-hr FRR from exterior. The dark gray siding was fiber cement board (noncombustible siding) while the light gray siding was engineered wood (combustible) siding material.

Figure 1. a. The test setup for wind driven building to building fire spread tests. The target building has an hour fire resistant rated wall assembly.

Figure 1. b. ignition of the combustible siding.

Figure 1. c. fire spread on the surface and flames touching all components in about 10 seconds on left side.

Figure 1. d. after suppression; severe damage can be seen on all components on the left-side.

Another concern with 1-hour FRR alone is the wide range of wall assemblies that can meet the performance requirements of ASTM E119. Figure 2 shows two different wall assemblies that achieve 1-hr FRR from either side.

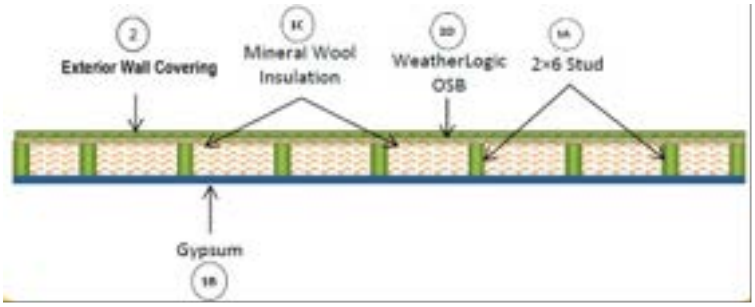

Figure 2. *a.* 1-hour fire resistance rated exterior wall with *OSB sheathing panel on the exterior side [1].*

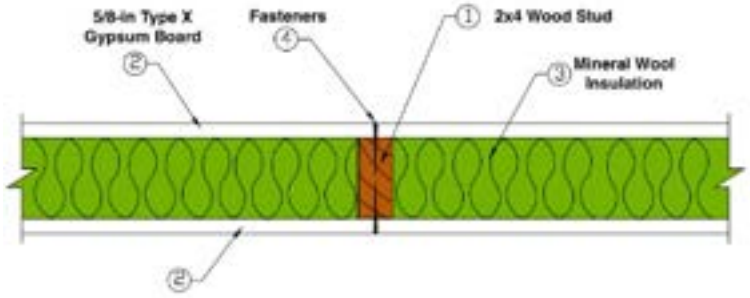

Figure 2. b. 1-hour fire resistance rated exterior wall with *Type X gypsum board on the exterior side [2].*

While Figure 2a and 2b both qualify as 1-hr FRR construction, the assembly in Figure 2a is particularly vulnerable to wildfire exposure at the base because combustible sheathing material is used in the assembly. Figure 3 shows a series of fire tests conducted at the IBHS Research Center where different configurations of 1-hour fire-resistant rated assembly with combustible engineered wood siding material were exposed to a small fire at the base. Figure 3a is about a typical 1-hour fire-resistant rated assembly constructed with OSB sheathing material. In this test the OSB sheathing material is exposed from bottom. During this experiment, the fire spread across the surface of the combustible exterior siding and impinged inside the wall cavity because of the exposed bottom surface of OSB sheathing material. Figure 3b shows a 1-hour fire-resistant rated assembly constructed with noncombustible sheathing material in accordance with Figure 2b. In this experiment the fire only ignited the combustible engineered wood siding material and did not impinge inside the wall assembly.

Figure 3. a. 1-hr FRR assembly with unprotected OSB Sheathing material at the bas3. Photo curtesy by Milad Shabanian, IBHS.

Figure 3. b. 1-hr FRR assembly with noncombustible sheathing material. Photo curtesy by Milad Shabanian, IBHS.

Item 2 of Section 504.5 permits the use of noncombustible materials. While this construction method provides comprehensive protection against fire spread, it does not specifically address the fire resistance rating and protection against fire impingement. Item 3 permits the use of heavy timber or log wall construction suggesting they offer similar protection. However, Section 602.4.4 in the IBC requires exterior walls of heavy timber construction to be noncombustible, which arguably aligns more appropriately with Item 2 or constructed

with FRTW or cross-laminated timber. In case that the exterior walls constructed with cross-laminated timber and heavy timber elements the exterior surface of such element shall be protected with: FRTW, Gypsum board or noncombustible materials.

In contrast, log wall construction technically aligns more with Item 1. According to Section 303 of ICC 400, 6-inch-thick logs can provide a 1-hour fire resistance against fire impingement. However, given their combustible nature, log wall constructions may exhibit varying fire spread rates, influenced by the different flame spread indices associated with various wood species.

Items 4 and 5 do not explicitly address fire impingement. These methods are only intended to limit the flame spread index of exterior surfaces. Figure 4 illustrates two typical exterior wall assembly constructed with ignition-resistant building material. Figure 4a is a typical exterior wall assembly protected on the exterior with noncombustible metal siding and Figure 4b is a wall protected with noncombustible fiber cement lap siding material.

Figure 4. a. Typical exterior wall assemblies constructed on the exterior with noncombustible metal siding. Photo curtesy by Milad Shabanian, IBHS.

Figure 4. b. Typical exterior wall assemblies constructed on the exterior with noncombustible fiber cement siding material. Photo curtesy by Milad Shabanian, IBHS.

An additional inconsistency in the IWUIC is that requirements for exterior wall construction are the same for IR1 and IR2. This is clearly a discrepancy as IR1 construction is required in conditions more severe than those requiring IR2 construction in Table 503.1.

This proposed code change will increase the level of fire protection and provide a more logical and consistent level of performance for exterior wall assemblies against fire impingement and flame spread for IR1 where defensible space is nonconforming by:

- Requiring a minimum of 1 hr. fire resistance rating for all exterior wall assemblies to address fire impingement, and,
- Limiting the flame spread index of exterior siding materials to address flame spread to other areas of the building.

Note: IBC is the source of all suggested definitions.

2. Design for code acceptance 3, American Wood Council, Fire-resistance-rated wood-frame wall and floor/ceiling assemblies. https://awc.org/wp-content/uploads/2021/12/awc-dca3_20210209_awcwebsite.pdf

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

This modification to the code will raise construction costs by introducing two stipulations for exterior walls.
According to research performed by IBHS and Headwaters Economics in 2022 [3], replacing a wooden composite cladding of a 1-hr fire rated wall assembly with fiber cement lap siding would increase the construction cost $1.38 per square foot in northern California. To attain a 1-hour fire-rated wall assembly for a wall constructed with noncombustible siding, the addition of 5/8-inch type X gypsum sheathing behind the siding is necessary, incurring an additional cost of approximately $0.40 per square foot.

Estimated Immediate Cost Impact Justification (methodology and variables):

The existing code mandates that exterior walls should be built with either a one-hour fire-resistant rated assembly or an ignition-resistant exterior surface. In contrast, the proposed amendment will necessitate exterior walls to be constructed with both a one-hour fire-resistant rated assembly and an ignition-resistant exterior surface where provisions of Section 603 (defensible space requirement) are not met.

WUIC36-24

Public Hearing Results (CAH1)

Errata: This proposal includes published errata https://www.iccsafe.org/wp-content/uploads/2024-Group-A-Consolidated-Monograph-Updates.pdf

Committee Action: **Disapproved**

Committee Reason: The committee stated that the reasons for disapproval of the proposal were: Concerns about the new proposed definition of exterior surfaces regarding weather-exposed surfaces. Specifically, that there are degrees of weather exposure including all sorts of different types of exposure including being subject to sun, rain, and moisture. There was also expressed concern about the 40-minute test requirement. (Vote: 13-0)

WUIC36-24

Individual Consideration Agenda

Comment 1:

IWUIC: SECTION 202, 504.5, 504.5.1, 504.5.2, 504.5.3

Proponents: Milad Shabanian, Insurance Institute for Buisness & Home Safety (mshabanian@ibhs.org); T. Eric Stafford, Insurance Institute for Business and Home Safety (testafford@charter.net) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Wildland Urban Interface Code

Delete without substitution:

~~**EXTERIOR SURFACES.** Weather-exposed surfaces.~~

~~**EXTERIOR WALL.** A wall, bearing or nonbearing, that is used as an enclosing wall for a building, other than a fire wall, and that has a slope of 60 degrees (1.05 rad) or greater with the horizontal plane.~~

504.5 Exterior walls. Where defensible space conforms to the provisions of Section 603, exterior walls of buildings or structures shall be constructed in accordance with Section 504.5.1 or Section 504.5.2.
Where defensible space does not conform to the provisions of Section 603, exterior walls of buildings or structures shall be constructed in accordance with Section 504.5.1 and Section 504.5.2.

Flashing shall be applied in accordance with Section 504.5.3.

Revise as follows:

504.5.1 Exterior wall assemblies. Exterior wall assemblies of buildings or structures shall have a minimum of 1-hour fire-resistance-rating, rated for exposure on the exterior side ~~in accordance with Section 501.3~~.
~~The exposed bottom edge of combustible sheathing shall be protected with noncombustible building material with a minimum assigned protection time of 40 minutes, or the sheathing shall be inset to rest directly on the foundation.~~

~~**Exception:** The bottom edge of exposed combustible sheathing is permitted to be covered with corrosion-resistant metal flashing provided there is an air gap of at least 1 inch between the metal flashing and the bottom edge of the combustible sheathing. Both legs of the flashing shall be attached a maximum of 6 inches (152.4 mm) on center.~~

504.5.2 Exterior wall covering ~~surfaces~~ . The exterior wall covering~~surfaces~~ shall be constructedwith *ignition-resistant building materials* in accordance with Section 503.2.

Exception: Exterior walls of heavy timber or log wall construction.

~~in accordance with one or more of the followings:~~

1. ~~Approved noncombustible materials complying with Section 503.2.1.~~
2. ~~Fire-retardant treated wood complying with Section 503.2.2.~~
3. ~~Ignition-resistant building materials complying with Section 503.2.4.~~

504.5.3 Flashing. A minimum of 6 inches (152 mm) of metal flashing or noncombustible material applied vertically on the exterior of the wall shall be installed at the ground, decking and roof intersections.

Reason: The primary objective of WUIC 36-24 is to address the performance of exterior walls against wildfire and direct flame exposure for buildings with and without the required defensible space. During the first committee action hearings, three key concerns were raised by the committee and opponents, which this comment aims to address.

- The first concern pertains to the definition of ‘exterior surfaces’ that was proposed to be added. Historically, the term has been used in Table 503.1 since 1997, and WUIC 36-24 sought to maintain consistency by using the same terminology. However, WUIC20-24, which was Approved as Modified during the first committee action hearings, changed to the the term to ‘exterior wall covering.’ Consequently, the proposed definition has been aligned with WUIC20-24.
- The second concern pertained requiring 40-minute protection for the exposed bottom edge of combustible sheathing on exterior walls. Although the proposed change contains language consistent with the International Building Code (IBC) and two option were provided, it was decided to remove this requirement with this comment. The plan is to collaborate with opponents and reintroduce it later.
- Lastly, an exception has been added specifically for heavy timber and log wall constructions to address concerns raised by the committee and others. This aligns the proposal with WUIC20-24, which exempts heavy timber and log wall construction from requiring noncombustible exterior wall coverings under the most severe wildfire conditions. Consequently, this comment ensures consistency in exterior wall requirements within IR1 and is consistent with WUIC20-24.

Cost Impact: Increase

Estimated Immediate Cost Impact:

This modification to the code will raise construction costs by introducing two stipulations for exterior walls.
According to research performed by IBHS and Headwaters Economics in 2022 [1], replacing a wooden composite cladding of a 1-hr fire rated wall assembly with fiber cement lap siding would increase the construction cost $1.38 per square foot in northern California. To attain a 1-hour fire-rated wall assembly for a wall constructed with noncombustible siding, the addition of 5/8-inch type X gypsum sheathing behind the siding is necessary, incurring an additional cost of approximately $0.40 per square foot.

[1] Headwaters Economics and Insurance Institute for Business & Home Safety, 2022, Construction costs for a wildfire-resistant home, California Edition. https://headwaterseconomics.org/wp-content/uploads/2022_HE_IBHS_WildfireConstruction.pdf

Estimated Immediate Cost Impact Justification (methodology and variables):

The existing code mandates that exterior walls should be built with either a one-hour fire-resistant rated assembly or an ignition-resistant exterior surface. In contrast, the proposed amendment will necessitate exterior walls to be constructed with both a one-hour fire-resistant rated assembly and an ignition-resistant exterior surface where provisions of Section 603 (defensible space requirement) are not met.

Comment (CAH2)# 54

WUIC37-24

IWUIC: 504.6

Proposed Change as Submitted

Proponents: Milad Shabanian, Insurance Institute for Business & Home Safety (mshabanian@ibhs.org); T. Eric Stafford, Insurance Institute for Business and Home Safety (testafford@charter.net)

2024 International Wildland Urban Interface Code

Revise as follows:

504.6 Underfloor enclosure. Buildings or structures shall have underfloor areas enclosed to the ground with exterior walls in accordance with Section 504.5. **Exception:**

1. Where defensible space conforms to the provisions of Section 603, complete ~~Complete~~ enclosure shall not be required where the underside of exposed floors and exposed structural columns, beams and supporting walls are constructed with one of the following: ~~protected as required for exterior 1-hour *fire-resistance-rated construction* or *heavy timber construction* or fire-retardant treated wood. The fire-retardant treated wood shall be labeled for exterior use and meet the requirements of Section 2303.2 of the International Building Code.~~

   1.1 Exterior 1-hour fire-resistance-rated construction.

   1.2. Noncombustible material.

   1.3. Heavy timber or log wall construction.

   1.4. Fire-retardant treated wood labeled for exterior use and meeting the requirements of Section 2303.2 of the International Building Code.

   1.5. Ignition-resistant building material on the exterior surface.

2. Where defensible space does not conform to the provisions of Section 603, complete enclosure shall not be required where the underside of exposed floors and exposed structural columns, beams and supporting walls are protected as required for exterior 1-hour fire-resistance-rated construction in accordance with Section 501.3 and the exterior surfaces of these assemblies are constructed with one of the following materials:

   2.1. Noncombustible material complying with Section 503.2.1

   2.2. Fire-retardant-treated wood complying with Section 503.2.2

   2.3. Ignition-resistant building materials complying with Section 503.2.4.

Reason: Table 503.1 requires the use of Ignition Resistant Construction Class 1 (IR1) in situations where defensible space is nonconforming. In such conditions, the structure may be exposed to embers, radiation heat, and direct flame contact during a wildfire. Accordingly, the underfloor area of the building needs to provide a minimum resistance against these exposures.

Currently, the exception in section 504.6 provides 3 alternatives for constructing the unenclosed underfloor areas of buildings:

1. Materials approved for not less than 1-hour fire-resistance-rated (FRR) construction on the exterior side.
2. Heavy timber construction
3. Fire-retardant treated wood.

These methods do not provide protection from flame spread during a wildfire. This proposal addresses this issue by creating two

exceptions addressing conditions with nonconforming defensible space and conditions with conforming defensible space.

For the nonconforming defensible space condition, this proposal requires the underside of exposed floors and exposed structural columns, beams and supporting walls to protected with 1-hour fire-resistant-rated construction and also protected on the exterior surfaces by ignition-resistant building materials complying with Section 503.2. This would provide protection from flame impingement and reduce rate of flame spread in areas where defensible space is nonconforming.

For the confirming defensible space condition, this proposal permits the use of the currently specified materials but expands the options to include noncombustible construction, log wall construction, and ignition resistant building materials on the exterior surface consistent with construction methods permitted by other areas in Section 504.

An additional inconsistency is that requirements for underfloor areas in the IWUIC are the same for IR1 and IR2. This is clearly a discrepancy as IR1 construction is required in conditions more severe than those requiring IR2 construction in Table 503.1. This proposed code change will increase the level of fire protection and provide a more logical and consistent level of performance for underfloor areas against fire impingement and flame spread for IR1 where defensible space is nonconforming by:

- Requiring a minimum of 1 hr. fire resistance rating to address fire impingement, and,
- Limiting the flame spread index of exterior surfaces to address flame spread to other areas of the building.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

This code change proposal may increase the construction cost only where the underfloor area height is enough to be usable and 1-hour rated columns or walls covered on the exterior with combustible materials having a flame spread index more than 25 when tested in accordance with ASTM E84 (Figure 1). In such a case, the siding material will need to be removed or replaced with an ignition-resistant building material (noncombustible, FRTW, IR material) having a flame spread index less than 25.

According to research performed by IBHS and Headwaters Economics in 2022 [1], replacing a wooden composite cladding with fiber cement lap siding would increase the construction cost $1.38 per square foot in northern California.

Estimated Immediate Cost Impact Justification (methodology and variables):

Public Hearing Results (CAH1)

Errata: This proposal includes published errata https://www.iccsafe.org/wp-content/uploads/2024-Group-A-Consolidated-Monograph-Updates.pdf

Committee Action: **Disapproved**

Committee Reason: The committee stated that the reason for the disapproval of the proposal was based upon the testimony of proponent that previous actions address the concerns this proposal was attempting trying to address. (Vote: 13-0)

WUIC37-24

Individual Consideration Agenda

Comment 1:

IWUIC: 504.6

Proponents: Milad Shabanian, Insurance Institute for Buisness & Home Safety (mshabanian@ibhs.org); T. Eric Stafford, Insurance Institute for Business and Home Safety (testafford@charter.net) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Wildland Urban Interface Code

Revise as follows:

504.6 Underfloor enclosure. Buildings or structures shall have underfloor areas enclosed to the ground with exterior walls in accordance with Section 504.5. **~~Exception~~ Exceptions:** ~~Complete enclosure shall not be required where the underside of exposed floors and exposed structural columns, beams and supporting walls are protected as required for exterior 1-hour *fire-resistance-rated construction* or *heavy timber construction* or fire-retardant-treated wood. The fire-retardant-treated wood shall be labeled for exterior use and meet the requirements of Section 2303.2 of the International Building Code.~~

1. Where defensible space conforms to the provisions of Section 603, complete enclosure shall not be required where the underside of exposed floors and exposed structural columns, beams and supporting walls are protected with 1-hour fire-resistance-rated construction or *ignition-resistant building materials* complying with Section 503.2 on the exterior side.
2. Where defensible space does not conform to the provisions of Section 603, complete enclosure shall not be required where the underside of exposed floors and exposed structural columns, beams and supporting walls are protected with 1-hour fire-resistance-rated construction and *ignition-resistant building materials* complying with Section 503.2 on the exterior side.
3. Complete enclosure shall not be required where the underside of exposed floors and exposed structural columns, beams and supporting walls are constructed with heavy timber or log wall construction.

Reason: WUIC 37-24 had three main objectives:

- Address the issue with direct flame contact in nonconforming defensible space conditions.
- Expand alternatives to include noncombustible construction, log wall construction, and ignition-resistant building materials.
- Differentiate underfloor enclosure requirements between IR1 and IR2. Although both provide similar wildfire protection, their risk profiles vary.

During CAH#1, the committee and opponents provided comments on WUIC36-24 which are also applicable to WUIC 37-24. This comment aligns WUIC37-24 with WUIC36-24-SHABANIAN-C1. During CAH#1, concerns were raised with WUIC36-24 regarding the proposed definition "exterior surfaces" and the lack of consideration for log wall construction. This comment ensures alignment between WUIC37-24 and WUIC36-24-SHABANIAN-C1. Specifically, it removes the proposed defintion of exterior surfaces and adds a new exception for heavy timber and log wall construction.

Cost Impact: Increase

Estimated Immediate Cost Impact:

$0 or more. This code change proposal may increase the construction cost only where the underfloor area height is enough to be usable and 1-hour rated columns or walls covered on the exterior with combustible materials having a flame spread index more than 25 when tested in accordance with ASTM E84 (Figure 1). In such a case, the siding material will need to be removed or replaced with an ignitionresistant building material (noncombustible, FRTW, IR material) having a flame spread index less than 25.

Estimated Immediate Cost Impact Justification (methodology and variables):

Comment (CAH2)# 55

WUIC39-24

IWUIC: 504.6, 505.5.1 (New), 505.6, 506.3 (New), 506.3, 504.5.1

Proposed Change as Submitted

Proponents: Milad Shabanian, Insurance Institute for Business & Home Safety (mshabanian@ibhs.org); T. Eric Stafford, Insurance Institute for Business and Home Safety (testafford@charter.net)

2024 International Wildland Urban Interface Code

Revise as follows:

504.6 Underfloor enclosure. Buildings or structures shall have underfloor areas enclosed to the ground with exterior walls in accordance with Section 504.5. **Exception:** Complete enclosure shall not be required where the underside of exposed floors and exposed structural columns, beams and supporting walls are protected as required for exterior 1-hour *fire-resistance-rated construction* or *heavy timber construction* or fire-retardant-treated wood. The fire-retardant-treated wood shall be labeled for exterior use and meet the requirements of Section 2303.2 of the International Building Code. A minimum of 6 inches of noncombustible material or metal flashing extending vertically from grade is required on the exterior of columns and walls.

Add new text as follows:

505.5.1 Flashing. A minimum of 6 inches of noncombustible material or metal flashing extending vertically is required on the exterior of the wall at the ground, decking and roof intersections.

Revise as follows:

505.6 Underfloor enclosure. Buildings or structures shall have underfloor areas enclosed to the ground, with exterior walls in accordance with Section 505.5. **Exception:** Complete enclosure shall not be required where the underside of exposed floors and exposed structural columns, beams and supporting walls are protected as required for exterior 1-hour *fire-resistance-rated construction* or *heavy timber construction* or fire-retardant-treated wood. The fire-retardant-treated wood shall be labeled for exterior use and meet the requirements of Section 2303.2 of the International Building Code. A minimum of 6 inches of noncombustible material or metal flashing extending vertically from grade is required on the exterior of columns and walls.

Add new text as follows:

506.3 Exterior walls. A minimum of 6 inches of noncombustible material or metal flashing extending vertically is required on the exterior of the wall at the ground, decking and roof intersections.

Revise as follows:

~~**506.3**~~ **506.4 Underfloor enclosure.** Buildings or structures shall have underfloor areas enclosed to the ground with exterior walls in accordance with Section 506.3. **Exception:** Complete enclosure shall not be required where the underside of exposed floors and exposed structural columns, beams and supporting walls are protected as required for exterior 1-hour *fire-resistance-rated construction*, fire-retardant-treated wood or *heavy timber construction*. Fire-retardant-treated wood shall be labeled for exterior use and meet the requirements of Section 2303.2 of the International Building Code. A minimum of 6 inches of noncombustible material or metal flashing extending vertically from grade is required on the exterior of columns and walls.

504.5.1 Flashing. A minimum of 6 inches (152 mm) of ~~metal flashing or~~ noncombustible material or metal flashing extending~~applied~~ vertically is required on the exterior of the wall ~~shall be installed~~ at the ground, decking and roof intersections.

Reason: In the 2024 IWUIC, a new section was added to Class 1 ignition resistant construction (IR1) that requires a minimum of 6 inches of metal flashing or noncombustible material applied vertically on the exterior of the wall at the ground, decking and roof

intersections. In a wildfire event, buildings are threatened by at least one of the three fundamental wildfire exposures: embers, radiant heat, or direct flame contact. Of these exposures, ember exposure stands out as a prevalent cause of building ignition. Embers, propelled for miles by the wind, can penetrate small openings and accumulate around buildings, particularly where combustible debris is also present (Figure1).

Figure 1. 6-in noncombustible vertical clearance worked as fuel break at the base of exterior walls in Lahaina wildfire. Photo credit: Steve Hawks, IBHS.

Therefore, this proposal will add protection against embers for all structures in wildfire-prone areas by expanding ember protection requirements in IR1 and adding ember protection for IR2 and IR3. Figure 2 shows a 6-in noncombustible vertical clearance at the base of exterior walls and underfloor columns.

a b

Figure 2. 6-in Noncombustible vertical clearance at the base of exterior walls and underfloor area columns: a. Lahaina Fire 2023 (Photo curtesy Milad Shabanion, IBHS), b. Glass Fire 2020 (Photo curtesy Steve Hawks, IBHS).

The objective of this proposal is to enhance the resilience of buildings in wildfire-prone regions against embers by requiring a 6-inch noncombustible vertical clearance on exterior walls for all ignition resistant construction classes where they intersect with horizontal surfaces such as the ground, decks, and roof assemblies.

This code change intends to improve the protection of a vertical surface where the vertical surface intersects with a horizontal surface. The intersection of a vertical and horizontal surface is a known area where debris tends to accumulate and where embers tend to accumulate during a wildfire. The combination of accumulated debris and embers can ignite the debris, enabling the fire to spread to the vertical surface. The first part of this proposal adds a minimum 6 inches of noncombustible flashing on the exterior walls of Ignition-Resistant Class 2 and 3 constructions at points where exterior walls intersect with horizontal surfaces. The remainder of this proposal extends an equivalent level of ember-resistance to exposed columns and vertical members within unenclosed underfloor areas across all three classes of ignition-resistant construction.

Section 504.5.1 is proposed to be revised to match the language proposed for Sections 504.6, 505.5.1, 505.6, 506.3 and 506.4 and to

provide some clarity. As currently written, Section 504.5.1 could be interpreted to require metal flashing or noncombustible materials on a noncombustible wall such as a concrete or masonry wall. This clearly was not the intent of the original language. The revised language is intended to clarify this.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

This code change may increase the construction cost only where the exterior walls intersect with unenclosed projections such as attached decks, balconies, and roofs such as dormers.

Estimated Immediate Cost Impact Justification (methodology and variables):

The noncombustible flashing that needs to be installed instead of exterior siding material in these cases may be cheaper or more expensive than the siding material considering the range of flashing products available in the market. But in general the cost increase will not be significant. A review of common retailers websites indicates that the cost of 6 inch wide metal flashing varies according to the quantity purchased. Galvanized steel metal flashing that is 6 inches wide costs approximately $24.24 for a 50 foot length. This is approximately $0.48 per foot of material. Labor and fastener costs are estimated to be minimal.

WUIC39-24

Public Hearing Results (CAH1)

Committee Action: **As Submitted**

Committee Reason: The committee stated that the reason for the approval of the proposal was that it necessary to work out how the specified material or flashing is to be installed in the locations listed and it is a minimal cost worthwhile detailed addition. (Vote: 11-2)

WUIC39-24

Individual Consideration Agenda

Comment 1:

IWUIC: 504.5.1, 505.5.1, 506.3

Proponents: Gary J Ehrlich, NAHB, NAHB (gehrlich@nahb.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Wildland Urban Interface Code

Revise as follows:

504.5.1 Flashing. A minimum of 6 inches (152 mm) of noncombustible material or metal flashing extending vertically is required on the exterior of the wall at the ground, decking and roof intersections. Flashing provided in accordance with this section shall be lapped with flashing, counterflashing, or water-resistive barriers as required by the *International Building Code* or *International Residential Code*.

505.5.1 Flashing. A minimum of 6 inches of noncombustible material or metal flashing extending vertically is required on the exterior of the wall at the ground, decking and roof intersections. Flashing provided in accordance with this section shall be lapped with flashing,

counterflashing, or water-resistive barriers as required by the *International Building Code* or *International Residential Code*.

506.3 Exterior walls. A minimum of 6 inches of noncombustible material or metal flashing extending vertically is required on the exterior of the wall at the ground, decking and roof intersections. Flashing provided in accordance with this section shall be lapped with flashing, counterflashing, or water-resistive barriers as required by the *International Building Code* or *International Residential Code.*

Reason: The purpose of this committee comment is to insure any flashing added against the face of an exterior wall at a deck or other projection to comply with this section is properly integrated with flashing and water-resistive barrier materials provided in accordance with the IBC and IRC for moisture protection. Taken literally, the existing language added to the 2024 IWUIC for Class 1 construction, and the proposed language for Class 2 and 3 construction, could lead a builder or contractor to simply install a section of metal flashing or other non-combustible flashing material directly against the face of an exterior wall at a deck or roof intersection and think they are done. While this will provide the desired protection against embers landing on the deck or lower roof, it creates a "reverse shingle" condition that could allow moisture (e.g., from heavy rainfall) to wick down behind the flashing, reach wood framing components, and cause decay that could compromise structural performance. This comment adds language highlighting the need to integrate flashing used for ember protection with other flashing, counterflashing, or water-resistive barriers required at deck, roof and wall intersections for moisture protection. This could be accomplished by providing counterflashing behind the siding that laps over the exterior flashing provided for ember protection or extending a portion of the water-resistive barrier material to lap over the exterior flashing. If necessary, the counterflashing or WRB material can also be ignition-resistant or non-combustible material, or the flashing required by this section can extend through the flashing and the proper lapping accomplished behind the wall cladding.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The IBC and IRC already require flashing at exterior wall intersections with roofs, chimneys, porches, decks, balconies and similar projections, or other locations where moisture can enter a wall. Further, the IRC explicitly requires flashing to be installed "shingle fashion", specifies details for integration of WRB's and counterflashing with deck ledger flashing, and provides for counterflashing at roof sidewalls. Therefore, this comment simply provides clarification regarding practices already necessary for compliance with the IBC and IRC.

Comment (CAH2)# 233

WUIC42-24

IWUIC: 504.7, 505.7

Proposed Change as Submitted

Proponents: Edward Lisinski, American Wood Council (elisinski@awc.org); Jason Smart, American Wood Council (jsmart@awc.org)

2024 International Wildland Urban Interface Code

Revise as follows:

504.7 Appendages and projections. *Unenclosed accessory structures* attached to buildings with habitable spaces and projections, such as decks, shall be ~~not less than 1-hour fire-resistance-rated construction, *heavy timber construction* or~~ constructed of one of the following:

1. 1-hour *fire-resistance-rated construction.*
2. *Heavy timber construction.*
3. ~~1.~~ *Approved noncombustible* materials.
4. ~~2.~~ Fire-retardant-treated wood identified for exterior use and meeting the requirements of Section 2303.2 of the International Building Code.
5. ~~3.~~ Ignition-resistant building materials in accordance with Section 503.2. **Exception:** Coated materials shall not be used as the walking surface of decks.
6. Any materials permitted by code where all exterior walls to which the *unenclosed accessory structure* is attached have a 1-hour fire-resistance rating, rated for exposure to fire from the exterior side, and have ignition-resistant materials complying with Section 503.2 on the exterior side.

505.7 Appendages and projections. *Unenclosed accessory structures* attached to buildings with habitable spaces and projections, such as decks, shall be ~~not less than 1-hour *fire-resistance-rated construction*, *heavy timber construction* or~~ constructed of one of the following:

1. 1-hour *fire-resistance-rated construction.*
2. *Heavy timber construction.*
3. ~~1.~~ *Approved noncombustible* materials.
4. ~~2.~~ Fire-retardant-treated wood identified for exterior use and meeting the requirements of Section 2303.2 of the International Building Code.
5. ~~3.~~ Ignition-resistant building materials in accordance with Section 503.2. **Exception:** Coated materials shall not be used as the walking surface of decks.
6. Any materials permitted by code where all exterior walls to which the *unenclosed accessory structure* is attached have a 1-hour fire-resistance rating, rated for exposure to fire from the exterior side, and have ignition-resistant materials complying with Section 503.2 on the exterior side.

Reason: The two options currently listed in the charging language of Sections 504.7 and 505.7 for appendages and projections are moved down into the existing list of other options. An additional option is added to the requirements for unenclosed accessory structures, such as decks, in Class 1 and Class 2 ignition-resistant construction. This additional option allows for unenclosed accessory structures to be constructed of any materials permitted by code where the exterior walls, to which the unenclosed accessory structures are attached, comply with enhanced fire protection requirements. These enhanced fire protection requirements for exterior walls require both a 1-hour fire-resistance rating and use of ignition-resistant materials on the exterior side. These requirements are more stringent than current exterior wall requirements in Class 1 ignition-resistant construction, which is permitted to be used where defensible space provisions of Section 603 are not met. This option for enhanced protection of the adjacent exterior walls will help prevent entry of fire into the building in the event of ignition of the unenclosed accessory structure, such as decks.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

$0 or less. There could be a cost decrease for some buildings.

Estimated Immediate Cost Impact Justification (methodology and variables):

The proposal provides one additional option for compliance (Item 6). This new option allows for more cost-effective deck construction in cases where exterior walls meet enhanced fire protection requirements. The other existing provisions and options currently allowed in 504.7 and 505.7 remain functionally unchanged.

WUIC42-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee stated that the reasons for the disapproval of the proposal were: It is premature to add this option if there is a standard under development. It would be good for that standard to be developed and testing to be done to see how the deck would affect the exterior wall. Also, the need to address the exterior glazing, vents, and door openings. (Vote: 12-1)

WUIC42-24

Individual Consideration Agenda

Comment 1:

IWUIC: 504.7, 505.7

Proponents: Edward Lisinski, American Wood Council (elisinski@awc.org); Jason Smart, American Wood Council (jsmart@awc.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Wildland Urban Interface Code

504.7 Appendages and projections. *Unenclosed accessory structures* attached to buildings with habitable spaces and projections, such as decks, shall be constructed of one of the following:

1. 1-hour *fire-resistance-rated construction*.
2. *Heavy timber construction*.
3. *Approved noncombustible* materials.
4. Fire-retardant-treated wood identified for exterior use and meeting the requirements of Section 2303.2 of the International Building Code.
5. Ignition-resistant building materials in accordance with Section 503.2. **Exception:** Coated materials shall not be used as the walking surface of decks.

6. Any materials permitted by code where ~~all~~ exterior walls ~~to which the *unenclosed accessory structure* is attached have a 1-hour fire-resistance rating, rated for exposure to fire from the exterior side, and have ignition-resistant materials complying with Section 503.2 on the exterior side.~~ within five feet (5') horizontally from the unenclosed accessory structure or projection comply with the following.

   6.1. Exterior walls are 1-hour fire-resistance rated, rated for exposure to fire from the exterior side;

   6.2. Exterior walls are constructed of ignition-resistant materials complying with Section 503.2 on the exterior side;

   6.3. Glazing in such exterior walls have a fire-protection rating of not less than 45 minutes, rated for exposure to fire from the exterior side;

   6.4. Doors in such exterior walls have a fire-protection rating of not less than 45 minutes, rated for exposure to fire from the exterior side;

   6.5. Vents in such exterior walls comply with the performance requirements of Section 504.10.1; and

   6.6. Eaves and soffits in such exterior walls comply with the requirements of Section 504.3.

505.7 Appendages and projections. *Unenclosed accessory structures* attached to buildings with habitable spaces and projections, such as decks, shall be constructed of one of the following:

1. 1-hour *fire-resistance-rated construction*.
2. *Heavy timber construction*.
3. *Approved noncombustible* materials.
4. Fire-retardant-treated wood identified for exterior use and meeting the requirements of Section 2303.2 of the International Building Code.
5. Ignition-resistant building materials in accordance with Section 503.2. **Exception:** Coated materials shall not be used as the walking surface of decks.
6. Any materials permitted by code where ~~all~~ exterior walls ~~to which the *unenclosed accessory structure* is attached have a 1-hour fire-resistance rating, rated for exposure to fire from the exterior side, and have ignition-resistant materials complying with Section 503.2 on the exterior side.~~ within five feet (5') horizontally from the unenclosed accessory structure or projection comply with the following.

   6.1. Exterior walls are 1-hour fire-resistance rated, rated for exposure to fire from the exterior side;

   6.2. Exterior walls are constructed of ignition-resistant materials complying with Section 503.2 on the exterior side;

   6.3. Glazing in such exterior walls have a fire-protection rating of not less than 45 minutes, rated for exposure to fire from the exterior side;

   6.4. Doors in such exterior walls have a fire-protection rating of not less than 45 minutes, rated for exposure to fire from the exterior side;

   6.5. Vents in such exterior walls comply with the performance requirements of Section 505.10.1; and

   6.6. Eaves and soffits in such exterior walls comply with the requirements of Section 504.3.

Reason: This proposal has been updated to incorporate feedback from the committee and opposing testimonies regarding the need for additional protection of the structure. New provisions have been included to enhance fire-protection measures of windows, doors, soffits and eaves in the adjacent wall(s), as well as an extension of these fire-protection measures for a specified distance beyond the edge of the deck. Note that the fire-protection rating of the windows and doors were increased to 45 minutes of protection, instead of 20 minutes that are required in other places in the IWUIC. This corresponds with fire-protection ratings required for windows and doors in one-hour fire-resistance-rated exterior wall assemblies in accordance with IBC Section 716. Also, the other options in Section 504.8 (and 505.8) for tempered glazing, multiple layered glazing panels, and glass block are not mentioned here because they are not tied to a performance

requirement. This is the same reason why the options for noncombustible doors or solid core wood doors found in 504.9 (and 505.9) have been removed.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

$0

Estimated Immediate Cost Impact Justification (methodology and variables):

The proposal provides one additional option for compliance with unenclosed accessory structures attached to buildings. Because this is just one option out of six, if a designer or builder chooses not to use this option, there would be no cost of construction change. However, if a designer or builder does choose to use this option, depending on the existing fire protection measures of the building, it could increase the cost of some buildings.

Comment (CAH2)# 113

WUIC44-24

IWUIC: 504.7.1, 505.7.1, 506.6 (New), 506.6.1 (New)

Proposed Change as Submitted

Proponents: Milad Shabanian, Insurance Institute for Business & Home Safety (mshabanian@ibhs.org); T. Eric Stafford, Insurance Institute for Business and Home Safety (testafford@charter.net)

2024 International Wildland Urban Interface Code

Revise as follows:

504.7.1 Underfloor areas. ~~Where the attached structure is located and constructed so that the structure or any portion thereof projects over a descending slope surface greater than 10 percent, the area below the structure shall have underfloor areas enclosed to within 6 inches (152 mm) of the ground, with exterior wall construction in accordance with Section 504.5.~~
Unenclosed accessory structures and projections attached to buildings with habitable spaces shall have underfloor areas enclosed to the ground with exterior wall construction in accordance with Section 504.5. **Exception:** Complete enclosure shall not be required where the underside of exposed floors and exposed structural columns, beams and supporting walls are constructed in accordance with Section 504.7 and a minimum of 6 inches of metal flashing or noncombustible material applied vertically on the exterior of the vertically aligned structural elements such as columns and supporting walls at the ground.

505.7.1 Underfloor areas. ~~Where the attached structure is located and constructed so that the structure or any portion thereof projects over a descending slope surface greater than 10 percent, the area below the structure shall have underfloor areas enclosed to within 6 inches (152 mm) of the ground, with exterior wall construction in accordance with Section 505.5.~~Unenclosed accessory structures and projections attached to buildings with habitable spaces shall have underfloor areas enclosed to the ground with one of the following methods:

1. Exterior wall construction in accordance with Section 505.5.

2. Noncombustible corrosion-resistant mesh with openings not to exceed 1/8 inch (3.2 mm).

Exception: Complete enclosure shall not be required where the underside of exposed floors and exposed structural columns, beams and supporting walls are constructed in accordance with Section 505.7 and a minimum of 6 inches of metal flashing or noncombustible material applied vertically on the exterior of the vertically aligned structural elements such as columns and supporting walls at the ground.

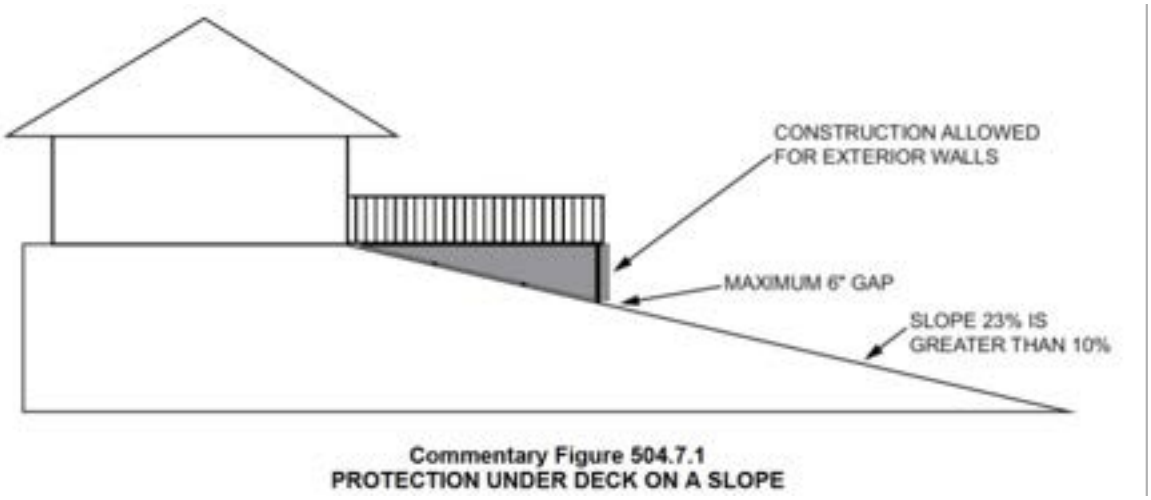
Add new text as follows:

506.6 Appendages and projections. The underfloor areas of unenclosed accessory structures and projections, such as decks, balconies, porches, and stairs attached to buildings with habitable spaces shall be constructed in accordance with Section 506.6.1

506.6.1 Underfloor areas. Unenclosed accessory structures and projections attached to buildings with habitable spaces shall have underfloor areas enclosed to the ground with noncombustible corrosion-resistant mesh with openings not to exceed 1/8 inch (3.2 mm). **Exception:** Complete enclosure shall not be required where a minimum of 6 inches of metal flashing or noncombustible material applied vertically on the exterior of columns and supporting walls at the ground.

Reason: Figure 1 clarifies the intention of sections 504.7.1 and 505.7.1. There are 4 concerns surrounding the current requirements of the IWUIC regarding the construction of an underfloor area of attached accessory structures.
First, there is no scientific reason to support the slope limitations provided in these sections. All structures, their attached accessory structures, detached accessory structures and their underfloor areas are exposed to at least one of the wildfire exposures. As it is well studied, wildfires can threaten buildings through three different exposures: embers, radiation heat, and direct flame contact. Excluding the underfloor area of attached accessory structures located on a surface with a slope less than 10 percent will result in excluding many balconies, decks, stairs, and other attached accessory structures constructed on flat surfaces. The code requirements should not

differentiate between underfloor areas of building and attached structures. This is also against the requirements provided in the California Building Code (Chapter 7A, Section 707.9A).



Commentary Figure 504.7.1
PROTECTION UNDER DECK ON A SLOPE

Figure 1. 6-in gap at the ground level (IWUIC Commentary).

Second, technical concerns around having a 6-in opening at the base of walls. Currently, the code requires the underfloor areas of attached accessory structures to be fully enclosed to within 6 inches (152 mm) of the ground (Figure 1). The 6-in opening seems to be required for water irrigation purposes. However, this requirement does not align well with provided construction methods for attached accessory structures.

According to sections 504.7 and 505.7, appendages and projections shall be constructed with one of the following alternatives:

1. 1-hour fire-resistant construction.
2. Heavy timber construction.
3. Approved noncombustible materials.
4. Fire-retardant-treated wood.
5. Ignition-resistant building materials in accordance with section 503.2.

In a 1-hour fire-resistant floor assembly, the fire shall not pass the floor assembly for at least 1 hour during ASTM E119 or UL 263 fire test. Consequently, water intrusion through the floor system is not possible.

In heavy timber construction, based on the definition (Figure 2) from IBC, “the exterior walls are of noncombustible materials” with some exceptions.

602.4.4 Type IV-HT. Type IV-HT (Heavy Timber) construction is that type of construction in which the exterior walls are of noncombustible materials and the interior building elements are of solid wood, laminated heavy timber or structural composite lumber (SCL), without concealed spaces or with concealed spaces complying with Section 602.4.4.3. The minimum dimensions for permitted materials including solid timber, glued-laminated timber, SCL and cross-laminated timber (CLT) and the details of Type IV construction shall comply with the provisions of this section and Section 2304.11. Exterior walls complying with Section 602.4.4.1 or 602.4.4.2 shall be permitted. Interior walls and partitions not less than 1- hour fire-resistance rated or heavy timber conforming with Section 2304.11.2.2 shall be permitted.

Figure 2. IBC requirements for Heavy Timber (HT) construction.

Figure 3 provides examples of attached accessory structure constructed with noncombustible materials. It is evident that building a noncombustible attached accessory structure with maximum 6-in gap at the base is unnecessary and impractical in many cases. IWUIC provides an exception for underfloor areas of buildings and detached accessory structures while missing a similar requirement for attached accessory structures. In many instances such as examples provided in Figure 3, attached accessory structures are required to have unenclosed underfloor areas and having an exception is unavoidable.

Figure 3. Unenclosed and enclosed attached accessory structure nonconforming with current requirements.

In addition, there is a safety concern about having a 6-in gap at the base during a wildfire. Combustible debris and embers can both collect in corners and around the building where exterior walls intersect with horizontal surfaces (Figure 4). IBHS research shows that protecting these areas with noncombustible materials can protect the building from ignitions caused by embers. Leaving a gap at the base of exterior walls of attached accessory structures will increase the chance of combustible debris and ember accumulation under the deck area.

Figure 4. Ember accumulation around a building, IBHS Research Center.

Finally, the IWUIC provides identical requirements for construction of underfloor areas of attached accessory structures in IR1 and IR2. On the other hand, the IWUIC does not address this known vulnerability in IR3. All buildings located in wildfire prone areas need to be always protected against ember exposure.

This code change proposal intends to address these concerns by revising the requirements in sections 504.7.1 and 505.7.1 and adding a new section forIR3.

Section 504.7.1 revised to:

- Eliminate the slope limitation.
- Eliminate the 6-in opening at the base.

- Add exception for unenclosed underfloor areas.
- Add a 6-in noncombustible flashing requirement to columns and walls of unenclosed underfloor areas.

Section 505.7.1 revised to:

- Eliminate the slope limitation.
- Eliminate the 6-in gap at the base.
- Provide additional alternative (1/8-in noncombustible mesh) for protection of underfloor areas to make it less restrictive than IR Class 1.
- Add exception for unenclosed underfloor areas.
- Add a 6-in noncombustible flashing requirement to columns and walls of unenclosed underfloor areas.

New section added to IR Class 3 to:

- Add a 1/8-in noncombustible screen mesh protection for underfloor areas to make it ember-resistant with less restrictive requirements than IR Class 1 and 2.
- Add exception for unenclosed underfloor areas.
- Add a 6-in noncombustible flashing requirement to columns and walls of unenclosed underfloor areas to make unenclosed underfloor areas ember-resistant.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

This code change proposal will increase the construction cost where it expands the scope of these sections through eliminating the limitation of the ground slope. However, the code change will reduce construction costs by proposing exceptions for unenclosed underfloor areas. It will also increase the construction cost in IR Class 3 construction where the code change will mandate additional requirements for protecting underfloor areas with 1/8-in noncombustible mesh screen or 6-in metal flashing.

According to research performed by IBHS and Headwaters Economics in 2022 [1], constructing an unenclosed underfloor area with a wall constructed with noncombustible cement board siding instead of a wall with wooden composite siding will increase the construction cost $1.38 per square foot.

Estimated Immediate Cost Impact Justification (methodology and variables):

Public Hearing Results (CAH1)

Errata: This proposal includes published errata https://www.iccsafe.org/wp-content/uploads/2024-Group-A-Consolidated-Monograph-Updates.pdf

Committee Action: **As Submitted**

Committee Reason: The committee stated that the reasons for the approval of the proposals were: It is expanding options versus being more restrictive and because of that, it provides more options for the design. Additionally, it was noted that it is supported with the data provided. (Vote: 8-4)

WUIC44-24

Individual Consideration Agenda

Comment 1:

IWUIC: 504.7.1, 505.7.1, 506.6.1

Proponents: Gary J Ehrlich, NAHB, NAHB (gehrlich@nahb.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Wildland Urban Interface Code

Revise as follows:

504.7.1 Underfloor areas. Unenclosed accessory structures and projections attached to buildings with habitable spaces shall have underfloor areas enclosed to the ground with materials permitted for exterior wall construction in accordance with Section 504.5. **Exception:** Complete enclosure shall not be required where the underside of exposed floors and exposed structural columns, beams and supporting walls are constructed in accordance with Section 504.7 and a minimum of 6 inches of ~~metal flashing or~~ noncombustible material or metal flashing extending ~~applied~~ vertically from grade is provided on the exterior of ~~the vertically aligned structural elements such as~~ supporting columns and ~~supporting~~ walls ~~at the ground~~.

505.7.1 Underfloor areas. Unenclosed accessory structures and projections attached to buildings with habitable spaces shall have underfloor areas enclosed to the ground with one of the following methods:

1. Materials permitted for exterior ~~Exterior~~ wall construction in accordance with Section 505.5.

2. Noncombustible corrosion-resistant mesh with openings not to exceed 1/8 inch (3.2 mm).

Exception: Complete enclosure shall not be required where the underside of exposed floors and exposed structural columns, beams and supporting walls are constructed in accordance with Section 505.7 and a minimum of 6 inches of ~~metal flashing or~~ noncombustible material or metal flashing extending ~~applied~~ vertically from grade is provided on the exterior of ~~the vertically aligned structural elements such as~~ supporting columns and ~~supporting~~ walls ~~at the ground~~.

506.6.1 Underfloor areas. Unenclosed accessory structures and projections attached to buildings with habitable spaces shall have underfloor areas enclosed to the ground with noncombustible corrosion-resistant mesh with openings not to exceed 1/8 inch (3.2 mm).

Exception: Complete enclosure shall not be required where a minimum of 6 inches of ~~metal flashing or~~ noncombustible material or metal flashing extending ~~applied~~ vertically from grade is provided on the exterior of supporting columns and ~~supporting~~ walls ~~at the ground~~.

Reason: The existing language of Sections 504.7.1 and 505.7.1, and the revised language in Section 504.7.1 and Item #1 under 505.7.1, require the underfloor space to be enclosed with exterior wall construction complying with 504.5 or 505.5, as applicable. The use of the term “exterior wall” can be taken literally to mean the underfloor space shall be enclosed with exterior wall assemblies that not only comply with the IWUIC’s requirements for using materials or methods of construction that provide ignition and fire resistance, but also need to meet structural requirements for out-of-plane wind loads and lateral wind and seismic resistance through shear walls or wall bracing, weather protection requirements (i.e., water-resistive barriers and flashing), and energy code requirements for insulation and air barriers. The cost and design implications of providing a complete enclosure for these underfloor areas that essentially makes them occupiable or habitable spaces is considerable.Note also if the underfloor areas affected by this proposal are completely enclosed and of a size and height that could be converted to habitable space, some jurisdictions may count the area as part of the total square footage for property tax assessment purposes, thus increasing the homeowner’s tax burden (and monthly cost to a tenant if the property is rented) even more than would occur simply due to the higher cost of construction to comply with IWUIC requirements.This comment follows the lead of the current IWUIC commentary for the existing requirements, which refer to enclosing the underfloor area with “materials allowed for exterior wall construction.” This is very different than calling the resulting enclosure an “exterior wall” and would not necessarily lead a designer, builder, or code official to apply all of the requirements consistent with an exterior wall.This comment also revises the requirements for 6” of noncombustible material or metal flashing to align with the language used for similar requirements in WUIC39-24. The key difference is removing the language specifying the material be “applied vertically on the exterior”, which could be interpreted to require 6” of metal flashing or other noncombustible material be applied over a column or wall that is already constructed of noncombustible material.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

This comment will decrease the cost of construction relative to the original proposal

Estimated Immediate Cost Impact Justification (methodology and variables):

This comment will decrease the cost of construction relative to the original proposal as it will provide for enclosing spaces below decks, stairs, porches and other accessory structures or projecting elements in a manner that will protect against ember intrusion and radiant heat but not create an enclosure that building officials may also require incorporate lateral structural resistance, protection against moisture intrusion and vapor drive, and even insulation and air barriers.

Comment (CAH2)# 301

Comment 2:

IWUIC: 504.7.1, 505.7.1, 506.6.1

Proponents: Gary J Ehrlich, NAHB, NAHB (gehrlich@nahb.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Wildland Urban Interface Code

Revise as follows:

504.7.1 Underfloor areas. Unenclosed accessory structures and projections attached to buildings with habitable spaces shall have underfloor areas enclosed to the ground with exterior wall construction in accordance with Section 504.5. **Exception:** Complete enclosure shall not be required where the underside of exposed floors and exposed structural columns, beams and supporting walls are constructed in accordance with Section 504.7 and vertically aligned structural elements at grade such as columns and supporting walls are protected with a minimum of 6 inches of metal flashing or noncombustible material applied vertically on the exterior at grade ~~of the vertically aligned structural elements such as columns and supporting walls at the ground~~.

505.7.1 Underfloor areas. Unenclosed accessory structures and projections attached to buildings with habitable spaces shall have underfloor areas enclosed to the ground with one of the following methods:

1. Exterior wall construction in accordance with Section 505.5.

2. Noncombustible corrosion-resistant mesh with openings not to exceed 1/8 inch (3.2 mm).

Exception: Complete enclosure shall not be required where the underside of exposed floors and exposed structural columns, beams and supporting walls are constructed in accordance with Section 505.7 and vertically aligned structural elements at grade such as columns and supporting walls are protected with a minimum of 6 inches of metal flashing or noncombustible material applied vertically on the exterior at grade. ~~of the vertically aligned structural elements such as columns and supporting walls at the ground.~~

506.6.1 Underfloor areas. Unenclosed accessory structures and projections attached to buildings with habitable spaces shall have underfloor areas enclosed to the ground with noncombustible corrosion-resistant mesh with openings not to exceed 1/8 inch (3.2 mm).

Exception: Complete enclosure shall not be required where vertically aligned exposed structural elements such as columns and supporting walls are protected with a minimum of 6 inches of metal flashing or noncombustible material applied vertically on the exterior at grade. ~~of columns and supporting walls at the ground.~~

Reason: The purpose of this committee comment is to address an issue with the construction of balconies created by WUIC43 including

them in the list of elements considered to be accessory structures or projections with underfloor areas that need to be regulated by 504.7, 505.6 and 506.6 and also by this proposal. The exception as currently written can be interpreted to apply only if an accessory structure or projection is supported on exposed columns or walls. Otherwise, enclosure to grade is required.

However, balconies are cantilevered from the structure of the building they are associated with and do not have exposed supporting columns or walls outside the exterior walls of the building. Thus, one could interpret a balcony two or more stories above grade would have to be enclosed all the way down to grade. Besides the significant cost implications of doing so, this doesn't make sense even from a wildfire mitigation perspective. Being a structurally cantilevered element, the extent that a balcony can project from the face of a building is self-limiting, thus the ability of heat or embers to be trapped below a balcony is limited.

This comment revises the language addressing the need for exposed supporting columns and walls at grade to consist of noncombustible materials for the first 6 inches above grade or be protected with noncombustible flashing for the first six inches to clarify that part of the exception only applies if such elements exist. Otherwise, a balcony would still need to be constructed of fire-rated construction, heavy timber, noncombustible materials, fire-retardant-treated wood or other ignition-resistant materials.

Cost Impact: Increase

Estimated Immediate Cost Impact:

The original proposal as modified by this committee comment will increase the cost of construction.

Estimated Immediate Cost Impact Justification (methodology and variables):

The proposal as modified by this committee comment will still increase the cost of construction for unenclosed accessory structures connected to buildings with habitable space and projections that are supported by exposed columns or walls at grade and would either need to be enclosed by exterior walls complying with IWUIC requirements or have the bottom 6" of exposed columns and walls be noncombustible material or protected with 6 inches of noncombustible flashing. But with the comment, balconies on a multifamily building (or other building) would not need to be enclosed all the way down to grade, which could be many floors worth of enclosure.

Comment (CAH2)# 554

Comment 3:

IWUIC: 504.7.1, 504.7.1.1 (New), 504.7.1.2 (New), 505.7.1, 506.6, 506.6.1

Proponents: Jonathan Humble, Jonathan Humble, FAIA, LLC, National Multi-Family Housing Council (festeel@att.net) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Wildland Urban Interface Code

504.7.1 Underfloor areas. *Unenclosed accessory structures* and projections attached to buildings with habitable spaces shall ~~have underfloor areas enclosed to the ground with exterior wall construction in accordance with Section 504.5.~~ be constructed in accordance with 504.7.1.1 or 504.7.1.2.

Exception: ~~Complete enclosure shall not be required where the underside of exposed floors and~~ Walls shall not be required for *accessory structures* and projections whose exposed structural columns, beams and supporting walls are constructed of fire-retardant-treated wood or ignition resistant building materials ~~in accordance with Section 504.7 and~~ that include a minimum of 6 inches (152 mm) of metal flashing or noncombustible material applied vertically on the exterior of the vertically aligned structural elements such as columns and supporting walls at the ground.

Add new text as follows:

504.7.1.1 Accessory structures and projections near grade . *Unenclosed accessory structures* and projections attached to buildings

with habitable spaces, that are less than 80 inches (2,032 mm) measured from the deck, floor, or landing framing underside to any point to the grade below, including accessory stairs or ramps and intermediate landings, shall be constructed in accordance with one or more of the following:

1. *Accessory structures* or projections constructed of approved *noncombustible* building materials in accordance with Section 503.2.1, with noncombustible ground cover installed at grade below the *accessory structure* or projection.
2. From the deck, floor or landing the accessory structure or projection shall be enclosed with walls constructed in accordance with Section 504.5 down to grade.

504.7.1.2 Accessory structures and projections above other accessory structures and projections. *Unenclosed* a*ccessory structures* and projections attached to buildings with habitable spaces, that are 80 inches (2,032 mm) or greater measured from the deck, floor, or landing underside framing to another deck, floor, or landing surface below or to the grade below, shall be constructed in accordance with one or more of the following:

1. Constructed of *noncombustible* building materials in accordance with Section 503.2.1,
2. Constructed of *ignition-resistant building material*s in accordance with Section 503.2.4.

505.7.1 Underfloor areas. *Unenclosed accessory structures* and projections attached to buildings with habitable spaces shall ~~have underfloor areas enclosed to the ground with one of the following methods:~~ be constructed in accordance with Section 504.7.1.

~~1. Exterior wall constructed in accordance with Section 505.5.~~
~~2. Constructed of ignition-resistant building material in accordance with 503.2.4.~~

Exception: ~~Complete enclosure shall not be required where the underside of exposed floors and~~ Walls shall not be required for accessory structures or projections whose exposed structural columns, beams and supporting walls are constructed of fire-retardant-treated wood or ignition resistant building materials ~~in accordance with Section 505.7 and~~ that include a minimum of 6 inches (152 mm) of metal flashing or noncombustible material applied vertically on the exterior of the vertically aligned structural elements such as columns and supporting walls at the ground.

506.6 Appendages and projections. The underfloor areas of *unenclosed accessory structures* and projections, such as decks, balconies, porches, and stairs attached to buildings with habitable spaces shall be constructed in accordance with Section 506.6.1 or 504.7.1.

506.6.1 Underfloor areas. Unenclosed accessory structures and projections attached to buildings with habitable spaces shall have underfloor areas enclosed to the ground with noncombustible corrosion-resistant mesh with openings not to exceed 1/8 inch (3.2 mm).

Exception: Complete enclosure shall not be required where a minimum of 6 inches of metal flashing or noncombustible material applied vertically on the exterior of columns and supporting walls at the ground.

Reason: The original proposal WUI44-24 changed the requirements from a fire mitigation protection requirement (Radiant heat and fire) to a requirement designed to mitigate the impact of burning embers to unenclosed accessory structures and projections by establishing requirements for either noncombustible construction or the creation defensible spaces.

Unfortunately, the proposal also created unintended consequences. The original proposal requires that all balconies or decks above other balconies or decks be enclosed. Example, a balcony or deck on the second or higher story would be required to have its underside enclosed down to the deck or balcony below because the proposal does not provide guidance as to how to address this scenario. Another Example, a balcony or deck on a second story with no balcony or deck below would be required to enclose the underside down two-stories to grade because of a lack of direction in the proposal. The National Multi-Family Housing Council does not believe this to be the intent by the proponent nor the bibliographical material provided by the proponent.

Further, the requirement for enclosure of the underfloor area of a accessory structure or projection is based on the proponents reason statement which

discusses debris accumulation as the culprit. However, the example photographs in Figure 3 of the proponents reason statement, and the bibliographical materials, both illustrate clean underfloor areas with outdoor furniture. This raises the question if the issue is debris or deck furniture?

Finally, the exceptions in 504.7.1 and 505.7.1 appear to be redundant to their charging paragraph. Both Sections 504.5 and 505.5 that are referenced contain a list of acceptable building materials, however it is not clear why the application of metal flashing at the base of columns of noncombustible or even ignition resistant building material will provide any better fire resistance or improve the amount of time for embers to impact those building materials.

The modifications shown in this proposal attempt to compromise with the proponents intended scope, as follows:

1. The modifications are designed to handle two scenarios each; the first where a balcony or deck is near grade, and the second where a balcony or deck is above another deck or another story, or, above grade by more than 80 inches,
2. addressing decks and balconies above the first-floor level to have differing requirements to mitigate burning embers from initiating a fire to the habitable portion of the building.
3. Differentiating requirements for noncombustible construction versus other constructions requirements for wall enclosures,
4. Inclusion of a minimum headroom requirement of 80 inches (Value taken from the International Building Code Chapter 11) for any point under the unenclosed accessory structure or projection to further demarcate the change from a structure or projection near grade versus one at a greater height or over another structure or projection,
5. The exceptions in 504.7.1 and 505.7.1 were revised to apply to only those materials that could combust and not noncombustible building materials, and
6. Revising Section 506.6 by adding the optional use of Section 504.7.1,

These changes will allow the ember protection requirements to be maintained and at the same time allow building owners to design buildings with balconies or decks on all stories.

Bibliography: No bibliographical items.

Cost Impact: Increase

Estimated Immediate Cost Impact:

The modification proposed will increase the cost impact the same as the original proposal WUIC44-24. The additional measures needed to provide a defendable space under decks, balconies, landings that the like will require additional materials and labor to provide same.

Estimated Immediate Cost Impact Justification (methodology and variables):

This proposed modification will increase the construction cost as the requirements for requiring ember mitigation require building materials that are noncombustible or ignition-resistant which are of greater cost that the materials currently allowed in the 2024 IWUIC. Cost will vary on which measure is designed into the building.

Comment (CAH2)# 496

WUIC45-24

IWUIC: 504.9, 504.9.1 (New), 505.9, 505.9.1 (New), 506.9 (New), 506.9.1 (New)

Proposed Change as Submitted

Proponents: Milad Shabanian, Insurance Institute for Business & Home Safety (mshabanian@ibhs.org); T. Eric Stafford, Insurance Institute for Business and Home Safety (testafford@charter.net)

2024 International Wildland Urban Interface Code

Revise as follows:

504.9 Exterior doors. Exterior doors shall be *approved noncombustible* construction, solid-core wood not less than $1\frac{3}{4}$ inches thick (44 mm) and protected with a minimum 6-inch noncombustible material, such as a kick plate, applied at the base on the exterior of the door, or have a fire protection rating of not less than 20 minutes. Windows within doors and glazed doors shall be in accordance with Section 504.8. **~~Exception~~ Exceptions:** ~~Vehicle access doors.~~

1. Vehicle access doors.
2. The 6 inches of noncombustible material at the base is not required for solid-core wood doors not less than $1\frac{3}{4}$ inches thick (44 mm) protected by an approved noncombustible door such as a storm door.

Add new text as follows:

504.9.1 Exterior underfloor access doors. Exterior underfloor access doors shall be constructed with noncombustible material or a minimum of 6-in noncombustible material that extends vertically from the base.

Revise as follows:

505.9 Exterior doors. Exterior doors shall be *approved noncombustible* construction, solid core wood not less than $1\frac{3}{4}$ inches thick (45 mm) and protected with a minimum 6-inch noncombustible material such as a kick plate at the base on the exterior of door , or have a fire protection rating of not less than 20 minutes. Windows within doors and glazed doors shall be in accordance with Section 505.8. **~~Exception~~ Exceptions:** ~~Vehicle access doors.~~

1. Vehicle access doors.
2. The 6 inches of noncombustible material at the base is not required for solid-core wood door not less than $1\frac{3}{4}$ inches thick (44 mm) protected by an approved noncombustible door such as a storm door.

Add new text as follows:

505.9.1 Exterior underfloor access doors. Exterior underfloor access doors shall be constructed with noncombustible material or a minimum 6-in noncombustible material that extends vertically at the base.

506.9 Exterior doors. Exterior doors shall be protected with a minimum 6-inch noncombustible material at the base on the exterior of the door. **Exceptions:**

1. Vehicle access doors.
2. Exterior doors protected by an approved noncombustible door such as a storm door.

506.9.1 Exterior underfloor access doors. Exterior underfloor access doors shall be constructed with noncombustible material or a minimum 6-in noncombustible material that extends vertically at the base.

Reason: Like other parts of the building envelope, exterior doors can be exposed to flames, radiant heat, and embers. NIST's Waldo Canyon Fire (2012) post-investigation in El Paso County, Colorado, reports doors as a frequent damaged component of the building [1]. Maintaining a proper defensible space around the building reduces the potential thermal insults from flames. However, embers can still accumulate at the base of a door and potentially penetrate through the door jamb. IBHS's post-Marshall Fire (2021) investigation in Boulder County, Colorado, showed damage to exterior doors due to ember accumulation at the base, as can be seen in Figure 1a. Figure 1b demonstrates ignition of the door jamb due to ember penetration during the Victorian Bushfire (2009) in Australia [2].

(a) (b)

Figure 1. ignition from accumulation of embers and debris at the base of the door.

This code change proposal intends to address this vulnerability by providing requirements for all buildings located in wildfire prone areas (IR1,2 and 3) to protect the exterior doors against embers.

Requiring a 6-in noncombustible vertical protection by a kickplate at the base of exterior doors or a storm door will reduce this vulnerability (Figure 2).

(a) (b)

Figure 2. Protection for exterior doors (a) storm door, (b) kickplate.

The 6-in noncombustible vertical clearance at the base of the door can protect the exterior door assembly against embers. As a part of this effort, a new section was added to the IR1, 2, and 3 exterior doors to protect exterior underfloor access doors (Figure 3) against embers.

(a) (b)

Figure 3. Exterior underfloor access doors (a) unprotected vs. (b) protected against embers.

National Institute of Standards and Technology. https://doi.org/10.6028/NIST.TN.1910
[2] Leonard, J. (2009). Report to the 2009 Victorian bushfires Royal Commission. Building performance in bushfires (CSIRO Sustainable Ecosystems, Issue. CSIRO Sustainable Ecosystems.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

This code change will slightly increase the construction cost by requiring a 6-in noncombustible protection at the base for exterior doors and exterior underfloor access doors.

Estimated Immediate Cost Impact Justification (methodology and variables):

A web search of several retailers carrying kickplate, storm doors and a metal underfloor access door revealed that a kickplate costs approximately $33, a storm door costs approximately $400 and 12-in by 12-in metal underfloor access door costs around $40. Additional labor costs are estimated to be negligible.

WUIC45-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee stated that the reasons for the disapproval of the proposal were: The desire to have the revisions in two separate proposals. The underfloor space and noncombustible door there add value to the requirements. Concern about putting something in the code that in real life scenarios may not do anything. It includes all types of doors including glass doors which is not appropriate. The committee would like to see some more evidence of the doors and the fire consuming the structure. (Vote: 12-1)

WUIC45-24

Individual Consideration Agenda

Comment 1:

IWUIC: 504.9, 504.9.1, 505.9, 505.9.1, 506.9, 506.9.1

Proponents: Milad Shabanian, Insurance Institute for Business & Home Safety, Insurance Institute for Business & Home Safety (mshabanian@ibhs.org); T. Eric Stafford, Insurance Institute for Business and Home Safety (testafford@charter.net) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Wildland Urban Interface Code

Revise as follows:

504.9 Exterior doors. Exterior doors shall be *approved noncombustible* construction, solid-core wood not less than $1\frac{3}{4}$ inches thick (44 mm) ~~and protected with a minimum 6-inch noncombustible material, such as a kick plate, applied at the base on the exterior of the door~~ or have a fire protection rating of not less than 20 minutes. Windows within doors and glazed doors shall be in accordance with Section 504.8. **Exception ~~Exceptions~~:**

1. ~~1.~~ Vehicle access doors.
2. ~~2. The 6 inches of noncombustible material at the base is not required for solid-core wood doors not less than $1\frac{3}{4}$ inches thick (44 mm) protected by an approved noncombustible door such as a storm door.~~

504.9.1 Exterior underfloor access doors. Exterior underfloor access doors shall be constructed with noncombustible material or a minimum of 6-in noncombustible material that extends vertically from the ~~base~~ ground.

Revise as follows:

505.9 Exterior doors. Exterior doors shall be *approved noncombustible* construction, solid core wood not less than $1\frac{3}{4}$ inches thick (45 mm) ~~and protected with a minimum 6-inch noncombustible material such as a kick plate at the base on the exterior of door~~ or have a fire protection rating of not less than 20 minutes. Windows within doors and glazed doors shall be in accordance with Section 505.8. **Exception ~~Exceptions~~:**

1. ~~1.~~ Vehicle access doors.
2. ~~2. The 6 inches of noncombustible material at the base is not required for solid-core wood door not less than $1\frac{3}{4}$ inches thick (44 mm) protected by an approved noncombustible door such as a storm door.~~

505.9.1 Exterior underfloor access doors. Exterior underfloor access doors shall be constructed with noncombustible material or a minimum 6-in noncombustible material that extends vertically at the base.

Delete without substitution:

~~**506.9 Exterior doors.** Exterior doors shall be protected with a minimum 6-inch noncombustible material at the base on the exterior of the door. **Exceptions:**~~

1. ~~Vehicle access doors.~~
2. ~~Exterior doors protected by an approved noncombustible door such as a storm door.~~

Revise as follows:

506.9.~~1~~ Exterior underfloor access doors. Exterior underfloor access doors shall be constructed with noncombustible material or a

minimum 6-in noncombustible material that extends vertically at the base.

Reason: This comment addresses feedback provided by the committee. The committee found merit in the proposed changes related to exterior underfloor access doors. However, they weren't convinced that the new requirements proposed for exterior doors were needed and requested more evidence indicating a problem. The committee recommended that the issues raised in this proposal should be submitted in two separate proposals. Based on the committee's reason and recommendations to the proponents, this comment simply removes the requirements proposed for exterior doors and maintains the parts related to underfloor access doors.

Cost Impact: Increase

Estimated Immediate Cost Impact:

A web search of several retailers carrying metal underfloor access door revealed that a 12-in by 12-in metal underfloor access door costs around $40. Additional labor costs are estimated to be negligible.

Estimated Immediate Cost Impact Justification (methodology and variables):

--

WUIC46-24

IWUIC: 504.9.1 (New), ASTM Chapter 07, UL Chapter 07

Proposed Change as Submitted

Proponents: Robert Marshall, FCAC, FCAC (fcac@iccsafe.org)

2024 International Wildland Urban Interface Code

Add new text as follows:

504.9.1 Garage door perimeter gap. Exterior garage doors for vehicles shall resist the intrusion of embers by protecting the gaps between each door and the opening at the bottom, sides and top by all of the following:

1. Bottom opening shall provide a maximum gap of 1/8 inch (3.2 mm) between the surface and the door opening seal.
2. Sides and top by one or more of he following:

   2.1 Provide a maximum gap of 1/8 inch (3.2 mm) between the door and the door opening.

   2.2 Cover or block the gap with weather-stripping products constructed of materials which comply with both of the following:

      2.2.1 The tensile strength of he material shall be tested in accordance with ASTM D638 before and after light exposure in accordance with ASTM G155 for a period of 2000 hours, and the maximum allowable difference in tensile strength values between exposed and non-exposed samples shall not exceed 10 percent.

      2.2.2 The material shall be tested in accordance with UL 94 and have a flammability rating of V-2 or better.

   2.3 Cover or block the gap with metal flashing.

Revise as follows:

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box C700
West Conshohocken, PA 19428-2959

D638-22	Standard Test Method for Tensile Properties of Plastics.

UL

UL LLC
333 Pfingsten Road
Northbrook, IL 60062-2096

94-2023	Tests for Flammability of Plastic Materials for Parts in Devices and Appliances, 7th edition

Reason: One of the issues with wildland fires is the spread of flaming or hot embers into structures. This proposal is intended to address protection of vehicle door of a garage to reduce this exposure and eliminate a route of ember entry by addressing the gap created between the garage door and the garage door opening.

Section 504.9.1 requires a battery backup for motorized garage door openers. Often in a wildland fire, utility power is shut down, or damaged, to an area or region. When the utility power is no longer available, and the residents need to evacuate, the garage door can still be opened to allow vehicles to exit and then closed to protect the opening into the garage.

Section 504.9.2 addresses the gap, or clearance, provided around the garage door allowing for door movement and operation. This gap needs to be evaluated to inhibit the passage of flaming embers. There are four methods of protection offered in this section: 1) design the door so there is a maximum ⅛" gap on all four sides of the door; 2) provide weatherstripping to cover or fill the gap—weatherstripping must be designed to stay in place during the impact of the fire so criteria is provided (Items 2.1 and 2.2) to address the strength and

flammability of the material; and 3) install metal flashing to cover the gap. Any one of the methods can be utilized, or a combination of these methods will suffice. For example, the door may have less than a 1/8" gap along the header (Item 3) and be provided with weatherstripping on the bottom and sides (Item 2).

As part of the requirements for protecting the gap, new test standards are included to ensure that where weather-stripping is chosen as the solution, the weather-stripping material is reliable and dependable for the purpose.

FCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and early 2024 the FCAC has held several virtual meetings and one in-person meeting open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the **FCAC Website**

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

The approximate cost of compliance to add an approved protection material around the edges of a vehicle garage door is $50. As this is only one of the compliance options, the added cost will be applicable in an estimated 1/3 to 1/2 of the cases.

Estimated Immediate Cost Impact Justification (methodology and variables):

The materials needed for compliance with this proposal are readily available in the retail and wholesale building supply chain. Installation labor is minimal or can be DIY.

WUIC46-24

Public Hearing Results (CAH1)

Committee Action: **As Submitted**

Committee Reason: The committee stated that the reason for the approval of the proposal was that the testimony all supported the fact that gaps in garage door openings is a problem that needs fixing, and the nationally recognized standards can be used in the new requirements to protect these gaps. (Vote: 12-1)

WUIC46-24

Individual Consideration Agenda

Comment 1:

IWUIC: 504.9.1, UL Chapter 07

Proponents: Jonathan Roberts, UL Solutions, UL Solutions (jonathan.roberts@ul.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Wildland Urban Interface Code

Revise as follows:

504.9.1 Garage door perimeter gap. Exterior garage doors for vehicles shall resist the intrusion of embers by protecting the gaps between each door and the opening at the bottom, sides and top by all of the following:

1. Bottom opening shall provide a maximum gap of 1/8 inch (3.2 mm) between the surface and the door opening seal.
2. Sides and top by one or more of he following:

   2.1 Provide a maximum gap of 1/8 inch (3.2 mm) between the door and the door opening.

   2.2 Cover or block the gap with weather-stripping products constructed of materials which comply with ~~both of~~ the following:

      2.2.1 The tensile strength of he material shall be tested in accordance with ASTM D638 before and after light exposure in accordance with ASTM G155 for a period of 2000 hours, and the maximum allowable difference in tensile strength values between exposed and non-exposed samples shall not exceed 10 percent.

      ~~2.2.2 The material shall be tested in accordance with UL 94 and have a flammability rating of V-2 or better.~~

   2.3 Cover or block the gap with metal flashing.

Delete without substitution:

UL

UL LLC
333 Pfingsten Road
Northbrook, IL 60062-2096

~~94-2023~~ ~~Tests for Flammability of Plastic Materials for Parts in Devices and Appliances, 7th edition~~

Reason: UL 94 (Tests for Flammability of Plastic Materials for Parts in Devices and Appliances) is a small scale test intended to be used solely to measure and describe the flammability properties of materials, used in devices and appliances, in response to a small open flame or radiant heat source under controlled laboratory conditions. The scope specifically states the test requirements do not cover polymeric materials when used for building construction.

This test standard is not the correct test for evaluating garage-door edge-gap materials used to protect against intrusion of embers.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposed language does not add cost, one could even argue that it removes a test and therefore it reduces the cost of construction.

Comment (CAH2)# 238

WUIC48-24

IWUIC: 504.10, 505.10

Proposed Change as Submitted

Proponents: Aaron Phillips, Asphalt Roofing Manufacturers Association (ARMA), Asphalt Roofing Manufacturers Association (aphillips@asphaltroofing.org)

2024 International Wildland Urban Interface Code

Revise as follows:

504.10 Vents. Where provided, ~~ventilation~~ openings ~~for enclosed attics, gable ends, ridge ends, under eaves and cornices, enclosed eave soffit spaces, enclosed rafter spaces formed where ceilings are applied directly to the underside of roof rafters, underfloor ventilation, foundations and crawl spaces, or any other opening~~ intended to permit ventilation, either in a horizontal or vertical surface, shall be in accordance with Section 504.10.1 or Section 504.10.2 to resist building ignition from the intrusion of burning embers and flame through the ventilation openings.

505.10 Vents. Where provided, ~~ventilation~~ openings ~~for enclosed attics, gable ends, ridge ends, under eaves and cornices, enclosed eave soffit spaces, enclosed rafter spaces formed where ceilings are applied directly to the underside of roof rafters, underfloor ventilation, foundations and crawl spaces, or any other opening~~ intended to permit ventilation, either in a horizontal or vertical surface, shall be in accordance with Section 505.10.1 or Section 505.10.2 to resist building ignition from the intrusion of burning embers and flame through the ventilation openings.

Reason: The existing charging language of sections 504.10 and 505.10 contains a lengthy and potentially incomplete list which includes a mixture of constructions (e.g., enclosed attics, enclosed eave soffit spaces, enclosed rafter spaces) and ventilation opening locations (e.g., gable ends, ridge ends, under eaves and cornices, foundations). However, a careful review of the current language reveals the intent is for the provisions to apply to any "opening intended to permit ventilation." This proposal simplifies the charging language by removing the list and relying on the heart of the provision, i.e., all ventilation openings are to be protected.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal makes no technical change to existing provisions. Therefore, there should be no impact on construction cost. See also the proponent's reason statement.

WUIC48-24

Public Hearing Results (CAH1)

Committee Action: **As Submitted**

Committee Reason: The approval of the proposal was based on the proponent's reason statement. (Vote: 11-2)

WUIC48-24

Individual Consideration Agenda

Comment 1:

IWUIC: 504.10, 505.10, 506.5

Proponents: Gary J Ehrlich, NAHB, NAHB (gehrlich@nahb.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Wildland Urban Interface Code

Revise as follows:

504.10 Ventilation Openings~~Vents~~. Where provided, openings intended to permit ventilation, either in a horizontal or vertical surface, shall be in accordance with Section 504.10.1 or Section 504.10.2 to resist building ignition from the intrusion of burning embers and flame through the ventilation openings. **Exceptions:**

1. Clothes dryer and kitchen exhaust openings shall comply with the duct termination requirements of the *International Mechanical Code* or *International Residential Code*, as applicable.
2. Duct and air transfer openings in exterior walls provided for fully-ducted HVAC systems shall comply with the opening protection requirements of the *International Mechanical Code* or *International Residential Code*, as applicable.

505.10 Ventilation Openings~~Vents~~. Where provided, openings intended to permit ventilation, either in a horizontal or vertical surface, shall be in accordance with Section 505.10.1 or Section 505.10.2 to resist building ignition from the intrusion of burning embers and flame through the ventilation openings. **Exceptions:**

1. Clothes dryer and kitchen exhaust openings shall comply with the duct termination requirements of the *International Mechanical Code* or *International Residential Code*, as applicable.
2. Duct and air transfer openings in exterior walls provided for fully-ducted HVAC systems shall comply with the opening protection requirements of the *International Mechanical Code* or *International Residential Code*, as applicable.

506.5 Ventilation openings~~Vents~~. Where provided, attic ventilation openings, foundation or underfloor vents, or other ventilation openings in vertical exterior walls and vents through roofs shall not exceed 144 square inches (0.0929 m^2) each. Such vents shall be covered with noncombustible corrosion-resistant mesh with openings not to exceed 1/8 inch (3.2 mm) or shall be designed and approved to prevent flame or ember penetration into the structure. **Exceptions:**

1. Clothes dryer and kitchen exhaust openings shall comply with the duct termination requirements of the *International Mechanical Code* or *International Residential Code*, as applicable.
2. Duct and air transfer openings in exterior walls provided for fully ducted HVAC systems shall comply with the opening protection requirements of the *International Mechanical Code* or *International Residential Code*, as applicable.

Reason: The purpose of this committee comment is to resolve a conflict that proposal WUIC15-21 created last cycle and WUIC48-24 drew more attention to.

From the 2006 through the 2018 edition of the IWUIC, Sections 504.10 and 505.10 allowed ventilation openings to be “designed and approved to prevent flame or ember penetration into the structure” as an alternative to the noncombustible corrosion-resistant mesh. This provided a compliance path for exhaust and intake vents not specific to ventilated attic and rafter assemblies or crawlspace foundations. While the concept of protecting all openings in a wildfire-prone area makes sense, the removal of the performance language in deference to either providing noncombustible corrosion-resistant mesh with openings not exceeding 1/8” or listed vent products tested to ASTM E2886 creates conflicts with openings for dryer and kitchen exhaust vents as well as openings for intake and exhaust vents serving HVAC equipment. Despite the fact the IWUIC commentary on these sections focuses on attic and crawlspace vents. these other

types of openings can easily be interpreted as being “intended to permit ventilation” and requiring them to be protected only with 1/8” mesh or listed vent products creates conflicts with existing provisions in the IBC, IRC, and IMC addressing such openings. This comment proposes two exceptions to resolve the conflict.

Exception #1 points to the provisions of the IMC and IRC for clothes dryer and kitchen exhaust openings. IMC Section 505.4 and IRC Section M1502.3 for dryer exhaust duct terminations, and IMC Section 505.3 and IRC Section M1503.3 for kitchen exhaust discharge, require a backdraft damper at the exhaust duct termination or exhaust discharge. Further, the IMC and IRC specifically prohibit the installation of screens at dryer exhaust duct terminations. To prevent an internal conflict between the I-Codes, an exception to address these openings is required. Note these dampers are typically aluminum or steel blades or frames, are designed to close to prevent inward (reverse) airflow and can be gravity operated (where air pressure or wind velocity could close the damper) or motorized. It is clear these dampers will by default protect against ember intrusion.

Exception #2 points to the applicable provisions for protection of other duct and air transfer openings in the IBC and IRC. IBC Section 717 provides requirements for ducts and air transfer openings required to be protected (e.g., when such openings are in fire-rated exterior walls). Further, IRC Section R303.6, IMC Section 401.5 and IMC Section 501.3.2 require air exhaust and intake openings be protected with corrosion-resistant screens, louvers or grills with ¼” min and ½” max opening size, and otherwise comply with exterior wall opening protection requirements in the IBC. These openings will generally lead to metallic ducts that would not present an ignition risk should embers penetrate the screens, louvers or grills.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The exceptions proposed in the committee comment point to existing code provisions that address clothes dryer and kitchen exhaust vents and HVAC intake and exhaust vents. At the very least these pointers simply clarify what is already required for these sorts of ventilation openings, thus there is no cost impact. The pointers could reduce cost relative to the original proposal by eliminating potential conflicts or heading off someone requiring a listed, fire-tested vent where it is not necessary or where such a product may not even exist.

Comment (CAH2)# 304

Comment 2:

IWUIC: 504.10, 505.10

Proponents: Aaron Phillips, Asphalt Roofing Manufacturers Association (ARMA), Asphalt Roofing Manufacturers Association (aphillips@asphaltroofing.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Wildland Urban Interface Code

Revise as follows:

504.10 Ventilation openings~~Vents~~. Where provided, openings intended to permit ventilation, either in a horizontal or vertical surface, shall be in accordance with Section 504.10.1 or Section 504.10.2 to resist building ignition from the intrusion of burning embers and flame through the ventilation openings.

505.10 Ventilation openings~~Vents~~. Where provided, openings intended to permit ventilation, either in a horizontal or vertical surface, shall be in accordance with Section 505.10.1 or Section 505.10.2 to resist building ignition from the intrusion of burning embers and flame through the ventilation openings.

Reason: WUIC48-24 was supported as submitted during CAH #1. However, the Committee suggested that a change in section titles

would improve the proposal. This comment is in direct response to that suggestion. Specifically, it recommends changing the titles of Sections 504.10 and 505.10 from "Vents" to "Ventilation openings," which aligns the section titles with the contents of the sections.

A separate comment to WUIC51-24 offers the same change for Section 506.5 to address the titles of all three of the relevant sections.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The comment alters section titles only, which will have no effect on cost of construction.

Comment (CAH2)# 154

Comment 3:

IWUIC: 504.10, 505.10

Proponents: Aaron Phillips, Asphalt Roofing Manufacturers Association (ARMA), Asphalt Roofing Manufacturers Association (aphillips@asphaltroofing.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Wildland Urban Interface Code

Revise as follows:

504.10 Vents. Where provided, openings intended to permit ventilation of enclosed attics or enclosed rafter spaces in accordance with *International Building Code* Section 1202.2 or of under-floor areas in accordance with *International Building Code* Section 1202.4, either in a horizontal or vertical surface, shall be in accordance with Section 504.10.1 or Section 504.10.2 to resist building ignition from the intrusion of burning embers and flame through the ventilation openings.

505.10 Vents. Where provided, openings intended to permit ventilation of enclosed attics or enclosed rafter spaces in accordance with *International Building Code* Section 1202.2 or of under-floor areas in accordance with *International Building Code* Section 1202.4, either in a horizontal or vertical surface, shall be in accordance with Section 505.10.1 or Section 505.10.2 to resist building ignition from the intrusion of burning embers and flame through the ventilation openings.

Reason: Existing language of 504.10 and 505.10 indicate that all "openings ... intended to permit ventilation" are to be protected. WUIC48-24 removes an unnecessary and potentially incomplete list of opening types and locations and retains this core requirement. Opposition testimony when WUIC48-24 was heard during the first Committee Action Hearing raised concerns that the proposed changes would cause an interpretation not previously exercised that penetrations through the building envelope which do not terminate within an enclosed attic, enclosed rafter space, or under-floor area, such as HVAC intake and exhaust openings or clothes dryer exhausts, would require protection.

The proponent is unaware of any instances in which building envelope penetrations which do not provide access to an enclosed attic, enclosed rafter space, or under-floor area have led to issues in wildfires. Therefore, this comment proposes to restrict the ventilation opening provisions to enclosed attic, enclosed rafter space, and under-floor area openings, since these are the openings of concern that evidence indicates can be problematic during a wildfire.

A companion comment to WUIC51-24 is being offered to address this issue in Section 506.5 to provide coordination across all three ignition resistant construction classes.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Although the existing code language requires protection of all "openings ... intended to permit ventilation," the understood practice is not to protect openings such as clothes dryer exhausts and HVAC intakes and exhausts in accordance with these sections. Based on that understanding, this comment represents a clarification to align code language with current practice, and as such, should cause no change in cost of construction.

Comment (CAH2)# 160

WUIC51-24

IWUIC: 504.10, 504.10.2, 505.10, 505.10.2, 506.5

Proposed Change as Submitted

Proponents: Aaron Phillips, Asphalt Roofing Manufacturers Association (ARMA), Asphalt Roofing Manufacturers Association (aphillips@asphaltroofing.org)

2024 International Wildland Urban Interface Code

Revise as follows:

504.10 Vents. Where provided, ventilation openings for enclosed attics, gable ends, ridge ends, under eaves and cornices, enclosed eave soffit spaces, enclosed rafter spaces formed where ceilings are applied directly to the underside of roof rafters, underfloor ventilation, foundations and crawl spaces, or any other opening intended to permit ventilation, ~~either in a horizontal or vertical surface~~ , shall be in accordance with Section 504.10.1 or Section 504.10.2 to resist building ignition from the intrusion of burning embers and flame through the ventilation openings.

504.10.2 Prescriptive requirements. ~~Where provided, attic ventilation~~ Ventilation openings~~, foundation or underfloor vents, or other ventilation openings in vertical or horizontal surfaces and vents through roofs shall not exceed 144 square inches (0.0929 m^2) each. Such vents~~ shall be fully covered with noncombustible corrosion-resistant mesh with openings not to exceed $^1/_8$ inch (3.2 mm) or with vents ~~shall be~~ designed and *approved* ~~approved~~ to prevent flame or ember penetration into the structure.

505.10 Vents. Where provided, ventilation openings for enclosed attics, gable ends, ridge ends, under eaves and cornices, enclosed eave soffit spaces, enclosed rafter spaces formed where ceilings are applied directly to the underside of roof rafters, underfloor ventilation, foundations and crawl spaces, or any other opening intended to permit ventilation, ~~either in a horizontal or vertical surface,~~ shall be in accordance with Section 505.10.1 or Section 505.10.2 to resist building ignition from the intrusion of burning embers and flame through the ventilation openings.

505.10.2 Prescriptive requirements. ~~Where provided, attic ventilation~~ Ventilation openings~~, foundation or underfloor vents, or other ventilation openings in vertical or horizontal surfaces and vents through roofs shall not exceed 144 square inches (0.0929 m^2) each. Such vents~~ shall be fully covered with noncombustible corrosion-resistant mesh with openings not to exceed 1/8 inch (3.2 mm) or with vents ~~shall be~~ designed and *approved* ~~approved~~ to prevent flame or ember penetration into the structure.

506.5 Vents. ~~Where provided, attic ventilation~~ Ventilation openings~~, foundation or underfloor vents, or other ventilation openings in vertical exterior walls and vents through roofs shall not exceed 144 square inches (0.0929 m^2) each. Such vents~~ shall be fully covered with noncombustible corrosion-resistant mesh with openings not to exceed 1/8 inch (3.2 mm) or with vents~~shall be~~ designed and *approved*~~approved~~ to prevent flame or ember penetration into the structure.

Reason: This proposal makes changes to the IWUIC vent provisions (1) to clarify that ventilation openings are permitted on sloped surfaces, (2) to remove the ventilation opening size limitation from the prescriptive compliance option, and (3) to require full coverage of ventilation openings regardless of the compliance path. Also, the proposal cleans up the prescriptive options (sections 504.10.2 and 505.10.2) and section 506.5 by removing the unnecessary and potentially confusing list of ventilation opening locations.

Ventilation Openings on Sloped Surfaces. The ventilation sections in the 2024 IWUIC restrict ventilation openings to horizontal or vertical surfaces. This could imply that ventilation openings on sloped surfaces (e.g., rooftops) are not subject to these requirements, which is not understood to be the intention or a desirable interpretation. Ventilation openings on all surfaces of the building should provide protection, and removal of the restriction to horizontal and vertical surfaces from sections 504.10 and 505.10 clarifies that all ventilation openings must be addressed.

Prescriptive Option Size Limitation. The size of ventilation openings is limited to 144 square inches when complying via the prescriptive option. This restriction has been in the IWUIC since the first edition, but no technical justification was discovered during an examination of the available code development records or through discussions with several parties involved in creation of the original IWUIC and

California Building Code Chapter 7A provisions. It is worth noting that California provisions have not included such a size limitation.

Full Coverage of Ventilation Openings. The performance compliance option in sections 504.10.1 and 505.10.1 includes the important provision that ventilation openings be fully covered. This proposal adds this practical requirement to the prescriptive path and to section 506.5.

Cleanup. Sections 504.10.2, 505.10.2 and 506.5 include an unnecessary list of ventilation opening locations. In their simplest form, these sections state, "Where provided, ventilation openings ... in vertical or horizontal surfaces and vents through roofs ...." The intention is clearly to require these provisions to apply to any ventilation opening. The cleanup simplifies the language and eliminates potential misinterpretation of the requirements.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The changes offered in this proposal primarily improve clarity of existing provisions. Removal of the ventilation opening size restriction which is present in the prescriptive requirements should not affect construction cost because the existing performance path already provides a means to demonstrate compliance for vents installed over ventilation openings which are larger than 144 square inches.

WUIC51-24

Public Hearing Results (CAH1)

Committee Action: **As Submitted**

Committee Reason: The committee stated that the reason for the approval of the proposal was that it is an editorial change to bring into compliance what is already acceptable practice. (Vote: 13-0)

WUIC51-24

Individual Consideration Agenda

Comment 1:

IWUIC: 506.5

Proponents: Aaron Phillips, Asphalt Roofing Manufacturers Association (ARMA), Asphalt Roofing Manufacturers Association (aphillips@asphaltroofing.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Wildland Urban Interface Code

506.5 Ventilation openings~~Vents~~. Ventilation openings shall be fully covered with noncombustible corrosion-resistant mesh with openings not to exceed 1/8 inch (3.2 mm) or with vents designed and *approved* to prevent flame or ember penetration into the structure.

Reason: Both WUIC51-24 and WUIC48-24 were supported as submitted during CAH #1. While considering WUIC48-24, the Committee suggested that a change in section titles would improve the proposal. This comment is in direct response to that suggestion. Specifically, it recommends changing the title of Section 506.5 from "Vents" to "Ventilation openings," which aligns the section title with the content of

the section.

This is offered as a comment to WUIC51-24 because section 506.5 was not included in WUIC48-24. A separate comment to WUIC48-24 offers the same change for Sections 504.10 and 505.10.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The comment alters section titles only, which will have no effect on cost of construction.

Comment (CAH2)# 153

Comment 2:

IWUIC: 506.5

Proponents: Aaron Phillips, Asphalt Roofing Manufacturers Association (ARMA), Asphalt Roofing Manufacturers Association (aphillips@asphaltroofing.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Wildland Urban Interface Code

Revise as follows:

506.5 Vents. Where provided, ~~V~~ventilation openings of enclosed attics or enclosed rafter spaces in accordance with *International Building Code* Section 1202.2 or of under-floor areas in accordance with *International Building Code* Section 1202.4 shall be fully covered with noncombustible corrosion-resistant mesh with openings not to exceed 1/8 inch (3.2 mm) or with vents designed and *approved* to prevent flame or ember penetration into the structure.

Reason: Although the existing language of Section 506.5 in the 2024 IWUIC requires protection of all openings through the building envelope (i.e., by stating the requirements apply to "other ventilation openings in vertical exterior walls and vents through roofs"), the simplification of the vents section charging language in all three ignition resistant classes proposed via WUIC48-24 and WUIC51-24 raised concerns that the new language would cause an interpretation not previously exercised that penetrations through the building envelope which do not terminate within an enclosed attic, enclosed rafter space, or under-floor area, such as HVAC intake and exhaust openings or clothes dryer exhausts, would require protection.

The proponent is unaware of any instances in which building envelope penetrations which do not provide access to an enclosed attic, enclosed rafter space, or under-floor area have led to issues in wildfires. Therefore, this comment proposes to restrict the ventilation opening provisions to enclosed attic, enclosed rafter space, and under-floor area openings, since these are the openings of concern that evidence indicates can be problematic during a wildfire.

The same change is offered in a comment to WUIC48-24 for Sections 504.10 and 505.10 to align the provisions across all three ignition resistant construction classes.

The comment also brings back the opening phrase, "Where provided," so that Section 506.5 is consistent with 504.10 and 505.10.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Although the existing code language requires protection of all openings, the understood practice is not to protect openings such as clothes dryer exhausts and HVAC intakes and exhausts in accordance with this section. Based on that understanding, this comment represents a clarification to align code language with current practice, and as such, should cause no change in cost of construction.

Comment 3:

IWUIC: 504.10.2, 505.10.2, 506.5

Proponents: Brent Pickett, Western Fire Center, Inc., O'Hagin (brent@westernfire.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Wildland Urban Interface Code

Revise as follows:

504.10.2 Prescriptive requirements. Attic vents must be noncombustible and corrosion-resistant. Additionally, all v~~V~~entilation openings shall be fully covered with noncombustible corrosion-resistant material(s) including mesh with openings not to exceed $^{1}/_{8}$ inch (3.2 mm) or with vents designed and *approved* to prevent flame and ~~or~~ ember penetration into the structure.

505.10.2 Prescriptive requirements. Attic vents must be noncombustible and corrosion-resistant. Additionally, all v~~V~~entilation openings shall be fully covered with noncombustible corrosion-resistant material(s) including mesh with openings not to exceed $^{1}/_{8}$ inch (3.2 mm) or with vents designed and *approved* to prevent flame and ~~or~~ ember penetration into the structure.

506.5 Vents. Attic vents must be noncombustible and corrosion-resistant. Additionally, all v~~V~~entilation openings shall be fully covered with noncombustible corrosion-resistant material(s) including mesh with openings not to exceed $^{1}/_{8}$ inch (3.2 mm) or with vents designed and *approved* to prevent flame and ~~or~~ ember penetration into the structure.

Reason: By removing the phrase “either in horizontal or vertical surface” would then allow essentially all vent types to be used, including sloped roof vents as indicated in the proposed rationale.

The existing 504.10.1 section gives performance requirements for vents tested to ASTM E2886, which are not applicable for “roof ridge and off-ridge (field) vents” (see section 1.1 in E2886). This is because many of the existing roof vents are typically too large for the E2886 test apparatus. The proposed change to 504.10.2 gives prescriptive requirements limiting the vent opening and requires that all vent types have #1) “a noncombustible and corrosion-resistant mesh not to exceed ⅛ inch” or be #2) “designed and approved to prevent flame or ember penetration into the structure.”

Since there is not currently a performance standard to resist flame and embers for roof vents, the only method for approval would be the prescriptive approach by requiring ⅛” noncombustible mesh. However, as currently drafted, this approach only attempts to mitigate the ember issue, but it completely neglects the flame concern. Both aspects of fire protection need to be addressed.

Research regarding vents has been performed at our independent third-party fire testing laboratory on multiple on-the-market roof vents using a modified E108 test (fire test for roof coverings) that exposes individual roof vent samples to the flame defined in the E108 with a combustible cotton target in the attic space below the vent opening (sheathing). We found that with some plastic/combustible roof vents (including field, intake, and ridge vents), the dripping and burning plastic dripped down through the vent opening and ignited the cotton target (see images below of some instances).

Based on these findings, it is proposed instead of requiring only the mesh to be noncombustible, that the vent material itself also be noncombustible, which would eliminate the potential for combustible flames from the vent itself to enter the attic space. Ultimately, it will make the structure much less susceptible to exterior WUI fire. Furthermore, the melting of the attic vents creates an inherent safety issue for first responders (see image below).

Bibliography: ASTM E108

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

None. Noncombustible, corrosion-resistant vents are already sold in high volumes across the US.

Comment (CAH2)# 703

WUIC53-24

IWUIC: SECTION 503, 503.1, TABLE 503.1, 503.2, 503.2.1, 503.2.2, 503.2.3, 503.2.4, 503.2.4.1, 503.2.4.2, 503.2.4.3, 503.2.4.3.1, 503.2.4.3.2, 503.2.4.3.3

~~a. Access shall be in accordance with Section 403.~~

~~b. Subdivisions shall have a conforming water supply in accordance with Section 402.1.~~

~~IR 1 = Ignition-resistant construction in accordance with Section 504.~~

~~IR 2 = Ignition-resistant construction in accordance with Section 505.~~

~~IR 3 = Ignition-resistant construction in accordance with Section 506.~~

~~N.C. = Exterior walls shall have a fire-resistance rating of not less than 1 hour and the exterior surfaces of such walls shall be noncombustible. Usage of log wall construction is allowed.~~

~~c. Conformance based on Section 603.~~

~~d. Conformance based on Section 404.~~

~~e. A nonconforming water supply is any water system or source that does not comply with Section 404, including situations where there is no water supply for structure protection or fire suppression.~~

Revise as follows:

503.2 Ignition-resistant building material. Ignition-resistant building materials shall <u>be designed for exterior use and</u> comply with any one of the requirements in Section 503.2.1 through ~~503.2.4~~ <u>503.2.4.3.3</u>.

503.2.1 Noncombustible material. Material shall comply with the definition of *noncombustible* materials in Section 202.

503.2.2 Fire-retardant-treated wood. Fire-retardant-treated wood shall be identified for exterior use and shall meet the requirements of Section 2303.2 of the *International Building Code*.

503.2.3 Fire-retardant-treated wood roof coverings. Roof assemblies containing fire-retardant-treated wood shingles and shakes shall comply with the requirements of Section 1505.6 of the *International Building Code* and shall be classified as Class A roof assemblies as required in Section 1505.2 of the *International Building Code*.

503.2.4 Ignition-resistant building material. Material shall be tested on the front and back faces in accordance with the extended ASTM E84 or UL 723 test, for a total test period of 30 minutes, or with the ASTM E2768 test. The materials shall bear identification showing the fire test results. Panel products shall be tested with a ripped or cut longitudinal gap of $^{1}/_{8}$ inch (3.2 mm). The materials, when tested in accordance with the test procedures set forth in ASTM E84 or UL 723 for a test period of 30 minutes, or with ASTM E2768, shall comply with Sections 503.2.4.1 through 503.2.4.3. **Exception:** Materials composed of a combustible core and a noncombustible exterior covering made from either aluminum at a minimum 0.019 inch (0.48 mm) thickness or corrosion-resistant steel at a minimum 0.0149 inch (0.38 mm) thickness shall not be required to be tested with a ripped or cut longitudinal gap.

503.2.4.1 Flame spread. The material shall exhibit a flame spread index not exceeding 25.

503.2.4.2 Flame front. The material shall exhibit a flame front that does not progress more than 10 feet 6 inches (3200 mm) beyond the centerline of the burner at any time during the test.

503.2.4.3 Weathering. Ignition-resistant building materials shall maintain their performance in accordance with this section under conditions of use. The materials shall meet the performance requirements for weathering (including exposure to temperature, moisture and ultraviolet radiation) contained in Sections 503.2.4.3.1 through 503.2.4.3.3, as applicable to the materials and conditions of use.

503.2.4.3.1 Evaluation requirements for weathering. Fire-retardant-treated wood, wood-plastic composite materials and plastic lumber materials shall be evaluated after weathering in accordance with Method A "Test Method for Accelerated Weathering of Fire-Retardant-Treated Wood for Fire Testing" in ASTM D2898.

503.2.4.3.2 Wood-plastic composite materials. Wood-plastic composite materials shall also demonstrate acceptable fire performance after weathering by the following procedure: first testing in accordance with ASTM E1354 at an incident heat flux of 50 kW/m^2 in the horizontal orientation, then weathering in accordance with ASTM D7032 and then retesting in accordance with ASTM E1354 and exhibiting an increase of no more than 10 percent in peak rate of heat release when compared to the peak heat release rate of the nonweathered material.

503.2.4.3.3 Plastic lumber materials. Plastic lumber materials shall also demonstrate acceptable fire performance after weathering by the following procedure: first testing in accordance with ASTM E1354 at an incident heat flux of 50 kW/m^2 in the horizontal orientation, then weathering in accordance with ASTM D6662 and then retesting in accordance with ASTM E1354 and exhibiting an increase of no more than 10 percent in peak rate of heat release when compared to the peak heat release rate of the nonweathered material.

Reason: This code change proposes one construction method for buildings and structures in the wildland-urban interface area. This is a companion proposal to another proposal which deletes Sections 505 and 506. In other words, the other proposal removes Ignition Resistant Construction Classes 2 and 3. Replacing these multiple classifications with a single defined Ignition Resistant Construction as provided by Section 504 of this code. As the IWUIC is intended to provide a minimum standard of protection for the Wildland-Urban Interface areas, a single classification of Ignition Resistant Construction should be provided to accomplish the following goals:

1. Protect lives and property within the Wildland-Urban Interface areas
2. Provide clear and consistent standards, simplifying the construction process
3. Providing a minimum standard of protection, with appendices providing potential pathways for increased protection beyond the minimum

Defensible space is a component of home hardening and the benefits go hand in hand with the construction materials. Embers will find the path of least resistance.

Defensible space is the buffer between your structure and the surrounding area.

Adequate defensible space acts as a barrier to slow or halt the progress of fire that would otherwise engulf your property. It also helps ensure the safety of firefighters defending your home. Defensible space is the first line of defense for your home against wildfire.

The intensity of wildfire fuel management varies within the 100-foot perimeter of the home, with more intense fuels' reduction occurring closer to your home. Start at the home and work your way out to 100 feet or to your property line, whichever is closer. Learn more about the Defensible Space Zones below.

It takes the combination of both Defensible Space and Home Hardening to give your home and property the best chance of surviving a wildfire.

Bibliography: Construction costs for a wildfire-resistant home: California edition - Headwaters Economics

Fire Research Division | NIST

https://nvlpubs.nist.gov/nistpubs/TechnicalNotes/NIST.TN.2205.pdf

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

Construction costs for a typical single-family (1,750 square-foot) home would increase approximately $2,000 including developer overhead costs

Estimated Immediate Cost Impact Justification (methodology and variables):

In 2004, and as a precursor to California adopting Building Code Chapter 7A, the Office of the State Fire Marshal requested an analysis identifying the costs and benefits associated with proposed regulations in the state's wildfire-prone areas. The study was conducted by Fire Cause Analysis and

evaluated economic and construction data within various business sectors to analyze construction costs if proposed regulations were implemented.33 The study found construction costs for a typical single-family (1,750 square-foot) home would increase approximately $2,000 including developer overhead costs. As an aggregated total at the state level, construction costs would increase approximately $30 million per year for the estimated 14,000 new homes built in areas where regulations would apply. The authors concluded the costs of not implementing regulations, in the form of property losses and suppression costs, exceeded the projected costs for regulations and therefore recommended adopting mitigation standards in wildfire-prone areas.

In 2019, the National Institute of Building Sciences (NIBS) released a report identifying the benefit-cost ratio (BCR) of investing in hazard mitigation, including wildfires.35 The authors found that for every $1 spent on up-front costs for wildfire mitigation, a benefit of $4 was received.

In 2021, the National Research Council of Canada released a study analyzing the benefit-cost ratio for building new construction to comply with the country's wildland urban interface (WUI) Guide.38 In its examination, approximately $12,000 CAD (~$9,500 USD) was added to the overall costs for a new, 2,000-square-foot home to meet the provision of Canada's National WUI Guide. The comprehensive report also examined costs for retrofitting existing structures, as well as transferred costs at the community and national scale. Similar to the NIBS study in 2019, the NRC report found an up-front investment in wildfire-resistant construction and vegetation management yielded benefits that exceeded long-term costs and losses.

WUIC53-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee stated that the reasons for the disapproval of the proposal were: Based on the action and comments on WUIC54. The committee noted that they had a desire to see all these related proposals correlated into one package that could come back in the next cycle. (Vote: 11-2)

WUIC53-24

Individual Consideration Agenda

Comment 1:

Proponents: Crystal Sujeski, CAL FIRE/Office of the State Fire Marshal (crystal.sujeski@fire.ca.gov) requests As Submitted

Reason: The proposal intends to delete Table 503.1 Ignition Resistant Material, which allows for alternative means of reducing building construction materials when defensible space and water supply are considered.

Defensible space and water supply are not constant at any given time. However, a structure's construction is constant, and when a minimum standard is applied, it can greatly assist the building's survivability.

Table 503.1 is flawed in that fire hazard severity areas evaluate the "hazard," not the risk of a structure's ignition potential. "Hazard" is based on the physical conditions that create a likelihood and expected fire behavior over a period without considering mitigation measures such as home hardening, recent wildfire, or fuel reduction efforts. "Risk" is the potential damage a fire can achieve in the area under existing conditions, accounting for any modifications such as fuel reduction projects, defensible space, and ignition-resistant building construction.

Table 502.1 Fire Hazard Severity is outdated and only evaluates critical fire weather frequency, fuel model, and slope. The factors that should be considered in determining fire hazards within wildland areas are fire history, flame length, terrain, local weather, and potential fuel over a 50-year period. Outside of wildlands, a model should consider factors that might threaten buildings, including terrain, weather, urban vegetation cover, blowing embers, proximity to wildlands, fire history, and fire hazards in nearby wildlands. One of the most important factors not considered in Table 502.1 is the areas where winds have been identified as a major cause of wildfire spread;

Another consideration is the increased risk for utility-associated wildfires.

The International Wildland-Urban Interface Code has the opportunity to be the minimum standard for the nation.This table is not a structure loss model regarding the potential ignition of building materials. The IWUIC regulations reduce the risk of embers fanned by wind-blown wildfires from igniting buildings. The roofing, siding, decking, windows, and vents codes shall apply throughout all areas of fire hazard severity.

Wildfire is not just an issue for California!

The Chimney Tops Two fire began November 23, 2016, as a human-caused wildfire in Great Smoky Mountains National Park. On November 28, driven by strong winds, it combined with ignitions from downed powerlines into a swarming conflagration that burned across 11,410 acres into Gatlinburg, Tennessee, and nearby communities. Some 2,400 structures were destroyed or damaged, and 14 people were unnecessarily killed. In a second instance, the Tubbs fire kindled from downed powerlines on the evening of October 8, 2017, became another roaring conflagration. The landscape was parched by prolonged drought, and when the ignition met with powerful east winds, the fire burned 37,000 acres of Sonoma County and into Santa Rosa, California. Some 5,600 structures were destroyed, and 22 people died. In the third instance, the Marshall Fire, beginning December 30, 2021 (Figure 1), was carried by strong winds through dry grass and across 6,000 acres in Boulder County, Colorado, initiating fires in the towns of Superior and Louisville that destroyed 1,056 structures.

Bibliography: Same as original proposal

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

2024 International Wildland Urban Interface Code

Revise as follows:

SECTION 504
~~CLASS 1 IGNITION-RESISTANT CONSTRUCTION~~ CONSTRUCTION METHODS FOR EXTERIOR WILDFIRE EXPOSURE

504.1 General. ~~Class 1 ignition~~ Ignition-resistant construction shall be in accordance with Sections 504.2 through ~~504.11~~ 504.11.6.

504.2 Roof assembly. Roofs shall have a *roof assembly* that complies with a Class A ~~rating~~ fire classification when tested in accordance with ASTM E108 or UL 790. ~~For *roof assemblies* where the profile allows a space between the *roof covering* and *roof deck*, the space at the eave ends shall be firestopped to preclude entry of flames or embers or have one layer of 72-pound (32.4 kg) mineral-surfaced, nonperforated cap sheet complying with ASTM D3909 installed over the combustible *roof deck*.~~ **Exceptions:**

1. Class A *roof assemblies* include those with coverings of brick, masonry or an exposed concrete *roof deck*.
2. Class A *roof assemblies* also include ferrous or copper shingles or sheets, metal sheets and shingles, clay or concrete roof tile or slate installed on noncombustible decks or ferrous, copper or metal sheets installed without a *roof deck* on noncombustible framing.
3. Class A *roof assemblies* include minimum 16 oz/sq ft (0.0416 kg/m^2) copper sheets installed over combustible *roof decks*.

Add new text as follows:

504.2.1 Roof covering gaps. Roof covering gaps and voids shall be protected as follows:

1. Where the roofing covering profile has an airspace under the roof covering and is installed over a combustible deck, the combustible deck shall be protected by any of the following:
   1.1 Install a 72-pound (32.7 kg) cap sheet, complying with ASTM D3909, over the roof deck.
   1.2 Install mineral wool board or other noncombustible material with a minimum thickness of 1 inch (25.4 mm) between the roofing material and the wood framing or deck.
   1.3 Install a Class A fire classification roof underlayment, tested in accordance with ASTM E108 or UL 790. If the sheathing consists of exterior fire-retardant treated wood, the underlayment shall not be required to comply with a Class A classification.
2. Bird stops shall be used at the eaves, when the profile fits, to prevent debris from entering at the eave. Hip and ridge caps shall be mudded to prevent intrusion of fire or embers.

Revise as follows:

~~**504.2.1**~~ **504.2.2 Roof valleys.** Where provided, valley flashings shall be not less than 0.019 inch (0.48 mm) (No. 26 galvanized sheet gage) corrosion-resistant metal installed over a minimum 36-inch-wide (914 mm) underlayment consisting of one layer of 72-pound (32.~~4~~ 7 kg) mineral-surfaced, nonperforated cap sheet complying with ASTM D3909 running the full length of the valley.

Add new text as follows:

504.2.3 Skylights. Skylights, including tubular daylighting devices and sloped glazing shall comply with section 504.8

Revise as follows:

504.3 Protection of enclosed eaves. The exposed underside of enclosed roof ~~Eaves~~eaves and soffits shall be protected on the exposed underside by any of the following:

1. Noncombusible materials.
2. ~~ignition-resistant~~ Ignition-resistant materials . ~~or by~~
3. Fire-retardant-treated wood labeled for exterior use.
4. ~~materials~~ Materials *approved* for not less than 1-hour *fire-resistance-rated construction* on the exterior side.,
5. 2-inch (51 mm) nominal dimension lumber., or
6. 1-inch (25 mm) nominal fire-retardant-treated lumber or $^{3}/_{4}$-inch (19.1 mm) nominal fire-retardant-treated plywood~~,~~ identified for exterior use ~~and meeting the requirements of Section 2303.2 of the International Building Code~~.
7. Boxed-in roof eave soffit assemblies with an underside that meets the performance criteria in Section 504.7.2 when tested in accordance with the test procedures set forth in ASTM E2957.

Fascias are required and shall be ~~protected on the backside by~~ ignition-resistant materials, fire retardant-treated wood labeled for exterior use ~~or by~~ materials *approved* for not less than 1-hour *fire-resistance-rated construction* or 2-inch (51 mm) nominal dimension lumber.

Add new text as follows:

504.3.1 Protection of open eaves. The exposed roof deck on the underside of unenclosed roof eaves shall consist of one or more of the following:

1. Noncombustible material.
2. Ignition-resistant material.
3. Fire-retardant-treated wood labeled for exterior use.
4. Materials approved for not less than 1-hour fire-resistance-rated construction on the exterior side.
5. 2-inch (51 mm) nominal dimension lumber.
6. One layer of 5/8-inch (16 mm) Type X gypsum sheathing applied behind an exterior covering on the underside of the roof deck.
7. The exterior portion of a 1-hour fire-resistance-rated exterior assembly applied to the underside of the roof deck designed for exterior fire exposure, including assemblies using the gypsum panel and sheathing products listed in the Gypsum Association Fire Resistance Design Manual.

Fascias, if provided, shall be of fire-retardant-treated wood, ignition-resistant materials, materials approved for not less than 1-hour fire-resistance -rated construction or 2-inch (51 mm) nominal dimension lumber.

504.4 Gutters and downspouts. Gutters and downspouts shall be constructed of *noncombustible* material. Gutters shall be provided with an *approved* means to prevent the accumulation of leaves and debris in the gutter.

Revise as follows:

504.5 Exterior walls. Exterior walls of buildings or structures shall be constructed with one of the following methods:

1. ~~Materials *approved* for not less than~~ 1-hour *fire-resistance-rated construction* ~~on the exterior side~~.
2. *Approved noncombustible* materials.
3. Heavy timber. ~~or *log wall construction*~~ Assembly of sawn lumber or glue-laminated wood with the smallest minimum nominal dimension of 4 inches (102 mm). Sawn or glue-laminated planks splined, tongue-and-grove or set close together and well spiked.
4. Log wall construction. Assembly that has been tested in accordance with the test procedures for a 10-minute direct flame contact exposure test set forth in ASTM E2707 with the conditions of acceptance shown in Section 504.9.3.
5. Wall assemblies suitable for exterior fire exposure containing one layer of 5/8-inch (15.9 mm) Type X gypsum sheathing applied behind the exterior wall covering or cladding on the exterior side of the framing.

~~4.~~ 6 . Fire-retardant-treated wood ~~on the exterior side. The fire-retardant-treated wood~~ shall be labeled for exterior use and meet the requirements of Section 2303.2 of the International Building Code.

~~5~~ 7. Ignition-resistant materials complying with Section 503.2 ~~on the exterior side~~.

Such material shall extend from the top of the foundation to the underside of the roof sheathing.

Add new text as follows:

504.5.1 Exterior wall coverings. The exterior wall covering shall comply with one or more of the following requirements, except as permitted for exterior walls complying with Section 504.5:

1. Noncombustible material.
2. Ignition-resistant material labeled for exterior use.
3. Fire-retardant-treated wood. The fire-retardant-treated wood shall be labeled for exterior use and shall meet the requirements of Section 2303.2 of the International Building Code.

Revise as follows:

504.5.~~1~~ 2 Flashing. A minimum of 6 inches (152 mm) of metal flashing or noncombustible material applied vertically on the exterior of the wall shall be installed at the ground, decking and roof intersections.

504.6 Underfloor enclosure. Buildings or structures shall have underfloor areas enclosed to the ground with exterior walls in accordance with Section 504.5. **Exception:** Complete enclosure shall not be required where the underside of exposed floors and exposed structural columns, beams and supporting walls are protected as required for exterior 1-hour *fire-resistance-rated construction* or *heavy timber construction* or fire-retardant-treated wood. The fire-retardant-treated wood shall be labeled for exterior use and meet the requirements of Section 2303.2 of the International Building Code.

Revise as follows:

504.7 ~~Appendages and projections~~ Projections. *Unenclosed accessory structures* attached to buildings with habitable spaces and projections, ~~such as~~other than decks, shall be ~~not less than 1-hour fire-resistance-rated construction,~~ *heavy timber construction* or constructed of one of the following:

1. ~~*Approved noncombustible*~~ Noncombustible materials.

2. Fire-retardant-treated wood identified for exterior use and meeting the requirements of Section 2303.2 of the International Building Code.
3. Ignition-resistant building materials in accordance with Section 503.2. ~~**Exception:** Coated materials shall not be used as the walking surface of decks.~~
4. Materials approved for not less than 1-hour fire-resistance-rated construction on the exterior side, as tested in accordance with ASTM E119 or UL 263.
5. One layer of 5/8-inch (15.9 mm) Type X gypsum sheathing applied behind the exterior covering on the underside of the ceiling.
6. The exterior portion of a 1-hour fire-resistance-rated exterior assembly, as tested in accordance with ASTM E119, applied to the underside of the ceiling assembly, including assemblies using the gypsum panel and sheathing products listed in the Gypsum Association Fire Resistance Design Manual.
7. The underside of a floor projection assembly that meets the performance criteria in Section 504.7.2 when tested in accordance with the test procedures set forth in ASTM E2957.

504.7.1 ~~Underfloor areas~~ Underside of projections. ~~Where the attached structure is located and constructed so that the structure or any portion thereof projects over a descending slope surface greater than 10 percent, the area below the structure shall have underfloor areas enclosed to within 6 inches (152 mm) of the ground, with exterior wall construction in accordance with Section 504.5.~~
The underside of projections shall be enclosed to grade in accordance with the requirements of this chapter or the underside of the exposed underfloor shall be protected by one or more of the following:

Exception: Structural columns and beams are not required to be protected in accordance with Section 504.7.1 when constructed with sawn lumber or glue-laminated wood with the smallest minimum nominal dimension of 4 inches (102 mm). Sawn or glue-laminated planks shall be splined, tongue-and-groove, or set close together and well spiked.

1. Noncombustible material.
2. The ignition-resistant material shall be labeled for exterior use and shall meet the requirements of Section 503.2.
3. The fire-retardant-treated wood shall be labeled for exterior use and shall meet the requirements of Section 2303.2 of the International Building Code.
4. Materials approved for not less than 1-hour fire-resistance-rated construction on the exterior side, as tested in accordance with ASTM E119 or UL 263.
5. One layer of 5/8-inch (15.9 mm) Type X gypsum sheathing applied behind an exterior covering on the underside of the floor projection.
6. The exterior portion of a 1-hour fire-resistance-rated exterior assembly, as tested in accordance with ASTM E119 or UL 263, applied to the underside of the floor, including assemblies using the gypsum panel and sheathing products listed in the Gypsum Association Fire Resistance Design Manual.
7. The underside of a floor assembly that meets the performance criteria in Section 504.7.2 when tested in accordance with the test procedures set forth in ASTM E2957.

Add new text as follows:

504.7.2 Conditions of acceptance for ASTM E2957. The ASTM E2957 test shall be conducted on a minimum of three test specimens and meet the conditions of acceptance in Items 1 through 3 below. If any one of the three tests does not meet the conditions of acceptance, three additional tests shall be performed. All three additional tests must meet the conditions of acceptance.

1. Absence of flame penetration of the eaves or horizontal projection assembly at any time.
2. Absence of structural failure of the eaves or horizontal projection subassembly at any time.
3. Absence of sustained combustion of any kind at the conclusion of the 40-minute test.

504.7.3 Decks. The walking surface material of decks, porches, balconies and stairs shall comply with the requirements of Sections 504.7.3.1 through 504.7.3.4.

504.7.3.1 Flashing. A minimum of a 6-inch (150 mm) metal flashing, applied vertically on the exterior of the wall, shall be installed at all deck-to-wall intersections.

504.7.3.2 Decking surfaces. The walking surface material of decks, porches, balconies and stairs shall be constructed with any of the following materials:

1. Material that complies with the performance requirements of Section 504.7.3.3.
2. Ignition-resistant material that complies with the performance requirements of Section 504.7.2.
3. Fire-retardant-treated wood labeled for exterior use and shall meet the requirements of section 2302 of the International Building Code.
4. Noncombustible material.
5. Any material that complies with the performance requirements of Section 504.7.3.4 when tested in accordance with ASTM E2632 provided that any attached exterior wall covering is noncombustible or ignition-resistant materials. **Exception:** Wall material shall be permitted to be of any material that otherwise complies with this chapter when the decking surface material complies with the performance requirements ASTM E84 with a Class B flame spread index.

504.7.3.3 Performance requirements for Section 504.7.3.2, Item 1. Materials shall be tested in accordance with both ASTM E2632 and ASTM E2726 and comply with the conditions of acceptance in Sections 504.7.3.3.1 and 504.7.3.3.2. The material shall also be tested in accordance with ASTM E84 or UL 723 and comply with the performance requirements of Section 503.2.4.

504.7.3.3.1 Conditions of acceptance for ASTM E2632. . The ASTM E2632 test shall be conducted on a minimum of three test specimens and meet the conditions of acceptance in Items 1 through 3 below. If any one of the three tests does not meet the conditions of acceptance, three additional tests shall be performed. All three additional tests must meet the conditions of acceptance.

1. Peak heat release rate of less than or equal to 25 kW/ft² (269 kW/m²).
2. Absence of sustained flaming or glowing combustion of any kind at the conclusion of the 40-min observation period.
3. Absence of falling particles that are still burning when reaching the burner or floor.

504.7.3.3.2 Conditions of acceptance for ASTM E2726. The ASTM E2726 test shall be conducted, using a “Class A” size roof test brand, on a minimum of three test specimens and meet the conditions of acceptance in Items 1 and 2 below. If any one of the three tests does not meet the conditions of acceptance, three additional tests shall be performed. All three additional tests must meet the conditions of acceptance.

1. Absence of sustained flaming or glowing combustion of any kind at the conclusion of the 40-minute observation period.
2. Absence of falling particles that are still burning when reaching the burner or floor.

504.7.3.4 Performance requirements for Section 504.7.3.2, Item 5. The ASTM E2632 test shall be conducted on a minimum of three test specimens and meet the condition of acceptance in Item 1 below. If any one of the three tests does not meet the condition of acceptance, three additional tests shall be performed. All three additional tests must show a peak heat release rate shall be 25 kW/ft² (269 kW/ m²) or less.

Revise as follows:

504.8 Exterior glazing. Exterior windows, window walls and exterior glazed doors having a glazed area of 25 percent or more of the door area, windows within exterior doors, and skylights shall be constructed of any of the following:

1. ~~tempered glass, multilayered glazed panels,~~ Multilayered glazed panels with at least one tempered panel or dome complying with Section 2406 of the International Building Code. ~~,~~
2. ~~glass~~ Glass block units. ~~, or have a~~
3. A minimum fire-protection rating of ~~not less than~~ 20 minutes when tested in accordance with NFPA 257 or UL 9, and shall be exempt from the hose stream test.

Add new text as follows:

504.8.1 Structural glass veneer. The wall assembly behind structural glass veneer shall comply with Section 504.5.

504.8.2 Operable skylights. Operable skylights shall be protected by a non-combustible mesh screen and the dimensions of the openings in the screen shall not exceed ⅛ inch (3.2 mm).

Revise as follows:

504.9 Exterior doors. Exterior doors shall be constructed in accordance with any of the following:

1. ~~*approved noncombustible*~~ Noncombustible construction. ~~,~~
2. ~~solid core~~ Solid-core wood not less than $1\frac{3}{4}$ inches thick (44 mm). ~~, or~~
3. ~~have~~ Have a fire protection rating of not less than 20 minutes when tested according to NFPA 252.
4. The exterior door shall be constructed of solid core wood that complies with the following requirements:
   4.1. Stiles and rails shall not be less than 1 3/8 inches (35 mm) thick.
   4.2. Panels shall not be less than 1¼ inches thick, except for the exterior perimeter of the panel that shall be permitted to taper to a tongue not less than 3/8 inch (35 mm) thick.
5. The exterior surface or cladding shall be tested to meet the performance requirements of Section 504.9.3 when tested in accordance with ASTM E2707 with the conditions of acceptance shown in Section 504.9.3.

Windows within doors and exterior glazed doors shall be in accordance with Section 504.8.

~~**Exception:** Vehicle access doors.~~

Add new text as follows:

504.9.1 Garage doors. Automatic garage door openers for vehicle doors serving a residential building shall be equipped with a battery backup function.

504.9.2 Garage door perimeter gap. Exterior garage doors shall resist the intrusion of embers from entering by preventing gaps between doors and door openings, at the bottom, sides and tops of doors, from exceeding ⅛ inch (3.2 mm). Gaps between doors and door openings shall be controlled by one of the following methods:

1. Weather-stripping products shall be constructed of materials which comply with both of the following:
   1.1. The tensile strength of the material shall be tested in accordance with ASTM D638 before and after exposure to ASTM G155 for a period of 2,000 hours, and the maximum allowable difference in tensile strength values between exposed and non-exposed samples shall not exceed 10 percent.
   1.2. When tested to UL 94, the materials shall have a flammability rating of V-2 or better.
2. Door overlaps onto jambs and headers.

3. Garage door jambs and headers covered.

504.9.3 Conditions of acceptance for ASTM E2707. The ASTM E2707 test shall be conducted on a minimum of three test specimens and meet the conditions of acceptance in Items 1 and 2 below. If any one of the three tests does not meet the conditions of acceptance, three additional tests shall be performed. All three additional tests must meet the conditions of acceptance.

1. Absence of flame penetration through the wall assembly at any time.
2. Absence of evidence of glowing combustion on the interior surface of the assembly at the end of the 70-minute test.

504.10 Vents. Where provided, ventilation openings for enclosed attics, gable ends, ridge ends, under eaves and cornices, enclosed eave soffit spaces, enclosed rafter spaces formed where ceilings are applied directly to the underside of roof rafters, underfloor ventilation, foundations and crawl spaces, or any other opening intended to permit ventilation, either in a horizontal or vertical surface, shall be in accordance with Section 504.10.1 or Section 504.10.2 to resist building ignition from the intrusion of burning embers and flame through the ventilation openings.

504.10.1 Performance requirements. Ventilation openings shall be fully covered with listed vents, tested in accordance with ASTM E2886, to demonstrate compliance with all the following requirements:

1. There shall be no flaming ignition of the cotton material during the Ember Intrusion Test.
2. There shall be no flaming ignition during the Integrity Test portion of the Flame Intrusion Test.
3. The maximum temperature of the unexposed side of the vent shall not exceed 662°F (350°C).

Delete and substitute as follows:

~~**504.10.2 Prescriptive requirements.** Where provided, attic ventilation openings, foundation or underfloor vents, or other ventilation openings in vertical or horizontal surfaces and vents through roofs shall not exceed 144 square inches (0.0929 m^2) each. Such vents shall be covered with noncombustible corrosion-resistant mesh with openings not to exceed 1/8 inch (3.2 mm) or shall be designed and approved to prevent flame or ember penetration into the structure.~~

504.10.2 Off ridge and ridge vents. Vents that are installed on a sloped roof, such as dormer vents, shall comply with all of the following:

1. Vents shall be covered with a mesh where the dimensions of the mesh therein shall be a minimum of 1/16 inch (1.6 mm) and shall not exceed ⅛ inch (3.2 mm) in diameter.
2. The mesh material shall be noncombustible.
3. The mesh material shall be corrosion resistant.

504.10.3 Vent locations. Attic ventilation openings shall not be located in soffits, in eave overhangs, between rafters at eaves or in other overhang areas. Gable-end and dormer vents shall be located not less than 10 feet (3048 mm) from lot lines. Underfloor ventilation openings shall be located as close to grade as practical.

Delete and substitute as follows:

~~**504.11 Detached accessory structures.** Detached accessory structures located less than 50 feet (15 240 mm) from a building containing habitable space shall have exterior walls constructed with materials *approved* for not less than 1-hour *fire-resistance-rated construction* , heavy timber, *log wall construction*, or constructed with *approved noncombustible* materials or fire-retardant-treated wood on the exterior side. The fire-retardant-treated wood shall be labeled for exterior use and meet the requirements of Section 2303.2 of the~~

~~International Building Code.~~

504.11 Accessory buildings and miscellaneous structures. Accessory buildings and miscellaneous structures shall be constructed to conform to the ignition-resistance requirements of Sections 504.11.1 through 504.11.6.

~~**504.11.1 Underfloor areas.** Where the detached structure is located and constructed so that the structure or any portion thereof projects over a descending slope surface greater than 10 percent, the area below the structure shall have underfloor areas enclosed to within 6 inches (152 mm) of the ground, with exterior wall construction in accordance with Section 504.5 or underfloor protection in accordance with Section 504.6. **Exception:** The enclosure shall not be required where the underside of exposed floors and exposed structural columns, beams and supporting walls are protected as required for exterior 1-hour *fire-resistance-rated construction* or *heavy timber construction* or fire-retardant-treated wood on the exterior side. The fire-retardant-treated wood shall be labeled for exterior use and meet the requirements of Section 2303.2 of the International Building Code.~~

504.11.1 Applicability. Sections 504.11.2 through 504.11.6 apply to accessory buildings, and attached or detached miscellaneous structures, on the same lot as an applicable building, including but not limited to trellises, arbors, patio covers, gazebos and similar structures. **Exceptions:**

1. Decks shall comply with the requirements of Section 504.7.3.
2. Awnings and canopies shall comply with the requirements of Section 3105 of the International Building Code.

Add new text as follows:

504.11.2 Miscellaneous structures and accessory buildings within 3 feet.. Miscellaneous structures and accessory buildings of any size, when separated from an applicable building on the same lot by a distance of less than 3 feet (914 mm), shall be constructed of noncombustible materials or of ignition-resistant materials as described in Section 503.2.4.

504.11.3 Accessory buildings greater than 120 square feet, located 3 feet or more but less than 50 feet. Accessory buildings that are greater than 120 square feet (11.15 m^2) in size and separated from an applicable building on the same lot by a distance of 3 feet (914 mm) or more but less than 50 feet (15 240 mm) shall be constructed of noncombustible materials or of ignition-resistant materials as described in Section 503.2.4., located 3 feet or more but less than 50 feet.

504.11.4 Accessory buildings 120 square feet or less, located 3 feet or more but less than 50 feet. When required by the enforcing agency, accessory buildings 120 square feet (11.15 m^2) or less and separated from an applicable building on the same lot by a distance of 3 feet (914 mm) or more but less than 50 feet (15 240 mm) shall be constructed of noncombustible materials or of ignition-resistant materials as described in Section 503.2.4.

504.11.5 Miscellaneous structures located 3 feet or more but less than 50 feet. When required by the enforcing agency, miscellaneous structures that require a permit and are separated from an applicable building on the same lot by a distance of 3 feet (914 mm) or more but less than 50 feet (15 240 mm) shall be constructed of noncombustible materials or of ignition-resistant materials as described in Section 503.2.4.

504.11.6 Roof construction. Roof assemblies and roof coverings of accessory buildings required to be constructed entirely of noncombustible materials or of ignition-resistant materials shall comply with Sections 504.2 and 504.2.1.

Reason: This code change is to propose one construction method for building and structures in the wildland area. This is the companion to another proposal to delete sections 505 and 506 with the intent to remove Ignition Resistant Construction Classes 2 and 3. Replacing these multiple classifications will be a single defined Ignition Resistant Construction as provided by Section 504. As the IWUIC is intended to provide a minimum standard of protection for the Wildland-Urban Interface areas, a single classification of Ignition Resistant Construction should be provided to accomplish the following goals:

1. Protect lives and property within the Wildland-Urban Interface areas

2. Provide clear and consistent standards, simplifying the construction process
3. Provide a minimum standard of protection, with appendices providing potential pathways for increased protection beyond the minimum

Findings during a NIST case study of the 2018 Camp Fire (https://nvlpubs.nist.gov/nistpubs/TechnicalNotes/NIST.TN.2135.pdf) found that a primary factor in fire spread was significant ember exposure. As stated in the case study "In agreement with the other NIST case studies of WUI fires, the Camp Fire has demonstrated that embers can have significant impact on WUI communities. Laboratory and field work by NIST [57] has demonstrated that embers with enough energy to cause ignitions are readily generated from parcel-level combustibles such as landscaping mulch, fences, and firewood piles. These parcel-level fuels can cause ignitions over 40 m (130 ft) downwind. Ember ignitions downwind from parcel-level combustibles enable fire to readily spread from parcel to parcel. In high hazard areas, WUI structures therefore need to be able to withstand the exposures generated from both wildland and parcel-level combustibles." (A Case Study of the Camp Fire, pg.141)

Given the distances that embers can travel, this minimum standard of protection should be across all Wildland-Urban Interface areas; regardless of whether they have been designated as Moderate, High or Extreme hazards. An analysis of California structures damaged by wildfire in 2017 found that more homes were damaged in the areas designated as moderate fire hazard severity (3645 damaged) than those damaged in areas designated as very high fire hazard severity (2215 damaged). Of those damaged, a similar percentage of those structures were recorded as destroyed; 92% of damaged structures being destroyed in moderate fire hazard severity zones, and 86% of damaged structures being destroyed in very high fire hazard severity zones. This data indicates that the requirements proposed in 504 which mirror the California Building Code Chapter 7A requirements are working.

Construction Costs for a Wildfire Resistant Home, California Edition (headwaterseconomics.org)

The Headwaters Economics study by the Insurance Institute for Business & Home Safety outlines that California's Chapter 7A requirements should be the bare minimum. If there is a proposal for three construction versions, using the proposed code provisions as the minimum with an enhanced version and an optimum version for best performance standards. "In preliminary research conducted by Baylis and Boomhower (2021), the authors examined home survivability factors for nearly 50,000 homes exposed to wildfires between 2007 and 2020 across California. The authors reported that a home built in 2010 or later was nearly 40% less likely to be destroyed by a wildfire compared to a home built in 1985 or before. Home survivability was closely correlated to modern building codes requiring homeowner mitigation measures. Additionally, a home was more likely to survive if its nearest neighbor also complied with recent mitigation regulations resulting in a positive net spillover effect for the larger neighborhood.

Roof - Section 504.2

Roofs are highly vulnerable to ignition due to their relatively large horizontal surface area. The exposure of roof coverings to a range of climatic conditions, including wind, rain, and sun, means the roof covering will require maintenance and eventual replacement. Many Class A fire-rated roof covering options are available (e.g., asphalt fiberglass composition shingles). A main reason the roof is vulnerable is because the roof edge—including gutters and roof-to-wall intersections where roof covering meets other materials (e.g., siding used in dormers and split-level homes)—is exposed to ember ignitions. These areas must be properly protected by adding additional flashing at roof-to-wall locations.

Under-Eave Area - Sections 504.3 and 504.3.1

Research suggests eaves are extremely important in structure survivability. Eaves play an important role for building design but they also create vulnerabilities and pathways for the building to ignite. Embers can travel through vents in the eave into the attic and accumulate in gaps between blocking and rafters in open-eave construction. Should flames reach the under-eave area, open eaves can also trap heat. Once there is an ignition in the under-eave area, fire will spread laterally more quickly.

Vents in the under-eave area are inlet openings and therefore allow air to enter the attic space. During a wildfire, vent openings can allow the entry of wind-blown embers into the interior attic space. If combustible materials in the attic ignite, the house can burn from the inside out. The importance of ember and flame entry through vents during a wildfire, and as per requirements in Chapter 7A, have resulted in the development of vents designed to resist the intrusion of flames and embers.

Exterior Wall and Wall Covering - Sections 504.5 and 504.5.1

Exterior walls and components in the wall assembly can be vulnerable if exposed to embers, flames, or prolonged exposure to radiant heat from burning items located close to the home. These exposures can ignite combustible siding and the resulting flames can spread vertically and laterally to other wall components such as windows and the under-eave area. Siding extending close to the ground can be vulnerable to ignition by embers accumulating at the base of the wall that ignite it or components in the wall assembly (e.g., wood sheathing). Requirements are included to address the wall assembly itself, along with the exterior wall covering. The wall could be fire resistant, but a combustible exterior wall covering could carry fire up the wall to the eaves and attic.

Attached Deck - Sections 504.7.3 through 504.7.3.4

Similar to a roof, a deck can cover a large horizontal surface area and can be vulnerable to embers and under-deck flame impingement exposures. A burning deck can expose the side of the house to extended radiant heat and/or direct flame contact. The deck walking surface and structural support members, as well as what is stored on or below the deck are therefore important considerations.

Most commonly used deck board products (including wood and plastic composite boards) are combustible. Decks with noncombustible walking surfaces include lightweight concrete or a flagstone product. Regardless of the walking surface, decks are typically supported by solid wood joists, beams, and columns that will be vulnerable to ignition if nearby combustible materials ignite.

Enclosing the under-deck area vertically around the perimeter can minimize the accumulation of vegetative debris, vegetation, and other combustible materials. For enclosed decks, installing vents to ensure that excessive moisture does not accumulate in the under-deck area is critical to avoid moisture-related degradation.

Glazing - Sections 504.8 through 804.8.2

Window manufacturers and suppliers indicated that where dual-pane windows are required to be tempered, most window manufacturers only supply windows with both panes tempered. Other manufacturers will supply what the customer requests, and will only provide one-pane tempered. Since all comparative versions of the wildfire-resistant home are compliant, the price of windows would not result in a significant cost difference.

Doors - Section 504.9

Doors and door frames can fail for the same reasons as windows. Embers can accumulate in the small gaps between the door and frame, resulting in ignition of the door-framing and weather-sealing material.

Vents - Section 504.10 through 504.10.3

Flame- and ember-resistant vents are required to be listed. Currently, only vents in a vertical orientation are listed. Where vents are installed in other than by the OSFM Building Materials Listing Program, will be required for all attic and crawl space vents.

Accessory Structures - Section

The following table helps visualize the resultant requirements.

NIST Technical note 2205 explains how the mitigation of accessory structures help in hardening a building in the wildland area.

https://nvlpubs.nist.gov/nistpubs/TechnicalNotes/NIST.TN.2205.pdf

Bibliography: Construction costs for a wildfire-resistant home: California edition - Headwaters Economics

Fire Research Division | NIST

https://nvlpubs.nist.gov/nistpubs/TechnicalNotes/NIST.TN.2205.pdf

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

Construction costs for a typical single-family (1,750 square-foot) home would increase approximately $2,000 including developer overhead costs.

Estimated Immediate Cost Impact Justification (methodology and variables):

In 2004, and as a precursor to California adopting Building Code Chapter 7A, the Office of the State Fire Marshal requested an analysis identifying the costs and benefits associated with proposed regulations in the state's wildfire-prone areas. The study was conducted by Fire Cause Analysis and evaluated economic and construction data within various business sectors to analyze construction costs if proposed regulations were implemented.33 The study found construction costs for a typical single-family (1,750 square-foot) home would increase approximately $2,000 including developer overhead costs. As an aggregated total at the state level, construction costs would increase approximately $30 million per year for the estimated 14,000 new homes built in areas where regulations would apply. The authors concluded the costs of not implementing regulations, in the form of property losses and suppression costs, exceeded the projected costs for regulations and therefore recommended adopting mitigation standards in wildfire-prone areas.

In 2019, the National Institute of Building Sciences (NIBS) released a report identifying the benefit-cost ratio (BCR) of investing in hazard mitigation, including wildfires.35 The authors found that for every $1 spent on up-front costs for wildfire mitigation, a benefit of $4 was received.

In 2021, the National Research Council of Canada released a study analyzing the benefit-cost ratio for building new construction to comply with the country's wildland urban interface (WUI) Guide.38 In its examination, approximately $12,000 CAD (~$9,500 USD) was added to the overall costs for a new, 2,000-square-foot home to meet the provision of Canada's National WUI Guide. The comprehensive report also examined costs for retrofitting existing structures, as well as transferred costs at the community and national scale. Similar to the NIBS study in 2019, the NRC report found an up-front investment in wildfire-resistant construction and vegetation management yielded benefits that exceeded long-term costs and losses.

WUIC54-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee stated that the reasons for the disapproval of the proposal were: The comparison between California and the many other states that have just adopted the code and what their results are. There is a lot of information in the proposal and there was a lot of attempts at making modifications that the committee really did not want to try to do. The desire to see the proposal, along with what has been already approved, being combined into the proposal in some way, shape or form, or take out those

things that has already addressed. The reason for this is that the proposal is confusing, and it is difficult to prepare a position for it with all the other changes being made by other proposals. The code is not broken the way it is now. There are enhancements forthcoming and going through and affordable housing, which this country desperately needs, especially for lower to median incomes, this proposal works against these objectives. Using these standards, a lot of multifamily housing is to the point where you have already got automatic fire sprinklers and you are just adding more and more building standards on top, and it is tough to compete. It just has to be added a little bit slower or it is really going to be tough for affordable housing if they have to build in these areas and at the same time try to be cost effective, keep rents down for residents. (Vote: 11-2)

WUIC54-24

Individual Consideration Agenda

Comment 1:

IWUIC: 504.2, 504.2.1, 504.2.2, 504.5, 504.6, 504.7, 504.7.1, 504.7.3.2, 504.7.3.4, 504.9, 504.9.1, 504.9.2, 504.10, 504.10.1, 504.10.3, 504.11, UL Chapter 07 (New)

Proponents: Crystal Sujeski, CAL FIRE/Office of the State Fire Marshal (crystal.sujeski@fire.ca.gov) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Wildland Urban Interface Code

Revise as follows:

504.2 Roof assembly. Roofs shall have a *roof assembly* that complies with a Class A fire classification when tested in accordance with ASTM E108 or UL 790. . **Exceptions:** The following assemblies are exempt from testing and shall be considered as a classification equivalent to Class A.

1. ~~Class A *roof*~~ *Roof assemblies* include those with coverings of brick, masonry or an exposed concrete *roof deck*.
2. ~~Class A *roof*~~ *Roof assemblies* also include with ferrous or copper shingles or sheets, metal sheets and shingles, clay or concrete roof tile or slate installed on noncombustible decks or ferrous, copper or metal sheets installed without a *roof deck* on noncombustible framing.
3. ~~Class A *roof*~~ *Roof assemblies* include minimum 16 oz/sq ft (0.0416 kg/m^2) copper sheets installed over combustible *roof decks*.
4. Roof assemblies of slate roof covering over ASTM D226, Type II underlayment over combustible decks.

504.2.1 Roof covering gaps. ~~Roof covering gaps and voids~~ Where there is a void under the roof covering it shall be protected as follows:

1. Where the roofing is installed over a combustible deck, and the roofing ~~covering~~ profile ~~has~~ creates an airspace under the roof covering, the installation shall comply with the following: ~~and is installed over a combustible deck, the combustible deck shall be protected by any of the following~~:
   1.1 Install a 72-pound (32.7 kg) cap sheet, complying with ASTM D3909, over the roof deck.
   1.2 Install mineral wool board or other noncombustible material with a minimum thickness of 1 inch (25.4 mm) between the roofing material and the wood framing or deck.
   1.3 Install a Class A fire classification roof underlayment, tested in accordance with ASTM E108 or UL 790. If the sheathing consists of exterior fire-retardant treated wood, the underlayment shall not be required to comply with a Class A classification.

2. Bird stops shall be used at the eaves, when the profile fits, to prevent debris from entering at the eave. Hip and ridge caps shall be mudded to prevent intrusion of fire or embers.

504.2.2 Roof valleys. Where provided, valley flashings shall be not less than 0.019 inch (0.48 mm) (No. 26 galvanized sheet gage) corrosion-resistant metal installed over a minimum 36-inch-wide (914 mm) underlayment consisting of one layer of 72-pound (32.7 kg) mineral-surfaced, nonperforated cap sheet complying with ASTM D3909 running the full length of the valley.

504.5 Exterior walls. Exterior walls of buildings or structures shall be constructed with one of the following methods:

1. 1-hour *fire-resistance-rated construction* .
2. *Approved noncombustible* materials.
3. Heavy timber. Assembly of sawn lumber or glue-laminated wood with the smallest minimum nominal dimension of 4 inches (102 mm). Sawn or glue-laminated planks splined, tongue-and-grove or set close together and well spiked.
4. Log wall construction. Assembly that has been tested in accordance with the test procedures for a 10-minute direct flame contact exposure test set forth in ASTM E2707 with the conditions of acceptance shown in Section 504.9.3.
5. Wall assemblies suitable for exterior fire exposure containing one layer of 5/8-inch (15.9 mm) Type X gypsum sheathing applied behind the exterior wall covering or cladding on the exterior side of the framing.
6. Fire-retardant-treated wood shall be labeled for exterior use and meet the requirements of Section 2303.2 of the International Building Code.
7. Ignition-resistant materials complying with Section 503.2 .

Such material shall extend from the top of the foundation to the underside of the roof sheathing.

504.6 Underfloor enclosure. Buildings or structures shall have underfloor areas enclosed to the ground with exterior walls in accordance with Section 504.5. **Exception:** Complete enclosure shall not be required where the underside of exposed floors and exposed structural columns, beams and supporting walls are protected as required for exterior 1-hour *fire-resistance-rated construction* or *heavy timber construction* or fire-retardant-treated wood. The fire-retardant-treated wood shall be labeled for exterior use and meet the requirements of Section 2303.2 of the International Building Code.

Revise as follows:

504.7 Projections. *Unenclosed accessory structures* attached to buildings with habitable spaces and projections, other than decks, shall be *heavy timber construction* or constructed of one of the following:

1. Noncombustible materials.
2. Fire-retardant-treated wood identified for exterior use and meeting the requirements of Section 2303.2 of the International Building Code.
3. Ignition-resistant building materials in accordance with Section 503.2.
4. Materials approved for not less than 1-hour fire-resistance-rated construction on the exterior side, as tested in accordance with ASTM E119 or UL 263.
5. One layer of 5/8-inch (15.9 mm) Type X gypsum sheathing applied behind the exterior covering on the underside of the ceiling.
6. The exterior portion of a 1-hour fire-resistance-rated exterior assembly, as tested in accordance with ASTM E119, or UL 263 applied to the underside of the ceiling assembly, including assemblies using the gypsum panel and sheathing products listed in the Gypsum Association Fire Resistance Design Manual.
7. The underside of a floor projection assembly that meets the performance criteria in Section 504.7.2 when tested in accordance with the test procedures set forth in ASTM E2957.

504.7.1 Underside of projections.

The underside of projections shall be enclosed to grade in accordance with the requirements of this chapter or the underside of the exposed underfloor shall be protected by one or more of the following:

Exception: Structural columns and beams are not required to be protected in accordance with Section 504.7.1 when constructed with sawn lumber or glue-laminated wood with the smallest minimum nominal dimension of 4 inches (102 mm). Sawn or glue-laminated planks shall be splined, tongue-and-groove, or set close together and well spiked.

1. Noncombustible material.
2. The ignition-resistant material shall be labeled for exterior use and shall meet the requirements of Section 503.2.
3. The fire-retardant-treated wood shall be labeled for exterior use and shall meet the requirements of Section 2303.2 of the International Building Code.
4. Materials approved for not less than 1-hour fire-resistance-rated construction on the exterior side, as tested in accordance with ASTM E119 or UL 263.
5. One layer of 5/8-inch (15.9 mm) Type X gypsum sheathing applied behind an exterior covering on the underside of the floor projection.
6. The exterior portion of a 1-hour fire-resistance-rated exterior assembly, as tested in accordance with ASTM E119 or UL 263, applied to the underside of the floor, including assemblies using the gypsum panel and sheathing products listed in the Gypsum Association Fire Resistance Design Manual.
7. The underside of a floor assembly that meets the performance criteria in Section 504.7.2 when tested in accordance with the test procedures set forth in ASTM E2957.

504.7.3.2 Decking surfaces. The walking surface material of decks, porches, balconies and stairs shall be constructed with any of the following materials:

1. Material that complies with the performance requirements of Section 504.7.3.3.
2. Ignition-resistant material that complies with the performance requirements of Section 504.7.2.
3. Fire-retardant-treated wood labeled for exterior use and shall meet the requirements of section 2302 of the International Building Code.
4. Noncombustible material.
5. ~~Any material that complies with the performance requirements of Section 504.7.3.4 when tested in accordance with ASTM E2632 provided that any attached exterior wall covering is noncombustible or ignition-resistant materials.~~ ~~**Exception:** Wall material shall be permitted to be of any material that otherwise complies with this chapter when the decking surface material complies with the performance requirements ASTM E84 with a Class B flame spread index.~~

504.7.3.4 Performance requirements for Section 504.7.3.2, Item 5. The ASTM E2632 test shall be conducted on a minimum of three test specimens and meet the condition of acceptance in Item 1 below. If any one of the three tests does not meet the condition of acceptance, three additional tests shall be performed. All three additional tests must show a peak heat release rate shall be 25 kW/ft² (269 kW/ m²) or less.

Revise as follows:

504.9 Exterior doors. Exterior doors shall be constructed in accordance with any of the following:

1. Noncombustible construction.
2. Solid-core wood not less than $1\frac{3}{4}$ inches thick (44 mm).
3. Have a fire protection rating of not less than 20 minutes when tested according to NFPA 252, UL10B or UL10C.

4. The exterior door shall be constructed of solid core wood that complies with the following requirements:
    4.1. Stiles and rails shall not be less than 1 3/8 inches (35 mm) thick.
    4.2. Raised Panels shall not be less than 1¼ inches (32mm) thick, except for the exterior perimeter of the panel that shall be permitted to taper to a tongue not less than 3/8 inch (35 mm) thick.
5. The exterior surface or cladding shall be tested to meet the performance requirements of Section 504.9.3 when tested in accordance with ASTM E2707 with the conditions of acceptance shown in Section 504.9.3.

Windows within doors and exterior glazed doors shall be in accordance with Section 504.8.

504.9.1 Garage doors. Automatic garage door openers for vehicle doors serving a residential building shall be equipped with a battery backup function.

504.9.2 Garage door perimeter gap. Exterior garage doors shall resist the intrusion of embers from entering by preventing gaps between doors and door openings, at the bottom, sides and tops of doors, from exceeding ⅛ inch (3.2 mm). Gaps between doors and door openings shall be controlled by one of the following methods:

1. Weather-stripping products shall be constructed of materials which comply with both of the following:
    1.1. The tensile strength of the material shall be tested in accordance with ASTM D638 before and after exposure to ASTM G155 for a period of 2,000 hours, and the maximum allowable difference in tensile strength values between exposed and non-exposed samples shall not exceed 10 percent.
    1.2. When tested to UL 94, the materials shall have a flammability rating of V-2 or better.
2. Door overlaps onto jambs and headers.
3. Garage door jambs and headers covered.

504.10 Vents. Where provided, ventilation openings for enclosed attics, gable ends, ridge ends, under eaves and cornices, enclosed eave soffit spaces, enclosed rafter spaces formed where ceilings are applied directly to the underside of roof rafters, underfloor ventilation, foundations and crawl spaces, or any other opening intended to permit ventilation, either in a horizontal or vertical surface, shall be in accordance with Section 504.10.1 or Section 504.10.2 to resist building ignition from the intrusion of burning embers and flame through the ventilation openings.

504.10.1 Performance requirements. Ventilation openings shall be fully covered with listed vents, tested in accordance with ASTM E2886, to demonstrate compliance with all the following requirements:

1. There shall be no flaming ignition of the cotton material during the Ember Intrusion Test.
2. There shall be no flaming ignition during the Integrity Test portion of the Flame Intrusion Test.
3. The maximum temperature of the unexposed side of the vent shall not exceed 662°F (350°C).

504.10.3 Vent locations. Attic ventilation openings shall not be located in soffits, in eave overhangs, between rafters at eaves or in other overhang areas. Gable-end and dormer vents shall be located not less than 10 feet (3048 mm) from lot lines. Underfloor ventilation openings shall be located as close to grade as practical.

504.11 Accessory buildings and miscellaneous structures. Accessory buildings and miscellaneous structures shall be constructed to conform to the ignition-resistance requirements of Sections 504.11.1 through 504.11.6.

Add new standard(s) as follows:

2024 International Wildland Urban Interface Code

Delete without substitution:

~~SECTION 505~~
~~CLASS 2 IGNITION-RESISTANT CONSTRUCTION~~

Revise as follows:

~~**505.1 General.** Class 2 ignition-resistant construction shall be in accordance with Sections 505.2 through 505.11.~~

~~**505.2 Roof assembly.** Roofs shall have a *roof assembly* that complies with not less than a Class A rating when tested in accordance with ASTM E108 or UL 790, or an *approved noncombustible roof covering*. For *roof assemblies* where the profile allows a space between the *roof covering* and *roof deck*, the space at the eave ends shall be firestopped to preclude entry of flames or embers, or have one layer of cap sheet complying with ASTM D3909 installed over the combustible *roof deck*.~~

~~**505.2.1 Roof valleys.** Where provided, valley flashings shall be not less than 0.019 inch (0.48 mm) (No. 26 galvanized sheet gage) corrosion-resistant metal installed over a minimum 36-inch-wide (914 mm) underlayment consisting of one layer of 72-pound (32.4 kg) mineral-surfaced, nonperforated cap sheet complying with ASTM D3909 running the full length of the valley.~~

~~**505.3 Protection of eaves.** Combustible eaves, fascias and soffits shall be enclosed with solid materials with a minimum thickness of $^{3}/_{4}$ inch (19 mm). Exposed rafter tails shall not be permitted unless constructed of heavy timber materials.~~

~~**505.4 Gutters and downspouts.** Gutters and downspouts shall be constructed of *noncombustible* material. Gutters shall be provided with an *approved* means to prevent the accumulation of leaves and debris in the gutter.~~

~~**505.5 Exterior walls.** Exterior walls of buildings or structures shall be constructed with one of the following methods:~~

1. ~~Materials *approved* for not less than 1-hour *fire-resistance-rated construction* on the exterior side.~~
2. ~~*Approved noncombustible* materials.~~
3. ~~*Heavy timber* or *log wall construction*.~~
4. ~~Fire-retardant-treated wood on the exterior side. The fire-retardant-treated wood shall be labeled for exterior use and meet the requirements of Section 2303.2 of the International Building Code.~~
5. ~~Ignition-resistant materials on the exterior side.~~

~~Such material shall extend from the top of the foundation to the underside of the roof sheathing.~~

~~**505.6 Underfloor enclosure.** Buildings or structures shall have underfloor areas enclosed to the ground, with exterior walls in accordance with Section 505.5. **Exception:** Complete enclosure shall not be required where the underside of exposed floors and exposed structural columns, beams and supporting walls are protected as required for exterior 1-hour *fire-resistance-rated construction* or *heavy timber construction* or fire-retardant-treated wood. The fire-retardant-treated wood shall be labeled for~~

exterior use and meet the requirements of Section 2303.2 of the International Building Code.

505.7 Appendages and projections. *Unenclosed accessory structures* attached to buildings with habitable spaces and projections, such as decks, shall be not less than 1-hour *fire-resistance-rated construction*, *heavy timber construction* or constructed of one of the following:

1. *Approved noncombustible* materials.
2. Fire-retardant treated wood identified for exterior use and meeting the requirements of Section 2303.2 of the International Building Code.
3. Ignition-resistant building materials in accordance with Section 503.2. **Exception:** Coated materials shall not be used as the walking surface of decks.

505.7.1 Underfloor areas. Where the attached structure is located and constructed so that the structure or any portion thereof projects over a descending slope surface greater than 10 percent, the area below the structure shall have underfloor areas enclosed to within 6 inches (152 mm) of the ground, with exterior wall construction in accordance with Section 505.5.

505.8 Exterior glazing. Exterior windows, window walls and glazed doors, windows within exterior doors, and skylights shall be tempered glass, *multilayered glazed panels*, glass block or have a fire protection rating of not less than 20 minutes.

505.9 Exterior doors. Exterior doors shall be *approved noncombustible* construction, solid core wood not less than $1\frac{3}{4}$ inches thick (45 mm), or have a fire protection rating of not less than 20 minutes. Windows within doors and glazed doors shall be in accordance with Section 505.8. **Exception:** Vehicle access doors.

505.10 Vents. Where provided, ventilation openings for enclosed attics, gable ends, ridge ends, under eaves and cornices, enclosed eave soffit spaces, enclosed rafter spaces formed where ceilings are applied directly to the underside of roof rafters, underfloor ventilation, foundations and crawl spaces, or any other opening intended to permit ventilation, either in a horizontal or vertical surface, shall be in accordance with Section 505.10.1 or Section 505.10.2 to resist building ignition from the intrusion of burning embers and flame through the ventilation openings.

505.10.1 Performance requirements. Ventilation openings shall be fully covered with listed vents, tested in accordance with ASTM E2886, to demonstrate compliance with all the following requirements:

1. There shall be no flaming ignition of the cotton material during the Ember Intrusion Test.
2. There shall be no flaming ignition during the Integrity Test portion of the Flame Intrusion Test.
3. The maximum temperature of the unexposed side of the vent shall not exceed 662°F (350°C).

505.10.2 Prescriptive requirements. Where provided, attic ventilation openings, foundation or underfloor vents, or other ventilation openings in vertical or horizontal surfaces and vents through roofs shall not exceed 144 square inches (0.0929 m^2) each. Such vents shall be covered with noncombustible corrosion-resistant mesh with openings not to exceed 1/8 inch (3.2 mm) or shall be designed and approved to prevent flame or ember penetration into the structure.

505.10.3 Vent locations. Attic ventilation openings shall not be located in soffits, in eave overhangs, between rafters at eaves or in other overhang areas. Gable-end and dormer vents shall be located not less than 10 feet (3048 mm) from lot lines. Underfloor ventilation openings shall be located as close to grade as practical.

505.11 Detached accessory structures. Detached accessory structures located less than 50 feet (15 240 mm) from a building containing habitable space shall have exterior walls constructed with materials *approved* for not less than 1-hour *fire-resistance-rated construction*, heavy timber, *log wall construction*, or constructed with *approved noncombustible* materials or fire-retardant-treated wood on the exterior side. The fire-retardant-treated wood shall be labeled for exterior use and meet the requirements of Section 2303.2 of the International Building Code.

505.11.1 Underfloor areas. Where the detached *accessory structure* is located and constructed so that the structure or any portion

~~thereof projects over a descending slope surface greater than 10 percent, the area below the structure shall have underfloor areas enclosed to within 6 inches (152 mm) of the ground, with exterior wall construction in accordance with Section 505.5 or underfloor protection in accordance with Section 505.6.~~ ~~**Exception:** The enclosure shall not be required where the underside of exposed floors and exposed structural columns, beams and supporting walls are protected as required for exterior 1-hour *fire-resistance-rated construction* or heavy-timber construction or fire-retardant-treated wood on the exterior side. The fire-retardant-treated wood shall be labeled for exterior use and meet the requirements of Section 2303.2 of the International Building Code.~~

Delete without substitution:

~~SECTION 506~~
~~CLASS 3 IGNITION-RESISTANT CONSTRUCTION~~

Revise as follows:

~~**506.1 General.** Class 3 ignition-resistant construction shall be in accordance with Sections 506.2 through 506.4.~~

~~**506.2 Roof assembly.** Roofs shall have a *roof assembly* that complies with not less than a Class B rating when tested in accordance with ASTM E108 or UL 790 or an *approved noncombustible roof covering*. For *roof assemblies* where the profile allows a space between the *roof covering* and *roof deck*, the space at the eave ends shall be firestopped to preclude entry of flames or embers, or have one layer of cap sheet complying with ASTM D3909 installed over the combustible *roof deck*.~~

~~**506.2.1 Roof valleys.** Where provided, valley flashings shall be not less than 0.019 inch (0.44 mm) (No. 26 galvanized sheet gage) corrosion-resistant metal installed over a minimum 36-inch-wide (914 mm) underlayment consisting of one layer of 72-pound (32.4 kg) mineral-surfaced, nonperforated cap sheet complying with ASTM D3909 running the full length of the valley.~~

~~**506.3 Underfloor enclosure.** Buildings or structures shall have underfloor areas enclosed to the ground with exterior walls. **Exception:** Complete enclosure shall not be required where the underside of exposed floors and exposed structural columns, beams and supporting walls are protected as required for exterior 1-hour *fire-resistance-rated construction*, fire-retardant-treated wood or *heavy-timber construction*. Fire-retardant-treated wood shall be labeled for exterior use and meet the requirements of Section 2303.2 of the International Building Code.~~

~~**506.4 Gutters and downspouts.** Gutters and downspouts shall be constructed of *noncombustible* material. Gutters shall be provided with an *approved* means to prevent the accumulation of leaves and debris in the gutter.~~

~~**506.5 Vents.** Where provided, attic ventilation openings, foundation or underfloor vents, or other ventilation openings in vertical exterior walls and vents through roofs shall not exceed 144 square inches (0.0929 m^2) each. Such vents shall be covered with noncombustible corrosion-resistant mesh with openings not to exceed 1/8 inch (3.2 mm) or shall be designed and approved to prevent flame or ember penetration into the structure.~~

Reason: This code change is to propose one construction method for building and structures in the wildland area. This is the companion to another proposal to delete sections 505 and 506 with the intent to remove Ignition Resistant Construction Classes II and III. Replacing these classifications will be a single defined Ignition Resistant Construction as provided by Section 504 of this code. As the IWUIC is intended to provide a minimum standard of protection for the Wildland-Urban Interface areas, a single classification of Ignition Resistant Construction should be provided to accomplish the following goals:

1. Protect lives and property within the Wildland-Urban Interface areas

2. Provide clear and consistent standards, simplifying the construction process

3. Providing a minimum standard of protection, with appendices providing potential pathways for increased protection beyond the minimum

Findings during a NIST case study of the 2018 Camp Fire (https://nvlpubs.nist.gov/nistpubs/TechnicalNotes/NIST.TN.2135.pdf) found that

a primary factor in fire spread was significant ember exposure. As stated in the case study "In agreement with the other NIST case studies of WUI fires, the Camp Fire has demonstrated that embers can have significant impact on WUI communities. Laboratory and field work by NIST [57] has demonstrated that embers with enough energy to cause ignitions are readily generated from parcel-level combustibles such as landscaping mulch, fences, and firewood piles. These parcel-level fuels can cause ignitions over 40 m (130 ft) downwind. Ember ignitions downwind from parcel-level combustibles enable fire to readily spread from parcel to parcel. In high hazard areas, WUI structures therefore need to be able to withstand the exposures generated from both wildland and parcel-level combustibles." (A Case Study of the Camp Fire, pg.141)

Given that this far distances that embers can travel, this minimum standard of protection should be across the Wildland-Urban Interface areas; regardless of whether they have been designated as Moderate, High or Extreme hazards. In an analysis of California structures damaged by wildfire in 2017 found that of more homes were damaged in the areas designated as moderate fire hazard severity (3645 damaged) than those damaged in areas designated as very high fire hazard severity (2215 damaged). Of those damaged, a similar percentage of those structures were recorded as destroyed. 92% of damaged structures being destroyed in moderate fire hazard severity zones. 86% of damaged structures being destroyed in very high fire hazard severity zones. This data indicates that the requirements proposed in 504 which mirror the California 7A requirements are working.

In an analysis of California structures damaged by wildfire in 2017 found that of more homes were damaged in the areas designated as moderate fire hazard severity (3645 damaged) than those damaged in areas designated as very high fire hazard severity (2215 damaged). Of those damaged, a similar percentage of those structures were recorded as destroyed. 92% of damaged structures being destroyed in moderate fire hazard severity zones. 86% of damaged structures being destroyed in very high fire hazard severity zones.

Whereas the designated fire hazard severity zone did not play a large determining factor in whether a structure was damaged or destroyed, the date of construction did play a large role. In 2017, 33,508 structures that were constructed prior to 2009 were damaged in wildfires. In the same year, only 592 structures that were built after 2009 were damaged or destroyed by wildfire. The year 2009 is significant as it was the first full year that structures build in Wildland-Urban Interface areas were required to comply with California Building Code, Chapter 7A requirements. This data indicates that the requirements proposed in 504 which mirror the California 7A requirements are working.

Construction Costs for a Wildfire Resistant Home, California Edition (headwaterseconomics.org)

The Headwaters Economics study by the Insurance Institute for Business & Home Safety outlines that California's Chapter 7A requirements are a minimum. If there is a proposal for three construction versions, using the proposed code provisions as the minimum with an enhanced version and an optimum version for best performance standards. "In preliminary research conducted by Baylis and Boom hower (2021), the authors examined home survivability factors for nearly 50,000 homes exposed to wildfires between 2007 and 2020 across California.30 The authors reported that a home built in 2010 or later was nearly 40% less likely to be destroyed by a wildfire compared to a home built in 1985 or before. Home survivability was closely correlated to modern building codes requiring homeowner mitigation measures. Additionally, a home was more likely to survive if its nearest neighbor also complied with recent mitigation regulations resulting in a positive net spillover effect for the larger neighborhood.

Roof

Roofs are highly vulnerable to ignition due to their relatively large horizontal surface area. The exposure of roof coverings to a range of climatic conditions, including wind, rain, and sun, means the roof covering will require maintenance and eventual replacement. Many Class A fire-rated roof covering options are available (e.g., asphalt fiberglass composition shingles). A main reason the roof is vulnerable is because the roof edge—including gutters and roof-to-wall intersections where roof covering meets other materials (e.g., siding used in dormers and split-level homes)—is exposed to ember ignitions. These areas must be properly protected by adding additional flashing t roof-to-wall locations.

Under-Eave Area

Research suggests eaves are extremely important in structure survivability.1 Eaves play an important role for building design but they also create vulnerabilities and pathways for the building to ignite. Embers can travel through vents in the eave into the attic and accumulate in gaps between blocking and rafters in open-eave construction. Should flames reach the under-eave area, open eaves can also trap heat. Once there is an ignition in the under-eave area, fire will spread laterally more quickly.

Vents in the under-eave area are inlet vents and therefore allow air to enter the attic space. During a wildfire, vent openings can allow the entry of wind-blown embers into the interior attic space. If combustible materials in the attic ignite, the house can burn from the inside out.2 The importance of ember and flame entry through vents during a wildfire, and as per requirements in Chapter 7A, have resulted in the development of vents designed to resist the intrusion of flames and embers.

Exterior Wall

Exterior walls and components in the wall assembly can be vulnerable if exposed to embers, flames, or prolonged exposure to radiant heat from burning items located close to the home. These exposures can ignite combustible siding and the resulting flames can spread vertically and laterally to other wall components such as windows and the under-eave area. Siding extending close to the ground can be vulnerable to ignition by embers accumulating at the base of the wall that ignite it or components in the wall assembly (e.g., wood sheathing).

Attached Deck

Similar to a roof, a deck can cover a large horizontal surface area and can be vulnerable to embers and under-deck flame impingement exposures. A burning deck can expose the side of the house to extended radiant heat and/or direct flame contact. The deck walking surface and structural support members, as well as what is stored on or below the deck are therefore important considerations.

Most commonly used deck board products (including wood and plastic composite boards) are combustible. Decks with noncombustible walking surfaces include lightweight concrete or a flagstone product. Regardless of the walking surface, decks are typically supported by solid wood joists, beams, and columns that will be vulnerable to ignition if nearby combustible materials ignite. Enclosing the under-deck area vertically around the perimeter can minimize the accumulation of vegetative debris, vegetation, and other combustible materials. For enclosed decks, installing vents to ensure that excessive moisture does not accumulate in the under-deck area is critical to avoid moisture-related degradation.

Glazing Window manufacturers and suppliers indicated that whereas Chapter 7A only requires one pane in a dual-paned window to be tempered, many window manufacturers only supply windows with both panes tempered. Other manufacturers will supply what the customer requests but will default to one-pane tempered. Since all comparative versions of the wildfire-resistant home are Chapter 7A-compliant, the price of windows would not result in a net cost difference.

Doors

Doors (including window glass set in doors) and door frames can fail for the same reasons as windows. Embers can accumulate in the small gaps between the door and frame, resulting in ignition of the door-framing and weather-sealing material. Vents: Flame- and ember-resistant vents, approved and listed by the OSFM Building Materials Listing Program, will be required for all attic and crawlspace vents. Separation Distance from accessory structures NIST Technical note 2205 explains how the mitigation of accessory structures help in hardening a building in the wildland area.

Bibliography: https://nvlpubs.nist.gov/nistpubs/TechnicalNotes/NIST.TN.2135.pdf
https://headwaterseconomics.org/natural-hazards/wildfire-resistant-costs-california/

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

Construction costs for a typical single-family (1,750 square-foot) home would increase approximately $2,000 including developer overhead costs.

Estimated Immediate Cost Impact Justification (methodology and variables):

In 2004, and as a precursor to California adopting Building Code Chapter 7A, the Office of the State Fire Marshal requested an analysis identifying the costs and benefits associated with proposed regulations in the state's wildfire-prone areas. The study was conducted by Fire Cause Analysis and evaluated economic and construction data within various business sectors to analyze construction costs if proposed regulations were implemented.33 The study found construction costs for a typical single-family (1,750 square-foot) home

would increase approximately $2,000 including developer overhead costs. As an aggregated total at the state level, construction costs would increase approximately $30 million per year for the estimated 14,000 new homes built in areas where regulations would apply. The authors concluded the costs of not implementing regulations, in the form of property losses and suppression costs, exceeded the projected costs for regulations and therefore recommended adopting mitigation standards in wildfire-prone areas.

In 2019, the National Institute of Building Sciences (NIBS) released a report identifying the benefit-cost ratio (BCR) of investing in hazard mitigation, including wildfires.35 The authors found that for every $1 spent on up-front costs for wildfire mitigation, a benefit of $4 was received.

In 2021, the National Research Council of Canada released a study analyzing the benefit-cost ratio for building new construction to comply with the country's wildland urban interface (WUI) Guide.38 In its examination, approximately $12,000 CAD (~$9,500 USD) was added to the overall costs for a new, 2,000-square-foot home to meet the provision of Canada's National WUI Guide. The comprehensive report also examined costs for retrofitting existing structures, as well as transferred costs at the community and national scale. Similar to the NIBS study in 2019, the NRC report found an up-front investment in wildfire-resistant construction and vegetation management yielded benefits that exceeded long-term costs and losses.

WUIC55-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee stated that the reasons for the disapproval of the proposal were: The concern about the use of the code in states other than California and the negative impact of limiting the construction options in these locations with different types and levels of hazard. The desire to have more data to reinforce the deletions. The preference is to make smaller incremental changes instead of larger wholesale changes for the locations that are a little slower in adopting the code. (Vote: 11-2)

WUIC55-24

Individual Consideration Agenda

Comment 1:

Proponents: Crystal Sujeski, CAL FIRE/Office of the State Fire Marshal (crystal.sujeski@fire.ca.gov) requests As Submitted

Reason: same as original proposal

Bibliography: same as orininal propoasl

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Comment (CAH2)# 804

Comment 2:

Proponents: Cary Yballa, Central County Fire Department, Cal FPO (cyballa@ccfd.org) requests As Submitted

Reason: This code change is to propose one construction method for building and structures in the wildland area. This is the companion to another proposal to delete sections 505 and 506 with the intent to remove Ignition Resistant Construction Classes II and III. Replacing these classifications will be a single defined Ignition Resistant Construction as provided by Section 504 of this code. As the IWUIC is intended to provide a minimum standard of protection for the Wildland-Urban Interface areas, a single classification of Ignition Resistant Construction should be provided to accomplish the following goals:

1. Protect lives and property within the Wildland-Urban Interface areas

2. Provide clear and consistent standards, simplifying the construction process

3. Providing a minimum standard of protection, with appendices providing potential pathways for increased protection beyond the minimum

Findings during a NIST case study of the 2018 Camp Fire (https://nvlpubs.nist.gov/nistpubs/TechnicalNotes/NIST.TN.2135.pdf) found that a primary factor in fire spread was significant ember exposure. As stated in the case study "In agreement with the other NIST case studies of WUI fires, the Camp Fire has demonstrated that embers can have significant impact on WUI communities. Laboratory and field work by NIST [57] has demonstrated that embers with enough energy to cause ignitions are readily generated from parcel-level combustibles such as landscaping mulch, fences, and firewood piles. These parcel-level fuels can cause ignitions over 40 m (130 ft) downwind. Ember ignitions downwind from parcel-level combustibles enable fire to readily spread from parcel to parcel. In high hazard areas, WUI structures therefore need to be able to withstand the exposures generated from both wildland and parcel-level combustibles." (A Case Study of the Camp Fire, pg.141)

Given that this far distances that embers can travel, this minimum standard of protection should be across the Wildland-Urban Interface areas; regardless of whether they have been designated as Moderate, High or Extreme hazards. In an analysis of California structures damaged by wildfire in 2017 found that of more homes were damaged in the areas designated as moderate fire hazard severity (3645 damaged) than those damaged in areas designated as very high fire hazard severity (2215 damaged). Of those damaged, a similar percentage of those structures were recorded as destroyed. 92% of damaged structures being destroyed in moderate fire hazard severity zones. 86% of damaged structures being destroyed in very high fire hazard severity zones. This data indicates that the requirements proposed in 504 which mirror the California 7A requirements are working.

IWUIC: SECTION 603, 603.1, 603.2, TABLE 603.2, FIGURE 603.2, 603.2.1, 603.2.2, 603.2.3, 603.1 (New), 603.2 (New), 603.3 (New), 603.3.1 (New), 603.4 (New), 603.4.1 (New), 603.4.2 (New), 603.4.2.1 (New)

Proposed Change as Submitted

Proponents: Cary Yballa, Central County Fire Department, Cal FPO (cyballa@ccfd.org); Crystal Sujeski, CAL FIRE/Office of the State Fire Marshal (crystal.sujeski@fire.ca.gov); Darcy Davidson, Carlsbad Fire Department, California Fire Prevention Officers (darcy.davidson@carlsbadca.gov)

2024 International Wildland Urban Interface Code

Revise as follows:

SECTION 603
~~DEFENSIBLE SPACE~~ VEGETATION PLAN

603.1 ~~Objective.~~ ~~Provisions of this section are intended to modify the fuel load in areas adjacent to structures to create a *defensible space*~~

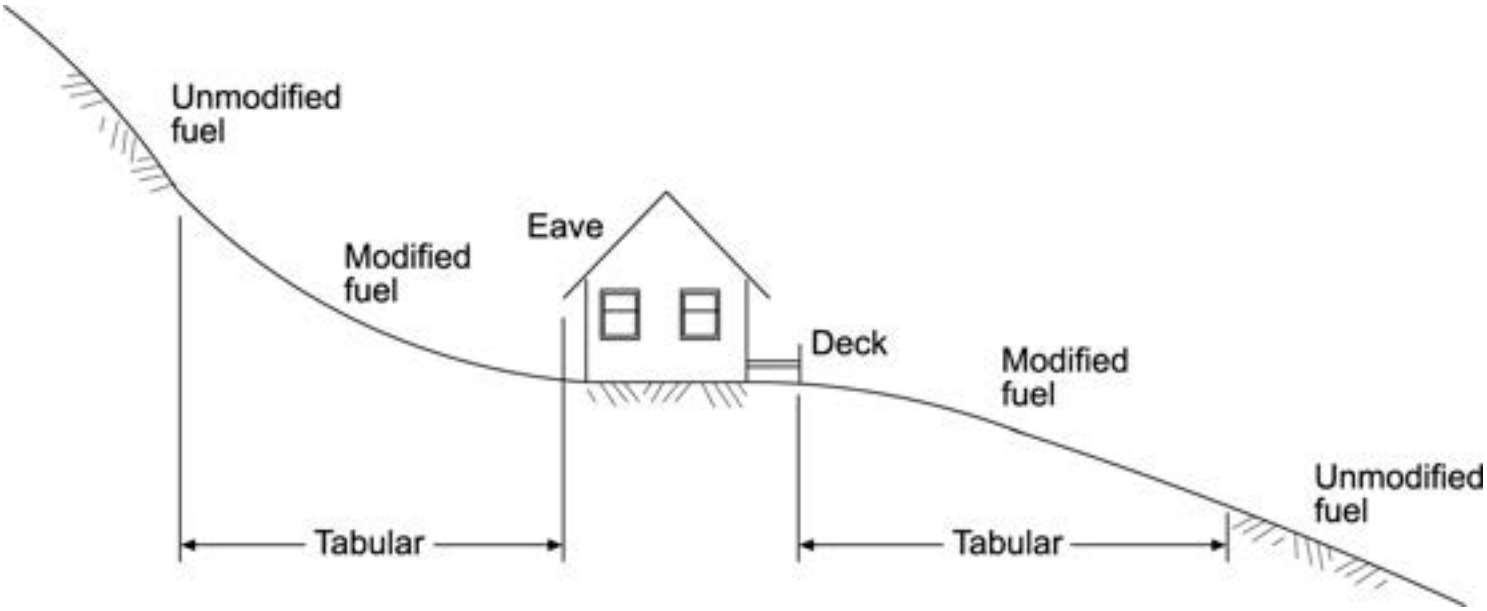
~~603.2~~ ~~Fuel modification.~~ ~~Buildings or structures, constructed in compliance with the conforming *defensible space* category of Table 503.1, shall comply with the *fuel modification* distances contained in Table 603.2. For all other purposes the *fuel modification* distance shall be not less than 30 feet (9144 mm) or to the lot line, whichever is less. Distances specified in Table 603.2 shall be measured on a horizontal plane from the perimeter or projection of the building or structure as shown in Figure 603.2. Distances specified in Table 603.2 are allowed to be increased by the *code official* because of a site-specific analysis based on local conditions and the *fire protection plan*.~~

~~TABLE 603.2 REQUIRED DEFENSIBLE SPACE~~

~~WILDLAND-URBAN INTERFACE AREA~~	~~FUEL MODIFICATION DISTANCE (feet)[a]~~
~~Moderate hazard~~	~~30~~
~~High hazard~~	~~50~~
~~Extreme hazard~~	~~100~~

~~For SI: 1 foot = 304.8 mm.~~

~~a. Distances are allowed to be increased due to site-specific analysis based on local conditions and the *fire protection plan*.~~



~~**FIGURE 603.2 MEASUREMENTS OF FUEL MODIFICATION DISTANCE**~~

~~**603.2.1 Responsible party.** Persons owning, leasing, controlling, operating or maintaining buildings or structures requiring *defensible spaces* are responsible for modifying or removing nonfire-resistive vegetation on the property owned, leased or controlled by said person.~~

~~**603.2.2 Trees.** Trees are allowed within the *defensible space*, provided that the horizontal distance between crowns of adjacent trees and crowns of trees and structures, overhead electrical facilities or unmodified fuel is not less than 10 feet (3048 mm).~~

~~**603.2.3 Ground cover.** Deadwood and litter shall be regularly removed from trees. Where ornamental vegetative fuels or cultivated ground cover, such as green grass, ivy, succulents or similar plants are used as ground cover, they are allowed to be within the designated *defensible space*, provided that they do not form a means of transmitting fire from the native growth to any structure.~~

Add new text as follows:

603.1 General. Planting of vegetation for new landscaping shall be selected to reduce vegetation in proximity to a structure and to maintain vegetation as it matures.

603.2 Application. All new plantings of vegetation in designated Wildland-Urban Interface areas shall comply with Sections 603.3 through 603.4.2.1.

603.3 Landscape plans. Landscape plans shall be provided when required by the enforcing agency. The landscape plan shall include development and maintenance requirements for the vegetation management zone adjacent to structures and roadways, and to provide significant fire hazard reduction benefits for public and firefighting safety.

603.3.1 Contents. In addition to the construction site plan as outlined in the *International Building Code* landscape plans shall contain the following:

1. Delineation of the 30-foot (9144 mm) and 100-foot (3048 mm) fuel management zones from all structures.

2. Identification of existing vegetation to remain and proposed new vegetation.

3. Identification of irrigated areas.

4. A plant legend with both botanical and common names, and identification of all plant material symbols.

5. Identification of ground coverings within the 30-foot (9144 mm) zone.

603.4 Vegetation. All new vegetation shall be fire-smart vegetation in accordance with this section. **Exception:** Trees classified as fire-smart vegetation complying with Section 603.4.2.1. To be considered fire-smart vegetation, it must meet at least one of the following:

1. Be identified as fire-smart vegetation in an approved book, journal or listing from an approved organization.

2. Be identified as fire-smart vegetation by a licensed landscape architect with supporting justification.

3. Plants considered fire-smart vegetation and approved by the local enforcing agency.

603.4.1 Shrubs. All new plantings of shrubs shall comply with the following:

1. Shrubs shall not exceed 6 feet (1829 mm) in height.

2. Groupings of shrubs are limited to a maximum aggregate diameter of 10 feet (3048 mm).

3. Shrub groupings shall be separated from other groupings a minimum of 15 feet (4572 mm).

4. Shrub groupings shall be separated from structures a minimum of 30 feet (9144 mm).

5. Where shrubs are located below or within a tree's drip line, the lowest tree branch shall be a minimum of three times the height of the understory shrubs or 10 feet (3048 mm), whichever is greater.

603.4.2 Trees. Trees shall be managed as follows within the 30-foot zone (9144 mm) of a structure:

1. New trees shall be planted and maintained so that the tree's drip line at maturity is a minimum of 10 feet (3048 mm) from any combustible structure.

2. The horizontal distance between crowns of new trees and crowns of adjacent trees shall not be less than 10 feet (3048 mm).

3. Existing trees shall be trimmed to provide a minimum separation of 10 feet (3048 mm)away from chimney and stovepipe outlets

603.4.2.1 Non-fire-smart vegetation. New trees not classified as fire-smart vegetation, such as conifers, palms, pepper trees and eucalyptus species, shall be permitted provided the tree is planted and maintained so that the tree's drip line at maturity is a minimum of 30 feet from any combustible structure. **Exception:** New, single specimen trees, planted so that the tree's drip line at maturity is a minimum of 10 feet (3048 mm) from any combustible structure and are well pruned and maintained to not form a means of rapidly transmitting fire from other nearby vegetation to a structure or from a structure to other nearby vegetation or to interrupt the advance of embers toward a structure.

Reason: The proposal to relocate section "Defensible Space" to follow the newly created section titled "Vegetation Plan" focuses on the planting of vegetation for new landscaping and to maintain defensible space for structures within the wildland urban interface areas. Chapter 5 of the Wildland Urban Interface Code requires vegetation management compliance prior to the final approval for building permits issued, this new section will give guidance on how to comply with the vegetation plan compliance when new landscaping is planted in these areas.

This section will apply only to new plantings of vegetation (other than a brief mention of existing trees in section 603.4.2) only in the Wildland Urban Interface area. Existing vegetation management is addressed in the Defensible Space section.

Requirements for landscape plans are laid out in this section. Since many local fire departments manage the Vegetation Plan Compliance requirements through submittals of landscape plans, there is a need for language to spell out the minimum requirements. This section provides these requirements to ensure adequate information is provided on the plans to conduct a plan review. Defensible space and Vegetation Management go hand in hand. Defensible space is based on the location of the structures in relation to the property lines as well as manmade and natural fire breaks. These topographic features are an essential factor in determining the risks of wildfire spread.

It also addresses how to select fire smart vegetation and provide basic information on planting to ensure that as the plantings grow to maturity, they can be maintained per the section for the Defensible Space requirements. Specifically addressed are shrubs and trees. The intention for shrubs is to select fire-smart species and to purposefully plant them in groupings and arrangements that ensure they create a landscape that can be easily maintained as they grow. Similarly with shrubs, new tree plantings must also be carefully considered. Trees have the added ability to create a pathway that will lead a fire up to the most vulnerable portions of a house (eaves, vents, and roofs), but also considered was the understanding that trees can provide much needed shade and can prevent the "urban heat island" effect.

The existing tree requirements that are briefly mentioned in this section because it will be very likely existing trees will be part of a new landscape plan as property owners landscape their yards.

Unique to the trees section are the requirements for non-fire-smart vegetation. Since so many of the popular varies of trees may not qualify for fire-smart status, requirements for non-fire-smart vegetation are also found in the trees section. The requirement for non-fire-smart vegetation is to simply plant them further away from structures to mitigate the additional hazard these trees may bring. This subsection allows property owners to have a path of compliance when they have a robust maintenance plan in place. The exception allows for small lots to have some kind of landscaping closer to the structure. The spacing an maintenance are the most important factors. Tree species become secondary when the spacing and maintenance are in compliance.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

$0 or it may increase of the cost of construction dependent upon the landscaping material and vegetation selected to comply with this section.

Estimated Immediate Cost Impact Justification (methodology and variables):

It is a property owners design choices that will determine the cost of landscaping. With many variables of cost per region and area will be driven by the local contractor, supply and demand.

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee stated that the reasons for the disapproval of the proposal were: Agreement that the requirements might be more appropriately located in an appendix. There was a request from the committee to see some more information and reasoning with regards to some of the prescriptive requirement such as the spacing. The need for language cleanup that could be done throughout the proposal that was brought up in the testimony. The cost impact statement was questioned and that there is a need for more information. The intent is going in the right direction, but there is a need to see a little bit more correlation with the vegetation management plan and the fire protection plan. (Vote: 12-1)

Individual Consideration Agenda

Comment 1:

IWUIC: SECTION 603, 603.1, 603.2, 603.2.1, 603.2.2, 603.2.3, FIGURE 603.2, TABLE 603.2, 603.3, 603.3.1, 603.4, 603.4.1, 603.4.2, 603.4.2.1

Proponents: Cary Yballa, Central County Fire Department, Cal FPO (cyballa@ccfd.org); Crystal Sujeski, CALFIRE/Office of the State Fire Marshal, CAL FIRE/Office of the State Fire Marshal (crystal.sujeski@fire.ca.gov) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Wildland Urban Interface Code

SECTION 603
DEFENSIBLE SPACE

603.1 Objective. Provisions of this section are intended to modify the fuel load in areas adjacent to structures to create a *defensible space*.

603.2 Fuel modification. Buildings or structures, constructed in compliance with the conforming *defensible space* category of Table 503.1, shall comply with the *fuel modification* distances contained in Table 603.2. For all other purposes the *fuel modification* distance shall be not less than 30 feet (9144 mm) or to the lot line, whichever is less. Distances specified in Table 603.2 shall be measured on a horizontal plane from the perimeter or projection of the building or structure as shown in Figure 603.2. Distances specified in Table 603.2 are allowed to be increased by the *code official* because of a site-specific analysis based on local conditions and the *fire protection plan*.

603.2.1 Responsible party. Persons owning, leasing, controlling, operating or maintaining buildings or structures requiring *defensible spaces* are responsible for modifying or removing nonfire-resistive vegetation on the property owned, leased or controlled by said person.

603.2.2 Trees. Trees are allowed within the *defensible space*, provided that the horizontal distance between crowns of adjacent trees and crowns of trees and structures, overhead electrical facilities or unmodified fuel is not less than 10 feet (3048 mm).

603.2.3 Ground cover. Deadwood and litter shall be regularly removed from trees. Where ornamental vegetative fuels or cultivated ground cover, such as green grass, ivy, succulents or similar plants are used as ground cover, they are allowed to be within the designated *defensible space*, provided that they do not form a means of transmitting fire from the native growth to any structure.

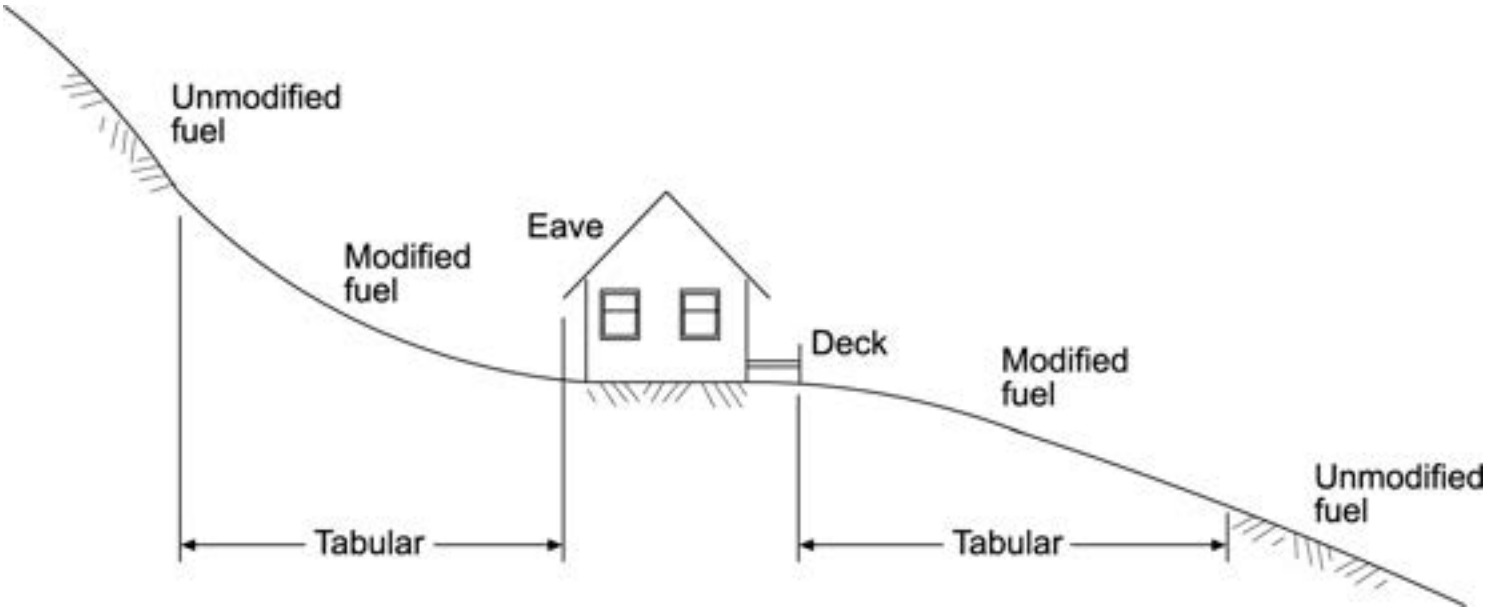

FIGURE 603.2 MEASUREMENTS OF FUEL MODIFICATION DISTANCE

TABLE 603.2 REQUIRED DEFENSIBLE SPACE

WILDLAND-URBAN INTERFACE AREA	FUEL MODIFICATION DISTANCE (feet)[a]
Moderate hazard	30
High hazard	50
Extreme hazard	100

For SI: 1 foot = 304.8 mm.

a. Distances are allowed to be increased due to site-specific analysis based on local conditions and the *fire protection plan*.

Revise as follows:

SECTION ~~603~~ 604
VEGETATION PLAN

~~**603.1**~~ **604.1 General.** Planting of vegetation for new landscaping shall be selected to reduce vegetation in proximity to a structure and to maintain vegetation as it matures.

~~**603.2**~~ **604.2 Application.** All new plantings of vegetation in designated Wildland-Urban Interface areas shall comply with Sections 604.3 through 604.4.2.1.

~~**603.3**~~ **604.3 Landscape plans.** Landscape plans shall be provided when required by the enforcing agency. The landscape plan shall include development and maintenance requirements for the vegetation management zone adjacent to structures and roadways, and to provide significant fire hazard reduction benefits for public and firefighting safety.

~~**603.3.1**~~ **604.3.1 Contents.** In addition to the construction site plan as outlined in the *International Building Code* landscape plans shall contain the following:

1. Delineation of the 30-foot (9144 mm) and 100-foot (3048 mm) fuel management zones from all structures.

2. Identification of existing vegetation to remain and proposed new vegetation.

3. Identification of irrigated areas.

4. A plant legend with both botanical and common names, and identification of all plant material symbols.

5. Identification of ground coverings within the 30-foot (9144 mm) zone.

~~603.4~~ 604.4 **Vegetation.** All new vegetation shall be fire-smart vegetation in accordance with this section.

Exception: Trees classified as non-fire-smart vegetation complying with Section 604.4.2.1.

To be considered fire-smart vegetation, it must meet at least one of the following:

1. Be identified as fire-smart vegetation in an approved book, journal or listing from an approved organization.

2. Be identified as fire-smart vegetation by a licensed ~~landscape architect~~ professional with supporting justification.

3. Plants considered fire-smart vegetation and approved by the local enforcing agency.

~~603.4.1~~ 604.4.1 **Shrubs.** All new plantings of shrubs shall comply with the following:

1. Shrubs shall not exceed 6 feet (1829 mm) in height.

2. Groupings of shrubs are limited to a maximum aggregate diameter of 10 feet (3048 mm).

3. Shrub groupings shall be separated from other groupings a minimum of 15 feet (4572 mm).

4. Shrub groupings shall be separated from structures a minimum of 30 feet (9144 mm).

5. Where shrubs are located below or within a tree's drip line, the lowest tree branch shall be a minimum of three times the height of the understory shrubs or 10 feet (3048 mm), whichever is greater.

~~603.4.2~~ 604.4.2 **Trees.** Trees shall be managed as follows within the 30-foot zone (9144 mm) of a structure:

1. New trees shall be planted and maintained so that the tree's drip line at maturity is a minimum of 10 feet (3048 mm) from any combustible structure.

2. The horizontal distance between crowns of new trees and crowns of adjacent trees shall not be less than 10 feet (3048 mm).

3. Existing trees shall be trimmed to provide a minimum separation of 10 feet (3048 mm)away from chimney and stovepipe outlets

~~603.4.2.1~~ 604.4.2.1 **Non-fire-smart vegetation.** New trees not classified as fire-smart vegetation, such as conifers, palms, pepper trees and eucalyptus species, shall be permitted provided the tree is planted and maintained so that the tree's drip line at maturity is a minimum of 30 feet from any combustible structure.

Exception: New, single specimen trees, planted so that the tree's drip line at maturity is a minimum of 10 feet (3048 mm) from any combustible structure and are well pruned and maintained to not form a means of rapidly transmitting fire from other nearby vegetation to a structure or from a structure to other nearby vegetation or to interrupt the advance of embers toward a structure.

Reason: The intent of this comment is to restore Section 603 "Defensible Space". It was not the intent of the original proposal WUI60-24 to eliminate Defensible Space from the code. This comment includes the movement of the proposed "Vegetation Plan" to its own Section following directly after Section 603 "Defensible Space".

Based upon the comments of the committee during the first hearing, Section 604.4 has been modified to reflect the following changes.

The exception with 604.4 now reads "non-fire smart vegetation" to better coordinate the exception with Section 604.4.2.1. The subject of Section 604.4.2.1 is "non-fire smart vegetation" which was not reflected in the text of the original proposal.

In item 2 of Section 604.4, the term "licensed landscape architect" has been changed to "licensed professional". This modification was made to address a concern by the committee that the original language may have only been applicable in certain regions. The change is also reflective of a floor modification that was made during the first committee hearing.

Cost Impact: Increase

Estimated Immediate Cost Impact:

$0 or it may increase the cost of construction dependent upon the landscaping material and vegetation selected to comply with the section.

Estimated Immediate Cost Impact Justification (methodology and variables):

It is a property owner design choices that will determine the cost of landscaping. With many variables of cost per region and area will be driven by the local contractor, supply and demand. Requirements existing within the code, (2024 IWUIC Section 604.2), already require the removal of non-fire smart vegetation within the modified defensible space.

Proposed Change as Submitted

Proponents: Robert Marshall, FCAC, FCAC (fcac@iccsafe.org)

2024 International Wildland Urban Interface Code

Revise as follows:

[A] 102.8 Existing conditions. The legal occupancy or use of any structure ~~or condition~~ existing on the date of adoption of this code shall be permitted to continue without change, except as is specifically ~~covered~~ provided for in this code, the International Fire Code or the *International Property Maintenance Code*, or as is deemed necessary by the *code official* for the general safety and welfare of the occupants and the public. Existing properties shall comply with the defensible space requirements in Section 603 and Chapter 7.

Add new text as follows:

CHAPTER 7
MAINTENANCE REQUIREMENTS

SECTION 701
GENERAL

701.1 Scope. Where a building or structure was constructed in accordance with this code or was previously *approved*,maintenance of new and existing buildings, structures, systems and premises shall comply with this chapter. The construction requirements of this chapter are not intended to apply retroactively.

SECTION 702
IGNITION-RESISTANT CONSTRUCTION

702.1 General. Ignition-resistant construction features found to be damaged, missing or non-compliant shall be repaired or replaced.

SECTION 703
FIRE PROTECTION AND LIFE SAFETY SYSTEMS

703.1 General. *Fire protection* and *life safety system*s shall be maintained operable at all times in accordance with the applicable standard

SECTION 704
FIRE ACCESS ROADS

704.1 Obstructions. Fire access roads shall not be obstructed in any manner, including the parking of vehicles. The minimum widths and clearances established in Section 403.3 shall be maintained at all times.

704.2 Maintenance. Fire access roadsshall be maintained in a condition equal to or better than the condition at the time of approval.

704.3 Signs and marking. Road identification signs required in Section 403.4.1 and marking of fire protection equipment required in Section 403.5 shall be maintained and legible.

SECTION 705
PREMISES IDENTIFICATION

705.1 General. Signs and markings for premise identification required in Section 403.6 shall be maintained and legible.

SECTION 706
WATER SUPPLY

Revise as follows:

~~**404.9**~~**706.1 ~~Testing and maintenance~~General.** Water sources, draft sites, and hydrants ~~and other fire protection equipment~~ required by this code shall be subject to periodic tests as required by the *code official*. ~~Such equipment installed under the provisions of this code shall be maintained in an operative condition at all times and shall be repaired or replaced where defective. Additions, repairs, alterations and servicing of such fire protection equipment and resources shall be in accordance with *approved* standards.~~

Add new text as follows:

706.2 Maintenance. Water sources, draft sites and hydrants shall be maintained in an operative condition at all times.

SECTION 707
DEFENSIBLE SPACE AND VEGETATION MANAGEMENT

Revise as follows:

~~**604.1**~~ **707.1 General.** *Defensible spaces* required by Section 603 or by an *approved* vegetation management plan in accordance with 502.2 shall be maintained at all times in accordance with 706.2 through 706.4.2 ~~Section 604~~.

Add new text as follows:

707.1.1 Fire protection plans. Where an *approved fire protection plan* contains *defensible space* requirements other than those in Table 603.2, the *defensible space* requirements in the *approved fire protection plan* shall be maintained at all times.

Revise as follows:

~~**604.2**~~ **707.2 Modified area.** Nonfire-resistive vegetation or growth shall be kept clear of buildings or structures, in accordance with Section 603, in such a manner as to provide a clear area for fire suppression operations.

~~**604.3**~~ **707.3 Responsibility.** Persons owning, leasing, controlling, operating or maintaining buildings or structures are responsible for maintenance of *defensible spaces*. Maintenance of the *defensible space* shall include modifying or removing nonfire-resistive vegetation and keeping leaves, needles and other dead vegetative material regularly removed from roofs of buildings and structures.

~~**604.4**~~ **707.4 Trees.** Tree crowns extending to within 10 feet (3048 mm) of any structure shall be pruned to maintain a minimum horizontal clearance of 10 feet (3048 mm). Tree crowns within the *defensible space* shall be pruned to remove limbs located less than 6 feet (1829 mm) above the ground surface ~~adjacent to the trees~~.

~~604.4.1~~ 707.4.1 **Chimney clearance.** Portions of tree crowns that extend to within 10 feet (3048 mm) of the outlet of a chimney shall be pruned to maintain a minimum horizontal clearance of 10 feet (3048 mm).

~~604.4.2~~ 707.4.2 **Deadwood removed.** Deadwood and ~~litter~~ dying branches shall be regularly removed from trees.

Delete without substitution:

~~603.2.1 **Responsible party**. Persons owning, leasing, controlling, operating or maintaining buildings or structures requiring *defensible spaces* are responsible for modifying or removing nonfire-resistive vegetation on the property owned, leased or controlled by said person.~~

Add new text as follows:

707.5 Accumulation of dead vegetation. Leaves, needles, or other vegetation on roofs, in gutters, on or below decks, porches, balconies or exterior stairways shall be regularly removed.

707.6 Woodpiles. A minimum of 10 feet (3048 mm) clearance to combustible materials shall be maintained in all directions around all exposed woodpiles. **Exception:** Where an approved vegetation management plan requires a different clearance distance.

707.7 Liquid Propane Gas (LPG) storage tanks. A minimum of 10 feet clearance to combustible materials shall be maintained in all directions around aboveground Liquid Propane Gas (LPG) storage tanks. **Exception:** Where an *approved* vegetation management plan requires a different clearance distance.

Revise as follows:

~~603.2.3~~707.8 **Ground cover.** ~~Deadwood and litter shall be regularly removed from trees. Where~~ ~~o~~Ornamental vegetative fuels or cultivated ground cover, such as green grass, ivy, succulents or similar plants ~~are~~ used as ground cover, ~~they are allowed~~ shall be permitted to be within the designated *defensible space*, provided that they do not form a means of transmitting fire from the native growth to any structure.

Reason: This proposal accomplishes 3 things:

1. It creates a new Chapter for all maintenance requirements applicable to fire hazard mitigation of structures and premises regulated by the IWUIC. New construction requirements remain in Chapters 4, 5 and 6.

2. It relocates all existing requirements that are maintenance related from Chapter 6 into the appropriate sections of this new Chapter for clarity and easier use of this code.

3. It adds reasonable new requirements for maintenance or repair or replacement of features that were identified by F-CAC as gaps that needed to be addressed.

FCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and early 2024 the FCAC has held several virtual meetings and one in-person meeting open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the **FCAC Website**

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

$0 for new construction. This proposal does not impose any new or additional cost to initial construction. However, there are new requirements for the maintenance and/or repair of wildfire mitigation measures that are already required for new construction. Maintenance and repair costs are variable and specific cost estimates could vary significantly over the lifespan of a building or property.

Estimated Immediate Cost Impact Justification (methodology and variables):

This proposal will impose additional costs related to ongoing maintenance, repair or replacement of features that were required for initial construction and site approval but do not increase the cost of initial construction.

Estimated Life Cycle Cost Impact:

Maintenance and repair costs are variable and specific cost estimates could vary significantly over the lifespan of a building or property. Costs may necessitate purchase of replacement materials, labor (which could by DIY) and increase as time goes by.

WUIC70-24

Public Hearing Results (CAH1)

Errata: This proposal includes published errata https://www.iccsafe.org/wp-content/uploads/2024-Group-A-Consolidated-Monograph-Updates.pdf

Committee Action: **Disapproved**

Committee Reason: The committee stated that the reasons for the disapproval of the proposal were: It was noted by the committee that it is not the intent of the existing conditions requirements in Section 102.8 for all existing properties to comply with the proposed new conditions, whether they were subject to this code or not when they were originally built. There are a few other sections like ground cover that could be better aligned with the other requirements that have already been approved in other proposals. (Vote: 10-3)

WUIC70-24

Individual Consideration Agenda

Comment 1:

IWUIC: [A] 102.8, CHAPTER 7, SECTION 701, 701.1

Proponents: Robert Marshall, FCAC, FCAC (fcac@iccsafe.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Wildland Urban Interface Code

Revise as follows:

[A] 102.8 Existing conditions. The legal occupancy or use of any structure existing on the date of adoption of this code shall be permitted to continue without change, except as is specifically provided for in this code, the International Fire Code or the *International Property Maintenance Code*, or as is deemed necessary by the *code official* for the general safety and welfare of the occupants and the public. ~~Existing properties shall comply with the defensible space requirements in Section 603 and Chapter 7.~~

CHAPTER 7
MAINTENANCE REQUIREMENTS

SECTION 701

GENERAL

701.1 Scope. Where a building or structure was constructed in accordance with this code or was previously *approved*, maintenance of ~~new and existing~~ buildings, structures, systems and premises in accordance with this code shall comply with this chapter. The construction requirements of this chapter are not intended to apply retroactively.

Reason: At the request of the committee, two modifications to the original proposal were made to make it more clear that these are maintenance provisions for buildings already constructed under this code. The remainder of the proposal does not change from the original.

FCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and early 2024 the FCAC has held several virtual meetings and one in-person meeting open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the **FCAC Website**.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal merely relocates all existing maintenance language. There are no core changes to any provision, and therefore no cost impact.

Add new text as follows:

SECTION C101
COMMUNITY WUI FIRE HAZARD EVALUATION FRAMEWORK

C101.1

Definitions. The Community WUI Hazard Evaluation Framework presented here is intended for communities as small as a few hundred to tens of thousands of residents. The methodology is not intended for the documentation of single residences or large cities. It is intended to provide a community with an overview of the overall WUI fire-related hazards and to enable the code official to compare the relative hazards and preparedness levels of different communities. The information collected can be used by first responders and community and county officials to prioritize hazard mitigation within and around the community and to develop "tabletop" responses to different WUI fire scenarios. In the event of an actual WUI fire, the information collected could be used by first responders and local officials to safely evacuate civilians, to reduce the risk of first responder injuries and to enhance fire containment. The following are definitions and uses of the different components of Table C101.1 Community WUI Fire Hazard Evaluation Framework. This framework may be expanded to include additional characteristics that are not specifically listed in this preliminary version.

C101.2 Community. In the sense of WUI fire hazard, the community should be viewed in the context of evacuation arteries rather than jurisdictional boundaries. As such, the community may have parts that are incorporated or unincorporated. Community size is reported in acres, and the community boundary selected for this hazard evaluation can be provided for use in a geographic information system (GIS) layer in a number of formats, including but not limited to shapefile, geodatabase or Geo-Package. A topographic overview of the area (community) is used to describe the general conditions using one or more of the following key words: flat terrain, rolling hills, moderate slopes, valleys, steep slopes and/or plateau.

Information about prevailing weather patterns, such as localized winds or significant wind events (strength and direction), should also be included in the community profile.

C101.3 Fuels. The fuels section is intended to provide an overview of the structural, vegetative and other fuels present in the community. This is not a parcel-level assessment; however, if defensible space assessment data is available, it can be aggregated and utilized within this framework to provide higher resolution assessment of community fire hazard. Structure density is a simple metric to capture structure-to-structure spacing and provide insight on the potential structure-to-structure fire spread. For uniform communities, a representative structure separation distance (SSD) may be sufficient, whereas nonuniform communities will be better described using a histogram of SSD. The age of structures may also be a factor in structure vulnerability due to changes in building codes associated with structure hardening. Similarly, a community that was built over a short period of time can be represented by a single value representing the decade of construction, while a community that grew and expanded over long periods will be better represented by a histogram of structure ages.

A database such as LANDFIRE (www.landfire.gov/) can provide the vegetative fuel type and fuel loading throughout the community. This data will be limited by the age of the last LANDFIRE overflight and the 100 feet (30 meters) pixel spatial resolution.

Natural and artificial fuel breaks, including fuel treatments within and around the community, should be represented in a geospatial format and should include the year the vegetative fuel treatment was conducted. Fuel treatments should also include any logging activities in the area surrounding the community. Fire history in and around the community will describe the last time the community

experienced direct impacts from fire. Shapefiles of the fuel treatments and fire history will allow for spatial documentation of this data. Fuel treatments and fire history should be documented at least 10 miles (16 km) out from the edge of the community. Local conditions (e.g., fuel, topography, weather, evacuation routes) may require documentation well beyond 10 miles (16 km). The last large fire in the area of the community perimeter, together with the vegetative fuel loading, will provide information on the potential energy content of the vegetative fuels in the event of a short- or long-term drought.

The documentation of other community hazards, such as hazmat or high fuel load facilities (e.g., fixed propane tanks, hazardous material storage and use facilities, ammunition facilities lumber yards, pallet storage, tire storage), is important as they can affect civilians and first responder safety during evacuations, fire containment and mop-up activities. The information should be provided in the form of a GIS layer and may then be used by first responders to develop "tabletop" responses for emergency preparedness, and to direct response actions during a WUI fire event.

C101.4 Population. The population of the selected community will impact, among other factors, the minimum time required for evacuation. Population and population density, expressed as the number of residents per acre, are both important metrics that provide information that can be used for evacuation assessment. The permanent to transient population density ratio is intended to capture the fraction of the community that may be visiting for tourism and may not be aware of community evacuation and other fire related activities.

C101.5 Notification. The notification section of the Community WUI Hazard Evaluation is designed to capture the presence and type of mass-notification tools available to emergency managers. It should be noted that reliance on individual notification methods may result in limited notifications. If a Reverse 911 system is in place, the percentage of the community that will potentially receive the notifications from this system will estimate the number of residents that may require different notifications. Sirens or other fixed notification systems with power backup should also be listed in this section along with the fraction of the population covered by these systems. Additional notification systems that don't require phone or internet are also captured in this section, since WUI events frequently result in power outages or other service interruptions.

C101.6 Evacuation. This section of the Community WUI Hazard Evaluation is not intended to replace a full community evacuation study or act as a community evacuation plan. The primary purpose of this section is to compute, given a number of assumptions, a Minimum Throughput Time (MTT), to provide an initial idealized order of magnitude time to be considered in the early stages of evacuation pre-planning. This information can be of value to first responders and community emergency planning personnel, as it may potentially highlight critical evacuation bottlenecks inside or outside the community.

The MTT concept is a traffic engineering calculation of roadway capacity to provide an initial lower bound for planning community evacuation. The MTT is intended for isolated and partly isolated interface and intermix communities rather than a city setting with large populations and complex evacuation routes. A community should consider a detailed evacuation study to further enhance the community evacuation plan. There is a significant body of work associated with developing dynamic evacuation models. An example of a framework which includes coupled fire and evacuation considerations, as well as background on the individual model components, was published in 2019 in Safety Science, Volume 118, authored by Ronchi et al., titled "An open multi-physics framework for modelling WUI fire evacuations," on pages 868-880.

The MTT considers two significant factors: bottlenecks within and beyond town, and the total number of vehicles that must be accommodated. Bottlenecks slowing traffic throughput may be located within or outside of jurisdictional boundaries. Bottlenecks occurring well beyond the evacuating community may cause ripple effects significantly impacting community evacuation. In identifying the population for computing the MTT, consideration should be given to neighboring settlements/communities that may share the same evacuation route(s). The MTT should consider the minimum number of traffic lanes (i.e., 8 lanes merging into 2 lanes should be treated as 2 lanes) available for evacuation, the community population and the average speed limit of the egress routes. Contraflow, the implementation of reverse direction traffic flow, may be considered here, along with provisions for first responder access to the community. The computed Minimum Throughput Time (MTT) does not account for any of the numerous potential hindrances to evacuation traffic, such as road accidents, reduced speed due to smoke obscuration, merging of traffic in town to feed the primary arteries, large vehicles that occupy more space than cars and have reduced maneuverability, or fire activity impacts, such as burn overs, causing evacuation lane(s) closures and potential slowdowns associated with traffic redirections.

The evacuation section is also used to identify vulnerabilities of egress arteries including vegetative fuel setbacks as well as any hazardous material facilities which might affect evacuation. Fuel setback information, collected in 0.15 miles (0.25 km) increments along egress routes, presented in the form of a histogram and a GIS layer, could help identify vulnerable spots that may potentially impact evacuation and identify candidate locations for fuel treatments.

The presence of a Community Evacuation Plan, the presence and capacity of safety zones and other large crowd assembly areas, and

whether evacuation drills are performed will contribute to the community evacuation preparedness overview. The number of hospitals and senior care facilities and their total capacity will provide further information to assess overall community evacuation needs.

C101.7 Infrastructure / COOP / COG. The locations and needs of key facilities for maintaining continuity of operations (COOP) and continuity of government (COG), such as police, fire, EMS, hospitals, government buildings, cell towers, water sources, water provider infrastructure, electrical utility key infrastructure and natural gas key infrastructure should be listed and incorporated in this part of the evaluation framework.

Infrastructure characteristics, particularly related to water supply and electric utilities, can impact response and potential pre-fire hazard reduction. The public water system dependence on power supply, including the availability of backup power sources (i.e., generator backup) will provide insight into the resilience of the water system. The location of power lines (i.e., above or below ground) can impact evacuation, as downed power lines can impact evacuation and mobility throughout the community.

C101.8 Fire Fighting Response. The type of fire department, whether volunteer, career, or combined, may impact the likely availability and response time of first responder resources. The density of firefighting (ff) responders, as a ratio of the number of personnel on shift to the number of structures (number of ffs/number of structures) will provide information on the maximum possible coverage by the local resources.

In this section, mutual aid resources should be counted only if mutual aid agreements are in place and can ensure rapid deployment. Mutual aid response is captured through a histogram in 1-, 2-, 3- and 4-hour travel times. This may also be approximated using a geographic radius of distance from the community. The purpose of this information is to provide insight into the minimum response times by mutual aid.

TABLE C101.1 COMMUNITY WUI FIRE HAZARD EVALUATION FRAMEWORK

COMMUNITY	DATA TYPE	DATA LAYER IN MDS
Community shapefile, geodatabase or Geo-Package including topography and geographic attributes, and prevailing weather patterns (e.g., wind)	GIS layer	X
FUELS		
Structure Density (structure separation distances—SSD)	SSD histogram	
Age of structures	Histogram	
Vegetative fuel loading	Fuel type	
Fuel type	Tons/acre	
Fuel loading		
Natural and artificial fuel breaks	List, GIS layer	X
(including fuel treatments withina dn around community and year built)		
Community hazards (e.g., hazmat and high fuel load facilities)	Specify, GIS layer	X

Reason: The proposed appendix in the Wildland Urban Interface Code is meant to be a tool to enable communities to collect, assemble, and represent the associated risks within the Wildland Urban Interface (WUI) fire area.

Community level fire hazard data is not always readily available in a centralized location and not in a standard format. The proposed framework enables communities' leaders to collect their WUI fire hazard data in an immediately accessible format.

This framework allows the community WUI fire hazard area data to be an inclusive picture. Part of the data assembled in the framework layout will help first responders during an incident. This data may enhance situational awareness, facilitate ingress and egress routes, and increase structure survivability through targeted fire responder actions.

The framework allows decision makers the ability to access WUI fire hazard risks across multiple communities when implemented in this standardized method. For example, a comparison can be made between a community of 5,000 residents to a community with 20,000 residents. They will be able to compare their overall fire hazard as well as the relative fire hazard.

The information from the standardized framework may be used to assist with making design and prioritize resources at the community, county, and state level. These resources may include funding for fuel treatment around communities in designated very high fire hazard severity zones.

The proposed framework has the benefit of enabling communities, county and state to use a methodized approach to assess hazards, offer property solutions and inform first responders before and during incidents.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The cost impact will be varied. Much of the data is already available but may be in many different documents. Pulling the data together will range from zero to "X" amount for a new community starting from scratch. The intent is to be a standard approach for any size community.

WUIC71-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee stated that the reasons for the disapproval of the proposal were: Concern that the framework outline in the proposal is a lot more sophisticated than is currently in the existing appendix and how it relates back to the severity and additionally how it is treated elsewhere in the code. Concern for states like New York that have a statewide mutually globalization plan and how that is calculated into this, especially the value of structural firefighting versus wildland firefighting abilities. (Vote: 12-1)

2024 International Wildland Urban Interface Code

Revise as follows:

~~APPENDIX G~~
~~SELF-DEFENSE MECHANISM~~

~~SECTION G101~~
~~GENERAL~~

~~**G101.1 Identification of the problem.** The *International Wildland-Urban Interface Code* establishes a set of minimum standards to reduce the loss of property from wildfire. The purpose of these standards is to prevent wildfire spreading from vegetation to a building. Frequently, proposals are made by property or landowners of buildings located in the wildland-urban interface to consider other options and alternatives instead of meeting these minimum standards. This appendix chapter provides discussion of some elements of the proposed self-defense mechanisms and their role in enhancing the protection of exposed structures.~~

~~**G101.2 Structural survivability.** Various stages of assault occur as a building is exposed to a wildland-urban fire. Ashes are cast in front of a fire out of a smoke or convection column, which can result in secondary ignitions. Heavier embers that have more body weight and may contain more heat to serve as sources of ignition follow. Finally, the actual intrusion of a flame front and the radiant heat flux can expose combustibles outside of a building and the exterior structure of a building to various levels of radiant heat. A study revealed that the actual exposure of a building to the flame front by the perimeter of the fire was usually less than 6 minutes. However, the exposure to the forms of other materials that can result in proliferation of other ignitions can vary, depending on wind, topography and fuel conditions. To enhance structural survivability, the self-defense mechanisms must, first, do everything possible to prevent the ignition of materials from objects that are cast in front of the fire and, second, they must withstand the assault of the fire on the structure to prevent flames from penetrating into the building and resulting in an interior fire. There are considerable problems in achieving both of these objectives using some of the proposed alternative forms of protection such as the lack of definitive standards for self-defense mechanisms on the exterior of buildings. Although fire service has done considerable research into the evaluation of technology, such as smoke detectors, fire alarms, and interior sprinkler systems, very limited amount of study has been done on exterior sprinkler systems.~~
~~All forms of fire protection are classified as either active or passive. Active fire protection is taking specific action to control the fire in some manner. Passive fire protection uses resistance to ignition or provides some form of warning that allows other action to be taken. These two classifications of self-defense mechanisms create different problems with regard to being accepted as alternatives for building construction. Furthermore, certain self-defense mechanisms must be built in during new construction, and others may only be capable of being added as a retrofit to existing structures. As a matter of public policy, most *code officials* are reluctant to accept passive fire protection as an equivalent to a construction requirement, but are also reluctant to accept active fire protection systems that require intervention by suppression personnel.~~
~~The unequal distribution of self-defense mechanisms within a specific neighborhood poses another problem. If an individual is granted a waiver or exemption on the basis of putting in a nonmandated self-defense mechanism, and the neighbors to either side choose not to do so, or are not given the same options, there is a potential operational problem.~~

~~**G101.3 Alternative concepts.** Sections G101.3.1 through G101.3.6 provide consideration of several alternative self-defense~~

mechanisms.

G101.3.1 Exterior sprinkler systems. Currently, there is no nationally accepted standard for the design and installation of exterior fire sprinkler systems. Interior sprinkler systems are regulated by nationally recognized standards that have specific requirements. However, exterior sprinkler systems lack such uniformity. What is generally proposed is a type of sprinkler system, placed on the roofs or eaves of a building, whose primary purpose is to wet down the roof. These types of systems can be activated either manually or automatically. However, the contemporary thought on exterior sprinkler systems is that if the roof classification is of sufficient fire resistance, exterior sprinklers are of little or no value. Another option and alternative with exterior sprinklers is to use them to improve the relative humidity and fuel moisture in the *defensible space*. In this case, the exterior sprinkler is not used to protect the structure as much as it attempts to alter the fuel situation. However, studies do not support the idea that merely spraying water into the air in the immediate vicinity of a rapidly advancing wildland-urban fire does much good. Clearly, irrigation systems that keep plants healthy and fire-resistive plants that resist convection and radiated heat can accomplish the same purpose.

G101.3.2 Alternative water supply systems for exposure protection. Pools and spas are often offered as an alternative water source for fire departments. These water sources must be reliable and able to be accessed to be of any use by fire protection forces. Accessibility means that the fire department must be able to withdraw the water without having to go through extraordinary measures such as knocking down fences or having to set up drafting situations. Designs have been created to put liquid- or gas-fueled pumps or gravity valves on pools and spas to allow fire departments to access these water systems. A key vulnerability to the use of these alternative water systems is loss of electrical power. When the reliability of a water system depends on external power sources, it cannot be relied upon by fire fighters to be available in a worst-case scenario.

G101.3.3 Class A foam systems. One technology is Class A foam devices. These are devices that allow a homeowner to literally coat the exterior of their house with a thick layer of foam that prevents the penetration of embers and radiant heat to the structure. Experiments in various wildland fire agencies advocate foaming houses in advance of fire and flame fronts. To be accepted by the *code official*, the Class A foam system should pass rigorous scrutiny with regard to the manner and needs in which it is activated, the ways and means in which it is properly maintained, and a ways and means to test the system for its operational readiness during hiatus between emergencies.

G101.3.4 Enhanced exterior fire protection. This alternative method would increase the degree of fire resistance on the exterior of a building. This is most often an alternative recommended as a retroactive application when individual properties cannot achieve adequate *defensible space* on the exterior of a building. Normally, fire resistance and building scenarios are concerned with containing a fire. Fire-resistance ratings within building design ensures resistance to a fire for the specified time to compartmentalize the building's interior.To improve fire resistance on the exterior of the structure, the primary emphasis is on preventing intrusion into the building. This means protection of apertures and openings that may or may not be required to have any degree of fire resistance by accepted building codes. The option that is available here is for individuals to provide coverage in the form of shutters or closures to these areas, which, along with maintenance of combustible-free perimeters, can often prevent intrusion.

There are obvious limitations to this alternative. First and foremost is the means of adequately evaluating the proposed fire resistance of any given assembly. Testing techniques to determine fire resistance for such objects as drywall and other forms of construction may not be applicable to exterior application. Nonetheless, *code officials* should determine the utility of a specific fire resistance proposal by extrapolating conservatively.

G101.3.5 Shelter in place. Developments in the wildland-urban interface may be designed to allow occupants to "Shelter in place." Use of this design alternative should include ignition-resistant construction, access, water supply, automatic sprinkler systems, provisions for and maintenance of *defensible space*, and a *Fire Protection Plan*.A *Fire Protection Plan* describes ways to minimize the fire problems created by a specific project or development. The purpose for the *Fire Protection Plan* is to reduce the burden and impact of the project or development on the community's fire protection delivery system. The plan may utilize components of land use, building construction, vegetation management and other design techniques and technologies. It should include specific mitigation measures consistent with the unique problems resulting from the location, topography, geology, flammable vegetation and climate of the proposed site. The plan shall be consistent with this code, and approved by the fire *code official*. The cost of preparation and review is to be borne by the project or development proponent.

G101.3.6 Building location. The location of a new building within lot lines should be considered as it relates to topography and fire

~~behavior. Buildings located in natural chimneys, such as narrow canyons and saddles, are especially fire prone because winds are funneled into these areas and eddies are created. Buildings located on narrow ridges without setbacks may be subjected to increased flame and convective heat exposure from a fire advancing from below. Stone or masonry walls can act as heat shields and deflect the flames. Swimming pools and rated or noncombustible decks and patios can be used to create a setback, decreasing the exposure to the structure. Attic and under floor vents, picture windows and sliding glass doors should not face possible corridors due to the increased risk of flame or ember penetration.~~

~~**G101.4 Conclusion.** The purpose of the *International Wildland-Urban Interface Code* is to establish minimum standards that prevent the loss of structures, even if fire department intervention is absent. To accept alternative self-defense mechanisms, the *code official* must carefully examine whether these devices will be in place at the time of an event and whether they will assist or actually complicate the defense of the structure by fire suppression forces if they are available.The best alternative to having a building comply with all of the provisions of this code is to remove sources of fuel. This is closely paralleled by excellent housekeeping between the vegetation and the structure. Alternative ways of achieving each of these goals can and should be considered after scrutiny by appropriately credentialed and qualified fire protection personnel.~~

Add new text as follows:

APPENDIX G
VOLUNTARY HOME-HARDENING RECOMMENDATIONS

SECTION G101
GENERAL

G101.1 Identification of the problem. The International Wildland-Urban Interface Code establishes a set of minimum standards to reduce the loss of property from wildfire. The purpose of these standards is to prevent wildfire from spreading from vegetation to a building. Many homes were built in the wildland-urban interface areas prior to the implementation of provisions found in this code. As a result, many homes are lacking in their ability to survive an approaching wildfire. Many of the features discussed herein are designed as low-cost features to retrofit existing homes. Additionally, many owners desire to increase the survivability of their home and provide additional protection beyond the minimums prescribed in this code. This appendix chapter provides discussion of some elements of possible features to enhance survivability and harden the structure against an approaching wildfire.

G101.2 Structural survivability. The home hardening features listed in Section G101.21 were developed as a best practices guide to assist homeowners to increase the ignition-resistance of their homes from wildfires. Some of these items are based on upgrading to more stringent building materials when that building component is due for replacement as part of its normal maintenance or lifespan, such as the roof covering.

G101.2.1 Home hardening features. If homes are not already provided with the suggested protection, the following items should be considered in hardening a home against wildfire:

1. When it is time to replace your roof, replace it with a Class A fire rated roof.

2. Block any spaces between your roof covering and sheathing with noncombustible materials (bird stops).

3. Install a noncombustible gutter cover on gutters to precent the accumulation of leaves and debris in the gutter.

4. Cover your chimney and stovepipe outlets with a noncombustible corrosion resistant metal mesh screen (spark arrestor), with 3/8-inch to 1/2-inch openings.

5. Install ember and flame-resistant vents.

6. Caulk and plug gaps greater than 1/8-inch around exposed rafters and blocking to prevent ember intrusion into the attic or other enclosed spaces.

7. Inspect exterior siding for dry rot, gaps, cracks, and warping. Caulk or plug gaps greater than 1/8-inch in siding and replace any damaged boards, including those with dry rot

8. Install weather-stripping to fill gaps greater than 1/8-inch between garage doors and door frames to prevent ember intrusion. The weather-stripping must be compliant with UL Standard 10C.

9. When it's time to replace your windows or skylights, replace them with multilayered glazed panels containing at least one tempered pane or dome.

10. When it's time to replace your siding or deck, use compliant noncombustible or ignition-resistant materials.

11. Cover openings to operable skylights with noncombustible metal mesh screen with openings in the screen not to exceed 1/8-inch.

12. Install a minimum 6-inch metal flashing, applied vertically on the exterior of the wall at the deck-to-wall intersection to protect the building siding material.

G101.3 Defensible space features. The maintenance and defensible space features listed in Section G101.31 were developed as a best practices guide to assist homeowners to increase the effectiveness of their defensible space and improve the effects of the home hardening features to increase the survivability of their homes from wildfires.

G101.3.1 Maintenance and defensible space. The following maintenance and operational procedures assist to limit the impact on a home from an approaching wildfire:

1. Regularly clean your roof, gutters, decks, and the base of walls to avoid the accumulation of fallen leaves, needles, and other flammable materials.

2. Ensure that all combustible materials are removed from underneath, on top of, or within five feet of a deck.

3. Remove vegetation or other combustible materials that are within five feet of windows and glass doors.

4. Replace wood mulch products within five feet of all structures with noncombustible products such as dirt, stone, or gravel.

5. Remove all dead or dying grass, plants, shrubs, trees, branches, leaves, weeds, and pine needles within 30 feet of all structures or to the property line.

6. Ensure exposed firewood is stored at least 30 feet away from structures or completely covered in a fire-resistant material that will not allow embers to penetrate. Additionally, make sure you have 10 feet of clearance around your wood piles.

7. Be sure to store combustible outdoor furnishings away from your home when not in use.

8. Remember to properly store retractable awnings and umbrellas when not in use so they do not collect leaves and embers.

Reason: Home hardening is the term used to describe vegetation management compliance and building materials used to resist the intrusion of flames or embers projected by a wildland fire. It can be applied to new construction or for retrofitting an older home. Home Hardening considers the relationship between your home and its exposure to nearby combustible features such as vegetation, vehicles, accessory buildings, or even miscellaneous structures like a fence.

Your roof is one of the most vulnerable areas of your home! Due to its large surface area, your roof is more susceptible to embers and flame.

How is a roof vulnerable?

- Combustible roof coverings such as a non-fire-retardant treated wood shake or shingle roof. California requires roof coverings and assemblies to be Class A-ratedExternal Link. Common Class A roof coverings include asphalt shingles, tile or cement shingles, or metal panels.
- Gaps or openings in your roof assembly that have degraded exposing unprotected roof components.
- Debris accumulation on your roof, especially when located next to vulnerable areas such as combustible wall intersections.

What to do about a roof

- Keep your roof clear of debris and vegetation.
- Fill in gaps between the roof covering and the sheathing to prevent the intrusion of embers and flame.
- When it is time to replace your roof, install a Class A-rated roof covering such as asphalt fiberglass composition shingles.
- Replace combustible siding at roof-to-wall intersections with noncombustible siding.

How are roof attachments vulnerable?

- Debris accumulation around roof attachments.
- Gaps or penetrations in the roof covering from the installation of a roof attachment like a solar panel.

What to do about roof attachments

- Check periodically and keep areas around roof attachments free of debris.
- Ensure that roof attachments have enough space underneath them so that debris does not accumulate.
- Ensure openable skylights have a noncombustible metal mesh screen not exceeding 1/8 inch and have multipaned glazing with one layer of tempered glass.
- Install metal flashing around exposed wood frame skylights.

Check your gutters! Clean gutters regularly and install noncombustible gutter covers on gutters.

How are gutters vulnerable?

- Gutters without a gutter cover can allow accumulation of debris making it highly susceptible to embers and fire. If the debris catches on fire, it exposes unprotected combustible areas of your roof assembly.
- Gutters made of combustible materials such as vinyl can catch on fire and expose unprotected combustible areas of your roof assembly.

What to do about gutters

- At a minimum, install a noncombustible gutter cover to reduce the buildup of debris. When it is time to replace your gutters, replace them with a non-combustible option such as metal.
- Ensure your roof has a metal drip edge installed that completely covers the space above your gutter system.

Make sure your vents are protected from embers and fire. Upgrade your vents!

How are vents vulnerable?

- Access points such as your attic or crawlspace vents are areas embers or flames can enter and ignite combustible materials inside your home.
- Inlet vent that allows for the entry of wind-blown vegetative debris. Ridge or off-ridge vents located on your roof are more susceptible.
- Vents constructed of flammable materials such as plastic are highly vulnerable to embers and flames.

What to do about vents

- At a minimum, vents should have metal mesh screening that is at least 1/8 inch to protect against embers and flame.
- Upgrade to WUI-rated ember/flame-resistant vents. Be sure to accommodate for proper ventilation. Consult your local building official or licensed contractor for local building requirements for wildland areas.
- Keep debris away from all vents.
- Properly seal all openings including around blocking in vent areas.

Plug gaps or openings in your eaves and remove all vegetation and combustible materials that are directly underneath.

How are eaves vulnerable?

- Open eave construction with gaps or penetrations between the rafter tails and blocking as they are entry points for embers.
- Vents in eaves with gaps or penetrations in the blocking.
- Wide overhangs.
- Combustible fuel sources next to your home that can create a fire pathway for embers or flames to your eaves.

What to do about eaves

- Remove vegetation and combustible materials directly below eaves.
- Create a soffit eave (horizontal) or enclose eave (angled) using noncombustible material. Consult your local building official or licensed contractor for building codes in your area.
- Inspect eaves for gaps around rafter roof tails and blocking. Plug or caulk gaps.

Exterior siding that is combustible, has gaps, holes, or rot is vulnerable to both embers and flame.

How is siding vulnerable?

- If ignited, combustible siding can provide a path for flames to penetrate through other vulnerable areas such as windows, under-eave areas, or vents.
- Siding ignition from nearby combustibles that are too close to the house.
- Roof-to-wall areas where combustible siding is present.

- Gaps or penetrations in the exterior covering that are larger than 1/8 of an inch.

What to do about siding

- Plug or repair all gaps, holes, or rot in your exterior siding.
- Consider replacing combustible siding with a noncombustible or ignition-resistant material option. Consult your local building official or licensed contractor for local building codes in wildland areas.
- If a full replacement of your exterior covering is not possible then consider a partial replacement by using a noncombustible siding material for the bottom 2 feet from the ground and add metal flashing to protect the bottom edge sheathing.

Close the gap! Poorly sealed doors with gaps or penetrations provide a path for embers to enter your home or garage.

How are doors vulnerable?

- Doors that have rot or decay.
- Combustible door framing material as embers tend to accumulate at the bottom thresholds and sides.
- Doors that have gaps or penetrations greater than 1/8 inch.
- Door screens that are not made of metal mesh.
- Fuel sources stored nearby or inside a garage which increases its ignition potential.
- Garage doors that lack gasketing or have gaps that allow for the intrusion of embers.

What to do about doors

- Install or replace non-compliant wood screen or sliding doors with a noncombustible option.
- Install metal mesh screens in sliding or screen doors.
- Relocate combustibles and flammables inside your garage so they are not located next to ignition sources.
- Add metal flashing at garage door jambs and headers.
- Add gasketing (weather-striping) to garage doors to prevent ember intrusion.

Remove combustibles and vegetation around windows and upgrade older vulnerable single-pane windows with ones designed for areas that experience wildland fire.

How are windows vulnerable?

- Windows that are left open unattended.
- Combustible framing material that, when ignited, glass breaks or falls out providing a path for embers or flames to enter your home.
- Radiant heat which can cause windows to break even before fire reaches the house. Single-pane and large windows are particularly vulnerable.
- Windows that face large vegetation areas or have vegetation directly underneath.
- Vinyl windows that do not have an internal reinforcement bar in the horizontal or vertical separator member as they are prone to failure from radiant exposure due to deformation of the frame.

What to do about windows

- Install or upgrade to double-pane tempered glass windows. Tempered glass is about four times more resistant to breaking during a wildfire.
- Noncombustible metal framing material is an optimal choice.
- Confirm if vinyl windows have a vertical or horizontal reinforcement bar.
- Create a 0 to 5 ember-resistant zone by removing vegetation and other combustibles by all windows.
- Install metal mesh window screens to improve the performance of windows subjected to radiant heat exposure.

Protect your deck! Deck ignitions can start from flames underneath or embers on top.

How is a deck vulnerable?

- Combustible damaged or rotting deck boards as they are more easily ignitable.

- Deck boards made of combustible materials that are attached to the residence.
- Deck-to-wall intersections that have combustible siding and no metal flashing.
- Combustibles within the first 0 to 5 feet zone around a combustible deck (patio furniture, planter boxes, door mats, etc.)
- Combustible items stored underneath your deck that could be an ignition source for fire.
- Decks that overhang a slope that can be exposed to flames from trees or other vegetation downslope.
- Lattice or other combustible fencing options are used as a vertical enclosure under a deck, as it is readily ignitable.

What to do about decks

- Create an ember-resistant zone under the deck footprint extending five feet outward to reduce the likelihood of under-deck flame exposure. Use hardscapes like gravel, pavers, or concrete.
- Ensure sufficient defensible space if your deck is overhanging and located on a slope to minimize flame spread.
- Replace deck boards with ignition-resistant, noncombustible, fire-retardant-treated wood, or material that complies with performance testing standards (this includes steps, stairs, and railings).
- Replace any damaged or rotting deck boards as they ignite more easily.
- Install a minimum of a 6-inch metal flashing applied vertically on the exterior wall and at deck-to-wall intersections.
- If a full replacement of your deck is not possible then consider a partial replacement by replacing the walking surface boards with a noncombustible option for the first 1 ft. away from the residence.
- Remove combustible items stored under your deck.
- Regularly clear debris on top of or underneath your deck.

Bibliography: https://www.fire.ca.gov/home-hardening

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The section is voluntary. The cost is determined based on the recommendations to harden an existing structure in the Wildland Urban area.

WUIC72-24

Public Hearing Results (CAH1)

Committee Action: **As Submitted**

Committee Reason: The committee stated that the reasons for the approval of the proposal were: It updates the appendix with new information and brings it up to current criteria. It is an information only existing appendix that is being updated with current terminology. It is an appropriate change regarding providing information and as an educational piece, it also allows ICC as a code organization to modify it as the code continues to be modified to make sure it aligns the two groups together. It has a lot of credibility because it's been vetted by organizations that have expertise and it correlates with the intent of the code. (Vote: 11-2)

WUIC72-24

Individual Consideration Agenda

Comment 1:

IWUIC: G101.2.1

Proponents: Aaron Phillips, Asphalt Roofing Manufacturers Association (ARMA), Asphalt Roofing Manufacturers Association (aphillips@asphaltroofing.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Wildland Urban Interface Code

Revise as follows:

G101.2.1 Home hardening features. If homes are not already provided with the suggested protection, the following items should be considered in hardening a home against wildfire:

1. When it is time to replace your roof, replace it with a *roof assembly* classified as Class A when tested in accordance with ASTM E108 or UL 790 ~~fire rated roof~~.
2. Block any spaces between your roof covering and sheathing with noncombustible materials (bird stops).
3. Install a noncombustible gutter cover on gutters to precent the accumulation of leaves and debris in the gutter.
4. Cover your chimney and stovepipe outlets with a noncombustible corrosion resistant metal mesh screen (spark arrestor), with 3/8-inch to 1/2-inch openings.
5. Install ember and flame-resistant vents.
6. Caulk and plug gaps greater than 1/8-inch around exposed rafters and blocking to prevent ember intrusion into the attic or other enclosed spaces.
7. Inspect exterior siding for dry rot, gaps, cracks, and warping. Caulk or plug gaps greater than 1/8-inch in siding and replace any damaged boards, including those with dry rot
8. Install weather-stripping to fill gaps greater than 1/8-inch between garage doors and door frames to prevent ember intrusion. The weather-stripping must be compliant with UL Standard 10C.
9. When it's time to replace your windows or skylights, replace them with multilayered glazed panels containing at least one tempered pane or dome.
10. When it's time to replace your siding or deck, use compliant noncombustible or ignition-resistant materials.
11. Cover openings to operable skylights with noncombustible metal mesh screen with openings in the screen not to exceed 1/8-inch.
12. Install a minimum 6-inch metal flashing, applied vertically on the exterior of the wall at the deck-to-wall intersection to protect the building siding material.

Reason: This comment coordinates language in section G102.2.1 with changes brought forward in WUIC33-24, which was recommended for approval as submitted during Committee Action Hearing #1. ASTM E108 and UL 790 tests are performed on *roof assemblies* to establish a classification (Class A, B, or C). In contrast, ASTM E119 or UL 263 tests evaluate the duration for which building elements contain a fire, retain their structural integrity, or exhibit both properties during a predetermined test exposure. The result of these tests is expressed as a *fire resistance rating.*

The current language in G101.2.1, item 1 implies that a fire resistance rated roof should be installed, when the intent is to recommend that the building owner install a roof assembly classified as Class A in accordance with ASTM E108 or UL 790.

Even though this is an informational section, there is benefit to clarification of the language for consistency with other sections of the

International Codes.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The modification offered in this comment clarifies existing provisions. Therefore, no change in cost of construction is expected.

Comment (CAH2)# 22

F5-24

IFC: 105.5.36

Proposed Change as Submitted

Proponents: Scott Plumer, Arvada Fire Protection District, Arvada Fire Protection District

2024 International Fire Code

Revise as follows:

105.5.36 Open burning. An operational permit is required for the kindling or maintaining of an open fire or a fire on any public street, alley, road, or other public or private ground. Instructions and stipulations of the permit shall be complied with.

Exception: *Recreational fires* and *portable outdoor fireplaces*.

Reason: This proposal adds an exception for *portable outdoor fireplaces* to the open burning requirements. There is no need to require permits for these appliances since the code already requires they be used according to the manufacturer instructions.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal will not affect the cost of construction as it is a clarification only.

F5-24

Public Hearing Results (CAH1)

Committee Action: **As Submitted**

Committee Reason: The committee stated that the reason for the approval of the proposal was that the addition of “portable outdoor fireplaces” to the exception makes sense because it is contained and safer than open burning. (Vote: 14-0)

F5-24

Individual Consideration Agenda

Comment 1:

IFC: 105.5.36, SECTION 202, 307.1, 307.1.1, 307.2, 307.5

Proponents: Jeffrey Shapiro, P.E., FSFPE, Lake Travis Fire Rescue, Lake Travis Fire Rescue (jshapiro@ltfr.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Fire Code

Revise as follows:

105.5.36 Open burning. An operational permit is required for *open burning* ~~the kindling or maintaining of an open fire or a fire~~ on any ~~public street, alley, road, or other~~ public or private property~~ground~~. Instructions and stipulations of the permit shall be complied with.

~~**Exception:** *Recreational fires* and *portable outdoor fireplaces.*~~

BONFIRE. ~~An outdoor fire utilized~~ A type of o*pen burning*, conducted for ceremonial purposes.

OPEN BURNING. The kindling or burning of materials wherein products of combustion are emitted directly into the ambient air without passing through a stack or chimney from an enclosed chamber, other than ~~Open burning does not include~~ road flares, smudgepots and similar devices associated with safety or occupational uses~~ typically considered open flames~~, *recreational fires* ~~or use of~~ and fires in portable outdoor fireplaces. For the purpose of this definition, a chamber ~~shall be regarded as~~ is considered to be enclosed when, during the time combustion occurs, only apertures, ducts, stacks, flues or chimneys necessary to provide combustion air and permit the escape of exhaust gas are open.

307.1 General. ~~A person shall not kindle or maintain or authorize to be kindled or maintained any *open burning* unless conducted and *approved* in accordance~~ Open burning, *recreational fires* and portable outdoor fireplaces shall comply with Sections 307.1.1 through 307.5.

307.1.1 Prohibited open burning. *Open burning* shall be prohibited unless *approved* and shall not be conducted when atmospheric conditions or local circumstances make such fires hazardous.

Exception: Prescribed burning for the purpose of reducing the impact of wildland fire when authorized by the *fire code official*.

307.2 Permit required. A permit shall be obtained from the *fire code official* in accordance with Section 105.5 prior to conducting *open burning* for any purpose, including but not limited to ~~kindling a fire for~~ recognized silvicultural or range or wildlife management practices, prevention or control of disease or pests, or a *bonfire*. Application for a permit~~such approval~~ shall only be presented by and permits shall only be issued to the *owner* of the land on which *open burning* will be conducted~~the fire is to be kindled~~.

307.5 Attendance. *Open burning*, including but not limited to *bonfires*~~bonfires,~~; *recreational fires;* and ~~use of~~ portable outdoor fireplaces that are in use shall be constantly attended until the fire is extinguished. ~~Not fewer than o~~One or more portable fire extinguishers complying with Section 906 with a minimum 4-A rating or other *approved* on-site fire-extinguishing equipment, such as dirt, sand, water barrel, garden hose or water truck, shall be available for immediate utilization.

Reason: The proposed addition of "portable outdoor fireplaces" in the exception brought to light a much larger issue in the code related to use and definition of the term "open burning." Open burning, as currently defined, does not include portable outdoor fireplaces, so adding this to the permit exception makes no sense. Likewise, recreational fires aren't included in the definition of open burning, so arguably the exception to the open burning permit in 105.5.36 made no sense in the current and previous editions of the code. Deleting the exception would be a simple fix, but because it exposes other inconsistencies associated with the defined open burning term, it makes sense to clean up sections that are associated with open burning permits. This proposal does not intend to make any technical changes in that regard. It simply fixes the mistake made by approving the original proposal and what appears to be other related provisions that led to confusion or misunderstanding.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Cleans up existing provisions with no intended technical changes.

Comment (CAH2)# 782

2024 International Fire Code

Revise as follows:

AEROSOL PRODUCT. A combination of a container, a propellant and a material that is dispensed. Aerosol products shall be classified by means of the calculation of their chemical heats of combustion and shall be designated Level ~~1, Level 2 or Level 3.~~3, Level 2 or Level 1.

~~Level 3 aerosol products~~ Level 1. ~~Those with a total chemical heat of combustion that is greater than 13,000 Btu/lb (30 kJ/g).~~ An aerosol product that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as an Aerosol (Category 3). Where the GHS category is not known, the following is acceptable for classification purposes: Those with a total chemical heat of combustion that is less than or equal to 8,600 British thermal units per pound (Btu/lb) (20 kJ/g).

~~Level 1 aerosol products~~ Level 3. ~~Those with a total chemical heat of combustion that is less than or equal to 8,600 British thermal units per pound (Btu/lb) (20 kJ/g).~~ An aerosol product that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as an Aerosol (Category 1). Where the GHS category is not known, the following is acceptable for classification purposes: Those with a total chemical heat of combustion that is greater than 13,000 Btu/lb (30 kJ/g)..

~~Level 2 aerosol products~~ Level 2. An aerosol product that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as an Aerosol (Category 2). Where the GHS category is not known, the following is acceptable for classification purposes:Those with a total chemical heat of combustion that is greater than 8,600 Btu/lb (20 kJ/g), but less than or equal to 13,000 Btu/lb (30 kJ/g).

2024 International Building Code

Revise as follows:

[F] AEROSOL PRODUCT. A combination of a container, a propellant and a material that is dispensed. Aerosol products shall be classified by means of the calculation of their chemical heats of combustion and shall be designated Level ~~1, Level 2 or Level~~ 3, Level 2 or Level 1.

~~Level 3 aerosol products~~ Level 1. ~~Those with a total chemical heat of combustion that is greater than 13,000 Btu/lb (30 kJ/g).~~ An aerosol product that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as an Aerosol (Category 3). Where the GHS category is not known, the following is acceptable for classification purposes: Those with a total chemical heat of combustion that is less than or equal to 8,600 British thermal units per pound (Btu/lb) (20 kJ/g).

~~Level 1 aerosol products~~ Level 3. ~~Those with a total chemical heat of combustion that is less than or equal to 8,600 British thermal units per pound (Btu/lb) (20 kJ/g).~~ An aerosol product that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as an Aerosol (Category 1). Where the GHS category is not known, the following is acceptable for classification purposes: Those with a total chemical heat of combustion that is greater than 13,000 Btu/lb (30 kJ/g).

~~Level 2 aerosol products~~ Level 2. An aerosol product that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as an Aerosol (Category 2). Where the GHS category is not known, the following is acceptable for classification purposes:Those with a total chemical heat of combustion that is greater than 8,600 Btu/lb (20 kJ/g), but less than or equal to 13,000 Btu/lb (30 kJ/g).

Reason:
Fire Code officials must enforce the hazardous materials provisions of the International Fire Code (IFC) and the International Building Code (IBC) to ensure that people and property in our communities are safe. While code officials need to verify and validate the hazards of materials, classifying hazardous materials in accordance with definitions and hazard classes in the I-codes is the responsibility of facility owners and is an ongoing challenge. Consequences of missing or incorrect classification include increased fire and life safety risk

and can lead to misclassification of an occupancy.

Due to the expansion of international chemical trade, the United Nations (UN) developed a Globally Harmonized System (GHS) of classification of hazardous materials. The GHS is an internationally agreed upon standard of classification and labeling that in most cases utilizes prescriptive, standardized testing procedures and criteria to classify hazardous materials. Federal law (29 CFR 1910.1200 (OSHA) and 49 CFR 173.127 (DOT)) mandates that manufacturers selling, producing or transporting chemicals in the United States classify chemicals according to the GHS system and make the information readily available in product Safety Data Sheets (SDSs).

This proposal aims to incorporate the readily available GHS (Revision 7) classifications into the I-code definitions to better align with federal standards for hazardous materials classification. Proper identification of multiple hazards and the degree of hazard are likely outcomes of utilizing the GHS.

For consistency with other Hazardous Materials classifications throughout the I-codes, this proposal re-orders the Aerosol products to list the highest hazard materials first (Level 3), followed in order by reduced level of hazard, ending with the least hazardous material (Level 1).

Aerosol definitions are similar between IFC and GHS, with the same cut-off values for heat of combustion. However, GHS definitions of aerosols include additional testing criteria including ignition distance tests and percentage of flammable components. Minimal changes are anticipated by using the proposed definitions.

FCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and early 2024 the FCAC has held several virtual meetings and one in-person meeting open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the **FCAC Website**

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal is meant to provide correlation with the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) which is used globally and by OSHA. This revised definition will not affect the application of the code and will make compliance more straightforward. US manufacturers and distributors of hazardous materials have been required to use the GHS classification system to communicate the hazards of materials in Safety Data Sheets (SDS) since 2012.

F7-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The proposal was disapproved based upon technical problems with the classifications that need to be addressed. The GHS definition does not appropriately address heat of combustion which was the primary criteria for aerosols as addressed in NFPA 30B. If the GHS definition is used, there will also need to be additional information, guidance, and criteria to address this key criteria. (Vote 13-1)

F7-24

Individual Consideration Agenda

Comment 1:

IFC: SECTION 202; IBC: SECTION 202

Proponents: Robert Marshall, FCAC, FCAC (fcac@iccsafe.org); Lynne Kilpatrick, HMEx Assistant, self (lynne.kilpatrick@hmexassistant.com); Megan Hall, UC Berkeley Fire Prevention, self (mchall@berkeley.edu) requests As Modified by Committee (AMC2)

Replace as follows:

2024 International Fire Code

AEROSOL PRODUCT. A combination of a container, a propellant and a material that is dispensed. Aerosol products shall be classified by means of the calculation of their chemical heats of combustion and shall be designated Level 1, Level 2 or Level 3.

Level 1 ~~aerosol products~~. Those with a total chemical heat of combustion that is less than or equal to 8,600 British thermal units per pound (Btu/lb) (20 kJ/g) and, where the heat of combustion is unknown, those classified as Aerosols (Category 3) under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS).

Level 2 ~~aerosol products~~. Those with a total chemical heat of combustion that is greater than 8,600 Btu/lb (20 kJ/g), but less than or equal to 13,000 Btu/lb (30 kJ/g) and, where the heat of combustion is unknown, those classified as Aerosols (Category 2) under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS).

Level 3 ~~aerosol products~~. Those with a total chemical heat of combustion that is greater than 13,000 Btu/lb (30 kJ/g) and, where the heat of combustion is unknown, those classified as Aerosols (Category 1) under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS).

2024 International Building Code

[F] AEROSOL PRODUCT. A combination of a container, a propellant and a material that is dispensed. Aerosol products shall be classified by means of the calculation of their chemical heats of combustion and shall be designated Level 1, Level 2 or Level 3.

Level 1 ~~aerosol products~~. Those with a total chemical heat of combustion that is less than or equal to 8,600 British thermal units per pound (Btu/lb) (20 kJ/g) and, where the heat of combustion is unknown, those classified as Aerosols (Category 3) under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS).

Level 2 ~~aerosol products~~. Those with a total chemical heat of combustion that is greater than 8,600 Btu/lb (20 kJ/g), but less than or equal to 13,000 Btu/lb (30 kJ/g) and, where the heat of combustion is unknown, those classified as Aerosols (Category 2) under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS).

Level 3 ~~aerosol products~~. Those with a total chemical heat of combustion that is greater than 13,000 Btu/lb (30 kJ/g) and, where the heat of combustion is unknown, those classified as Aerosols (Category 1) under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS).

Reason: This proposal aims to incorporate the readily available GHS (Revision 7) classifications into the I-code definitions to better align with federal standards for hazardous materials classification. Utilizing the GHS is likely to result in the proper identification of multiple hazards and the degree of hazard.

The original proposal was disapproved primarily because the GHS definition does not rely solely on the heat of combustion (HOC), which is the primary criterion used in NFPA 30B to address aerosols. The GHS also considers the percent of flammable constituents and, in some cases, ignition distance and flammability testing. The revision here maintains the current definition with the HOC as the primary criteria for classification, but also allows for the GHS classification when the HOC is unknown.If approved, this change is anticipated to encourage manufacturers to include the HOC in Section 9 (Physical and Chemical Properties) of the Safety Data Sheets they publish. This inclusion will make the HOC readily accessible to code users, thereby enhancing the information available to classify aerosols or verify assigned classifications correctly.

FCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and early 2024 the FCAC has held several virtual meetings and one in-person meeting open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as

interested parties. Related documents and reports are posted on the **FCAC Website**.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal is meant to provide correlation with the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) which is used globally and by OSHA. This revised definition will not affect the application of the code and will make compliance more straightforward. US manufacturers and distributors of hazardous materials have been required to use the GHS classification system to communicate the hazards of materials in Safety Data Sheets (SDS) since 2012.

Comment (CAH2)# 302

F13-24

IFC: SECTION 202; IBC: SECTION 202

Proposed Change as Submitted

Proponents: Andrew Klein, A S Klein Engineering, PLLC, Self Storage Association (andrew@asklein.com)

2024 International Fire Code

Revise as follows:

COMMERCIAL MOTOR VEHICLE. A motor vehicle used to transport passengers or property in commerce where the motor vehicle:

1. Has a gross vehicle weight rating of 10,000 pounds (454 kg) or more; or
2. Is designed to transport 16 or more passengers, including the driver.

2024 International Building Code

Revise as follows:

[F] COMMERCIAL MOTOR VEHICLE. A motor vehicle used to transport passengers or property in commerce where the motor vehicle meets one of the following:

1. Has a gross vehicle weight rating of 10,000 pounds (4540 kg) or more.
2. Is designed to transport 16 or more passengers, including the driver.

Reason: The current definition in the IFC for “Commercial Motor Vehicle is from 49 CFR Part 390.5, Federal Motor Carrier Safety Regulations, however the scope of those regulations deals exclusively with commercial motor vehicles which transport property or passengers in interstate commerce. This code change to the ICC aligns the IFC more closely with that federal regulation and helps avoid the improper application of this definition to RVs or vehicles used for van pools.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

$0.00 Construction costs for RV and van pool storage buildings could decrease.

Estimated Immediate Cost Impact Justification (methodology and variables):

Facilities designed for the storage of RVs and van pool vehicles will have a 12,000 SF threshold per fire area as opposed to a 5,000 SF threshold per fire area before sprinklers are required.

Estimated Life Cycle Cost Impact:

n/a

Estimated Life Cycle Cost Impact Justification (methodology and variables):

n/a

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: Limiting to vehicles in commerce does not reduce the fuel load that should still be regulated. This definition has much broader implications than RV and or van pool storage. (Vote 12-2)

F13-24

Individual Consideration Agenda

Comment 1:

IFC: SECTION 202; IBC: SECTION 202

Proponents: Andrew Klein, A S Klein Engineering, PLLC, Self Storage Association (andrew@asklein.com) requests As Modified by Committee (AMC2)

Replace as follows:

2024 International Fire Code

Revise as follows:

COMMERCIAL MOTOR VEHICLE. A motor vehicle used to transport passengers or property where the motor vehicle:

1. Has a gross vehicle weight rating of 10,000 pounds (454 kg) or more; or

2. Is designed to transport 16 or more passengers, including the driver.

Vehicles intended for private recreation shall not be considered commercial motor vehicles.

2024 International Building Code

Revise as follows:

[F] COMMERCIAL MOTOR VEHICLE. A motor vehicle used to transport passengers or property where the motor vehicle meets one of the following:

1. Has a gross vehicle weight rating of 10,000 pounds (4540 kg) or more.

2. Is designed to transport 16 or more passengers, including the driver.

Vehicles intended for private recreation shall not be considered commercial motor vehicles.

Reason: The definition of "Commercial Motor Vehicle" currently encompasses personally-owned RVs in private and privately-rented garages. The Committee did not want to limit the definition of "commercial motor vehicle" to ones only used in commerce, but committee members were supportive of the idea of a more targeted proposal that does not include RVs. This revised wording does just that.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

Garages designed for the storage of RVs will have a 12,000 SF threshold per fire area as opposed to a 5,000 SF threshold per fire area before sprinklers are required.

Estimated Immediate Cost Impact Justification (methodology and variables):

Savings of $36,000 - $285,000 for a 12,000 SF building assuming $3/SF for sprinklers and up to $250,000 if a fire pump and water tank would also bee required.

Comment (CAH2)# 559

F23-24

IFC: SECTION 202; IBC: SECTION 202

Proposed Change as Submitted

Proponents: Robert Marshall, FCAC, FCAC (fcac@iccsafe.org); Megan Hall, UC Berkeley Fire Prevention, self (mchall@berkeley.edu); Lynne Kilpatrick, HMEx Assistant LLC, self (lynne.kilpatrick@hmexassistant.com)

2024 International Fire Code

Revise as follows:

HIGHLY TOXIC. ~~A material which produces a lethal dose or lethal concentration which falls within any of the following categories:~~ A substance or mixture that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as Acute Toxicity Oral Category 1 or 2, Dermal Category 1 or 2, Inhalation Gases Category 1, Inhalation Vapors Category 1, or Inhalation Dusts and Mists Category 1 or 2. Where the GHS category is not known, one of the following is acceptable for classification purposes:

1. A chemical that has a median lethal dose (LD_{50}) of 50 milligrams or less per kilogram of body weight when administered orally to albino rats weighing between 200 and 300 grams each.

2. A chemical that has a median lethal dose (LD_{50}) of 200 milligrams or less per kilogram of body weight when administered by continuous contact for 24 hours (or less if death occurs within 24 hours) with the bare skin of albino rabbits weighing between 2 and 3 kilograms each.

3. A chemical that has a median lethal concentration (LC_{50}) in air of 200 parts per million by volume or less of gas or vapor, or 2 milligrams per liter or less of mist~~, fume~~ or dust, when administered by continuous inhalation for one hour (or less if death occurs within 1 hour) to albino rats weighing between 200 and 300 grams each.

Mixtures of these materials with ordinary materials, such as water, might not warrant classification as highly toxic. While this system is basically simple in application, any hazard evaluation that is required for the precise categorization of this type of material shall be performed by experienced, technically competent persons.

TOXIC. ~~A chemical falling within any of the following categories:~~A substance or mixture that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as Acute Toxicity Oral Category 3 or 4, Dermal Category 3, Inhalation Gases Category 2 or 3, Inhalation Vapors Category 2 or 3, or Inhalation Dusts and Mists Category 3 or 4. Where the GHS category is not known, one of the following is acceptable for classification purposes:

1. A chemical that has a median lethal dose (LD_{50}) of more than 50 milligrams per kilogram, but not more than 500 milligrams per kilogram of body weight when administered orally to albino rats weighing between 200 and 300 grams each.

2. A chemical that has a median lethal dose (LD_{50}) of more than 200 milligrams per kilogram but not more than 1,000 milligrams per kilogram of body weight when administered by continuous contact for 24 hours (or less if death occurs within 24 hours) with the bare skin of albino rabbits weighing between 2 and 3 kilograms each.

3. A chemical that has a median lethal concentration (LC_{50}) in air of more than 200 parts per million but not more than 2,000 parts per million by volume of gas or vapor, or more than 2 milligrams per liter but not more than 20 milligrams per liter of mist~~, fume~~ or dust, when administered by continuous inhalation for 1 hour (or less if death occurs within 1 hour) to albino rats weighing between 200 and 300 grams each.

2024 International Building Code

Revise as follows:

[F] HIGHLY TOXIC. ~~A material which produces a lethal dose or lethal concentration that falls within any of the following categories:~~
A substance or mixture that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as Acute Toxicity Oral Category 1 or 2, Dermal Category 1 or 2, Inhalation Gases Category 1, Inhalation Vapors Category 1, or Inhalation Dusts and Mists Category 1 or 2. Where the GHS category is not known, one of the following is acceptable for classification purposes:

1. A chemical that has a median lethal dose (LD_{50}) of 50 milligrams or less per kilogram of body weight when administered orally to albino rats weighing between 200 and 300 grams each.

2. A chemical that has a median lethal dose (LD_{50}) of 200 milligrams or less per kilogram of body weight when administered by continuous contact for 24 hours (or less if death occurs within 24 hours) with the bare skin of albino rabbits weighing between 2 and 3 kilograms each.

3. A chemical that has a median lethal concentration (LC_{50}) in air of 200 parts per million by volume or less of gas or vapor, or 2 milligrams per liter or less of mist, fume or dust, when administered by continuous inhalation for 1 hour (or less if death occurs within 1 hour) to albino rats weighing between 200 and 300 grams each.

Mixtures of these materials with ordinary materials, such as water, might not warrant classification as *highly toxic*. While this system is basically simple in application, any hazard evaluation that is required for the precise categorization of this type of material shall be performed by experienced, technically competent persons.

[F] TOXIC. ~~A chemical falling within any of the following categories:~~
A substance or mixture that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as Acute Toxicity Oral Category 3 or 4, Dermal Category 3, Inhalation Gases Category 2 or 3, Inhalation Vapors Category 2 or 3, or Inhalation Dusts and Mists Category 3 or 4. Where the GHS category is not known, one of the following is acceptable for classification purposes:

1. A chemical that has a median lethal dose (LD_{50}) of more than 50 milligrams per kilogram, but not more than 500 milligrams per kilogram of body weight when administered orally to albino rats weighing between 200 and 300 grams each.

2. A chemical that has a median lethal dose (LD_{50}) of more than 200 milligrams per kilogram, but not more than 1,000 milligrams per kilogram of body weight when administered by continuous contact for 24 hours (or less if death occurs within 24 hours) with the bare skin of albino rabbits weighing between 2 and 3 kilograms each.

3. A chemical that has a median lethal concentration (LC_{50}) in air of more than 200 parts per million, but not more than 2,000 parts per million by volume of gas or vapor, or more than 2 milligrams per liter but not more than 20 milligrams per liter of mist, fume or dust, when administered by continuous inhalation for 1 hour (or less if death occurs within 1 hour) to albino rats weighing between 200 and 300 grams each.

Reason: Fire Code officials must enforce the hazardous materials provisions of the International Fire Code (IFC) and the International Building Code (IBC) to ensure that people and property in our communities are safe. While code officials need to verify and validate the hazards of materials, classifying hazardous materials in accordance with definitions and hazard classes in the I-codes is the responsibility of facility owners which continues to be a challenge. Consequences of missing or incorrect classification include increased fire and life safety risk and can lead to misclassification of an occupancy.

Due to the expansion of international chemical trade, the United Nations (UN) developed a Globally Harmonized System (GHS) of classification of hazardous materials. The GHS is an internationally agreed upon standard of classification and labeling that in most cases utilizes prescriptive, standardized testing procedures and criteria to classify hazardous materials. Federal law (29 CFR 1910.1200 (OSHA) and 49 CFR 173.127 (DOT)) mandates that manufacturers selling, producing or transporting chemicals in the United States classify chemicals according to the GHS system and make the information readily available in product Safety Data Sheets (SDSs).

This proposal aims to incorporate the readily available GHS (Revision 7) classifications into the I-code definitions to better align with federal standards for hazardous materials classification. Proper identification of multiple hazards and the degree of hazard are likely

outcomes of utilizing the GHS.

The GHS and current IFC definitions for Highly toxic materials are the same (perfect alignment), except that “fumes” are not included in GHS terminology. The term “fume” is not defined in the IFC and is likely to be included in the measurements for vapors, dusts, and/or mists. The table below shows the alignment between current IFC Highly Toxic (dark blue shading) and GHS Categories. Definitions for Toxic materials align perfectly between current IFC and GHS definitions based on dermal exposure routes and for inhalation dusts and mists exposure routes. However, Toxic materials by oral, inhalation gases, and inhalation vapors routes of exposure have different cut-off values between current IFC and GHS definitions. For the sake of alignment with GHS, this proposal expands the current IFC Toxic definitions for these three routes of exposure. This Table demonstrates the alignment for each exposure route. Current IFC Toxic is shaded in medium blue. The proposed definition of Toxic (aligns with GHS) is expanded to include the area shaded in light blue. Unshaded (white) areas are not regulated.

IFC current	IFC proposal
Highly Toxic	Highly Toxic
Toxic	Toxic
	Toxic

		GHS			
Exposure Route	**Category 1**	**Category 2**	**Category 3**		**Category 4**	
Oral (LD50, mg/kg)	<5	5 - 50	50 - 300		300 - 500	500 - 2,000
Dermal (LD50, mg/kg)	<50	50-200	200-1,000		1,000 – 2,000	
Inhalation – Gases (LC50 ppm, 4 hr)	<100	100 - 500	500 - 1,000	1,000 – 2,500	2,500 - 20,000	
Inhalation – Vapors (LC50 mg/L, 4 hr)*	<0.5	0.5 - 2	2 - 4	4 - 10	10 - 20	
Inhalation – Dusts and Mists (LC50 mg/L, 4 hr)	<0.05	0.05 - 0.5	0.5 - 1		1 - 5	

Inhalation values in the above table use 4-hr exposure values. IFC values have been converted from 1-hr to 4-hr exposures per GHS Section 3.1.2.6.1: divide by 2 for gases and vapors, divide by 4 for dusts and mists. *Because ppm is a mass-to-mass or volume-to-volume ratio and mg/l is a mass-to-volume ratio, the following conversion was used for vapors: To convert from units of mg/L to ppm, use the following equation. Endpoint (ppm) = [Endpoint (mg/L) x 1000 x 24.5] / [Molecular Weight] Source: https://www.epa.gov/rmp/toxic-endpoints-are-milligrams-liter-mg-l-equivalent-parts-million-ppm

FCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and early 2024 the FCAC has held several virtual meetings and one in-person meeting open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the FCAC Website

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal is meant to provide correlation with the Globally Harmonized System (GHS) of Classification and Labelling of Chemicals

which is used globally and by OSHA. This revised definition will make compliance more straightforward. In some cases, this revised definition may more heavily regulate additional materials for new buildings as the revised definition widens what is considered Toxic. However, this is balanced out by the coordination and ease of enforcement that comes with being aligned with GHS and OSHA. US manufacturers and distributors of hazardous materials have been required to use the GHS classification system to communicate the hazards of materials in Safety Data Sheets (SDS) since 2012.

F23-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The table provided is useful in explaining the alignment or lack thereof with GHS Categories. Highly toxic materials align well but toxic materials do not. This will potentially increase the cost of construction as more buildings will need to be classified as Group H-4 without proper justification. The cost impact statement does not reflect these impacts. More technical data is needed to identify where the requirements are going to change based on a broader toxic designation. Potentially an analysis is needed to understand the significance of the hazard or the risk associated with the materials. The MAQ tables will need evaluation and revision potentially. (Vote 13-1)

F23-24

Individual Consideration Agenda

Comment 1:

IFC: SECTION 202; IBC: SECTION 202

Proponents: Robert Marshall, FCAC, FCAC (fcac@iccsafe.org); Lynne Kilpatrick, HMEx Assistant, self (lynne.kilpatrick@hmexassistant.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Fire Code

Revise as follows:

HIGHLY TOXIC. A substance or mixture that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as any one of the following GHS Acute Toxicity categories: ~~Acute Toxicity Oral Category 1 or 2, Dermal Category 1 or 2, Inhalation Gases Category 1, Inhalation Vapors Category 1, or Inhalation Dusts and Mists Category 1 or 2.~~

	Oral Category 1 or 2·
	Dermal Category 1 or 2·
	Inhalation Gases Category 1
	Inhalation Vapors Category 1·
	Inhalation Dusts and Mists Category 1 or 2.

Where the GHS category is not known, ~~one of the following is acceptable~~ use the following for classification purposes:

1.	A chemical that has a median lethal dose (LD_{50}) of 50 milligrams or less per kilogram of body weight when administered orally to albino rats weighing between 200 and 300 grams each.
2.	A chemical that has a median lethal dose (LD_{50}) of 200 milligrams or less per kilogram of body weight when administered by continuous contact for 24 hours (or less if death occurs within 24 hours) with the bare skin of albino rabbits weighing between 2 and 3 kilograms each.
3.	A chemical that has a median lethal concentration (LC_{50}) in air of 200 parts per million by volume or less of gas or vapor, or 2 milligrams per liter or less of mist or dust, when administered by continuous inhalation for one hour (or less if death occurs within 1 hour) to albino rats weighing between 200 and 300 grams each.

Mixtures of these materials with ordinary materials, such as water, might not warrant classification as highly toxic. While this system is basically simple in application, any hazard evaluation that is required for the precise categorization of this type of material shall be performed by experienced, technically competent persons.div widget

TOXIC. A substance or mixture that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as any one of the following GHS Acute Toxicity categories: ~~Acute Toxicity Oral Category 3 or 4, Dermal Category 3, Inhalation Gases Category 2 or 3, Inhalation Vapors Category 2 or 3, or Inhalation Dusts and Mists Category 3 or 4.~~

	Oral Category 3
	Dermal Category 3
	Inhalation Gases Category 2
	Inhalation Gases Category 3 and having an LC50 ≤1,000 ppm (4 hour exposure)
	Inhalation Vapors Category 2
	Inhalation Vapors Category 3 and having an LC50 ≤4 mg/l (4 hour exposure)
	Inhalation Dusts and Mists Category 3 or 4

Where the GHS category is not known, ~~one of the following is acceptable~~ use the following for classification purposes:

1.	A chemical that has a median lethal dose (LD_{50}) of more than 50 milligrams per kilogram, but not more than ~~500~~300 milligrams per kilogram of body weight when administered orally to albino rats weighing between 200 and 300 grams each.
2.	A chemical that has a median lethal dose (LD_{50}) of more than 200 milligrams per kilogram but not more than 1,000 milligrams per kilogram of body weight when administered by continuous contact for 24 hours (or less if death occurs within 24 hours) with the bare skin of albino rabbits weighing between 2 and 3 kilograms each.
3.	A chemical that has a median lethal concentration (LC_{50}) in air of more than 200 parts per million but not more than 2,000 parts per million by volume of gas or vapor, or more than 2 milligrams per liter but not more than 20 milligrams per liter of mist or dust, when administered by continuous inhalation for 1 hour (or less if death occurs within 1 hour) to albino rats weighing between 200 and 300 grams each.

2024 International Building Code

Revise as follows:

[F] HIGHLY TOXIC. A substance or mixture that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as any one of the GHS Acute Toxicity categories:
~~Acute Toxicity Oral Category 1 or 2, Dermal Category 1 or 2, Inhalation Gases Category 1, Inhalation Vapors Category 1, or Inhalation Dusts and Mists Category 1 or 2.~~

	Oral Category 1 or 2
	Dermal Category 1 or 2
	Inhalation Gases Category 1
	Inhalation Vapors Category 1
	Inhalation Dusts and Mists Category 1 or 2

Where the GHS category is not known, ~~one of the following is acceptable~~ use the following for classification purposes:

1.	A chemical that has a median lethal dose (LD_{50}) of 50 milligrams or less per kilogram of body weight when administered orally to albino rats weighing between 200 and 300 grams each.

2.	A chemical that has a median lethal dose (LD_{50}) of 200 milligrams or less per kilogram of body weight when administered by continuous contact for 24 hours (or less if death occurs within 24 hours) with the bare skin of albino rabbits weighing between 2 and 3 kilograms each.
3.	A chemical that has a median lethal concentration (LC_{50}) in air of 200 parts per million by volume or less of gas or vapor, or 2 milligrams per liter or less of mist, fume or dust, when administered by continuous inhalation for 1 hour (or less if death occurs within 1 hour) to albino rats weighing between 200 and 300 grams each.

Mixtures of these materials with ordinary materials, such as water, might not warrant classification as *highly toxic*. While this system is basically simple in application, any hazard evaluation that is required for the precise categorization of this type of material shall be performed by experienced, technically competent persons.

[F] TOXIC. A substance or mixture that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as <u>any one of the following GHS Acute Toxicity categories:</u>
~~Acute Toxicity Oral Category 3 or 4, Dermal Category 3, Inhalation Gases Category 2 or 3, Inhalation Vapors Category 2 or 3, or Inhalation Dusts and Mists Category 3 or 4.~~

	<u>Oral Category 3</u>
	<u>Dermal Category 3</u>
	<u>Inhalation Gases Category 2</u>
	<u>Inhalation Gases Category 3 and having an LC50 ≤1,000 ppm (4 hour exposure)</u>
	<u>Inhalation Vapors Category 2</u>
	<u>Inhalation Vapors Category 3 and having an LC50 ≤4 mg/l (4 hour exposure)</u>
	<u>Inhalation Dusts and Mists Category 3 or 4</u>

Where the GHS category is not known, ~~one of the following is acceptable~~ <u>use the following</u> for classification purposes:

1.	A chemical that has a median lethal dose (LD_{50}) of more than 50 milligrams per kilogram, but not more than ~~500~~<u>300</u> milligrams per kilogram of body weight when administered orally to albino rats weighing between 200 and 300 grams each.
2.	A chemical that has a median lethal dose (LD_{50}) of more than 200 milligrams per kilogram, but not more than 1,000 milligrams per kilogram of body weight when administered by continuous contact for 24 hours (or less if death occurs within 24 hours) with the bare skin of albino rabbits weighing between 2 and 3 kilograms each.
3.	A chemical that has a median lethal concentration (LC_{50}) in air of more than 200 parts per million, but not more than 2,000 parts per million by volume of gas or vapor, or more than 2 milligrams per liter but not more than 20 milligrams per liter of mist, fume or dust, when administered by continuous inhalation for 1 hour (or less if death occurs within 1 hour) to albino rats weighing between 200 and 300 grams each.

Reason: This proposal aims to incorporate the readily available GHS (Revision 7) classifications into the I-code definitions to better align with federal standards for hazardous materials classification. Proper identification of multiple hazards and the degree of hazard are likely outcomes of utilizing the GHS.

The original proposal was disapproved, based upon concerns that the new TOXIC definition expands the scope of what is currently regulated by the IFC. The proposed changes are consistent with aligning GHS with current IFC cut-offs for toxic materials for all routes of exposure except via the oral route. For dermal and inhalation routes of exposure, this would not change the scope of what is currently regulated as toxic material. For the oral route of exposure, a less conservative approach was used that results in only regulating materials with LD50 values at or below 300 mg/kg (as opposed to 500 mg/kg). While this reduces the current range for oral toxicity, exposure to first responders via the oral route is the least likely form of exposure to chemicals.

This proposed definition requires validation of LD50 and LC50 values for 2 routes of exposure: gases, and vapors. For example, if a material is classified as GHS Category 4 (Gases), the user will need to verify that the LC50 is less than or equal to 1,000 ppm.

Table showing alignment of current (IFC) vs. proposed changes

IFC currently regulated	IFC-CAH2 proposal
Highly Toxic	Highly Toxic

Toxic	Toxic
Toxic	~~Toxic~~ (not regulated)
Not regulated	Not regulated

Comparison table (IFC vs. GHS proposed) for all routes of exposure

		GHS			
Exposure Route	**Category 1**	**Category 2**	**Category 3**	**Category 4**	
Oral (LD50, mg/kg)	<5	5 50	50 - 300	~~300 500~~	500 - 2,000
Dermal (LD50, mg/kg)	<50	50 200	200-1,000	1,000 – 2,000	
Inhalation – Gases (LC50 ppm, 4 hr)	<100	100 - 500	500 - 1,000	1,000 – 2,500	2,500 - 20,000
Inhalation – Vapors (LC50 mg/L, 4 hr)*	<0.5	0.5 - 2	2 - 4	4 - 10	10 - 20
Inhalation – Dusts and Mists (LC50 mg/L, 4 hr)	<0.05	0.05 0.5	0.5 - 1	1 - 5	

Inhalation values in the above table use 4-hr exposure values. IFC values have been converted from 1-hr to 4-hr exposures per GHS Section 3.1.2.6.1: divide by 2 for gases and vapors, divide by 4 for dusts and mists. *Because ppm is a mass-to-mass or volume-to-volume ratio and mg/l is a mass-to-volume ratio, the following conversion was used for vapors: To convert from units of mg/L to ppm, use the following equation. Endpoint (ppm) = [Endpoint (mg/L) x 1000 x 24.5] / [Molecular Weight] Source: https://www.epa.gov/rmp/toxic-endpoints-are-milligrams-liter-mg-l-equivalent-parts-million-ppm

FCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and early 2024 the FCAC has held several virtual meetings and one in-person meeting open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the FCAC Website

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal is meant to provide correlation with the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) which is used globally and by OSHA. This comparison will make compliance more straightforward. In some cases, utilizing GHS definitions may more heavily regulate additional materials for new buildings; conversely, in other cases GHS definitions will result in reduced classification of materials. However, any differences are balanced out by the coordination and ease of enforcement that comes with being aligned with GHS and OSHA. US manufacturers and distributors of hazardous materials have been required to use the GHS classification system to communicate the hazards of materials in Safety Data Sheets (SDS) since 2012.

F24-24

IFC: SECTION 202; IBC: SECTION 202

Proposed Change as Submitted

Proponents: Robert Marshall, FCAC, FCAC (fcac@iccsafe.org); Lynne Kilpatrick, HMEx Assistant LLC, self (lynne.kilpatrick@hmexassistant.com); Megan Hall, UC Berkeley Fire Prevention, self (mchall@berkeley.edu)

2024 International Fire Code

Revise as follows:

INERT COMPRESSED GAS. A compressed gas that is capable of reacting with other materials only under abnormal conditions such as high temperatures, pressures and similar extrinsic physical forces. Within the context of the code, inert compressed gases do not exhibit either physical or *health hazard* properties as defined (other than acting as a simple asphyxiant) or hazard properties other than those of a *compressed gas*. Some of the more common inert compressed gases include argon, helium, krypton, neon, nitrogen and xenon.

2024 International Building Code

Revise as follows:

[F] INERT COMPRESSED GAS. A compressed gas that is capable of reacting with other materials only under abnormal conditions such as high temperatures, pressures and similar extrinsic physical forces. Within the context of the code, inert compressed gases do not exhibit either physical or health hazard properties as defined (other than acting as a simple asphyxiant) or hazard properties other than those of a *compressed gas*. Some of the more common inert compressed gases include argon, helium, krypton, neon, nitrogen and xenon.

Reason: This modification is a clarification and is intended to distinguish inert compressed gases, which may be gaseous or liquefied, from inert cryogenic fluids. It aligns with the revised definition of Compressed Gas submitted under a separate proposal.

FCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and early 2024 the FCAC has held several virtual meetings and one in-person meeting open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the FCAC Website

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal is meant to provide clarification and correlation with the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) which is used globally and by OSHA. This revised definition will not affect the application of the code and will make compliance more straightforward. US manufacturers and distributors of hazardous materials have been required to use the GHS classification system to communicate the hazards of materials in Safety Data Sheets (SDS) since 2012.

F24-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The proposal is not in alignment to have this term used throughout the body of the code. There was concern that term compressed needs to be addressed in the definition (Vote 8-5)

Individual Consideration Agenda

Comment 1:

IFC: SECTION 202; IBC: SECTION 202

Proponents: Lynne Kilpatrick, HMEx Assistant, self (lynne.kilpatrick@hmexassistant.com); Megan Hall, UC Berkeley Fire Prevention, self (mchall@berkeley.edu); Robert Marshall, FCAC, FCAC (fcac@iccsafe.org) requests As Modified by Committee (AMC2)

Replace as follows:

2024 International Fire Code

INERT GAS. A gas that is capable of reacting with other materials only under abnormal conditions such as high temperatures, pressures and similar extrinsic physical forces. Within the context of the code, inert gases do not exhibit either physical or *health hazard* properties as defined (other than acting as a simple asphyxiant) or hazard properties other than those of a *compressed gas*. ~~Some of the more common inert gases include argon, helium, krypton, neon, nitrogen and xenon.~~

2024 International Building Code

[F] INERT GAS. A gas that is capable of reacting with other materials only under abnormal conditions such as high temperatures, pressures and similar extrinsic physical forces. Within the context of the code, inert gases do not exhibit either physical or health hazard properties as defined (other than acting as a simple asphyxiant) or hazard properties other than those of a *compressed gas*. ~~Some of the more common inert gases include argon, helium, krypton, neon, nitrogen and xenon.~~

Reason: The original proposal was disapproved based on concerns that it did not align with how the term Inert Gas is used throughout the body of the code. The original proposal intended to distinguish between inert compressed gases and inert cryogenic fluids, given that a new sub-definition for Inert Cryogenic Fluid was proposed in F16-24 and Approved as Submitted by the Committee.This proposal retains the current definition to address the Committee's concern, but deletes the list of example gases which typically are not included in defintions.

FCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and early 2024 the FCAC has held several virtual meetings and one in-person meeting open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the FCAC Website

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposed change eliminates an example list of chemicals included in a definition and will not impact construction costs.

2024 International Fire Code

Revise as follows:

ORGANIC PEROXIDE. Liquid or solid ~~An~~ organic ~~compound~~ substances that contain~~s~~ the bivalent -O-O- structure and which may be considered to be a structural derivative of hydrogen peroxide where one or both of the hydrogen atoms have been replaced by ~~an~~ organic radicals. The term also includes organic peroxide formulations (mixtures). Organic peroxides ~~can present an explosion hazard (*detonation* or *deflagration*) or they can be shock sensitive~~ are thermally unstable substances or mixtures, which can undergo exothermic self-accelerating decomposition. In addition, they can have one or more of the following properties:

1. Be liable to explosive decomposition;
2. Burn rapidly;
3. Be sensitive to impact or friction;
4. React dangerously with other substances;
5. ~~They can also decompose~~ Decompose into various unstable compounds over an extended period of time.

Class I. Any organic peroxide which, as packaged, is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as an Organic Peroxide (Type B). Where the GHS Category is not known, the following is acceptable for classification purposes:
~~Describes t~~Those formulations that are capable of *deflagration* but not *detonation*.
Class II. Any organic peroxide which, as packaged, is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as an Organic Peroxide (Type C) or (Type D). Where the GHS Category is not known, the following is acceptable for classification purposes:
~~Describes t~~Those formulations that burn very rapidly and that pose a moderate reactivity hazard.
Class III.
Any organic peroxide which, as packaged, is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as an Organic Peroxide (Type E). Where the GHS Category is not known, the following is acceptable for classification purposes:

~~Describes t~~T

hose formulations that burn rapidly and that pose a moderate reactivity hazard.
Class IV. Any organic peroxide which, as packaged, is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as an Organic Peroxide (Type F). Where the GHS Category is not known, the following is acceptable for classification purposes:
~~Describes t~~Those formulations that burn in the same manner as ordinary combustibles and that pose a minimal reactivity hazard.
Class V. Any organic peroxide which, as packaged, is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as an Organic Peroxide (Type G). Where the GHS Category is not known, the following is acceptable for classification purposes:
~~Describes t~~Those formulations that burn with less intensity than ordinary combustibles or do not sustain combustion and that pose no reactivity hazard.
Unclassified detonable.

Any organic peroxide which, as packaged, is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as an Organic Peroxide (Type A). Type A Organic Peroxides are forbidden in transportation. Where the GHS Category is not known, the following is acceptable for classification purposes:

Organic peroxides that are capable of *detonation*. These peroxides pose an extremely high *explosion* hazard through rapid *explosive* decomposition.

2024 International Building Code

Revise as follows:

[F] ORGANIC PEROXIDE. Liquid or solid ~~An~~ organic ~~compound~~ substances that contains the bivalent -O-O- structure and which may be considered to be a structural derivative of hydrogen peroxide where one or both of the hydrogen atoms have been replaced by ~~an~~ organic radicals. The term also includes organic peroxide formulations (mixtures). Organic peroxides ~~can pose an *explosion* hazard (*detonation* or *deflagration*) or they can be shock sensitive~~ are thermally unstable substances or mixtures, which can undergo exothermic self-accelerating decomposition. In addition, they can have one or more of the following properties:

1. Be liable to explosive decomposition;
2. Burn rapidly;
3. Be sensitive to impact or friction;

Class I.
Any organic peroxide which, as packaged, is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as an Organic Peroxide (Type B). Where the GHS Category is not known, the following is acceptable for classification purposes:
~~Describes t~~Those formulations that are capable of *deflagration* but not *detonation*.
Class II.
Any organic peroxide which, as packaged, is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as an Organic Peroxide (Type C) or (Type D). Where the GHS Category is not known, the following is acceptable for classification purposes:
~~Describes t~~Those formulations that burn very rapidly and that pose a moderate reactivity hazard.
Class III.
Any organic peroxide which, as packaged, is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as an Organic Peroxide (Type E). Where the GHS Category is not known, the following is acceptable for classification purposes:

~~Describes t~~T

hose formulations that burn rapidly and that pose a moderate reactivity hazard.
Class IV.
Any organic peroxide which, as packaged, is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as an Organic Peroxide (Type F). Where the GHS Category is not known, the following is acceptable for classification purposes:
~~Describes t~~Those formulations that burn in the same manner as ordinary combustibles and that pose a minimal reactivity hazard.
Class V.
Any organic peroxide which, as packaged, is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as an Organic Peroxide (Type G). Where the GHS Category is not known, the following is acceptable for classification purposes:
~~Describes t~~Those formulations that burn with less intensity than ordinary combustibles or do not sustain combustion and that pose no reactivity hazard.
Unclassified detonable.

Any organic peroxide which, as packaged, is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as an Organic Peroxide (Type A). Type A Organic Peroxides are forbidden in transportation. Where the GHS Category is not known, the following is acceptable for classification purposes:

Organic peroxides that are capable of *detonation*. These peroxides pose an extremely high *explosion* hazard through rapid *explosive* decomposition.

Reason: Fire Code officials must enforce the hazardous materials provisions of the International Fire Code (IFC) and the International Building Code (IBC) to ensure that people and property in our communities are safe. While code officials need to verify and validate the hazards of materials, classifying hazardous materials in accordance with definitions and hazard classes in the I-codes is the responsibility of facility owners and is an ongoing challenge. Consequences of missing or incorrect classification include increased fire and life safety risk and can lead to misclassification of an occupancy.

Due to the expansion of international chemical trade, the United Nations (UN) developed a Globally Harmonized System (GHS) of classification of hazardous materials. The GHS is an internationally agreed upon standard of classification and labeling that in most cases utilizes prescriptive, standardized testing procedures and criteria to classify hazardous materials. Federal law (29 CFR 1910.1200 (OSHA) and 49 CFR 173.127 (DOT)) mandates that manufacturers selling, producing or transporting chemicals in the United States classify chemicals according to the GHS system and make the information readily available in product Safety Data Sheets (SDSs).

This proposal aims to incorporate the readily available GHS (Revision 7) classifications into the I-code identification of multiple hazards and the degree of hazard are likely outcomes of utilizing the GHS. The current definition for Organic Peroxide in the IFC is subjective and is not based on a defined test method or standardized set of criteria. Under the GHS, Organic Peroxide types are assigned based on the physical state, a determination of the formulations control and emergency temperature if applicable, and its performance under the testing protocol specified in the UN Manual of Tests and Criteria for Organic Peroxides. The GHS types and definitions proposed here are comparable to the generic transport types defined by the US Department of Transportation and reflect the relative hazard when packaged for transportation. This proposal aligns six DOT and GHS transport types with the five existing sub-categories of IFC Organic Peroxides. In that regard, transport Types C and D are proposed to be classified as Class II Organic Peroxides since both Types can present a moderate reactivity hazard.

FCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and early 2024 the FCAC has held several virtual meetings and one in-person meeting open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the FCAC Website

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal is meant to provide correlation with the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) which is used globally and by OSHA. This revised definition is not likely to affect the application of the code and will make compliance more straightforward. US manufacturers and distributors of hazardous materials have been required to use the GHS classification system to communicate the hazards of materials in Safety Data Sheets (SDS) since 2012.

IFC: SECTION 202; IBC: SECTION 202

Proponents: Robert Marshall, FCAC, FCAC (fcac@iccsafe.org); Kris Jaggari, Nouryon/OPPSD Representative (kris.jaggari@nouryon.com) requests As Modified by Committee (AMC2)

Replace as follows:

2024 International Fire Code

Revise as follows:

ORGANIC PEROXIDE. ~~An~~ Liquid or solid organic ~~compound~~ substances that contain~~s~~ the bivalent -O-O- structure and which may be considered to be a structural derivative of hydrogen peroxide where one or both of the hydrogen atoms have been replaced by ~~an~~ organic radicals. The term also includes organic peroxide formulations (mixtures). Organic peroxides can present an explosion hazard (detonation or deflagration) or they can be shock sensitive. They can also decompose into various unstable compounds over an extended period of time. Organic peroxide classifications used in the International Codes are based on the organic peroxide transport type determined in accordance with the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) and the burning rate of the material.

Class I. Describes those formulations that are capable of *deflagration* but not *detonation*. This class is comprised of organic peroxide formulations which, as packaged, are:

1. Organic peroxide Type B under GHS regardless of the burning rate.
2. Organic peroxide Type C or D under GHS with a large-scale burning rate equal to or greater than 300 kg/min.
3. Organic peroxide Type C or D under GHS with a small-scale burning rate equal to or greater than 9.0 kg/(min × m^2) unless the large-scale burning rate is less than 300 kg/min.
4. Organic peroxides of Type C, D, E, or F under GHS where the burning rate is not known

Class IIA. Describes those formulations that burn very rapidly and that pose a moderate reactivity hazard.
This class is comprised of organic peroxide formulations which, as packaged, are:

1. Organic peroxide Type C or D under GHS with a large-scale burning rate equal to or greater than 140 kg/min, but less than 300 kg/min.
2. Organic peroxide Type C or D under GHS with a small-scale burning rate equal to or greater than 2.2 kg/(min × m^2), but less than 9.0 kg/(min × m^2).
3. Organic peroxide Type E under GHS with a large-scale burning rate equal to or greater than 140 kg/min.
4. Organic peroxide Type E under GHS with a small-scale burning rate equal to or greater than 2.2 kg/(min × m^2).

Class IIB.
Describes those formulations that burn rapidly and that pose a moderate reactivity hazard. This class is comprised of organic peroxide formulations which, as packaged, are:

1. Organic peroxide Type C under GHS with a large-scale burning rate less than 140 kg/min.
2. Organic peroxide Type C under GHS with a small-scale burning rate less than 2.2 kg/(min × m^2).
3. Organic peroxide Type D or E under GHS with a large-scale burning rate equal to or greater than 60 kg/min, but less than 140 kg/min.
4. Organic peroxide Type D or E under GHS with a small-scale burning rate equal to or greater than 0.9 kg/(min × m^2), but less than 2.2 kg/(min × m^2).

Class III. Describes those formulations that burn rapidly and that pose a moderate reactivity hazard.
This class is comprised of organic peroxide formulations which, as packaged, are:

1. Organic peroxide Type D under GHS with a large-scale burning rate less than 60 kg/min.
2. Organic peroxide Type D under GHS with a small-scale burning rate less than 0.9 kg/(min × m²).
3. Organic peroxide Type E under GHS with a large-scale burning rate equal to or greater than 10 kg/min, but less than 60 kg/min.
4. Organic peroxide Type E under GHS with a small-scale burning rate less than 0.9 kg/(min × m²).
5. Organic peroxide Type F under GHS with a large-scale burning rate equal to or greater than 10 kg/min.
6. Organic peroxide Type F under GHS regardless of the small-scale burning rate.

Class IV. Describes those formulations that burn in the same manner as ordinary combustibles and that pose a minimal reactivity hazard.
This class is comprised of organic peroxide formulations which, as packaged, are organic peroxide Type E or F under GHS with a large-scale burning rate less than 10 kg/min.

Class V. Describes those formulations that burn with less intensity than ordinary combustibles or do not sustain combustion and that pose no reactivity hazard. This class is comprised of organic peroxide formulations which, as packaged, are organic peroxide Type G under GHS.
~~**Unclassified detonable**~~**Detonable.** *Organic peroxides* that are capable of *detonation*. These peroxides pose an extremely high-explosion hazard through rapid explosive decomposition. This class is comprised of organic peroxide formulations which are organic peroxide Type A under GHS.

2024 International Building Code

Revise as follows:

[F] ORGANIC PEROXIDE.
~~An~~ Liquid or solid organic ~~compound~~ substances that contain~~s~~ the bivalent -O-O- structure and which may be considered to be a structural derivative of hydrogen peroxide where one or both of the hydrogen atoms have been replaced by ~~an~~ organic radical~~s~~. The term also includes organic peroxide formulations (mixtures). Organic peroxides can present an explosion hazard (detonation or deflagration) or they can be shock sensitive. They can also decompose into various unstable compounds over an extended period of time. Organic peroxide classifications used in the International Codes are based on the organic peroxide transport type determined in accordance with the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) and the burning rate of the material.

Class I. Those formulations that are capable of *deflagration* but not *detonation*.
This class is comprised of organic peroxide formulations which, as packaged, are:

1. Organic peroxide Type B under GHS regardless of the burning rate.
2. Organic peroxide Type C or D under GHS with a large-scale burning rate equal to or greater than 300 kg/min.
3. Organic peroxide Type C or D under GHS with a small-scale burning rate equal to or greater than 9.0 kg/(min × m²) unless the large-scale burning rate is less than 300 kg/min.
4. Organic peroxides of Type C, D, E, or F under GHS where the burning rate is not known.

Class II~~A~~. Those formulations that burn very rapidly and that pose a moderate reactivity hazard.
This class is comprised of organic peroxide formulations which, as packaged, are:

1. Organic peroxide Type C or D under GHS with a large-scale burning rate equal to or greater than 140 kg/min, but less than 300 kg/min.
2. Organic peroxide Type C or D under GHS with a small-scale burning rate equal to or greater than 2.2 kg/(min × m²), but less than 9.0 kg/(min × m²).

3. Organic peroxide Type E under GHS with a large-scale burning rate equal to or greater than 140 kg/min.
4. Organic peroxide Type E under GHS with a small-scale burning rate equal to or greater than 2.2 kg/(min × m²).

Class IIB. Describes those formulations that burn rapidly and that pose a moderate reactivity hazard. This class is comprised of organic peroxide formulations which, as packaged, are:

1.	Organic peroxide Type C under GHS with a large-scale burning rate less than 140 kg/min.
2.	Organic peroxide Type C under GHS with a small-scale burning rate less than 2.2 kg/(min × m²).
3.	Organic peroxide Type D or E under GHS with a large-scale burning rate equal to or greater than 60 kg/min, but less than 140 kg/min.
4.	Organic peroxide Type D or E under GHS with a small-scale burning rate equal to or greater than 0.9 kg/(min × m²), but less than 2.2 kg/(min × m²).

Class III. Those formulations that burn rapidly and that pose a moderate reactivity hazard. This class is comprised of organic peroxide formulations which, as packaged, are:

1. Organic peroxide Type D under GHS with a large-scale burning rate less than 60 kg/min.
2. Organic peroxide Type D under GHS with a small-scale burning rate less than 0.9 kg/(min × m²).
3. Organic peroxide Type E under GHS with a large-scale burning rate equal to or greater than 10 kg/min, but less than 60 kg/min.
4. Organic peroxide Type E under GHS with a small-scale burning rate less than 0.9 kg/(min × m²).
5. Organic peroxide Type F under GHS with a large-scale burning rate equal to or greater than 10 kg/min.
6. Organic peroxide Type F under GHS regardless of the small-scale burning rate.

Class IV. Those formulations that burn in the same manner as ordinary combustibles and that pose a minimal reactivity hazard. This class is comprised of organic peroxide formulations which, as packaged, are organic peroxide Type E or F under GHS with a large-scale burning rate less than 10 kg/min.

Class V. Those formulations that burn with less intensity than ordinary combustibles or do not sustain combustion and that pose no reactivity hazard. This class is comprised of organic peroxide formulations which, as packaged, are organic peroxide Type G under GHS.

~~**Unclassified detonable**~~**Detonable.** *Organic peroxides* that are capable of *detonation*. These peroxides pose an extremely high *explosion* hazard through rapid *explosive* decomposition. This class is comprised of organic peroxide formulations which are organic peroxide Type A under GHS.

Reason: F26-24 and F270-24 were heard during CAH 1. Both proposals revised the definition of Organic Peroxide and its subclasses. This Comment combines the work in both F26-24 and F270-24 and makes revisions to the definitions in F26-24.Due to the expansion of international chemical trade, the United Nations (UN) developed the Globally Harmonized System of Classification and Labelling of Chemicals (GHS). The GHS is an internationally agreed upon standard of classification and labeling that in most cases utilizes prescriptive, standardized testing procedures and criteria to classify hazardous materials. The Safety Data Sheets (SDS) utilize the GHS classification system, so the GHS category Types A through G will be included on the SDS and readily available. The burning rate of organic peroxides is not a mandatory requirement for an SDS; however, the Organic Peroxide Industry has committed to providing the burning rate on the SDS for each organic peroxide formulation. Class I Organic Peroxide also includes criteria that where the burning rate is not known, in other words not included on the SDS, then the material is assumed to be Class I.

The current definition and subclasses for Organic Peroxide in the I-Codes are subjective and not based on defined test methods or standardized set of criteria. Under the GHS, Organic Peroxide types are assigned based on the physical state, a determination of the formulations control and emergency temperature if applicable, and its performance under the testing protocol specified in the UN Manual of Tests and Criteria for Organic Peroxides. The GHS types and definitions proposed here are comparable to the generic transport types defined by the US Department of Transportation and reflect the relative hazard when packaged for transportation.

This proposal incorporates the readily available GHS classifications into the determination of the I-Code classification method. The I-Code Classes 1 through V are determined with a combination of the GHS classification and the burning rate of the organic peroxide.

Additionally, this proposal splits the current Organic Peroxide Class II into Class IIA and IIB; creating an additional subclassification. The range of the burning rate for the current Class II is quite broad—with a lower limit of 60 kg/min and an upper limit of 300 kg/min. By splitting Class II, it creates Class IIA (burning rate of 140 kg/min to 300 kg/min) and Class IIB (burning rate of 60 kg/min to 140 kg/min). This will provide two I-Code classifications for materials similarly classified by GHS (Type C, D and E) which are then separated by their burning rate into either Class IIA or IIB. This additional classification allows better control of separation distances versus quantity and other features that reflect the burning behavior of the materials, beyond just the explosion hazard represented by the GHS designation. Code change F270-24 correlates other provisions in Chapters 50 and 62 and the IBC to address this new organic peroxide classification.

This proposal combines the GHS Types and the burning rate of the specific material to determine the IFC/IBC Organic Peroxide classification. The matrix below compares the GHS Types and burning rate tests to the I-Code classification.

GHS TYPE	BURNING RATE TEST	IFC/IBC CLASSIFICATION						
		Detonable	I	IIA	IIB	III	IV	V
A	Large Scale kg/min	Any						
	Small Scale kg/(min × m²)	Any						
B	Large Scale kg/min		Any					
	Small Scale kg/(min × m²)		Any					
C	Large Scale kg/min		≥300	≥140; <300	<140			
	Small Scale kg/(min × m²)		≥9 [a]	≥2.2; <9	<2.2			
D	Large Scale kg/min		≥300	≥140; <300	≥60; <140	<60		
	Small Scale kg/(min × m²)		≥9 [a]	≥2.2; <9	≥0.9; <2.2	<0.9		
E	Large Scale kg/min			≥140	≥60; <140	≥10; <60	<10	
	Small Scale kg/(min × m²)			≥2.2	≥0.9; <2.2	<0.9		
F	Large Scale kg/min					≥10	<10	

	Small Scale kg/(min × m²)					Any	NA	
G	Large Scale kg/min							Any
	Small Scale kg/(min × m²)							Any

If the large-scale burning rate for the same material is less than 300 kg/min, the small-scale burning rate shall be disregarded.

NA – Not applicable

FCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and early 2024 the FCAC has held several virtual meetings and one in-person meeting open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the **FCAC Website**.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal is to define and update storage classification of organic peroxides based on both the GHS transport type and burning rate. The information provided in this proposal helps both the code official and the code user to effectively implement the code. The proposal does not impact the cost of construction.

Comment (CAH2)# 435

F34-24

IFC: 203.6.1

Proposed Change as Submitted

Proponents: Kevin Scott, KH Scott & Associates LLC, self (khscottassoc@gmail.com)

2024 International Fire Code

Revise as follows:

203.6.1 Occupancy exemptions. Storage, use and handling of hazardous materials in accordance with Table ~~307.1.1 of the *International Building Code*~~ 5003.1.1(5) shall not be counted as contributing to maximum allowable quantities and shall not cause classification of an occupancy to be Group H. Such storage, use and handling shall comply with applicable provisions of this code.

Reason: The new section 203 dealing with occupancies will be a great benefit to code users and assist in the application of the code. Section 203.6.1 refers to a table of functions and activities where the quantity of hazardous materials is not included in the maximum allowable quantity. This section refers to table in the IBC. This means that to properly classify an occupancy with hazardous materials it takes both the IFC and the IBC to accomplish the evaluation.

The reality is that the table is located in the IFC, and is the new Table 5003.1.1(5). The table in the IFC and the table in the IBC are identical. therefore, rather than sending the code user to the IBC, the reference is changed to Table 5003.1.1(5) in the IFC. In this manner, the code user can complete the occupancy classification using either the IBC or IFC, but does not need to use both.

This is an editorial change to simply reference the table in the IFC.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is an editorial code change. The reference is changed from a table in the IBC to a table in the IFC.

F34-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: Disapproval is based upon concern that International Fire Code Table 5003.1.1(5) IFC is not necessarily the same exemptions as International Building Code Table 307.1.1 as these tables serve different purposes. (Vote 14-0)

F34-24

Individual Consideration Agenda

Comment 1:

IFC: 203.6.1, TABLE 5003.1.1(5)

Proponents: Kevin Scott, KH Scott & Associates LLC, self (khscottassoc@gmail.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Fire Code

203.6.1 Occupancy exemptions. Storage, use and handling of hazardous materials in accordance with Table 5003.1.1(5) shall not be counted as contributing to maximum allowable quantities and shall not cause classification of an occupancy to be Group H. Such storage, use and handling shall comply with applicable provisions of this code.

Revise as follows:

TABLE 5003.1.1(5) HAZARDOUS MATERIALS EXEMPTIONS[a]

Portions of table not shown remain unchanged.

MATERIAL CLASSIFICATION	OCCUPANCY OR APPLICATION	EXEMPTION
Flammable and combustible liquids and gases	Flammable finishing operations using flammable and combustible liquids	Buildings and structures occupied for the application of flammable finishes shall comply with Section 416 of the *International Building Code*.

For SI: 1 gallon = 3.785 L, °C = (°F – 32)/1.8.

a. Exempted materials and conditions listed in this table are required to comply with provisions of this code that are not based on exceeding maximum allowable quantities in Section 5003.

Reason: This item was Disapproved at CAH 1. It was disapproved for two reasons: 1) the table are not the same, 2) the tables have different purposes in each code.

Regarding the issue of the tables not being the same, that statement is correct. There is an editorial needed with regard to flammable finishing operations. The IFC wording is identical to the IBC wording which references a section in the IBC. The IFC needs to be be revised to include the reference to the IBC. This revision is purely editorial and is accomplished in this comment.

Further review of the tables in the IBC and IFC shows that the tables are identical - they are word for word, with references to the other code as needed. Therefore, whether the code user refers to either table during code application is immaterial. The end result is the same.

The initial goal of this code change was simply to allow the code user to accomplish occupancy classification using the IFC. That is the whole intent of duplicating the occupancy classification requirements from the IBC Chapter 3 to the IFC Chapter 2. The only difference between the two codes is that the exemptions table is located in IBC Chapter 3 and in IFC Chapter 50.

IBC Table 307.1.1 could be duplicated in IFC Chapter 2 and then the IFC would simply reference that table. But that would be foolish and redundant since the table already exists in the code as Table 5003.1.1(5). So the reference to Table 503.1.1(5) is appropriate. The bottom line is that it is the exact same table.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

There is no cost associated with this change. There is no change in code requirements. This change enhances code user friendliness.

Comment (CAH2)# 564

F36-24

IFC: 304.1.3

Proposed Change as Submitted

Proponents: Matthew Dobson, VSI, VSI (mdobson@vinylsiding.org)

2024 International Fire Code

Revise as follows:

304.1.3 Vegetation and Combustible Mulch. Weeds, grass, vines, combustible mulch or other growth that is capable of being ignited and endangering property, shall be cut down or prohibited and removed by the *owner* or occupant of the premises. Vegetation and combustible mulch clearance requirements in wildland-urban interface areas shall be in accordance with the *International Wildland-Urban Interface Code*.

Reason: Over the past code cycles there has been concern over smoker habits and wildfires and combustible mulch, and the potential hazard they pose with combustion of exterior walls. This change focuses on providing protections from two ignition sources discarded cigarettes or pre-rolls (joints) and wildfires. Many fire service members, the UL fire fighter safety institute, and other material stakeholders, like the Vinyl Siding Institute, have been focused on this issue over close to 10 years or more. The problem identified is the spread of fire from the exterior into the unprotected attic space and then spreading quickly to other parts of the building either through discarded cigarettes or wildfire. The term that is used in the proposal is "combustible mulch" rather than "combustible ground cover" because there is the potential for misinterpretation when describing "ground cover", as it might be thought to refer to products placed on the ground during repairs or renovations and should not be regulated.

Over the decade, fire departments in the Washington, DC region (Loudon County, VA) have been confronted with structure fires which have demonstrated a consistent pattern of starting on the outside. These fires have the potential for rapid loss of structural integrity and catastrophic collapse before occupants are alerted. As attention has grown locally, it is apparent that this type of fire is becoming common on a national basis.

These fires tend to follow a distinct pattern. These fires start at a low point on the exterior ground or in a waste basket with discarded cigarette and spread vertically along the exterior wall producing flammable gases, which are readily admitted into the attic area through ventilation soffits. If not cooled, these heated gases accumulate and combust, creating rapidly spreading fire conditions in the attic area, often without occupant awareness. The unchecked fire can result in full roof involvement, creating a dangerous and difficult situation for occupants and fire fighters.

The group examined a number of structure fires which have exhibited the pattern described above. There is agreement over 3 common aspects. First, these fires often result from careless smoking habits or wildfires. Second, when the smoking materials are not properly disposed of, they come into contact with combustible ground cover adjacent to a building and, very commonly, this is mulch or wildfires (flying embers) start the combustible ground cover (kindling). And, last, the combustible exterior wall is a factor in the the growth of these fires into the attic space.

The careless smoker is an impediment to effective fire prevention efforts. The fire service has consistently provided data that shows smoking is the leading cause of fatal fires in the United States. Public fire and life safety efforts have been reasonably effective at communicating the message to not smoke in bed, and various medical organizations have demonstrated the health risk associated with “second hand” smoke. We now see that people are routinely smoking outside, at or near the entrance to a building, which increases the possibility of an accidental ignition of outside combustibles.

If one were to chronicle the actions of today’s smoker, it shows the last action they take when exiting a building is to “light up.” When returning inside, they often drop the cigarette near the entrance. Many smokers seem to believe that dropping a match or cigarette onto the combustible ground cover or into a flower pot is an effective method of extinguishment, however, this behavior often places the smoking material directly into the mulch, initiating the low fire described earlier.

Combustible mulch has become a common exterior decorative material which aids in suppressing weed growth while enhancing a

building's curb appeal. However, most mulch is a dead organic material, comprised of chipped wood, tree bark or pine needles. Mulch is most effective when it is maintained in a moist state, however it can dry out very quickly and become a readily ignitable fuel source. Because of its relatively small mass in comparison to its surface area, when ignited, it will progress and sustain open flame.

The group discussed a method in which to proceed, the interest being to add ress, in the quickest manner, industrial and social changes which could reduce the possibility of a fire on the outside of a building. Each aspect presents unique challenges for fire prevention efforts:

1. Changing the behavior of the smoker is an ongoing and difficult challenge, especially as social pressures have resulted in regulatory changes to require people to smoke outside of a building. Further development of the "fire safe" cigarette, by way of testing using mulch, could be deemed too costly for the industry, and would have no effect on improper disposal of matches. Thus, the quickest and most practical strategy for this aspect of the problem is to expand public fire and life safety education to focus on the hazards of improper disposal of smoking materials, coupled with enforcement of applicable requirements for regulation of smoking and disposal of products. However, in this age of "information overflow" it is questionable if this would result in widespread behavioral changes for smokers.

2. Regulating the use and placement of mulch, that the study group believes could have the quickest and most significant impact toward reducing the exterior fire problem, while additional strategies to address the other problems noted are pursued. The use of wood and wood related mulch for building decoration is purely optional. It is not a required construction component under current building codes. Therefore, regulations to curtail its use or require that it be separated from a building's combustible exterior are reasonable and could be codified on a national basis. On a large scale, the mere action of creating separation of combustible materials has been a wildland fire tactic for years. Several states and local jurisdictions have already employed this theory by either recommending or requiring that wood-based mulch be separated from exterior combustible walls:

1. The Virginia Department of Forestry recommends to "provide a minimum of an 18 inch clearance between landscaping mulch beds and combustible building materials" and to "ensure proper clearance to electric devices, such as decorative lights, by following the manufacturer's instructions;"

2. In Raleigh, NC, following a disastrous fire in a multi-family building, the city passed a pine straw mulch ordinance that bans the use of pine straw as ground cover within 10 feet of multi-family dwellings. The ordinance exempts 1 and 2-family dwellings, however, the city strongly encourages these homeowners to comply with the pine straw restrictions;

3. The Commonwealth of Massachusetts prohibits the new application of mulch within 18 inches around combustible exteriors of buildings, such as wood or vinyl but not brick or concrete. Residential buildings with six units or less are exempted from this regulation, but it is recommended that all homeowners adopt these safety practices. The regulation applies to all other buildings including commercial properties.

4. Ventura County, CA prohibits mulch and wood chips within the required "defensible space" zone (which ranges from 0' to 30' from the exterior of a building).

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

This change could increase the cost of construction and maintenance, as non-combustible mulch can be more expensive than combustible mulch.

Based on a search of multiple retail stores the following averages can be used: $4.00 for 2.0 cu. ft. of wood mulch and $4.00 for 0.5 cu. ft. of pebble landscape rock or pea gravel.

Estimated Immediate Cost Impact Justification (methodology and variables):

Typical retail cost of non-combustible mulch (pea gravel) vs. combustible mulch, can range from 2-5 times more expensive.

Estimated Life Cycle Cost Impact:

However typical combustible mulch will need to be replaced every 1-2 years vs. non-combustible mulch which may last 10+ years.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

Based on estimated lifecycle of typical combustible mulch vs. non-combustible mulch.

F36-24

Public Hearing Results (CAH1)

Errata: This proposal includes published errata https://www.iccsafe.org/wp-content/uploads/2024-Group-A-Consolidated-Monograph-Updates.pdf

Committee Action: **Disapproved**

Committee Reason: The committee stated that the reasons for the disapproval of the proposal were: The language is too broad. Weeds, grass, or other growth that is capable of being ignited can be interpreted that you can't have any grass bordering the building. It was noted that there is an enforcement issue. It should not be applicable to single family homes because too many weekend workers go out and do their own stuff and it will put them in violation because they put mulch down. (Vote: 13-0)

F36-24

Individual Consideration Agenda

Comment 1:

IFC: 304.1.3, 304.1.3.1 (New)

Proponents: Matthew Dobson, VSI, VSI (mdobson@vinylsiding.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Fire Code

304.1.3 Vegetation and Combustible Mulch. Weeds, grass, vines~~, combustible mulch~~ or other growth that is capable of being ignited and endangering property, shall be cut down or prohibited and removed by the *owner* or occupant of the premises. Vegetation ~~and combustible mulch~~ clearance requirements in wildland-urban interface areas shall be in accordance with the *International Wildland-Urban Interface Code*.

Add new text as follows:

304.1.3.1 Combustible Mulch. Combustible mulch shall be prohibited within five feet or less from buildings of Type V construction, Group R1 and R2 occupancies with combustible exterior wall coverings.

Reason: The committee wanted this more specifically applied, so the revision is focused on just where the hazard has been identified. Additionally submitted is data from NFIRS/NFPA which shows potentially the size of this issue.

Summary of NFIRS Data Related to Exterior Fires

NFPA (National Fire Protection Association) data, using the *Home Structures Fires-Supporting Tables* file, dated 10/2021.

Per the explanatory supporting tables information, “Estimates were derived from the US Fire Administration’s National Fire Incident Reporting System (NFIRS) and the NFPA annual fire department experience survey and include proportional shares of unknown or missing data. Fires are rounded to the nearest 100, deaths and injuries are rounded to the nearest ten, and property loss is rounded to the nearest million dollars. Inflation adjustments were made only for the trend tables. Percentages were calculated on unrounded

estimates."

After a review of the available data, PEPA felt that combustible mulch may be a part of fire activity in several data points noted in the obtained data tables for multi-family units:

Smoldering
BBQs
Hot Embers
Smoking
Abandon or discarded material
Exposure fires
Unclassified outside areas

The below statistics are directly from NFIRS data.
The first set, Tables 1–15, is based on fires (or deaths) in all home properties. Tables 1–12 show estimates of reported fires, causes, and circumstances in homes overall.

Leading Causes of Reported Home Structure Fires (Table 5, Page 7)

- Smoking materials accounted for 16,300 fires (5%)
- Exposure fire accounted for 11,700 (3%) of fires

Reported Home Structure Fires by Equipment Involved in Ignition (Table 7, Page 9)

- Grill, barbeque, or hibachi accounted for 5,300 (2%) of fires

Reported Home Structure Fires by Heat Source (Table 8, Page 11)

- Unclassified hot or smoldering object accounted for 24,300 (7%) of fires
- Smoking materials accounted for 16,300 fires (5%)

Reported Home Structure Fires by Factors Contributing to Ignition: 2015-2019 Annual Averages (Table 9, Page 14)

- Exposure fire accounted for 11,700 fires (3%)

Tables 1B–12B show comparable data for apartments or other multifamily housing.

Leading Causes of Reported Apartment or Multifamily Housing Structure Fires between 2015-2019 (Table 5B, Page 48)

- Smoking materials accounted for 5,900 fires (5%)
- Exposure fire accounted for 1,700 (2%) of fires

Reported Apartment or Multifamily Housing Structure Fire by Equipment Involved in Ignition (Table 7B, Page 50)

- Grill, barbeque, or hibachi accounted for 800 (1%) of fires

Reported Apartment or Multifamily Housing Structure Fires by Heat Source (Table 8B, Page 52)

- Unclassified hot or smoldering object accounted for 7,900 fires (7%)
- Smoking materials accounted for 5,900 fires (5%)

Reported Apartment or Multifamily Housing Structure Fires by Factor Contributing to Ignition (Table 9B, Pages 54 & 55)

- Abandoned or discarded material or product accounted for 17,000 (16%) of fires
- Heat source too close to combustible accounted for 11,000 (10%) of fires
- Exposure fire accounted for 1,700 (2%) of fires

After contacting NFPA staff, we determined that obtaining more detailed information is not possible; data is either unavailable or insufficient.

We feel that combustible mulch could have played a role in any of the obtained statistics, and limiting its use in multifamily units could help to reduce the risk.

Cost Impact: Increase

Estimated Immediate Cost Impact:

As noted in original proposal.

Estimated Immediate Cost Impact Justification (methodology and variables):

See original proposal.

Estimated Life Cycle Cost Impact:

See original proposal.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

See original proposal.

Proposed Change as Submitted

Proponents: William Koffel, Koffel Associates, Inc., National Trash and Recycling Valet Association (wkoffel@koffel.com)

2024 International Fire Code

Delete and substitute as follows:

~~APPENDIX O~~
~~VALET TRASH AND RECYCLING COLLECTION IN GROUP R-2 OCCUPANCIES~~

SECTION 305
VALET TRASH COLLECTION

Revise as follows:

VALET TRASH COLLECTION. ~~An intermediary~~ service that removes trash or recycling materials placed outside of *dwelling units* or *sleeping units* for ~~final~~ collection.

Delete without substitution:

~~**304.1.1 Valet trash.** *Valet trash collection* shall be permitted only where *approved*. The *owner* and *valet trash collection* service provider shall comply with the rules and limitations established by the jurisdiction.~~

Revise as follows:

~~**O101.1**~~ **305.1 General..** *Valet trash collection* in Group R-2 occupancies shall comply with this ~~appendix~~ section.

~~**O102.1**~~ **305.2 ~~General~~ Containers.** Containers used for *valet trash collection* shall comply with Sections ~~O102.2~~ 305.2.1 through ~~O102.5~~ 305.2.4.

~~**O102.2**~~ **305.2.1 Integrity.** Valet trash or recycling materials shall be stored in containers that are of liquid-tight construction and equipped with lids. Lids shall be in the fully closed position.

~~**O102.3**~~ **305.2.2 Height.** Containers shall not exceed 30 inches (762 mm) in height.

~~**O102.4**~~ **305.2.3 Capacity and limit.** Individual containers shall not exceed 2.0 cubic feet (15 gallons; 56.8 L) in capacity. Only one trash or recycling container per *dwelling unit* or *sleeping unit* shall be permitted to be placed outside the *dwelling unit* or *sleeping unit* at one time. Trash and recycling containers shall not be placed outside a *dwelling unit* or *sleeping unit* at the same time.

~~**O102.5**~~ **305.2.4 Construction materials.** Containers and lids used for *valet trash collections* shall be constructed entirely of noncombustible materials or of materials that meet a peak rate of heat release not exceeding 300 kW/m^2 when tested in accordance with ASTM E1354 at an incident heat flux of 50 kW/m^2 in the horizontal orientation.

~~**O103.1**~~ **305.3 ~~General~~ Placement of containers..** Placement of containers used for *valet trash collection* outside a *dwelling unit* or *sleeping unit* shall comply with Sections ~~O103.2~~ 305.3.1 and ~~O103.3~~ 305.3.2.

~~O103.2~~ **305.3.1 Minimum means of egress width.** Containers used for *valet trash collection* shall not obstruct the minimum required egress width.

~~O103.3~~ **305.3.2 Stairways.** Containers used for *valet trash collection* shall not be placed on stair risers, within minimum required stairway landing dimensions or anywhere in an *interior exit stairway*.

~~O104.1~~ **305.4 Time limits.** Filled containers used for valet trash or recycling services shall not be placed outside a *dwelling unit* for more than 6 hours within any 24-hour period. Empty *approved* containers used for valet trash or recycling services shall not remain in a *corridor* for more than 12 continuous hours in a 24-hour period.

~~O104.2~~ **305.5 Collection rules.** The property owner or manager shall have written valet service rules, hours and penalties provided to all tenants and occupants. The property owner or manager shall be responsible for implementing, monitoring and enforcing all *valet trash collection* rules. A copy of the rules shall be provided to the *fire code official* upon request.

~~O104.3~~ **305.6 Suspension of service.** The *fire code official* has the authority to order the suspension of *valet trash collection* that is not in compliance with this ~~appendix~~ Section.

Delete without substitution:

~~SECTION O101 SCOPE~~

~~SECTION O102 CONTAINERS~~

~~SECTION O103 CONTAINER LOCATION~~

~~SECTION O104 ADDITIONAL REQUIREMENTS~~

~~SECTION O105 REFERENCED STANDARDS~~

~~**O105.1 General.** See Table O105.1 for standards that are referenced in various sections of this appendix. Standards are listed by the standard identification with the effective date, standard title, and the section or sections of this appendix that reference the standard.~~

~~**TABLE O105.1 REFERENCED STANDARDS**~~

~~STANDARD ACRONYM~~	~~STANDARD NAME~~	~~SECTIONS HEREIN REFERENCED~~
~~ASTM E1354—17~~	~~*Standard Test Method for Heat and Visible Smoke Release Rates for Materials and Products Using an Oxygen Consumption Calorimeter*~~	~~O102.5~~

Reason: The proponents of F8-21 indicated that Section 304.1.1 was needed because prior editions of the IFC did not prohibit valet trash collection services. As such, the proponents felt the need for users of valet trash collection serviced to receive approval and for the owner and code official to determine the appropriate requirements.

At the same time, the FCAC and industry worked to develop Appendix O which contains requirements for valet trash collection services where Appendix O is adopted. The purpose of the proposal is to relocate the provisions of Appendix O into a new Section of the IFC. As such, there will be specific requirements that apply to valet trash collection services.

The proposed text requires that the collection rules established between the service provider and the building owner/manager be provided to the fire official. The fire official has the authority to suspend the service when the collection rules and the requirements of Section 305 are not met. As such, the intent of the proponents of F8-21 is met because the fire official has stated requirements that must be met and ability to suspend the service when the requirements are not met.

Technically, the proposal does not change the provisions of Appendix O.

It should also be noted that similar provisions are included in the 2024 Edition of NFPA 101.

The change to the definition is consistent with concerns expressed during the last revision cycle related to the definition contained in F8-21. Actually, the ICC membership approved two definitions during the last cycle since there was also a definition in Appendix O that was also approved. The concern with the existing definition is that it could apply more broadly to the curb side trash collection services.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Moving the requirements in Appendix O do the body of the IFC does not result in an impact on the cost of construction.

F40-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee stated that the reasons for the disapproval of the proposal were: The appendix was just added to 2024 IFC and as it was stated, it is not known yet how this is going to affect the adoption. Since it is in the appendix, jurisdictions do have the opportunity to allow it, if it is appropriate in the location. Until it is known if there are problems that are created either with it or without it, then it should remain where it is. Leaving it in the appendix allows some jurisdictions to adopt and follow it and it allows others not to. (Vote: 12-2)

F40-24

Individual Consideration Agenda

Comment 1:

IFC: SECTION 305, SECTION 202, 304.1.1, 305.1, 305.2, 305.2.1, 305.2.2, 305.2.3, 305.2.4, 305.3, 305.3.1, 305.3.2, 305.4, 305.5, 305.6, SECTION O101, SECTION O102, SECTION O103, SECTION O104, SECTION O105, O105.1, TABLE O105.1

Proponents: William Koffel, Koffel Associates, Inc., National Trash and Recycling Valet Association (wkoffel@koffel.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Fire Code

SECTION 305
VALET TRASH COLLECTION

VALET TRASH COLLECTION. A service that removes trash or recycling materials placed outside of *dwelling units* or *sleeping units* for collection.

~~**304.1.1 Valet trash.** *Valet trash collection* shall be permitted only where *approved*. The *owner* and *valet trash collection* service provider shall comply with the rules and limitations established by the jurisdiction.~~

305.1 General. *Valet trash collection* in Group R-2 occupancies shall be permitted only where *approved.* The owner and the *valet trash collection* service shall comply with this section.

305.2 Containers. Containers used for *valet trash collection* shall comply with Sections 305.2.1 through 305.2.4.

305.2.1 Integrity. Valet trash or recycling materials shall be stored in containers that are of liquid-tight construction and equipped with lids. Lids shall be in the fully closed position.

305.2.2 Height. Containers shall not exceed 30 inches (762 mm) in height.

305.2.3 Capacity and limit. Individual containers shall not exceed 2.0 cubic feet (15 gallons; 56.8 L) in capacity. Only one trash or recycling container per *dwelling unit* or *sleeping unit* shall be permitted to be placed outside the *dwelling unit* or *sleeping unit* at one time. Trash and recycling containers shall not be placed outside a *dwelling unit* or *sleeping unit* at the same time.

305.2.4 Construction materials. Containers and lids used for *valet trash collections* shall be constructed entirely of noncombustible materials or of materials that comply with Section 304.3.2. ~~meet a peak rate of heat release not exceeding 300 kW/m^2 when tested in accordance with ASTM E1354 at an incident heat flux of 50 kW/m^2 in the horizontal orientation.~~

305.3 Placement of containers.. Placement of containers used for *valet trash collection* outside a *dwelling unit* or *sleeping unit* shall comply with Sections 305.3.1 and 305.3.2.

305.3.1 Minimum means of egress width. Containers used for *valet trash collection* shall not obstruct the minimum required egress width.

305.3.2 Stairways. Containers used for *valet trash collections* shall not be placed on stair risers, within minimum required stairway landing dimensions or anywhere in an *interior exit stairway*.

305.4 Time limits. Filled containers used for valet trash or recycling services shall not be placed outside a *dwelling unit* for more than 6 hours within any 24-hour period. Empty *approved* containers used for valet trash or recycling services shall not remain in a *corridor* for more than 12 continuous hours in a 24-hour period.

305.5 Collection rules. The property owner or manager shall have written valet service rules, hours and penalties provided to all tenants and occupants. The property owner or manager shall be responsible for implementing, monitoring and enforcing all *valet trash collection* rules. A copy of the rules shall be provided to the *fire code official* upon request.

305.6 Suspension of service. The *fire code official* has the authority to order the suspension of *valet trash collection* that is not in compliance with this Section.

Delete without substitution:

~~SECTION O101~~

~~**SCOPE**~~

~~**SECTION O102**~~
~~**CONTAINERS**~~

~~**SECTION O103**~~
~~**CONTAINER LOCATION**~~

~~**SECTION O104**~~
~~**ADDITIONAL REQUIREMENTS**~~

~~**SECTION O105**~~
~~**REFERENCED STANDARDS**~~

~~**O105.1 General.** See Table O105.1 for standards that are referenced in various sections of this appendix. Standards are listed by the standard identification with the effective date, standard title, and the section or sections of this appendix that reference the standard.~~

~~**TABLE O105.1 REFERENCED STANDARDS**~~

~~STANDARD ACRONYM~~	~~STANDARD NAME~~	~~SECTIONS HEREIN REFERENCED~~
~~ASTM E1354—17~~	~~*Standard Test Method for Heat and Visible Smoke Release Rates for Materials and Products Using an Oxygen Consumption Calorimeter*~~	~~O102.5~~

Reason: The Public Comment seeks to approve the original F40-24 proposal with two modifications.

As requested, the language from the 2024 IFC has been retained that requires approval of the fire official for valet trash collection to be provided and it explicitly states that the owner and the service provided need to comply with the requirements in the section. The second modification is in Section 305.2.4 and it incorporates the language approved by the Committee in F37-24.

The remainder of the proposal deleted Appendix O and transfers the existing language from Appendix O into a new Section 305. As stated in the original proposal, this provides the requirements in the body of the Code that the owner and the service provider are to meet. The language in the 2024 IFC does not provide specific requirements that need to be met (referenced in existing paragraph 304.1.1 and relocated to 305.1 in the Public Comment) unless the jurisdiction has also adopted Appendix O.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Moving the requirements in Appendix O to the body of the IFC does not result in an impact on the cost of construction.

Comment (CAH2)# 563

F41-24

IFC: 308.3.1

Proposed Change as Submitted

Proponents: Bruce Swiecicki, National Propane Gas Association, National Propane Gas Association (bswiecicki@npga.org)

2024 International Fire Code

Revise as follows:

308.3.1 Open-flame decorative devices. Open-flame decorative devices shall comply with all of the following restrictions:

1. Class I and Class II liquids ~~and LP-gas~~ shall not be used.
2. Fuel gas appliances shall be listed and installed in accordance with the *International Fuel Gas Code*.
3. ~~2.~~ Liquid- or solid-fueled lighting devices containing more than 8 ounces (237 ml) of fuel must self-extinguish and not leak fuel at a rate of more than 0.25 teaspoon per minute (1.26 ml per minute) if tipped over.
4. ~~3.~~ The device or holder shall be constructed to prevent the spillage of liquid fuel or wax at the rate of more than 0.25 teaspoon per minute (1.26 ml per minute) when the device or holder is not in an upright position.
5. ~~4.~~ The device or holder shall be designed so that it will return to the upright position after being tilted to an angle of 45 degrees (0.79 rad) from vertical. **Exception:** Devices that self-extinguish if tipped over and do not spill fuel or wax at the rate of more than 0.25 teaspoon per minute (1.26 ml per minute) if tipped over.
6. ~~5.~~ The flame shall be enclosed except where openings on the side are not more than 0.375-inch (9.5 mm) diameter or where openings are on the top and the distance to the top is such that a piece of tissue paper placed on the top will not ignite in 10 seconds.
7. ~~6.~~ Chimneys shall be made of noncombustible materials and securely attached to the open-flame device. **Exception:** A chimney is not required to be attached to any open-flame device that will self-extinguish if the device is tipped over.
8. ~~7.~~ Fuel canisters shall be safely sealed for storage.
9. ~~8.~~ Storage and handling of *combustible liquids* shall be in accordance with Chapter 57.
10. ~~9.~~ Shades, where used, shall be made of noncombustible materials and securely attached to the open-flame device holder or chimney.
11. ~~10.~~ Candelabras with flame-lighted candles shall be securely fastened in place to prevent overturning, and shall be located away from occupants using the area and away from possible contact with drapes, curtains or other combustibles.

Reason: There is no reason to prohibit fuel gas appliances for use with natural gas or propane when those appliances are listed and installed in accordance with the fuel gas code. The International Fuel Gas Code references the following decorative appliances that may have open flames:

ANSI Z21.60 Decorative Gas Appliances for Installation in Solid-Fuel Burning Fireplaces

ANSI Z21.97 Outdoor Decorative Appliances

There are potentially other listed appliances that may be suitable for this application as well. LP-Gas systems are closed systems that cannot spill like a container for a combustible or flammable liquid. There are safety features built into the performance standards for these appliances that other open flame devices may not have.

Bibliography: The following documents are referenced in the reason statement:

International Fuel Gas Code

ANSI Z21.60 Decorative Gas Appliances for Installation in Solid-Fuel Burning Fireplaces

ANSI Z21.97 Outdoor Decorative Appliances

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

There may be an increased cost associated with installing fuel gas decorative appliances as opposed to other open flame, decorative appliances. The cost of the appliance installed can be a few hundred dollars. If the appliance is fueled by a hard-piped gas system, the cost to run that piping may be a few hundred dollars as well. Total cost could be between $500 and $1,000, depending on the type of appliance and additional features.

Estimated Immediate Cost Impact Justification (methodology and variables):

The methodology I used to determine the cost impact was based on personal experience.

Estimated Life Cycle Cost Impact:

Assuming that the fuel gas appliance functions properly for 15 years, the life cycle cost impact would include the initial installation and the fuel gas that it takes to operate the appliance. Roughly, the cost of the fuel gas over that 15-year period would be $1,500, so the total life cycle cost impact would be between $2,000 and $2,500.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

I used current gas pricing for propane and an estimated 200 hours of operation per year, or 3,000 hours over the life of the appliance. For a 20,000 Btuh appliance, that equates to about 750 gallons of propane. At $2.00 per gallon, that equates to $1,500 over the life cycle.

F41-24

Public Hearing Results (CAH1)

11.

Committee Action: **As Submitted**

Committee Reason: The committee stated that the reason for the approval of the proposal was it makes a good connection for the fire code official to have a pointer to the IFGC for these types of appliances when they are installed. (Vote: 13-0)

F41-24

Individual Consideration Agenda

Comment 1:

IFC: 308.3.1

Proponents: Bruce Swiecicki, National Propane Gas Association, National Propane Gas Association (bswiecicki@npga.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Fire Code

Revise as follows:

308.3.1 Open-flame decorative devices. Open-flame decorative devices shall comply with all of the following restrictions:

1. Class I and Class II liquids shall not be used.
2. ~~Fuel gas appliances shall be listed and installed in accordance with the International Fuel Gas Code.~~
   Flammable gases shall not be used unless installed as part of a permanent appliance in accordance with the *International Fuel Gas Code*.
3. Liquid- or solid-fueled lighting devices containing more than 8 ounces (237 ml) of fuel must self-extinguish and not leak fuel at a rate of more than 0.25 teaspoon per minute (1.26 ml per minute) if tipped over.
4. The device or holder shall be constructed to prevent the spillage of liquid fuel or wax at the rate of more than 0.25 teaspoon per minute (1.26 ml per minute) when the device or holder is not in an upright position.
5. The device or holder shall be designed so that it will return to the upright position after being tilted to an angle of 45 degrees (0.79 rad) from vertical. **Exception:** Devices that self-extinguish if tipped over and do not spill fuel or wax at the rate of more than 0.25 teaspoon per minute (1.26 ml per minute) if tipped over.

6. The flame shall be enclosed except where openings on the side are not more than 0.375-inch (9.5 mm) diameter or where openings are on the top and the distance to the top is such that a piece of tissue paper placed on the top will not ignite in 10 seconds.
7. Chimneys shall be made of noncombustible materials and securely attached to the open-flame device. **Exception:** A chimney is not required to be attached to any open-flame device that will self-extinguish if the device is tipped over.
8. Fuel canisters shall be safely sealed for storage.
9. Storage and handling of *combustible liquids* shall be in accordance with Chapter 57.
10. Shades, where used, shall be made of noncombustible materials and securely attached to the open-flame device holder or chimney.
11. Candelabras with flame-lighted candles shall be securely fastened in place to prevent overturning, and shall be located away from occupants using the area and away from possible contact with drapes, curtains or other combustibles.

Reason: This comment is being submitted at the request of the Fire Code Action Committee, which expressed concern about the potential for propane cylinders to be used inside buildings. Such practice would be a violation of the IFC as well as NFPA 58. The proposed text was arrived at by members of the FCAC.

The proposed changes clarify that only listed decorative appliances complying with the International Fuel Gas Code and connected to fuel gas piping systems should be installed in assembly buildings.

Bibliography: International Fuel Gas Code

NFPA 58 "Liquefied Petroleum Gas Code"

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposal has no bearing on the cost of construction in that decorative appliances are optional in any building and therefore deciding to install a decorative appliance is a discretionary expense borne by the building owner.

Comment (CAH2)# 547

F43-24

IFC: 309.2

Proposed Change as Submitted

Proponents: Jonathan Roberts, UL Solutions, UL Solutions (jonathan.roberts@ul.com)

2024 International Fire Code

Revise as follows:

309.2 ~~Use in hazardous (classified) locations~~ Listing. Powered industrial trucks ~~used in areas designated as hazardous (classified) locations in accordance with NFPA 70~~ shall be *listed* and *labeled* for use in the environment intended in accordance with NFPA 505.

Reason: Regardless of the environment where used, powered industrial trucks should be listed and labeled for the environment intended in accordance with NFPA 505 (Fire Safety Standard for Powered Industrial Trucks Including Type Designations, Areas of Use, Conversions, Maintenance, and Operations).

This proposal clarifies the intended reference to and compliance with NFPA 505. The scope of NFPA 505 covers all environments, not just hazardous (classified) environments.

The standards, UL 558 (Industrial Trucks, Internal Combustion Engine Powered and UL 583 (Electric Battery Powered Industrial Trucks) are both referenced in NFPA 505 and address the associated hazards for both internal combustion engine powered (such as LP-gas, gasoline, diesel and CNG) and electric battery powered (such as Li-ion battery) industrial trucks.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

No increase in the cost of construction. NFPA 505 is already in use and compliance is an existing IFC requirement.

F43-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee stated that the reasons for the disapproval of the proposal were: The electrical classification should be clearly identified where required. The listing or labeling of the equipment being intended for use makes it less usable to the reader that there is a hazard present, and it should be addressed. Changing it from hazardous locations to all locations and everything really expands this requirement. There is no direction for an existing powered industrial truck that would move into a requirement for listing in a non-hazardous area. (Vote: 9-4)

F43-24

Individual Consideration Agenda

Comment 1:

IFC: 309.2

Proponents: Jonathan Roberts, UL Solutions, UL Solutions (jonathan.roberts@ul.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Fire Code

Revise as follows:

309.2 Use in hazardous (classified) locations. Fuel ~~Powered~~ powered industrial trucks used in areas designated as hazardous (classified) locations in accordance with NFPA 70 shall be *listed* and *labeled* for use in the environment intended in accordance with NFPA 505.

Reason: This change clarifies the requirements in section 309 apply to only fuel-powered industrial trucks. This change will correlate with other changes approved at CAH #1 that created a separate section and specific requirements for battery-powered industrial trucks.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

No increase in the cost of construction. NFPA 505 is already in use and compliance is an existing IFC requirement.

Comment (CAH2)# 236

F44-24

IFC: CHAPTER 3, SECTION 310, 310.1, 310.1.1 (New), 310.2, 310.2.1, 310.3, 310.4, 310.5, 310.6, 310.7, 310.8, 1207.10.4.1, 1207.10.7.7

Proposed Change as Submitted

Proponents: Marcelo Hirschler, GBH International, GBH International (mmh@gbhint.com); Geoffrey Raifsnider, Global Finishing Solutions, Self (graifsnider@globalfinishing.com)

2024 International Fire Code

CHAPTER 3
GENERAL REQUIREMENTS

Revise as follows:

SECTION 310
SMOKING AND VAPING

310.1 General. ~~The smoking~~ Smoking, vaping or carrying of a lighted pipe, cigar, cigarette or any other type of smoking or vaping paraphernalia or material is prohibited in the areas indicated in Sections 310.2 through 310.8.

Add new text as follows:

310.1.1 Applicability. Wherever, sections of the present code reference smoking, both smoking and vaping are intended to be referenced, unless otherwise stated.

Revise as follows:

310.2 Prohibited areas. Smoking and vaping shall be prohibited where conditions are such as to make such practices ~~smoking~~ a hazard, and in spaces where flammable or combustible materials are stored or handled.

Exception: In Group I-2 occupancies, patients shall be permitted to smoke or vape in designated patient care areas based on the clinical needs of the patient.

310.2.1 Group I-2. In Group I-2 occupancies, smoking and vaping shall be prohibited in patient care areas or where oxygen is used, stored or handled.

310.3 "No Smoking" signs. The *fire code official* is authorized to order the posting of "No Smoking" or "No Vaping" signs or the international symbol for no smoking in a conspicuous location in each structure or location in which smoking or vaping is prohibited. The content, lettering, size, color and location of required "No Smoking" or "No Vaping"signs shall be *approved*. **Exception:** "No Smoking" or "No Vaping" signs are not required in interior locations of the facility where signs are displayed at all major entrances into the facility.

310.4 Removal of signs prohibited. ~~A posted~~ Posted "No Smoking" or "No Vaping" signs ~~sign~~ shall not be obscured, removed, defaced, mutilated or destroyed.

310.5 Compliance with "No Smoking" or "No Vaping" signs. Smoking or vaping shall not be permitted nor shall a person smoke, vape, throw or deposit any lighted or smoldering substance in any place where "No Smoking" or "No Vaping" signs are posted.

310.6 Ash trays. Where smoking or vaping are ~~is~~ permitted, suitable noncombustible ash trays or match receivers shall be provided on

each table and at other appropriate locations. In Group I-2 occupancies, noncombustible metal containers with self-closing covers shall be provided in areas where smoking is permitted.

310.7 Burning objects. Lighted matches, cigarettes, cigars or other burning object shall not be discarded in such a manner that could cause ignition of other combustible material.

Revise as follows:

310.8 Hazardous environmental conditions. Where the *fire code official* determines that hazardous environmental conditions necessitate controlled use of smoking or vaping materials, the ignition or use of such materials in mountainous, brush-covered or forest-covered areas or other designated areas is prohibited except in *approved* designated smoking or vaping areas.

1207.10.4.1 Deployment documents. The following information shall be provided with the operation permit applications for mobile ESS deployments:

1. Relevant information for the mobile ESS equipment and protection measures in the *construction documents* required by Section 1207.1.5.
2. Location and layout diagram of the area in which the mobile ESS is to be deployed, including a scale diagram of all nearby exposures.
3. Location and content of signage, including no smoking or no vaping signs.
4. Description of fencing to be provided around the ESS, including locking methods.
5. Details on fire suppression, smoke and automatic fire detection, system monitoring, thermal management, exhaust ventilation and explosion control, if provided.
6. For deployment, the intended duration of operation, including anticipated connection and disconnection times and dates.
7. Location and description of local staging stops during transit to the deployment site. See Section 1207.10.7.5.
8. Description of the temporary wiring, including connection methods, conductor type and size, and circuit overcurrent protection to be provided.
9. Description of how fire suppression system connections to water supplies or extinguishing agents are to be provided.
10. Contact information for personnel who are responsible for maintaining and servicing the equipment, and responding to emergencies as required by Section 1207.1.8.1. [material based on NFPA 855 (2023)]

1207.10.7.7 Smoking and Vaping. Smoking and vaping shall be prohibited within 10 feet (3048 mm) of mobile ESS. Signs shall be posted in accordance with Section 310.

Reason: Recently it was found that vaping and vaping materials can also provide an ignition hazard. In fact, in California a severe fire incident has been determined to be related to vaping.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

There will be some added cost associated with revised or new signs dealing with vaping. Research indicates that new “no smoking signs” and “no smoking no vaping signs” are available at the same cost. The additional cost would be in the replacement of existing signage. The cost impact for new construction should be negligible or $0.

Estimated Immediate Cost Impact Justification (methodology and variables):

The submitters are not able to estimate the added cost.

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee stated that the reasons for the disapproval of the proposal were: The definition approved by F30-24 adds clarity to what is covered by “no smoking” and by changing the sign, there is then going to be a laundry list on signs. It is going to say no smoking, no smoking this, no smoking that, no vaping. Instead by keeping the sign simple and tying it back to the definition just approved is all that is necessary in the code. The proposal reason statement needs to include the actual evidence that supports the change. (Vote: 14-0)

F44-24

Individual Consideration Agenda

Comment 1:

IFC: CHAPTER 3, SECTION 310, 310.1

Proponents: Marcelo Hirschler, GBH International, GBH International (mmh@gbhint.com); Geoffrey Raifsnider, Global Finishing Solutions, Self (graifsnider@globalfinishing.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Fire Code

CHAPTER 3
GENERAL REQUIREMENTS

SECTION 310
SMOKING AND VAPING

Revise as follows:

310.1 General. Smoking, vaping or carrying ~~of~~ a lighted pipe, cigar, or cigarette or carrying any other type of smoking or vaping paraphernalia or material is prohibited in the areas indicated in Sections 310.2 through 310.8.

Reason: The committee considered that adding the information on vaping in every section referencing smoking was excessive and would lead to potential problems of omissions. The committee referenced the new definition approved in F30 as the approach. However, since definitions are not enforceable requirements, this comment adds enforceability by simply making the change in the charging section and not making any change in any other section.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Just like the new definition approved in F30, this has the potential to slightly increase costs but quantification is not possible.

2024 International Fire Code

SECTION 312
VEHICLE IMPACT PROTECTION

Revise as follows:

312.1 General. Vehicle impact protection required by this code within a garage or elsewhere ~~shall be provided by posts that comply with Section 312.2 or by other *approved* physical barriers that comply with Section 312.3~~ in accordance with Section 312.1.1 or 312.1.2 shall be provided with impact protection in accordance with Section 312.1.3.

Delete without substitution:

~~**312.2 Posts.** Guard posts shall comply with all of the following requirements:~~

1. ~~Constructed of steel not less than 4 inches (102 mm) in diameter and concrete filled.~~
2. ~~Spaced not more than 4 feet (1219 mm) between posts on center.~~
3. ~~Set not less than 3 feet (914 mm) deep in a concrete footing of not less than a 15-inch (381 mm) diameter.~~
4. ~~Set with the top of the posts not less than 3 feet (914 mm) above ground.~~
5. ~~Located not less than 3 feet (914 mm) from the protected object.~~

~~**312.3 Other barriers.** Barriers, other than posts specified in Section 312.2, that are designed to resist, deflect or visually deter vehicular impact commensurate with an anticipated impact scenario shall be permitted where *approved*.~~

Revise as follows:

~~**1207.11.7.1**~~ **312.1.1 Garages.** Where ~~an ESS~~ equipment or appliances are ~~is~~ installed or located in the normal driving path of vehicle travel within a garage, impact protection complying with Section ~~1207.11.3~~ 312.1.3 shall be provided. The normal driving path is a space between the garage vehicle opening and the interior face of the back wall to a height of 48 inches (1219 mm) above the finished floor. The width of the normal driving path shall be equal to the width of the garage door opening. Impact protection shall also be provided for an ESS installed at either of the following locations (see Figure ~~1207.11.7.1~~ 312.1.2):

1. On the interior face of the back wall and located within 36 inches (914 mm) to the left or to the right of the normal driving path.
2. On the interior face of a side wall and located within 24 inches (610 mm) of the back wall and 36 inches (914 mm) of the normal driving path.

Exception: Where the clear height of the vehicle garage opening is 7 feet 6 inches (2286 mm) or less, ~~ESS~~ equipment or appliances installed not less than 36 inches (914 mm) above the finished floor are not subject to vehicle impact protection requirements.

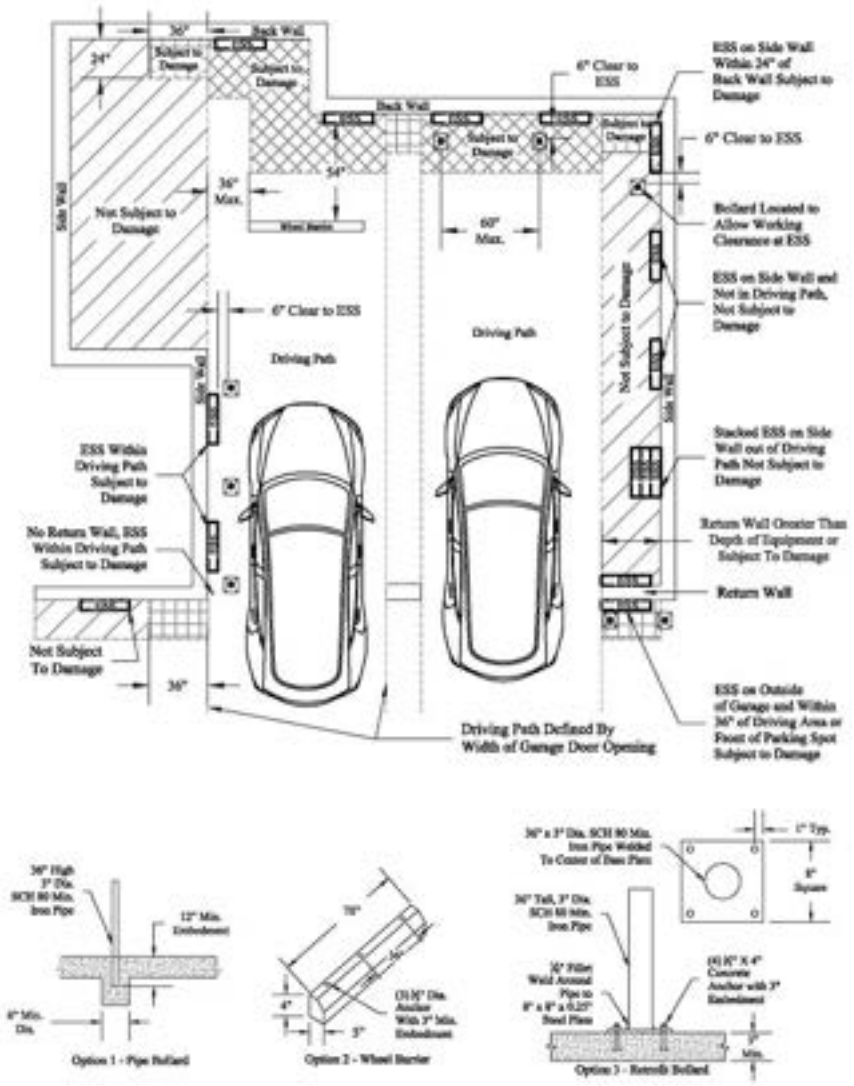

FIGURE ~~1207.11.7.1~~ 312.1.1 ~~ESS~~ VEHICLE IMPACT PROTECTION

~~1207.11.7.2~~ 312.1.2 Other locations subject to vehicle impact. Where ~~an ESS~~ a feature, appliance or equipment is installed in a location other than as defined in Section ~~1207.11.7.1~~ 312.1.1 and is subject to vehicle damage, impact protection shall be provided in accordance with Section ~~1207.11.7.3~~ 312.1.3.

~~1207.11.7.3~~ 312.1.3 Impact protection options. Where ~~ESS~~ a feature, appliance or equipment is required to be protected from impact in accordance with Section ~~1207.11.7.1~~ 312.1.1 or ~~1207.11.7.2~~ 312.1.2, such protection shall comply with one of the following:

1. Bollards constructed in accordance with one of the following:
   1.1. Minimum 48 inches (1219 mm) in length by 3 inches (76 mm) in diameter Schedule 80 steel pipe embedded in a concrete pier not less than 12 inches (304 mm) deep and 6 inches (152 mm) in diameter, with at least 36 inches (914 mm) of pipe exposed, filled with concrete and spaced at a maximum interval of 5 feet (1524 mm). Each bollard shall be located not less than 6 inches (152 mm) from ~~an ESS~~ a feature appliance or equipment.
   1.2. Minimum 36 inches (914 mm) in height by 3 inches (76 mm) in diameter Schedule 80 steel pipe fully welded to a minimum 8 inches (203 mm) by ¼-inch (6.4 mm) thick steel plate and bolted to a concrete floor by means of four ½-inch (13 mm) concrete anchors with 3-inch (76 mm) minimum embedment. Spacing shall be not greater than 60 inches (1524 mm), and each bollard shall be located not less than 6 inches (152 mm) from the ~~ESS~~ feature, appliance or equipment.
   1.3. Premanufactured steel pipe bollards shall be filled with concrete and anchored in accordance with the manufacturer's installation instructions, with spacing not greater than 60 inches (1524 mm). Each bollard shall be located not less than 6 inches (152 mm) from the ~~ESS~~ feature, appliance or equipment.

2. Wheel barriers constructed in accordance with one of the following:
   2.1. Four inches (102 mm) in height by 5 inches (127 mm) in width by 70 inches (1778 mm) in length wheel barrier made of concrete or polymer, anchored to the concrete floor not less than every 36 inches (914 mm) and located not less than 54 inches (1372 mm) from the ~~ESS~~ feature, appliance or equipment. Minimum 3½-inch (89 mm) diameter concrete anchors with 3-inch (76 mm) embedment per barrier shall be used. Spacing between barriers shall be not greater than 36 inches (914 mm).
   2.2. Premanufactured wheel barriers shall be anchored in accordance with the manufacturer's installation instructions.

3. *Approved* method designed to resist a 2,000-pound-force (8896 N) impact in the direction of travel at 24 inches (610 mm) above grade.

1207.11.7 Protection from impact. ESS installed in a location subject to vehicle damage ~~in accordance with Section 1207.11.7.1 or 1207.11.7.2~~ shall be provided with impact protection in accordance with Section ~~1207.11.7.3~~ 312.

Reason: Last cycle comprehensive guidance was developed in Section 1207 for ESS subject to vehicle impact due to the lack of sufficient guidance within the International Series of codes. Recognized options for impact protection within garages was added in addition to ballads.

This proposal takes that comprehensive language and replaces the existing language in Section 312 to provide for the more comprehensive guidance for any location the fire code requires impact protection for.

Section 1207.11.7 is modified to point to Section 312 as occurs throughout the fire code.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal does not create a new reuirement, it takes existing language proividing greater detail and increased methods of compliance and relocates it to a section covering the same topic.

F45-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: Though the intent was good there were a variety of concerns with this proposal in its current form. A feature or appliance can be a wide variety of things which may not be the intent of this section. More wording to clarify that these provisions apply "where required" is necessary. These revisions may also cause confusion for other types of needs for impact protection besides within a garage. The language should be carefully reviewed for the use of "ESS." (Vote 8-6)

F45-24

Individual Consideration Agenda

Comment 1:

IFC: SECTION 312, 312.1, 312.1.1 (New), 312.2, 312.3, 312.1.1, FIGURE 312.1.1, 312.1.2, 312.4 (New), 312.4.1 (New), 312.1.3, 1207.11.7

Proponents: Robert J Davidson, Davidson Code Concepts LLC, Self (rjd@davidsoncodeconcepts.com); Darcy Davidson, Carlsbad Fire Department, California Fire Prevention Officers (darcy.davidson@carlsbadca.gov) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Fire Code

SECTION 312
VEHICLE IMPACT PROTECTION

Revise as follows:

312.1 General. Vehicle impact protection required by this code ~~within a garage or elsewhere in accordance with Section 312.1.1 or 312.1.2 shall be provided with impact protection in accordance with Section 312.1.3~~shall be provided by posts that comply with Section 312.2 or by other *approved* physical barriers that comply with Section 312.3.

Add new text as follows:

312.1.1 Detached one- and two-family dwellings and townhouses. Impact protection required for detached one-and two-family dwellings and townhouses shall be provided in accordance with Section 312.4

Revise as follows:

312.2 Posts. Guard posts shall comply with all of the following requirements:

1. Constructed of steel not less than 4 inches (102 mm) in diameter and concrete filled.
2. Spaced not more than 4 feet (1219 mm) between posts on center.
3. Set not less than 3 feet (914 mm) deep in a concrete footing of not less than a 15-inch (381 mm) diameter.
4. Set with the top of the posts not less than 3 feet (914 mm) above ground.

5. Located not less than 3 feet (914 mm) from the protected object.

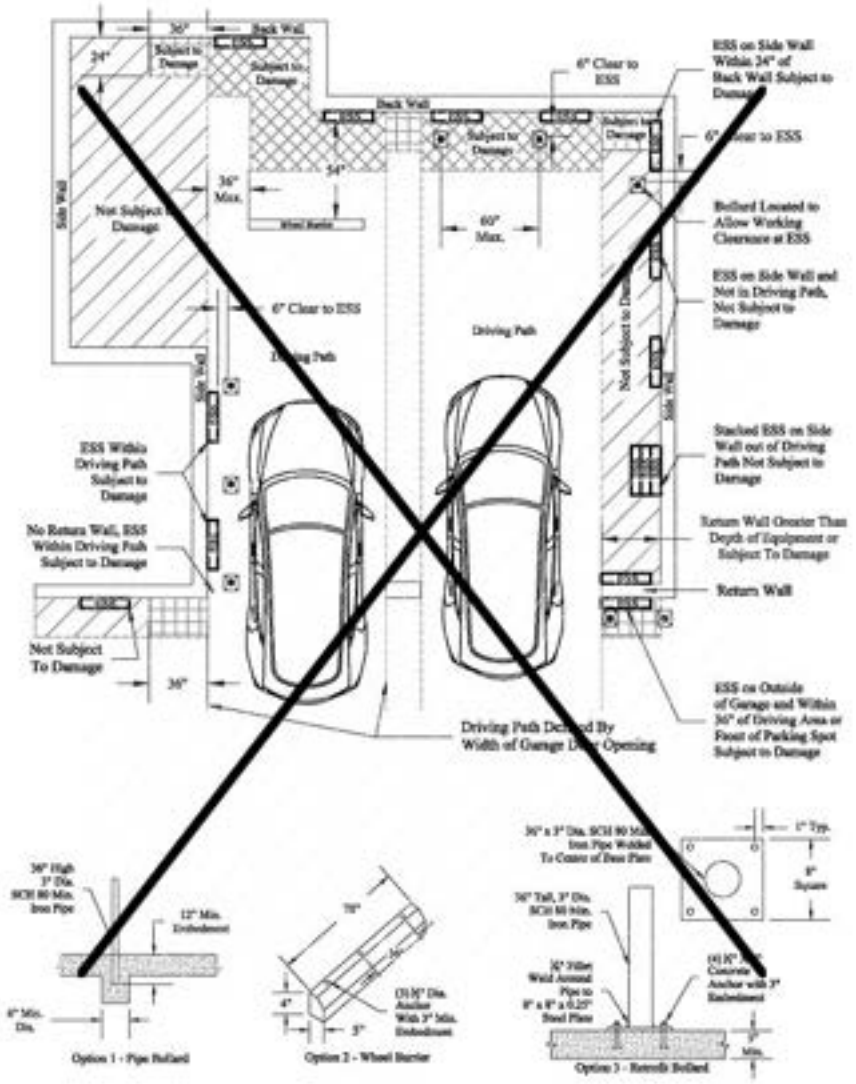
312.3 Other barriers. Barriers, other than posts specified in Section 312.2, that are designed to resist, deflect or visually deter vehicular impact commensurate with an anticipated impact scenario shall be permitted where *approved*.

Delete without substitution:

~~**312.1.1 Garages.** Where equipment or appliances are installed or located in the normal driving path of vehicle travel within a garage, impact protection complying with Section 312.1.3 shall be provided. The normal driving path is a space between the garage vehicle opening and the interior face of the back wall to a height of 48 inches (1219 mm) above the finished floor. The width of the normal driving path shall be equal to the width of the garage door opening. Impact protection shall also be provided for an ESS installed at either of the following locations (see Figure 312.1.2):~~

1. ~~On the interior face of the back wall and located within 36 inches (914 mm) to the left or to the right of the normal driving path.~~
2. ~~On the interior face of a side wall and located within 24 inches (610 mm) of the back wall and 36 inches (914 mm) of the normal driving path.~~

~~**Exception:** Where the clear height of the vehicle garage opening is 7 feet 6 inches (2286 mm) or less, equipment or appliances installed not less than 36 inches (914 mm) above the finished floor are not subject to vehicle impact protection requirements.~~



~~FIGURE 312.1.1~~ VEHICLE IMPACT PROTECTION

~~312.1.2 Other locations subject to vehicle impact.~~ ~~Where a feature, appliance or equipment is installed in a location other than as defined in Section 312.1.1 and is subject to vehicle damage, impact protection shall be provided in accordance with Section 312.1.3.~~

Add new text as follows:

312.4 Detached one- and two-family dwellings and townhouses. Where equipment or appliances are installed or located in the normal driving path of vehicle travel, impact protection shall comply with Sections 312.4.1 and 312.4.2.

312.4.1 Normal driving path within a garage. The normal driving within a garage the path is a space between the garage vehicle opening and the interior face of the back wall to a height of 48 inches (1219 mm) above the finished floor. The width of the normal driving path shall be equal to the width of the garage door opening. Impact protection shall also be provided for equipment or appliances installed at either of the following locations:

1. On the interior face of the back wall and located within 36 inches (914 mm) to the left or to the right of the normal driving path.
2. On the interior face of a side wall and located within 24 inches (610 mm) of the back wall and 36 inches (914 mm) of the normal driving path.

Exception: Where the clear height of the vehicle garage opening is 7 feet 6 inches (2286 mm) or less, equipment or appliances

installed not less than 36 inches (914 mm) above the finished floor are not subject to vehicle impact protection requirements.

~~312.1.3~~ **312.4.2 Impact protection options.** Where a feature, appliance or equipment is required to be protected from impact ~~in accordance with Section 312.1.1 or 312.1.2~~, such protection shall comply with one of the following:

1. Bollards constructed in accordance with one of the following:
   1.1. Minimum 48 inches (1219 mm) in length by 3 inches (76 mm) in diameter Schedule 80 steel pipe embedded in a concrete pier not less than 12 inches (304 mm) deep and 6 inches (152 mm) in diameter, with at least 36 inches (914 mm) of pipe exposed, filled with concrete and spaced at a maximum interval of 5 feet (1524 mm). Each bollard shall be located not less than 6 inches (152 mm) froma feature appliance or equipment.
   1.2. Minimum 36 inches (914 mm) in height by 3 inches (76 mm) in diameter Schedule 80 steel pipe fully welded to a minimum 8 inches (203 mm) by ¼-inch (6.4 mm) thick steel plate and bolted to a concrete floor by means of four ½-inch (13 mm) concrete anchors with 3-inch (76 mm) minimum embedment. Spacing shall be not greater than 60 inches (1524 mm), and each bollard shall be located not less than 6 inches (152 mm) from the feature, appliance or equipment.
   1.3. Premanufactured steel pipe bollards shall be filled with concrete and anchored in accordance with the manufacturer's installation instructions, with spacing not greater than 60 inches (1524 mm). Each bollard shall be located not less than 6 inches (152 mm) from the feature, appliance or equipment.
2. Wheel barriers constructed in accordance with one of the following:
   2.1. Four inches (102 mm) in height by 5 inches (127 mm) in width by 70 inches (1778 mm) in length wheel barrier made of concrete or polymer, anchored to the concrete floor not less than every 36 inches (914 mm) and located not less than 54 inches (1372 mm) from the feature, appliance or equipment. Minimum 3½-inch (89 mm) diameter concrete anchors with 3-inch (76 mm) embedment per barrier shall be used. Spacing between barriers shall be not greater than 36 inches (914 mm).
   2.2. Premanufactured wheel barriers shall be anchored in accordance with the manufacturer's installation instructions.
3. *Approved* method designed to resist a 2,000-pound-force (8896 N) impact in the direction of travel at 24 inches (610 mm) above grade.

1207.11.7 Protection from impact. ESS installed in a location subject to vehicle damage shall be provided with impact protection in accordance with Section 312.

Reason: In response to testimony and the committee's comments the proposal has been modified to leave existing sections 312.1 through 312.3 in place and unmodified.

A new Section 312.1.1 has been added addressing detached one- and two-family dwellings and townhouses with a pointer to new Section 312.4.

The protection language from 1207 has been brought over to only apply to the detached one- and two-family dwellings and townhouses.

The language has been modified to eliminate the reference to "ESS features" and to simply apply to "appliance or equipment".

Where the language on "normal driving path" previously only applied within a garage, the paragraph has been broken out to apply the vehicle driving path generically since impact protection could be required outside a garage, then the within the garage language is added as a subsection.

The example image has been deleted with the intent to add that to the IFC Commentary should this language be approved, the writing stsyele of teh IFC typiocally does not include images within the technical content.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal does not create a new reuirement, it takes existing language proividing greater detail and increased methods of compliance and relocates it to a section covering the same topic.

Comment (CAH2)# 669

Comment 1:

IFC: SECTION 312, 312.1, 312.2, 312.3, 312.4 (New), 312.1.1, FIGURE 312.1.1, 312.1.2, 312.1.3, 1207.11.7

Proponents: Joseph H. Cain, P.E., Solar Energy Industries Association (SEIA), Solar Energy Industries Association (SEIA) (joecainpe@gmail.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Fire Code

SECTION 312
VEHICLE IMPACT PROTECTION

312.1 General. Vehicle impact protection required by this code ~~within a garage or elsewhere~~ shall be provided by posts that comply with Section 312.2 or by other *approved* physical barriers that comply with Section 312.3. ~~in accordance with Section 312.1.1 or 312.1.2 shall be provided with impact protection in accordance with Section 312.1.3.~~ ESS in garages shall be protected from vehicle impact as required in Section 312.4.

312.2 Posts. Guard posts shall comply with all of the following requirements:

1. Constructed of steel not less than 4 inches (102 mm) in diameter and concrete filled.
2. Spaced not more than 4 feet (1219 mm) between posts on center.
3. Set not less than 3 feet (914 mm) deep in a concrete footing of not less than a 15-inch (381 mm) diameter.
4. Set with the top of the posts not less than 3 feet (914 mm) above ground.
5. Located not less than 3 feet (914 mm) from the protected object.

312.3 Other barriers. Barriers, other than posts specified in Section 312.2, that are designed to resist, deflect or visually deter vehicular impact commensurate with an anticipated impact scenario shall be permitted where *approved*.

Add new text as follows:

312.4 Protection of ESS from impact.. ESS installed in a location subject to vehicle damage in accordance with Section 324.1 or 324.2 shall be provided with impact protection in accordance with Section 324.3.

~~**312.1.1**~~ **312.4.1 ESS in ~~Garages~~ garages.** Where ~~equipment or appliances are~~ an ESS is installed ~~or located~~ in the normal driving path of vehicle travel within a garage, impact protection complying with Section ~~312.1.3~~ 312.4.3 shall be provided. The normal driving path is a space between the garage vehicle opening and the interior face of the back wall to a height of 48 inches (1219 mm) above the finished floor. The width of the normal driving path shall be equal to the width of the garage door opening. Impact protection shall also be provided for an ESS installed at either of the following locations (see Figure ~~312.1.2~~ 312.4.1):

1. On the interior face of the back wall and located within 36 inches (914 mm) to the left or to the right of the normal driving path.

2. On the interior face of a side wall and located within 24 inches (610 mm) of the back wall and 36 inches (914 mm) of the normal driving path.

Exception: Where the clear height of the vehicle garage opening is 7 feet 6 inches (2286 mm) or less, ~~equipment or appliances~~ ESS installed not less than 36 inches (914 mm) above the finished floor are not subject to vehicle impact protection requirements.

Revise as follows:

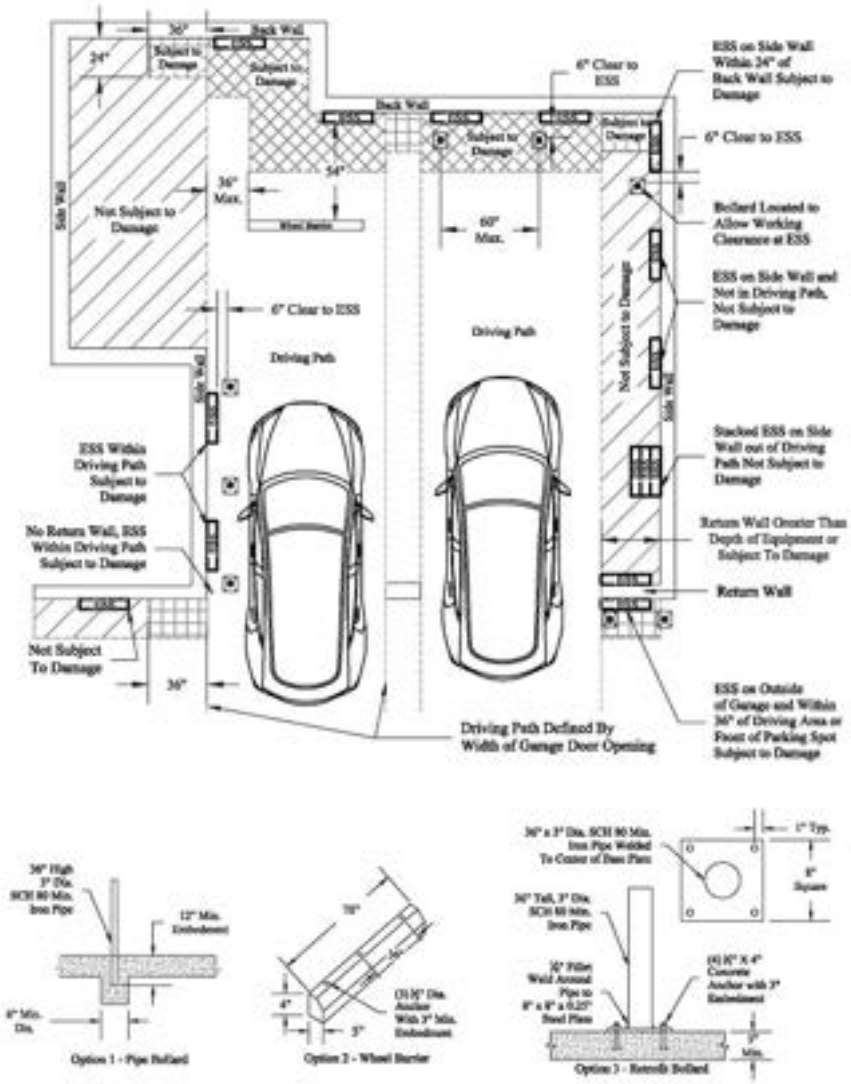


FIGURE ~~312.1.1~~ 312.4.1 ESS VEHICLE IMPACT PROTECTION

~~312.1.2~~ 312.4.2 Other ESS locations subject to vehicle impact. Where ~~a feature, appliance or equipment~~ an ESS is installed in a location other than as defined in Section ~~312.1.1~~ 312.4.1 and is subject to vehicle damage, impact protection shall be provided in accordance with Section ~~312.1.3.~~ 312.4.3.

~~312.1.3~~ 312.4.3 ESS ~~Impact~~ impact protection options. Where ~~a feature, appliance or equipment~~ ESS is required to be protected from impact in accordance with Section ~~312.1.1~~ 312.4.1 or ~~312.1.2~~ 312.4.2, such protection shall comply with one of the following:

1. Bollards constructed in accordance with one of the following:

   1.1. Minimum 48 inches (1219 mm) in length by 3 inches (76 mm) in diameter Schedule 80 steel pipe embedded in a concrete pier not less than 12 inches (304 mm) deep and 6 inches (152 mm) in diameter, with at least 36 inches (914 mm) of pipe exposed, filled with concrete and spaced at a maximum interval of 5 feet (1524 mm). Each bollard shall be located not less than 6 inches (152 mm) from ~~a feature appliance or equipment.~~ an ESS.

   1.2. Minimum 36 inches (914 mm) in height by 3 inches (76 mm) in diameter Schedule 80 steel pipe fully welded to a minimum 8 inches (203 mm) by ¼-inch (6.4 mm) thick steel plate and bolted to a concrete floor by means of four ½-inch (13 mm) concrete anchors with 3-inch (76 mm) minimum embedment. Spacing shall be not greater than 60 inches (1524 mm), and each bollard shall be located not less than 6 inches (152 mm) from the ~~feature, appliance or equipment.~~ ESS.

   1.3. Premanufactured steel pipe bollards shall be filled with concrete and anchored in accordance with the manufacturer's installation instructions, with spacing not greater than 60 inches (1524 mm). Each bollard shall be located not less than 6 inches (152 mm) from the ~~feature, appliance or equipment.~~ ESS.

2. Wheel barriers constructed in accordance with one of the following:

   2.1. Four inches (102 mm) in height by 5 inches (127 mm) in width by 70 inches (1778 mm) in length wheel barrier made of concrete or polymer, anchored to the concrete floor not less than every 36 inches (914 mm) and located not less than 54 inches (1372 mm) from the feature, appliance or equipment. Minimum 3½-inch (89 mm) diameter concrete anchors with 3-inch (76 mm) embedment per barrier shall be used. Spacing between barriers shall be not greater than 36 inches (914 mm).

   2.2. Premanufactured wheel barriers shall be anchored in accordance with the manufacturer's installation instructions.

3. *Approved* method designed to resist a 2,000-pound-force (8896 N) impact in the direction of travel at 24 inches (610 mm) above grade.

1207.11.7 Protection from impact. ESS installed in a location subject to vehicle damage shall be provided with impact protection in accordance with Section 312.

Reason: The Committee comments for F45-24 indicated good intent but a variety of concerns. The Committee expressed concern about the terms "feature or appliance," and suggested careful review for the use of "ESS."

This public comment includes two primary elements:

1. Restore the existing language in IFC 312 for general requirements for vehicle impact protection.

2. Restore the existing language in IFC 1207.11.7 for protection of ESS from vehicle impact, and relocate that existing language to new Section 312.4, immediately following existing language in 312 through 312.3.

The provisions presently found in IFC 1207.11.7 were developed specifically for ESS. The graphic presently found as Figure 1207.11.7.1 is titled ESS Vehicle Impact Protection, and includes depiction of various locations of ESS units within the graphic. Rather than trying to extend that language and that graphic to other "features or appliances," this public comment preserves the original content and simply moves it to a new Section 312.4. This PC also restores the original language of Sections 312.1 through 312.3.

We believe these requirements can coexist in Chapter 3 as separate requirements, without disrupting other chapters of the IFC that refer back to Section 312 for vehicle impact protection.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Vehicle impact protection for ESS relocated from IFC 1207.11.7 to IFC 312.4. No changes to technical requirements.

F48-24

IFC: 316.7 (New), 316.7.1 (New), 316.7.2 (New), 316.7.2.1 (New), 316.7.2.2 (New), 316.7.3 (New)

Proposed Change as Submitted

Proponents: James Carver, Self, Southern California Fire Prevention Officer's Association

2024 International Fire Code

Add new text as follows:

316.7 Electrified fences. Electrified fences for securing commercial and industrial property shall meet the requirements of Sections 316.7.1 to 316.7.3.

316.7.1 Power requirements. The fence shall be powered by an electrical energizer with both of the following output characteristics:

1. The impulse repetition rate does not exceed 1 hertz (hz).
2. The impulse duration does not exceed 10 milliseconds, or $^{10}/_{10000}$ of a second.

316.7.2 Signage. The fence shall be identified by prominently placed and legible warning signs.

316.7.2.1 Placement. The warning signs shall be placed at each gate and access point, and on both sides of the fence, at intervals along the fence not exceeding 30 feet.

316.7.2.2 Marking. The warning signs shall be marked with a written warning or a commonly recognized symbol for shock, a written warning or a commonly recognized symbol to warn people with pacemakers, and a written warning or commonly recognized symbol about the danger of touching the fence in wet conditions.

316.7.3 System shut off switch. An approved shut off switch shall be installed allowing controlled access to the electrified fence system for the fire department to shut of power. The shut off switch shall be readily marked.

Reason: Electrified fences have been used for a very long time but have seen an increase for protecting commercial and warehouse properties from theft. Often, these fences are not marked or identified and pose a hazard to firefighters responding to emergencies. This section is provided to bring requirements for electrified fences, including electrical charge and pulse rate, signage and emergency shut of by firefighters to the Fire Code.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

These requirements are only applicable if an electrified fence system is being installed, there is no additional cost to comply with the proposed sections. The requirements coincide with electrified fence requirements in the California Civil Code, and are considered an industry standard.

F48-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee stated that the reasons for the disapproval of the proposal were: Concerns with just some of the vagueness in some of the language. For example, there are legible warning signs required elsewhere in the code that have some significant details about what constitutes legible and the required size. There is a reference in the marking section about a recognized symbol that would be nice to see what that symbol is as part of the reason statement to have consistency about what would be considered a recognized sign. Also, the requirement for the fire department shut off switch to be readily marked needs more details such as how it is marked and where it is located, if it's a large fence, if there is more than one shut off, maybe at every entrance that the emergency services may use. (Vote: 9-4)

F48-24

Individual Consideration Agenda

Comment 1:

IFC: 316.7, 316.7.1, 316.7.2, 316.7.2.1, 316.7.2.2, 316.7.3

Proponents: James Carver, Self, Southern California Fire Prevention Officer's Association (james90245@pacbell.net) requests As Modified by Committee (AMC2)

Replace as follows:

2024 International Fire Code

Revise as follows:

316.7 Electrified fences. Electrified fences for securing commercial and industrial property shall meet the requirements of Sections 316.7.1 to 316.7.3.

Exception: This section does not apply to agricultural occupancies and operations.

316.7.1 Power requirements. The fence shall be powered by an electrical energizer with both of the following output characteristics:

1. The impulse repetition rate does not exceed 1 hertz (hz).
2. The impulse duration does not exceed 10 milliseconds, or $^{10}/_{10000}$ of a second.

316.7.2 Signage. The fence shall be identified by prominently placed and legible warning signs.

316.7.2.1 Placement. The warning signs shall be placed at each gate and access point, and on both sides of the fence, at intervals along the fence not exceeding 30 feet.

Revise as follows:

316.7.2.2 Marking. The warning signs shall state "WARNING ELECTRIFIED FENCE" and contain the international symbol for shock hazard. Warning signs shall be reflective with a minimum 2-inch letter height, minimum stroke of 1/2 inch and with a contrasting background. ~~be marked with a written warning or a commonly recognized symbol for shock, a written warning or a commonly recognized symbol to warn people with pacemakers, and a written warning or commonly recognized symbol about the danger of touching the fence in wet conditions.~~

316.7.3 System shut off switch. An approved shut off switch shall be installed at all fire department access points, allowing controlled access to the electrified fence system for the fire department to shut of power. The shut off switch shall be readily marked.

Reason: During the 1st Committee Action Hearing in Orlando, Committee members provided comments about the requirement being applicable to agricultural occupancies, the warning sign is not descriptive enough, and there needs to be a system shut off switch at all fire department access points. The revised proposal incorporates the Committee's comments.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposed changes clarify the sign requirements and where the fire department shut off switches are to be located. These are new requirements, only a clarification to requirements in the initial proposal.

Proposed Change as Submitted

Proponents: Robert Marshall, FCAC, FCAC (fcac@iccsafe.org)

2024 International Fire Code

Revise as follows:

320.4.3 Outdoor storage. Outdoor storage of lithium-ion or lithium metal batteries shall comply with Sections 320.4.3.1 through ~~320.4.3.3~~ 320.4.3.6.

Add new text as follows:

320.4.3.1 Technical opinion and report. A technical opinion and report complying with Section 104.8.2 shall be prepared to evaluate the fire and explosion risks associated with outdoor storage of lithium ion and lithium metal batteries and to make recommendations for fire and explosion protection. The report shall be submitted to the fire code official and shall require the fire code official's approval. In addition to the requirements of Section 104.2.2, the technical opinion and report shall evaluate all of the following:

1. Compliance with this section.
2. Firefighting access and water supply for emergencies involving outdoor battery storage.
3. Outdoor battery fire and explosion hazards
4. Hazards involving flying debris during fire incidents igniting adjacent storage areas, buildings, or other exposure hazards.
5. Handling, storage and monitoring of damaged batteries and post-fire monitoring.

Revise as follows:

~~**320.4.3.1**~~ **320.4.3.2 Distance from storage to exposures.** Outdoor storage of lithium-ion or lithium metal batteries~~, including storage beneath weather protection in accordance with Section 414.6.1 of the *International Building Code*,~~ shall comply with one of the following:

1. Battery storage shall be located not less than 20 feet (6096 mm) from any building, *lot line*, public street, public alley, public way or *means of egress*.
2. Battery storage shall be located not less than 3 feet (914 mm) from any building, *lot line*, public street, public alley, public way or *means of egress*, where the battery storage is separated by a 2-hour fire-resistance-rated assembly without openings or penetrations and extending 5 feet (1524 mm) above and to the sides of the battery storage area.
3. Battery storage shall be located not less than 3 feet (914 mm) from any building, *lot line*, public street, public alley, public way or *means of egress*, where batteries are contained in *approved,* prefabricated portable structures providing a complete 2-hour fire-resistance-rated enclosure.
4. A maximum of 15 cubic feet of lithium-ion or lithium metal batteries or cells packaged in accordance with DOTn shipping requirements where not less than 3 feet (914 mm) from any building with non-combustible exterior walls, lot line, public street, public alley, public way or means of egress.

~~**320.4.3.2**~~ **320.4.3.3 Storage area size limits and separation.** Outdoor storage areas for lithium-ion or lithium metal batteries~~, including storage beneath weather protection in accordance with Section 414.6.1 of the *International Building Code*,~~ shall not exceed 900 square feet (83.6 m^2). The height of battery storage in such areas shall not exceed 10 feet (3048 mm). Multiple battery storage areas shall be separated from each other by not less than ~~10 feet (3048 mm)~~ 20 feet (6096 mm) of open space.

~~320.4.3.3~~ **320.4.3.4 Fire detection.** Outdoor storage areas for lithium-ion or lithium metal batteries exceeding 900 sq. ft. (371 m^2), regardless of whether such areas are open, under weather protection or in a prefabricated portable structure, shall be provided with an *approved* automatic fire detection and alarm system complying with Section 907. The fire detection system shall use radiant energy-sensing fire detection.

Add new text as follows:

320.4.3.5 Containers. Containers for outdoor storage of used or waste batteries shall be open-top and constructed of noncombustible materials; containers complying with DOTn regulations for lithium-ion and lithium metal transportation or shall be approved for battery collection and storage.

320.4.3.6 Weather protection. Where weather protection is provided for sheltering outdoor lithium ion or lithium metal battery storage or use areas, such areas shall be considered outdoor storage or use where the weather protection structure complies with all of the following:

1. Walls shall not obstruct more than one side or more than 25 percent of the perimeter of the storage area.
2. The overhead structure shall be of approved noncombustible construction with a maximum area of 3,600 square feet (334.5 m2).
3. The distance from the structure to buildings, lot lines, public ways or means of egress to a public way shall be not less than the distance required for an outside storage in Section 320.4.3.2.
4. Weather protection structures used for sheltering lithium ion or lithium metal battery storage shall be separated from lithium ion or lithium metal battery piles or additional weather protection structures used to shelter lithium ion or lithium metal battery storage by no less than 20 feet (4572mm).
5. The height of battery storage in such areas shall not exceed 10 feet (3048 mm).

Reason: FCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and early 2024 the FCAC has held several virtual meetings and one in-person meeting open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the **FCAC Website**

This proposal accomplishes the following:

320.4.3.1 removed reference to IBC Weather protection which only applies to hazardous materials, currently we don't treat this battery storage as hazardous materials, but we were pointing to a hazardous material provision for the weather protection. Added 320.4.3.6 to provide weather protection specific to battery storage which is consistent with the requirements of NFPA 855.

320.4.3.1 #4: provides some relief by adding a provision for limited storage for waste batteries as they are collected/packaged for offsite shipping (typically in 55-gallon drums) with batteries in bags to prevent short circuiting, and space between filled with vermiculite. This is common practice and allows for waste pack containers to be outside vs inside, which is generally a much safer option. The quantity limit is still limited to 15 cf consistent with indoor storage allowance. See https://www.phmsa.dot.gov/sites/phmsa.dot.gov/files/2021-09/Lithium-Battery-Guide.pdf

320.4.3.2 eliminates the reference to IBC weather protection, it is now addressed directly in its own section.

320.4.3.4 Adds a size threshold for fire detection, which can be complicated and expensive for outdoor design and maintenance. Increases consistency with NFPA 855.

320.4.3.5 Adds a container section for outdoor storage which prescribes allowable container types. .

320.4.3.5 Adds the weather protection requirements.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

$0.00

Estimated Immediate Cost Impact Justification (methodology and variables):

The provisions of this revised section are focused upon outdoor storage and generally do not affect construction costs. This proposal increases storage options at locations where lithium-ion or lithium metal batteries are being stored outside, though the required technical report could present additional cost for locations that only have outdoor storage, (the report is currently necessary for any indoor storage over 15 cu. ft.), the permit costs are what are potentially increased in the short term, but overall costs are reduced in the long term by providing for an increase in storage options, increased weather protection structure size and allowance for small quantities in DOT shipping containers.

The justification is that by providing for recognition of approved DOT shipping container use and increasing the permissible size of the weather enclosure the over costs to a site storing batteries outside are reduced. Increasing storage options provides for cost containment. Requiring the technical report upfront identifies hazards and mitigation methods for those hazards, reducing long term operational costs for the facility and the emergency responders.

F53-24

Public Hearing Results (CAH1)

Committee Action: **As Submitted**

Committee Reason: The committee stated that the reasons for the approval of the proposal were: It addresses some important gaps and provides guidance about the technical report. Specifically, it evaluates the hazards on a site-specific basis, picking up the weather protection requirements, which are gaps in the codes right now. (Vote: 12-2)

F53-24

Individual Consideration Agenda

Comment 1:

IFC: 320.4.3.3, 320.4.3.4

Proponents: Abid Anwar, Tesla (aanwar@tesla.com) requests As Modified by Committee (AMC2)

Further modify as follows:

2024 International Fire Code

Revise as follows:

320.4.3.3 Storage area size limits and separation. Outdoor storage areas for lithium-ion or lithium metal batteries shall not exceed 900 square feet (83.6 m^2). The height of battery storage in such areas shall not exceed 10 feet (3048 mm). Multiple battery storage areas shall be separated from each other by not less than 20 feet (6096 mm) of open space. **Exception:** Where approved by the fire code official, smaller separation distances shall be permitted based on findings in the technical opinion report in compliance with Section

320.4.3.1

320.4.3.4 Fire detection. Outdoor storage areas for lithium-ion or lithium metal batteries exceeding 900 sq. ft. (371 m^2), regardless of whether such areas are open, under weather protection or in a prefabricated portable structure, shall be provided with an *approved* automatic fire detection and alarm system complying with Section 907. The fire detection system shall use radiant energy-sensing fire detection. **Exception:** Where approved by the fire code official, fire detection and alarm systems are permitted to be omitted based on the findings in the technical opinion report in compliance with Section 320.4.3.1.

Reason: F53-24 was Approved As Modified by Committee with the expectation to see a technical justification or risk basis where the proposed code changes do not correlate with NFPA 855. Tesla is committed to helping fire departments and first responders safely handle emergency situations involving all Tesla products. We have trained thousands of first responders to appropriately handle Tesla products and batteries through virtual and in-person training, through provision of decommissioned vehicles, support lines, and attendance at relevant safety and code conferences. Tesla understands the intent of the proposal in keeping first responders and the public safe, as such, Tesla proposes utilization of the technical opinion report to allow a performance-based pathway to omit and/or modify prescriptive code requirements where the site-specific risk analysis supports such actions.

This public comment retains the technical opinion report and increased prescriptive separation distances between storage areas while providing a means to:

1. reduce storage area separation distances based on the technical opinion report and accompanying site specific risk analysis as required per 320.4.3.1.
2. omit fire detection requirements based on the technical opinion report and accompanying site specific risk analysis as required per 320.4.3.1

The utilization of the technical opinion report to deviate from prescriptive code requirements through a rigorous risk and mitigation analysis is consistent with current use cases for technical opinion reports. The proposed code language provides the fire code official ultimate authority to accept the findings of the technical opinion report using the "where approved" charging language. No technical justification or substantiation was provided for the increase in battery array spacing from 10 ft. to 20 ft., however, this proposal allows for increased conservative prescriptive requirements with an avenue for performance and risk-based reductions.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

the modification proposed by AMC#2 does not affect the cost of construction as it relates to separation requirements pertaining to outdoor storage of lithium and lithium-ion batteries.

Comment (CAH2)# 549

F56-24

IFC: SECTION 322 (New), 322.1 (New), 322.2 (New)

Proposed Change as Submitted

Proponents: Robert Marshall, FCAC, FCAC (fcac@iccsafe.org)

2024 International Fire Code

Add new text as follows:

SECTION 322
NONCOMBUSTIBLE MATERIALS

322.1 Testing. Noncombustible materials shall be those materials that comply with Section 703.3.1 of the *International Building Code*.

322.2 Inherently noncombustible materials. Inherently noncombustible materials, such as concrete and steel, shall not be required to be tested to be acceptable as noncombustible materials.

Reason: In the area of material regulation, materials that pass ASTM E136 have long been considered to be those that are noncombustible materials.

Note that ASTM E136 is one of the very few ASTM fire test standards that has acceptance criteria. The acceptance criteria are different from the theoretical definition of a noncombustible material. The IBC includes in Chapter 7 added details on testing building materials to ASTM E136. Section 703.3.1 of the IBC includes also an exception that clarifies that some materials are acceptable for use as noncombustible materials irrespective of whether they "pass" ASTM E136.

There are definitions contained in the 2024 IMC and 2024 IFGC, and in the 2021 IPC, but they are actually more of a requirement than a definition.

In the area of material regulation, materials that pass ASTM E136 have long been considered in the US to be those that are noncombustible materials, and that concept is consistent with what IBC section 703.3 states.

The requirement for what constitutes a noncombustible material should be placed in a general requirement section, in Chapter 3.

If no requirement (or a definition containing a requirement) exists experience indicates that some material manufacturers have claimed that their material is noncombustible when it simply exhibits improved fire performance. When searching the internet, multiple web sites offer materials or products that are alleged to be noncombustible when that claim is incorrect. There is often a confusion in the public mind when considering a material that performs better than typical combustible materials, but should not be considered noncombustible.

This proposal recommends including a correct requirement for what materials shall be considered noncombustible materials and it is to comply with the IBC section 703.3.1. A second section states that a requirement for what is a noncombustible material does not mean that clearly noncombustible materials, such as steel, concrete, or masonry, need to be tested (for example to ASTM E136).

The language in section 703.3.1 of the IBC reads as follows:

> ***703.3.1 Noncombustible materials.*** *Materials required to be noncombustible shall be tested in accordance with ASTM E136. Alternately, materials required to be noncombustible shall be tested in accordance with ASTM E2652 using the acceptance criteria prescribed by ASTM E136.*
>
> ***Exception:*** *Materials having a structural base of noncombustible material as determined in accordance with ASTM E136, or with ASTM E2652 using the acceptance criteria prescribed by ASTM E136, with a surfacing of not more than 0.125 inch (3.18 mm)*

in thickness having a flame spread index not greater than 50 when tested in accordance with ASTM E84 or UL 723 shall be acceptable as noncombustible.

FCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and early 2024 the FCAC has held several virtual meetings and one in-person meeting open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the **FCAC Website**

Cost Impact: The code change proposal will not increase or decrease the cost of construction

This proposal adds a definition, which is consistent with long-held understanding of what is a noncombustible material.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal simply adds a clarification that is consistent with the existing requirement in the IBC.

F56-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee stated that the reasons for the disapproval were: Based on the many floor modifications discussed it is definitely not ready. The testing section in Section 322.1 that puts in a pointer really appears to be just a solution in search of a problem and there is no value in solving the problem. Opposition to the laundry list of things that would be considered noncombustible. It will result in many unintended consequences. There are a lot of places where noncombustible is used and it just does not address all of those in the reason statement. (Vote: 13-0)

F56-24

Individual Consideration Agenda

Comment 1:

IFC: SECTION 322, 322.1, 322.2

Proponents: Marcelo Hirschler, GBH International, GBH International (mmh@gbhint.com); Robert Marshall, FCAC, FCAC (fcac@iccsafe.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Fire Code

SECTION 322
NONCOMBUSTIBLE <u>BUILDING</u> MATERIALS

322.1 Testing. Noncombustible <u>building</u> materials shall be those materials that comply with Section 703.3.1 of the *International Building*

Code.

Revise as follows:

322.2 ~~Inherently noncombustible materials~~ Testing Not Required. ~~Inherently noncombustible materials, such as concrete and steel,~~ The following building materials shall not be required to be tested to be acceptable as noncombustible building materials.

1. Steel,
2. Concrete, containing no combustible aggregates or fibers,
3. Masonry, containing no combustible aggregates or fibers,
4. Glass (excluding plastic glazing),
5. 5xxx and 6xxx series aluminum alloys.

Reason: Several materials can claim to be inherently noncombustible, in many cases without it being truly valid. For example, any plastic or wood materials are always combustible. This issue is an important consideration for building materials (see for example chapter 8 of the IFC where requirements are different depending on whether the materials are or are not noncombustible.

Some materials exist (often insulation materials) where it is not possible to determine without testing (normally to ASTM E136, as required in the IBC) whether they are truly noncombustible. For example, fiberglass insulation materials will always contain some combustible binder to be useful. The material can pass the ASTM E136 test (and be noncombustible) if it contains a small amount of binder but fail the test with larger amount of binder. That can only be determined by testing and is impossible to note visually.

It makes no sense to test steel, concrete or masonry (if they contain no combustible aggregates or fibers, which would have to be certified by the proponent0. Therefore, as it has been shown by testing (and common sense) that testing steel, concrete or masonry to ASTM E136 is unnecessary, as they will pass the test they can be excluded from being required to be tested.

However, some new building materials are made with organic (such as foam plastics) components to lower the weight and make them easier to manipulate. In that case, it is unclear whether they are truly noncombustible materials, and they would need to be tested to know the answer for sure. That is why the requirement has been added that they contain no combustible aggregates or fibers.

Test results from at least two testing labs have been able to show that glass (whether ordinary glass or quartz) truly meets the requirements of ASTM E136 and is a noncombustible material. The same is not true for other glazing materials, which are typically plastic and are combustible; they must be excluded.

That brings up the question of aluminum. Typical building materials are, more often than not, alloys of aluminum and other metals. The Aluminum Association has published a report in Building Safety Journal (August 17th, 2020) where they discuss the “noncombustibility” of aluminum. It is of great interest that the 4 aluminum alloys that they tested “were selected for their widespread use in construction”. Those alloys tested all passed the ASTM E136 test. However, the same report also states that “Aluminum, just like many comparable metals, is not combustible in any general application other than when it is specifically made to be.” That suggests that there may be some aluminum alloys that may or may not be noncombustible. After considerable debate and investigation of test reports, consensus was reached that most of the aluminum alloys used as building materials belong to the 6xxx series of alloys, with less than 1.2% magnesium, and the main ones (such as 6063, 6061, 6005) have all been tested for noncombustibility. In terms of sheet aluminum products, the series 5xxx alloys (such as 5052, 5083, 5005) are often used in construction, with higher levels if magnesium (the highest being 5083, which contains 4.9% magnesium). This product has also been tested and shown to be noncombustible. Therefore, consensus was reached that it is safe to include “5xxx and 6xxx series aluminum alloys” to the list of building materials that do not require testing to be considered noncombustible materials.

The task group that developed this comment included representatives from a variety of industries, including: steel, aluminum, concrete, masonry, glass, wood, and plastics.

FCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and early 2024 the FCAC has held several virtual meetings and one in-person meeting open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as

interested parties. Related documents and reports are posted on the **FCAC Website**.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This will clarify that a number of materials are clearly noncombustible and will not require additional fire testing. If anything, this comment will decrease costs because less testing for non combustibility will be needed.

Proposed Change as Submitted

Proponents: Robert Marshall, FCAC, FCAC (fcac@iccsafe.org)

2024 International Fire Code

Revise as follows:

BATTERY-POWERED MICROMOBILITY DEVICES. Products or equipment that include Motorized bicycles, motorized scooters and other personal mobility devices intended for one or more riders powered by a lithium-ion or lithium metal battery. The term does not include automobiles and trucks built to DOT requirements. ~~motor vehicles that are required to be registered with the Department of Motor Vehicles for the state or jurisdiction~~

Add new definition as follows:

BATTERY-POWERED APPLIANCE. A device or apparatus with an electric motor powered by a battery.

BATTERY-POWERED INDUSTRIAL EQUIPMENT. A motorized hand truck, floor scrubber or buffer or similar device with an electric motor intended to be personally driven or guided, powered by a battery.

BATTERY-POWERED INDUSTRIAL TRUCK. A forklift, tractor, platform lift truck or similar apparatus with an electric motor powered by a battery.

BATTERY-POWERED AUTOMATED MOBILE PLATFORMS (AMPs). A device with an electric motor powered by a battery that provides an automated function involving lifting, carrying, product picking, towing, and similar operations. These devices may also be capable of automatous movement including operating, moving and completing automated functions independently, without direct human guidance or control.

BATTERY POWERED ROBOTIC EQUIPMENT. A machine or device with an electric motor powered by a battery capable of automatically carrying out a complex series of actions using computer programing. This equipment may be permanently mounted or capable of autonomous movement where they have the means to determine path selection by processing data from sensors, powered by a battery.

Revise as follows:

105.5 Required operational permits. The *fire code official* is authorized to issue operational permits for the operations set forth in Sections 105.5.2 through ~~105.5.54~~ 105.5.58.

Add new text as follows:

105.5.5 Battery powered devices, trucks, equipment and appliances. An operational permit is required for the use of a battery powered device, truck, equipment or appliance with a battery capacity greater than 300 Whs.

Revise as follows:

SECTION 322
BATTERY-POWERED ~~MICROMOBILITY~~ DEVICES, TRUCKS, EQUIPMENT

AND APPLIANCES

322.1 General. ~~Lithium ion and lithium metal~~ *Battery-powered micromobility devices, battery-powered industrial trucks, battery-powered industrial equipment, battery-powered robotic equipment and battery-powered appliances* shall be operated and maintained in accordance with this section. **Exceptions:**

1. Batteries with a capacity less than 300 Whs.

~~1.~~ 2. Storage, ~~repair~~ and use ~~charging in residential occupancies~~ of powered mobility devices, in Group R-2 dwelling units or detached one- and two-family dwellings and townhouses, other than Group R-4, Condition 2 Occupancies, provided that such devices are for personal use by its owner. The charging location shall not obstruct the means of egress.

~~2. Charging of a single powered mobility device in any occupancy by its owner.~~

Delete without substitution:

~~**322.1.1 Prohibited locations.** The use of a residential occupancy as a business for the charging of commercially owned *powered micromobility devices* as part of a rental or sales service shall not be permitted.~~

Add new text as follows:

322.1.1 Operational permit. An operational permit shall be obtained from the *fire code official* in accordance with Section 105.5 for the use and battery charging operations regulated by this Section.

Revise as follows:

~~**322.2**~~ **322.1.2 Battery charging operations ~~chargers and equipment~~.** ~~*Powered micromobility devices* shall be charged~~ Battery charging operations shall be in accordance with their device listing and the manufacturer's instructions using only the original equipment manufacturer-supplied charging equipment or charging equipment in accordance with the listing and manufacturer's instructions.

Add new text as follows:

322.1.3 Ventilation. Mechanical exhaust ventilation to the exterior shall be provided at the source in the charging location in accordance with *the International Mechanical Code*Chapter 5 to prevent the dangerous accumulation of any flammable or other hazardous gases that are produced or discharged by the battery during normal charging operation.

322.1.4 Spill control and neutralization. Approved methods and materials shall be provided for the control and neutralization of spills of electrolyte or other hazardous materials in areas containing batteries as follows:

1. For batteries with free-flowing electrolyte, the method and materials shall be capable of neutralizing a spill of the total capacity from the largest cell or block to a pH between 5.0 and 9.0.2.
2. For batteries with immobilized electrolyte, the method and material shall be capable of neutralizing a spill of 3.0 percent of the capacity of the largest cell or block in the room to a pH between 5.0 and 9.0.

322.1.5 Battery charging locations. Charging of any battery powered industrial equipment, battery powered industrial truck, battery powered robotic equipment or battery-powered appliance in any occupancy shall be in an approved outdoor location or in an indoor area that complies with Section 322.2.

322.1.5.1 Prohibited locations. Repair or charging operations for business purposes shall not be permitted in the following locations:

1. In a detached one- and two-family dwelling or townhouse occupied under the International Residential Code or R2, R3, or R4 Occupancies
2. In sleeping rooms or means of egress paths of R-1 Occupancies.

322.2 Requirements for indoor charging locations. Indoor charging operations shall be provided with fire detection, fire suppression and other hazard mitigation measures as required by this Section.

322.2.1 Charging requirements for lead-acid batteries. Indoor charging areas for lead-acid batteries shall comply with Section 322.1 and 322.2.2.8

322.2.2 Charging requirements for lithium-ion and lithium metal batteries. Indoor charging areas for lithium-ion and lithium metal batteries shall comply with Section 322.1 and 322.2.2.1 through 322.2.2.8

322.2.2.1 Fire suppression. The *fire area* containing the indoor charging location shall be protected by an *automatic sprinkler system* installed in accordance with Section 903.3.

322.2.2.2 Fire detection. The indoor charging location shall be protected by a fire alarm system utilizing a smoke detection system, thermal imaging system or radiant energy-sensing fire detection system

322.2.2.3 Electrical recepticles. The indoor charging location shall be provided with sufficient electrical receptacles to allow the charging equipment for each device to be directly connected to a receptacle installed in accordance with NFPA 70. The use of extension cords or relocatable power taps shall not be permitted.

322.2.2.4 Prohibited storage. Storage of combustible materials, combustible waste or hazardous materials shall not be permitted in the indoor charging location.

322.2.2.5 Means of egress. The charging operation shall not be conducted in or obstruct any required means of egress.

322.2.2.6 Storage enclosure. Removable batteries shall not be stacked or stored in an enclosed cabinet unless the cabinet is *listed* or is a specially designed battery containment enclosure *approved* for such purpose.

322.2.2.7 Battery charging seperation. A minimum distance of 18 inches (457.2 mm) shall be maintained between each removable storage battery during charging operations unless each battery is isolated from neighboring batteries by an *approved* fire-resistant material or is within a specially designed rack or cabinet designed and *approved* for such purpose.

322.2.2.8 Device charging seperation. A minimum of 18 inches (457.2 mm) shall be maintained between the locations of the batteries on each powered micromobility device, industrial truck, equipment, robot or appliance during charging operations.

322.3 Repairs. Repairs of *battery-powered micromobility devices*, *battery-powered industrial trucks*, *battery-powered industrial equipment*, *battery-powered appliances* and *battery-powered robotic equipment* shall be performed in *approved* locations outside of buildings or within buildings in areas specifically *approved* for that purpose.

Delete without substitution:

~~**322.4 Battery charging areas.** Where *approved*, *powered micromobility devices* shall permitted to be charged in a room or area that complies with all of the following:~~

1. ~~Only *listed* devices utilizing *listed* charging equipment shall be permitted to be charged.~~

2. ~~Is provided with sufficient electrical receptacles to allow the charging equipment for each device to be directly connected to a receptacle. Extension cords and relocatable power taps shall not be used.~~
3. ~~Storage of combustible materials, combustible waste or hazardous materials shall not be permitted.~~
4. ~~The charging operation shall not be conducted in or obstruct any required means of egress.~~
5. ~~Removable storage batteries shall not be stacked or charged in an enclosed cabinet unless the cabinet is specially designed and *approved* for such purpose.~~
6. ~~A minimum distance of 18 inches (457.2 mm) shall be maintained between each removable storage battery during charging operations unless each battery is isolated from neighboring batteries by an *approved* fire-resistant material.~~
7. ~~A minimum of 18 inches (457.2 mm) shall be maintained between the location of the battery on each *powered micromobility device* during charging operations.~~
8. ~~The indoor room or area shall be protected by a *fire alarm system* utilizing air-aspirating smoke detectors or radiant energy-sensing fire detection.~~

Add new text as follows:

322.4 Replacement batteries and chargers. Replacement batteries and chargers shall be the equipment manufacturer supplied or the replacement battery or charger shall be in compliance with the manufacturer's instructions for the certified equipment or device.

Revise as follows:

322.5 Fire safety plan. A fire safety plan shall be provided in accordance with Section 403.10.6. In addition, the fire safety plan shall include emergency response actions to be taken upon detection of a fire or possible fire involving lithium-ion or lithium metal battery storage.

~~**322.3**~~ **322.6 Listing.** ~~*Powered micromobility devices*~~ Battery powered equipment shall be *listed* and *labeled* in accordance with this Section where applicable and shall be operated and charged in accordance with its listing and the manufacturers instructions. ~~with UL 2272 or UL 2849, as applicable.~~

Add new text as follows:

322.6.1 Battery-powered micromobility devices. Battery-powered micromobility devices shall be listed and labeled in accordance with UL 2272 or UL 2849, as applicable.

322.6.2 Battery-powered Automated mobile platforms (AMPs). Battery-powered Automated mobile platforms (AMPs) shall be listed and labeled in accordance with UL 3100.

322.6.3 Battery-powered Robotic equipment. Battery-powered robotic equipment shall be *listed* and *labeled* in accordance with UL 3300.

322.6.4 Portable battery-powered equipment and appliances. Where installed or used, portable battery-powered equipment and appliances shall be *listed* and *labeled* in accordance with UL 2595 or the applicable standard for its use.

322.7 Hazardous (classified) locations. Battery powered micromobility devices, trucks, equipment, appliances and battery powered tools operated in in areas designated as hazardous (classified) locations in accordance with NFPA 70 shall be *listed* and *labeled* or approved for use in the environment intended.

Revise as follows:

TABLE 903.2.11.6 ADDITIONAL REQUIRED FIRE PROTECTION SYSTEMS

SECTION	SUBJECT
320.2	Lithium-ion and lithium metal battery storage
322.2.2.1	Lithium-ion and lithium metal battery charging locations

6004.3.3	Outdoor storage for highly toxic and toxic gas
6504.1.1	Pyroxylin plastic storage cabinets
6504.1.3	Pyroxylin plastic storage vaults
6504.2	Pyroxylin plastic storage and manufacturing

For SI: 1 cubic foot = 0.023 m^3.

Add new standard(s) as follows:

UL

Underwriters Laboratories LLC
333 Pfingsten Road
Northbrook, IL 60062

3100-2021	Automated Mobile Platforms
3300-2020	Outline of Investigation for Service, Communication, Information, Education and Entertainment Robots
2595-2015	General Requirements for Battery-Powered Appliances

Reason: FCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and early 2024 the FCAC has held several virtual meetings and one in-person meeting open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the **FCAC Website**

This proposal does several things.

The proposal consolidates all the requirements for battery powered *micromobility devices*, *industrial trucks*, *industrial equipment*, *robotic equipment* and *appliances* into this section.

Definitions are added for guidance on what types of devices, trucks, equipment and appliances are intended to be regulated.

Where a code requirement is specifying the “use” of a battery powered device, “use” is intended to be all operations relating to the device, including battery charging operations.

Further to the definition for BATTERY POWERED ROBOTIC EQUIPMENT, the automated functions of a battery-powered automated mobile platform (AMPs) may be provided by a gripping, suction attachment, scope or similar attachment to lift or carry the load, powered by a battery.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

$0.00

Estimated Immediate Cost Impact Justification (methodology and variables):

The building and fire code already have triggers in current editions for fire suppression and detection, so there are no increases in construction cost associated with this proposal.

The proposal does impose operational requirements based on the storage, use, repair and/or charging of battery powered devices and equipment, but those requirements do not impose or increase construction cost.

F58-24

Public Hearing Results (CAH1)

Committee Action: **As Submitted**

Committee Reason: The committee stated that the reason for the approval of the proposal was based on the proponent’s reason statement and specifically that it provides clarity for the requirements that are being relocated into one section. (Vote: 7-6)

Individual Consideration Agenda

Comment 1:

IFC: 322.1

Proponents: Robert J Davidson, Davidson Code Concepts LLC, Self (rjd@davidsoncodeconcepts.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Fire Code

Revise as follows:

322.1 General. *Battery-powered micromobility devices, battery-powered industrial trucks, battery-powered industrial equipment, battery-powered robotic equipment and battery-powered appliances* shall be operated and maintained in accordance with this section. **Exceptions:**

1. Batteries with a capacity less than ~~300~~ 200 Whs.
2. Storage, and use of powered mobility devices, in Group R-2 dwelling units or detached one- and two-family dwellings and townhouses, other than Group R-4, Condition 2 Occupancies, provided that such devices are for personal use by its owner. The charging location shall not obstruct the means of egress.

Reason: This proposal drops the size of the battery exception down to 200-watt hours. Personal mobility fleets can have batteries with between 200- and 300-watt hours. The 300-watt hours carve out would have eliminated regulating commercial fleets currently in existance.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

$0.00

Estimated Immediate Cost Impact Justification (methodology and variables):

The building and fire code already have triggers in current editions for fire suppression and detection, so there are no increases in construction cost associated with this proposal.

The proposal does impose operational requirements based on the storage, use, repair and/or charging of battery powered devices and equipment, but those requirements do not impose or increase construction cost.

Comment (CAH2)# 711

Comment 2:

IFC: 105.5.5, 322.1

Proponents: Jonathan Roberts, UL Solutions, UL Solutions (jonathan.roberts@ul.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Fire Code

Revise as follows:

105.5.5 Battery powered devices, trucks, equipment and appliances. An operational permit is required for the use of ~~a~~ battery powered devices and equipment as required by Section 322. ~~truck, equipment or appliance with a battery capacity greater than 300 Whs.~~

322.1 General. *Battery-powered micromobility devices, battery-powered industrial trucks, battery-powered industrial equipment, battery-powered robotic equipment and battery-powered appliances* shall be operated, ~~and~~ maintained, charged and repaired in accordance with this section. **Exceptions:**

1. Batteries with a capacity less than 300 Whs.
2. Storage, and use of powered mobility devices, in Group R-2 dwelling units or detached one- and two-family dwellings and townhouses, other than Group R-4, Condition 2 Occupancies, provided that such devices are for personal use by its owner. The charging location shall not obstruct the means of egress.

Reason: This more closely aligns the permit requirements with the devices and equipment regulated by Section 322, and covers not only use it also clarifies that section 322 also covers charging and repair operations. Additionally the 300 Wh minimum threshold is removed from 105.5.5 because it will be addressed within section 322.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This provides further clarification and a pointer to Section 322 so the addition of the language in this proposal results in no additional cost.

Comment (CAH2)# 682

Comment 3:

IFC: SECTION 322, 322.1

Proponents: Jonathan Roberts, UL Solutions, UL Solutions (jonathan.roberts@ul.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Fire Code

Revise as follows:

SECTION 322
BATTERY-POWERED DEVICES AND EQUIPMENT, ~~TRUCKS, EQUIPMENT AND APPLIANCES~~

322.1 General. The following b~~B~~attery-powered ~~*micromobility*~~devices and~~, *battery-powered industrial trucks, battery-powered industrial* equipment, *battery-powered robotic equipment and battery-powered appliances*~~ shall be operated and maintained in accordance with this section.

1. *Battery powered appliances*
2. *Battery powered automated mobile platforms*
3 *Battery powered industrial equipment*
4 *Battery powered industrial trucks*
5 *Battery powered micromobility devices*
6 *Battery powered robotic equipment*

Exceptions:

1. Equipment and devices with bBatteries with a capacity less than 300 Whs.
2. Storage, and use of powered mobility devices, in Group R-2 dwelling units or detached one- and two-family dwellings and townhouses, other than Group R-4, Condition 2 Occupancies, provided that such devices are for personal use by its owner. The charging location shall not obstruct the means of egress.

Reason: Reason: This proposal simplifies the title of this section so it doesn't include a long laundry list of products covered. The term "battery powered devices and equipment" adequately covers all of the products covered by this section.
322.1 is revised to move the items in the charging sentence into a numbered list for ease of reference. In addition item 2 - Battery powered automated mobile platforms is added to this section since it is covered by 322.6.2 of the original proposal.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is only a format change to the existing language, so there is no cost associated with this change.

Comment (CAH2)# 721

Comment 4:

Proponents: Abid Anwar, Tesla (aanwar@tesla.com) requests Disapproved

Reason: F58-24 was Approved by Committee with the acknowledgement that additional work is required prior to the second CAH to address concerns in the proposal. From the proposal and testimony, it was indicated that the proposal does not introduce new requirements rather consolidates existing requirements into an updated section 322 with expanded scope. Research on this topic indicates that F58-24 could impact millions of regulated occupancies and even more unique pieces of battery operated equipment. Although the intent may not have been so expansive, as proposed, F58-24 would be the most significant and far-reaching proposal approved in CAH #1. F58-24 should be disapproved for the following non-exhaustive list of reasons:

- The updated scope of Section 322 is expansive in regulating all battery powered appliances with capacities not less than 300 watt-hours. Battery operated devices with capacities not less than 300 watt-hours can be readily purchased for a litany of commercial and residential products. The exception for powered mobility devices in group R-2 dwelling units or detached one- and two-family dwellings and townhouses, other than group R-3, Condition 2 occupancies entails significant impact to residential occupancies for non-mobility related equipment.
- Residential battery operated equipment not less than 300 watt-hours results in onerous and burdensome requirements for residential applications for devices not limited to power tools, lawncare equipment, home health medical and life saving equipment. Residential dwellings and commercial occupancies would require the construction of fire areas, installation of fire suppression systems based on a live fire testing, operational permits and fire detection equipment.
- F58-24 does not simply consolidate requirements but creates onerous new requirements not substantiated in IFC 2024 or NFPA 505. Furthermore, no technical justification or risk basis is provided to justify the orders of magnitude scope increase:

- Contrary to provided testimony, fire suppression systems would be required for structures historically exempt from fire suppression requirements. Fire suppression based on live fire testing in accordance with 903.3 results in suppression requirements for occupancies exempted from suppression requirements in 903.2
    - Fire suppression not required for industrial trucks regulated by Section 309 or personal mobility equipment. Section 320 fire suppression requirements not applicable for new or refurbished batteries installed in equipment, devise or vehicles they are designed to power. Section 1207 fire suppression requirements only triggered where lithium ion and/or lithium metal storage capacities exceeded 20 kW. Fire suppression requirements not consistent with NFPA 505.
- Fire detection systems formerly only required by Section 322 for personal mobility equipment and not currently required for all equipment captured by scope of 322.
- Operational permit requirements not required in IFC 2024. Operational permit requirements are cumbersome, overly burdensome and unclear. For example, are battery operated appliances utilizing multiple batteries with capacities not greater than 300 kWh require an operational permit for use but exempt from charging operational permit.
    - Unclear on enforceability, validity or technical justification to mandate device level operational permits.
- Fire rated rooms required per updated scope of section 322 whereas not required in section 309 or 322 in IFC 2024
    - No combustible storage in fire area exceeds article 309 requirements for no combustibles within 3 feet or 322 requirements for no combustible in rooms where charging occurs.
    - Enclosed fire rated rooms required for charging of regulated equipment to avoid ban on combustible storage in the entire occupancy
- 18" separation between devices being charged unsupported in existing codes with no technical justification provided
- Exterior charging of regulated equipment only permissible in approved locations resulting in an enforcement nightmare

- example ramifications for the healthcare industry include significant complexities and cost associated with the ability of residential occupancies to receive life-saving medical equipment where battery capacities exceed 300 watt-hours for life saving medical equipment such as portable oxygen collectors and battery operated ventilators. will insurance providers require operational permits and proof of Section 322 compliance prior to delivering regulated equipment?
- example ramifications for construction and landscaping companies would require operational permits for utilization at each specific site and approval for pre-designated outdoor charging locations. Construction equipment could not be charged at active construction sites without approval for exterior charging locations. Interior charging at occupancies under construction precluded by requirements for fire suppression, fire area and fire detection requirements.
- Sweeping scope of F58 would result in significant potential for insurance indemnification due to complexities with interior charging requirements, operational permits and requirements for approved exterior charging locations.
- No technical substantiation or risk basis provided as basis for significant new requirement development and operational permit requirements
- Cost basis information incorrectly indicates zero. F58-24 will result in significant cost expenditure for commercial and residential occupancies regulated by F58 due to fire area, fire suppression and fire detection requirements.

Cost Impact: No change to code.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Comment (CAH2)# 552

F61-24

IFC: SECTION 202 (New), SECTION 323 (New), 323.1 (New), NFPA Chapter 80 (New)

Proposed Change as Submitted

Proponents: Kevin Duerr-Clark, NYS DOS, NYS DOS (kevin.duerr-clark@dos.ny.gov); Chad Sievers, NYS, NYS DOS (chad.sievers@dos.ny.gov); Daniel Carroll, New York State Department of State, Department of State (daniel.carroll@dos.ny.gov); John R Addario - NYS Department of State, NEW YORK STATE CODES DIVISION, New York State Department of State Division of Building Standards and Codes (john.addario@dos.ny.gov); Brian Tollisen, NYS Department of State, NYS Department of State (brian.tollisen@dos.ny.gov); Jeanne Rice, NYSDOS (jeanne.rice@dos.ny.gov); China Clarke, New York State Dept of State, Manager Technical Support Unit (china.clarke@dos.ny.gov)

2024 International Fire Code

Add new definition as follows:

LIVE FIRE TRAINING BUILDING. A building in which live fire training evolutions are conducted on a repetitive basis.This shall include, but not be limited to, containerized training structures, live fire training structures, and training towers.

Add new text as follows:

SECTION 323
LIVE FIRE TRAINING BUILDINGS

323.1 Live fire training buildings. Live fire training buildings and any appurtenances connected or attached to such buildings or structures shall be designed, constructed and maintained in accordance with the applicable provisions of NFPA 1402, this code and the *International Building Code*.

Add new standard(s) as follows:

NFPA

National Fire Protection Association
1 Batterymarch Park
Quincy, MA 02169-7471

1402-2019 Standard on Facilities for Fire Training and Associated Props

Reason: Live fire training facilities contain unique types of buildings/structures that are in some instances, purposely designed to not meet building codes and/or simulate potentially hazardous conditions. NFPA 1402, when combined with the building codes of the jurisdiction, provides for the necessary design and construction provisions of these types of buildings and gives the code enforcement community the tools necessary to properly regulate them. The scope of the standard acknowledges that building codes and gas codes do not address the unique and specific requirements for these specialized types of facilities. It is not the intent of this proposal to capture buildings that are designed, constructed, and maintained to the International Building Code and International Fire Code already, such as a B or A occupancy where instruction on fire practices takes place, rather, to capture those buildings not clearly covered by the Codes that would typically require variances or modifications of code language to be compliant.

From the previous cycle, based on committee comments, the definition of “Live Fire Training Building” was modified to ensure only buildings where live fire training exercises are conducted are captured. The “associated systems, appliances and props” was also removed from the definition and the term “appurtenances” was added to the section to ensure the intent is not to capture stand-alone props that may be co-located at the same facility such as a gas-fired car prop but to capture gas-fired props used to simulate fire in or on the structure. Furthermore the requirement that the building still had to be constructed following the applicable provisions of the IBC was added.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal is not intended to add any new provisions on buildings. The use of NFPA1402 to design and construct these types of buildings is already a standard of practice in the industry. This proposal is simply codifying the requirement, giving the code enforcement community a means to properly implement the provisions of NFPA 1402, and squarely placing the building into a specific use group for consistency.

F61-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: This proposal was disapproved as requiring compliance with the IBC would be problematic. In particular the IBC would require compliance for accessibility along with typical egress features such as stairway requirements, railings and guardrails. These buildings are only built occasionally and NFPA 1400 can be applied in those instances through the alternative methods and materials section. (Vote 14-0)

F61-24

Individual Consideration Agenda

Comment 1:

IFC: SECTION 202

Proponents: Jeanne Rice, NYSDOS (jeanne.rice@dos.ny.gov); Kevin Duerr-Clark, NYS DOS, NYS DOS (kevin.duerr-clark@dos.ny.gov); Stephen Van Hoose, NYS DOS, NYS DOS (stephen.vanhoose@dos.ny.gov); China Clarke, New York State Dept of State, Manager Technical Support Unit (china.clarke@dos.ny.gov) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Fire Code

LIVE FIRE TRAINING BUILDING. A building in which live fire training evolutions are conducted on a repetitive basis, where the building is designed such that the structure is not damaged during live fire training.This shall include, but not be limited to, containerized training structures, live fire training structures, and training towers.

Reason: The proposed modification is intended to address committee concerns about acquired buildings. Many fire departments do live fire training using acquired buildings, which are typically buildings designed for other uses which have reached the end of their life and are given to the fire department for use in training. The live fire trainings conducted in such buildings damage the structure, and such structures can usually only be utilized for 2-3 training sessions. This modification clarifies that the definition of live fire training buildings is intended to apply solely to buildings designed to be utilized as such without damage to the structure during training.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This modification is added simply to clarify which sections of the IBC are applicable, it does not add or remove provisions.

Comment 2:

IFC: 323.1

Proponents: Chad Sievers, NYS, NYS DOS (chad.sievers@dos.ny.gov) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Fire Code

323.1 Live fire training buildings. Live fire training buildings and any appurtenances connected or attached to such buildings or structures shall be ~~designed, constructed and~~ maintained in accordance with the maintenance and operational ~~applicable~~ provisions of NFPA 1402~~,~~ and this code ~~and the *International Building Code*~~.

Reason: This modification will remove the design and construction requirements from the original proposal code as requested in the 1st CAH. However, it will require a live fire training building to be inspected by a professional to ensure the buildings are safe after being subject extreme stress that is associated with the extreme temperature fluctuations.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

This proposal may increase the cost of construction or the cost may remain the same, depending on how the enforcement community has previously enforced the provisions of the code on these types of buildings. Some already enforce these additional standards, others may enforce nothing, treating these buildings as outside the scope. In the second scenario, the cost may increase in order to ensure compliance with the new standards

Estimated Immediate Cost Impact Justification (methodology and variables):

it is estimated that the cost will be less than $10,000 for the inspection performed in accordance with NFPA 1402 Section 7.2 the standard requires them to be performed at a 3 yr, 5 yr or 10 yr interval) with the typical one at a 5 yr interval.

Estimated Life Cycle Cost Impact:

it is estimateded that a live fire training build will last 25 years.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

see above

F62-24

IFC: SECTION 202 (New), SECTION 323 (New), 323.1 (New), 323.2 (New), 323.3 (New), 323.4 (New), 323.5 (New), 323.5.1 (New), 323.6 (New), 323.7 (New), 323.8 (New), 323.9 (New), 323.9.1 (New), 323.9.2 (New), 323.9.3 (New), UL Chapter 80 (New)

Proposed Change as Submitted

Proponents: Robert Marshall, FCAC, FCAC (fcac@iccsafe.org)

2024 International Fire Code

Add new definition as follows:

MODULAR ROOM. A prefabricated structure intended for indoor use to provide privacy that has walls, a ceiling, with or without an integrated floor, and that can include integral electrical wiring, ventilation, and furniture.

Add new text as follows:

SECTION 323
MODULAR ROOMS

323.1 General. *Modular rooms* shall comply with this section.

323.2 Permits. A construction permit shall be required for the installation of *modular rooms*.

323.3 Listing. *Modular rooms* shall be *listed* and *labeled* in accordance with UL 962. **Exception:** Precast concrete construction in accordance with Chapter 17 and 19 of the *International Building Code* shall not be required to be listed.

323.4 Location. *Modular rooms* shall not obstruct the means of egress and shall be installed in approved locations.

323.5 Installation. *Modular rooms* shall be installed in accordance with the listing and manufacturer's installation instructions.

323.5.1 Stacking. Modular rooms shall not be stacked.

323.6 Floor Area. The aggregate area of *modular rooms* shall not exceed 10 percent of the fire area.

323.7 Occupant Notification system. Where modular rooms are installed in areas equipped with an occupant notification system, the audible and visual signals shall provide notification to the occupants within the *modular room* in accordance with Section 907.5.

323.8 Automatic sprinkler system. Where modular rooms exceeding 24 ft2 (2.2 m2) are installed in areas protected by an automatic sprinkler system, the automatic sprinkler system shall provide protection within the *modular room* in accordance with Section 903.3.

323.9 Modular rooms used for sleeping. *Modular rooms* used for sleeping shall also comply with Sections 323.9.1 through 323.9.3.

323.9.1 Location. *Modular rooms* shall not be permitted in Group F,H,S, or U occupancy groups.

323.9.2 Number of Modular rooms used for sleeping. The *fire code official* is authorized to limit the number of *modular rooms* installed in a single fire area.

323.9.3 Smoke detection. In buildings equipped with a fire alarm system, the *modular room* shall be equipped with smoke detectors. In other buildings, the *modular room* shall be equipped with a smoke alarm in accordance with Section 907.2.11.

Add new standard(s) as follows:

UL

Underwriters Laboratories LLC
333 Pfingsten Road
Northbrook, IL 60062

962-2022 Household and Commercial Furnishings

Reason: Modular rooms are becoming increasingly popular and are showing up in a variety of different occupancies. This proposal provides a means for code officials to approve these installations and allow the use of these prefabricated furnishings. The locations where these are found include airports, convention centers, business and government buildings. These are factory-built products, rather than rooms being constructed as a part of the structure in accordance with the local building code.

Requiring the modular room to be listed to UL 962 provides the code official with verification that the modular structure met testing requirements for applicable fire and electrical shock safety for occupants.

The UL 962 listing standards covers the fabrication and safety of the modular room. UL 962 includes requirements for insulation, finish materials, internal wiring, lighting, ventilation, and other construction features. UL 962 requires that modular rooms be tested for flame spread, with minimum passing results equivalent to a UL 723 FSI of 200. UL 962 additionally contains furniture flammability requirements for upholstered seating and mattresses that may be incorporated into the modular room.

Proposed section 322.5 limits the size of a modular room to not exceed 100 ft^2 to reflect that these modular rooms are factory-built products and not conventional construction.This proposal treats modular rooms as products that can be installed in a building, and not as building construction, while not losing applicable code requirements.

FCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and early 2024 the FCAC has held several virtual meetings and one in-person meeting open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the **FCAC Website**

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

$0.00

Estimated Immediate Cost Impact Justification (methodology and variables):

Though there is cost increases with the need to comply with UL 962 and potentially adjustment to automatic sprinkers and fire alarm devices these are treated primarily as a product being placed in a building and are not associated with building construction. The cost of compliance with UL 962 will vary based upon the product being listed to this standard and how it will affect systems being used in the building.

F62-24

Public Hearing Results (CAH1)

Committee Action: **As Modified by Committee**

Committee Modification: 2024 International Fire Code
105.6.17 Modular Rooms. A construction permit is required to install modular rooms.

323.2 Construction Permits.
A construction permit in accordance with Section 105.6.17 shall be required for the installation of *modular rooms*.

Committee Reason: The committee stated that the reason for the approval of the modification was that it cleans up the revisions to provide the necessary information for the Chapter 1 requirements. The stated reasons for the approval of the proposal with the modification were: The new section provides information for these modular rooms being used throughout the world in locations such as airports and hotels. The definition makes it clear what these things are and what is being regulated in the section and it is very appropriate to be in the IFC. (Vote: 14-0)

F62-24

Individual Consideration Agenda

Comment 1:

IFC: 323.3, 323.8, 323.8.1 (New), 323.8.2 (New), 323.8.3 (New), 323.10 (New), 323.11 (New)

Proponents: Daniel Martin, Self (dmartin@jensenhughes.com); Mati Anders Shaeffer, Self requests As Modified by Committee (AMC2)

Further modify as follows:

2024 International Fire Code

Revise as follows:

323.3 Listing. *Modular rooms* shall be *listed* and *labeled* in accordance with UL 962. *Interior finishes* shall be in accordance with Chapter 8 of the *International Building Code.*

Exception: Precast concrete construction in accordance with Chapter 17 and 19 of the *International Building Code* shall not be required to be listed.

Delete and substitute as follows:

~~**323.8 Automatic sprinkler system.** Where modular rooms exceeding 24 ft2 (2.2 m2) are installed in areas protected by an automatic sprinkler system, the automatic sprinkler system shall provide protection within the *modular room* in accordance with Section 903.3.~~

323.8 Automatic sprinkler system. *Automatic sprinkler systems* for *modular rooms* shall comply with this section.

Add new text as follows:

323.8.1 Modular Rooms Not Exceeding 24ft^2 (2.2 m^2). Where permitted by the *fire code official*, *automatic sprinkler systems* shall not be required in isolated, temporarily occupied *modular rooms* that do not exceed 24ft^2 (2.2 m^2) and do not extend to the ceiling of the room or space in which the *modular room* is installed.

323.8.2 Modular Rooms Exceeding 24ft^2 (2.2 m^2). Where *modular rooms* exceeding 24ft^2 (2.2 m^2) are installed in areas protected by an *automatic sprinkler system*, the *automatic sprinkler system* shall provide protection within the *modular room* in accordance with Section 903.3.

323.8.3 Obstruction to Existing Automatic Sprinkler Systems. *Modular rooms* shall be installed such that the *modular room* does not obstruct existing *automatic sprinkler systems.*

323.10 Means of Egress from Modular Rooms. *Means of egress* from *modular rooms* shall be in accordance with Chapter 10 of the *International Building Code.*

323.11 Accessibility of Modular Rooms. Where *modular rooms* are required to be *accessible*, *accessibility* of *modular rooms* shall be in

accordance with Chapter 11 of the *International Building Code*.

Reason:
We are in general agreement with the overall goal of the proposal F62-24, but have the following comments and proposed changes.

Proposed IFC Section 323.3 (modification): While UL 962 offers an initial set of requirements for some materials, not all requirements of UL 962 correspond to associated requirements in IBC Chapter 8. This proposed change is intended to apply to any finish utilized as part of a modular room, including interior and exterior of the modular room. Below are the following reasons why reference to IBC Chapter 8 is being added.

UL 962 Section 37.3.3 and 37.3.6 requires interior finish materials with surface area greater than 10 sf to be investigated to UL 723, and when tested to UL 723, have a flame spread index of 200, and have a smoke developed index of 450 or be identified as such (Class C in accordance with IBC Chapter 8). These regulations are not consistent with IBC Section 803 requirements for flame spread index and smoke developed index based on building occupancy and automatic sprinkler system protection. Additionally, there are no size limitations for interior finish materials in IBC Section 803. UL 962 applies the 10 sf limit to individual materials, but does not address the combination of materials, each of which could be less than 10 sf but aggregately exceed the 10 sf limitation.

UL 962 Section 37.3.5 requires fabric materials without backings that are greater than 10 sf to comply with NFPA 701. IBC Chapter 8 references NFPA 701 in IBC Section 806.4 regarding fabric hangings and similar materials, which is consistent. However, there are no size limitations for fabric materials in IBC Section 806.4.

Interior finishes used for these modular rooms should be regulated in accordance with IBC Chapter 8 in addition to the listing in accordance with UL 962 so that occupants are provided with a level of safety consistent with what they would be afforded in other portions of a building.

Proposed IFC Section 323.8 (modification and addition): The proposed IFC Section 323.8 does not incorporate all requirements from NFPA 13 Section 9.2.10. The proposed change is missing the requirement for physical isolation from other modular rooms. Our proposed language is intended to be consistent with the provisions of NFPA 13 Section 9.2.10 based on area of the modular rooms.

NFPA 13 Section 9.2.10 includes provisions for sprinklers to be installed in small, temporarily occupied enclosures that do not extend to the ceiling – effectively, modular rooms. The requirement for physical isolation should be addressed in the proposed change to ensure that these modular rooms are sufficiently protected by the building's suppression system.

Additionally, installation of a modular room should not obstruct the functionality of an existing automatic sprinkler system installed within a building or space.

Proposed IFC Section 323.10 (addition): Means of egress from modular rooms was not addressed in the original proposal. Egress from modular rooms creates a hazard for occupants during an emergency. While door swings are addressed in UL 962, additional egress requirements of IBC Chapter 10, including threshold heights and door widths, should be addressed for consistency with requirements and designs found in the remainder of the building. This proposed revision provides guidance for code officials to direct installers and designers to applicable requirements.

Proposed IFC Section 323.11 (addition): Accessibility for modular rooms was not addressed in the original proposal. Though not all modular rooms are required to be accessible, similar to employee workstations or guestrooms, the proposed changes did not provide direction for accessibility requirements when applicable. This change provides guidance for code officials to direct installers and designers to applicable requirements.

Bibliography: NFPA 13 *Standard for the Installation of Sprinkler Systems* Section 9.2.10

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The potential cost impacts have already been addressed in the original proposal.

F67-24

IFC: 403.7.3.1, 403.7.3.2, 403.7.3.3

Proposed Change as Submitted

Proponents: Chad Sievers, NYS, NYS DOS (chad.sievers@dos.ny.gov); Jeanne Rice, NYS DOS, NYS DOS (jeanne.rice@dos.ny.gov); Kevin Duerr-Clark, NYS DOS, NYS DOS (kevin.duerr-clark@dos.ny.gov); China Clarke, New York State Dept of State, Manager Technical Support Unit (china.clarke@dos.ny.gov); John R Addario - NYS Department of State, NEW YORK STATE CODES DIVISION, New York State Department of State Division of Building Standards and Codes (john.addario@dos.ny.gov)

2024 International Fire Code

403.7.3.1 Fire safety and evacuation plans. The fire safety and evacuation plans required by Section 404 shall include a description of special staff actions. Plans shall include all of the following in addition to the requirements of Section 404:

1. Procedures for evacuation of detainees with needs for containment or restraint and post-evacuation containment, where present.
2. Procedures for a *defend-in-place* strategy.
3. Procedures for a full-floor or building evacuation, where necessary.

Revise as follows:

403.7.3.2 Fire safety plan. A copy of the fire safety plan shall be maintained at the facility at all times. The plan shall include both of the following in addition to the requirements of Section 404.2.2:

1. Location and number of cells.
2. Location of special locking arrangements.
3. Keys that operate doors installed in the means of egress shall be identified in the fire safety and evacuation plan.

403.7.3.3 Staff training. Staff shall be periodically instructed and kept informed of their duties and responsibilities under the plan. Records of instruction shall be maintained. Such instruction shall be reviewed by staff at intervals not exceeding 3 months. Training of new staff shall be provided promptly upon entrance to duty.

1. Staff shall be instructed in the proper use of portable fire extinguishers and other manual fire suppression equipment.
2. Staff shall be trained on the identification and use of keys that are necessary for unlocking doors that are installed in the means of egress.

Reason: Locked doors which require a key to operate are often found in the means of egress in I3 occupancies. The proposed change adds requirements for documentation of all such locked doors to be added to fire safety plans, ensuring that such information is easily accessible. The proposed change also adds requirements for staff training on identification and use of keys for locked doors in the means of egress, which will ensure that such doors can be opened by staff in the event of an emergency. Without proper training, staff may be unaware of the location of the keys and/or how to utilize the keys to unlock the doors, which could lead to means of egress being blocked in an emergency.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

The proposed change will increase the required staff fire safety training time. We estimate a cost of roughly $10 per employee for training on operating key-locked doors in the means of egress.

Estimated Immediate Cost Impact Justification (methodology and variables):

According to a study conducted by Training Magazine (https://pubs.royle.com/publication/?m=20617&i=678873&p=24&ver=html5), companies in 2020 spent an average of $1,111 for safety training per employee, providing an average of 55.4 hours of training per employee. This provides an average cost of $20.05/hour per employee for safety training. Adding training for key-locked doors in means of egress will likely add not more than 1/2 hour of safety training per employee.

F67-24

Public Hearing Results (CAH1)

Committee Action: **As Modified by Committee**

Committee Modification:

403.7.3.2 Fire safety plan. A copy of the fire safety plan shall be maintained at the facility at all times. The plan shall include ~~both of~~ the following in addition to the requirements of Section 404.2.2:

1. Location and number of cells.
2. Location of special locking arrangements.
3. Where locked doors are permitted in the means of egress, the location of keys that operate such doors ~~installed in the means of egress~~ shall be identified in the fire safety and evacuation plan.

403.7.3.3 Staff training. Staff shall be periodically instructed and kept informed of their duties and responsibilities under the plan. Records of instruction shall be maintained. Such instruction shall be reviewed by staff at intervals not exceeding 3 months. Training of new staff shall be provided promptly upon entrance to duty.

1. Staff shall be instructed in the proper use of portable fire extinguishers and other manual fire suppression equipment.
2. Where locked doors are permitted in the means of egress, staff shall be trained on the identification and use of keys that are necessary for unlocking such doors ~~that are installed in the means of egress~~.

Committee Reason: The committee agreed that keys need to be identified in the fire safety and evacuation plan and should be included in staff training. The modification reflects necessary clarification that the focus is on doors that are permitted to be locked. Without this clarification it could encourage doors to be locked within the means of egress path that should not be. (Vote 12-2)

F67-24

Individual Consideration Agenda

Comment 1:

IFC: 403.7.3.2

Proponents: Jeffrey Shapiro, P.E., FSFPE, Lake Travis Fire Rescue, Lake Travis Fire Rescue (jshapiro@ltfr.org) requests As Modified by Committee (AMC2)

Further modify as follows:

2024 International Fire Code

Revise as follows:

403.7.3.2 Fire safety plan. A copy of the fire safety plan shall be maintained at the facility at all times. The plan shall include the following in addition to the requirements of Section 404.2.2:

1. Location and number of cells.
2. Location of special locking arrangements.
3. ~~Where locked doors are permitted in the means of egress, the location~~ Location of keys that operate any locked doors that have been permitted in the means of egress. ~~such doors shall be identified in the fire safety and evacuation plan.~~

Reason: As approved, the added text in Item 3 is not congruent with the formatting of the previous two items. The revisions are intended to be editorial to improve flow and clarity.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Restructures existing text.

Comment (CAH2)# 796

F70-24

IFC: 404.2.3.1

Proposed Change as Submitted

Proponents: Robert Marshall, FCAC, FCAC (fcac@iccsafe.org)

2024 International Fire Code

Revise as follows:

404.2.3.1 Lockdown plan contents. Lockdown plans shall include the following:

1. Identification of individuals authorized to issue a lockdown order.
2. Security measures used during normal operations, when the building is occupied, that could adversely affect egress or fire department operations.
3. A description of identified emergency and security threats addressed by the plan, including specific lockdown procedures to be implemented for each threat condition.
4. Means and methods of initiating a lockdown plan for each threat, including:
   4.1. Occupant notification shall be based on a mass notification risk analysis conducted in accordance with NFPA 72, and the notification signal for a lockdown event ~~The means of notifying occupants of a lockdown event, which~~ shall be distinct from the fire alarm signal.
   4.2. Identification of each door or other access point that will be secured.
   4.3. A description of the means or methods used to secure doors and other access points.
   4.4. A description of how locking means and methods are in compliance with the requirements of this code for egress and accessibility.
5. Procedures for reporting to the fire department any lockdown condition affecting egress or fire department operations.
6. Procedures for determining and reporting the presence or absence of occupants to emergency response agencies during a lockdown.
7. Means for providing two-way communication between a central location and each area subject to being secured during a lockdown.
8. Identification of the prearranged signal for terminating the lockdown.
9. Identification of individuals authorized to issue a lockdown termination order.
10. Procedures for unlocking doors and verifying that the *means of egress* has been returned to normal operations upon termination of the lockdown.
11. Training procedures and frequency of lockdown plan drills.

Reason: This is the second of two proposals relating to notifying occupants during a lockdown. This proposal seeks to amend the means of notifying occupants during a lockdown by requiring a mass notification risk analysis to be performed. The proposal is needed because Chapter 4 the 2021 code requires a notification method distinct from the fire alarm system notification signal but provides no guidance as to the expectation for what kind of system.

A key aspect of a lockdown plan is to identify the organizational structure in charge of making decisions during a lockdown. It is critical to understand who is authorized to initiate and lift a lockdown order. There is often a need for different lockdown plans to address differing threats. Therefore, different types of messaging are required to notify occupants of different threats. For example, the correct procedure during a chemical release incident will be different from the correct procedure during an active shooter incident.

Mass notification often utilizes one or several communication technologies and is intended to communicate information about emergencies including but not limited to fire, human caused events (accidental and intentional), other dangerous situations, accidents, and natural disasters. A lockdown situation often requires a subsequent evacuation depending on the threat, and therefore is a reasonable trigger to perform a mass notification risk analysis.

This proposal **does not automatically** mandate the installation of any mass notification systems. Rather, it only requires a risk analysis be conducted for a building that chooses to utilize lockdown plans as detailed in section 404.

Requiring a risk analysis will result in a more comprehensive emergency response plan that is customized for the specific hazards and risks associated with the building. The risk analysis and emergency response plan can be as elaborate or as basic as the fire code official and building owner determines it needs to be. This proposal only emphasizes the need to document how communicating with the occupants of the building and possibly occupants that are outside the building will be accomplished.

FCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and early 2024 the FCAC has held several virtual meetings and one in-person meeting open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the **FCAC Website**

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

$0.00

Estimated Immediate Cost Impact Justification (methodology and variables):

There is no increase in construction cost because this proposal is not associated with construction, nor is this proposal requiring any new occupant notification system.

There will be some additional costs to conduct the risk analysis, which will be based on the complexity of the facility. For the purposes of this requirement, the scope of the risk analysis is limited to the scope of the emergency response plan being considered for a lockdown event. In extreme cases, the risk analysis may cost thousands of dollars to produce an expansive report of risks, and strategies to mitigate those risks.

F70-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: This proposal was disapproved as there were coordination issues that need to be resolved with industry. (Vote 13-0)

F70-24

Individual Consideration Agenda

Comment 1:

IFC: 404.2.3.1

Proponents: Robert Marshall, FCAC, FCAC (fcac@iccsafe.org) requests As Modified by Committee (AMC2)

Replace as follows:

2024 International Fire Code

404.2.3.1 Lockdown plan contents. Lockdown plans shall include the following:

1. Identification of individuals authorized to issue a lockdown order.
2. Security measures used during normal operations, when the building is occupied, that could adversely affect egress or fire department operations.
3. A description of identified emergency and security threats addressed by the plan, including specific lockdown procedures to be implemented for each threat condition.
4. Means and methods of initiating a lockdown plan for each threat, including:
   4.1.The means of notifying occupants of a lockdown event, which shall be distinct from the fire alarm signal.
   4.2.Identification of each door or other access point that will be secured.

   4.3.A description of the means or methods used to secure doors and other access points.

   4.4.A description of how locking means and methods are in compliance with the requirements of this code for egress and accessibility.

5. Procedures for reporting to the fire department any lockdown condition affecting egress or fire department operations.
6. Procedures for determining and reporting the presence or absence of occupants to emergency response agencies during a lockdown.
7. Means for providing two-way communication between a central location and each area subject to being secured during a lockdown.
8. Identification of the prearranged signal for terminating the lockdown.
9. Identification of individuals authorized to issue a lockdown termination order.
10. Procedures for unlocking doors and verifying that the *means of egress* has been returned to normal operations upon termination of the lockdown.
11. Training procedures and frequency of lockdown plan drills.
12. Where a mass notification risk analysis has been developed in accordance with Section 917.1, the occupant notification and instructions to be provided in the event of a mass notification event.

Reason: FCAC has worked with industry to resolve issues with the original proposal (F70-24). It is worth noting that since a lockdown response could impact an ongoing or subsequent fire alarm response, it is imperative that an MNS Risk Analysis be performed to consider the potential of two alarm conditions with conflicting emergency responses. Instead of revising the list in 404.2.3.1 #4 as proposed by F70-24, this public comment moves the new reference to MNS risk analysis to a new item in the contents of a lockdown plan; item 12. It references the mass notification risk analysis, where one was developed, by focusing on the occupant notification and instructions to be provided. In doing so, it provides the user guidance about the methods of occupant lockdown notification, by pointing them to the requirements of 917.1, the risk assessment, and by increasing the visibility of 917's related requirements.
FCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and early 2024 the FCAC has held several virtual meetings and one in-person meeting open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the **FCAC Website**

Cost Impact: Increase

Estimated Immediate Cost Impact:

$0.00

Estimated Immediate Cost Impact Justification (methodology and variables):

There is no increase in construction cost because this proposal is not associated with construction, nor is this proposal requiring any new occupant notification system.

There will be some additional costs to conduct the risk analysis, which will be based on the complexity of the facility. For the purposes of this requirement, the scope of the risk analysis is limited to the scope of the emergency response plan being considered for a lockdown event. In extreme cases, the risk analysis may cost thousands of dollars to produce an expansive report of risks, and strategies to mitigate those risks.

Proposed Change as Submitted

Proponents: Scott Brody, Self (sbrody96@gmail.com)

2024 International Fire Code

Revise as follows:

503.2.2 Authority. The *fire code official* shall have the authority to require or permit modifications to the required access widths where they are inadequate for fire or rescue operations or where necessary to meet the public safety, health, environmental, historic preservation, or other objectives of the jurisdiction.

Add new text as follows:

503.2.1.1 Single Lane Fire Apparatus Access Roads. Single lane fire apparatus access roads shall be not less than 12 ft (3658 mm) wide, and shall comply with all of the following:

1. The road shall be one-way, a one-way lane channel of a divided two-way road, or closed to ordinary motor vehicle traffic. **Exception:** In exclusively residential areas, a single bi-directional driving lane shall be permitted where designed in accordance 503.2.1.2.
2. The route from the Fire Station to the dwelling shall require traveling no more than 600 ft (182.88 m) until the nearest turnoff to another road, and there shall be no more than 1200 ft (365.76 m) of one lane road segments for each emergency service trip, unless approved otherwise.
3. A minimum 75 foot long (22.86 m) × 21 ft (6401 mm) wide passing space shall be installed not less than every 600 ft (182.88 m).
   - 3.1 Where parking is naturally prohibited in the vicinity of hydrants, active driveways, intersections, or other approved locations, these spaces shall be permitted to be counted toward the passing bay requirements.
   - 3.2 Where there are turnoffs to other roads not less than every 400 ft (121.92 m), passing bays are allowed to be omitted.
4. The road width at curves shall be increased where necessary to accommodate the swept path of all emergency vehicles.
5. The road shall not terminate in a dead end.
6. The route from the Fire Station to all buildings shall not be overly circuitous. The fire code official is authorized to modify the location and level of interconnection between fire apparatus access roads where their design is insufficient.
7. All parallel parking spaces shall be a minimum of 7 ft (2134 mm) wide.
8. Angle parking, and reverse angle parking, shall only be permitted where designed in accordance with approved dimensions.
9. All parking spaces shall be marked for the entire extent of the space with lines indicating the border between the outer edge of the parking space, and the fire apparatus travel lane. The fire code official is authorized to require the placement of enhanced signage and road markings indicating that the central lane must be kept clear at all times.

10. The fire code official is authorized to require a sufficient number of locations be provided for deliveries, maintenance vehicles, passenger drop-off/pickup, snow storage, or any other extenuating circumstance that results in excessive blockage of the road. The width of such spaces shall be determined based on the types of vehicles which are likely to require use of the space, and shall be approved.
11. Where a narrower street could impede apparatus access, or pose a risk that arriving pumpers would need to get too close to the building in order to establish a connection to the automatic sprinkler system and standpipe system, the fire code official is authorized to require installation of approved remote or interconnected fire department connections, or a fire pump system.
12. Buildings shall be equipped throughout with an approved automatic sprinkler system installed in accordance with Section 903.3.1.1, 903.3.1.2 or 903.3.1.3.
13. Where the travel distance on single lane roads exceeds 600 ft (182.88 m), and buildings sited along single lane road(s) have a combined occupant load of 350 persons or more, Automated External Defibrillators (AED) shall be made available and maintained within 450 ft (137.16 m) of all locations.
14. Except for one and two-family dwellings, and other *approved* low risk occupancies, construction type shall be IA, IB, IIA, IIIA, IV (A,B, or C), or V-A.
15. Buildings over 3 stores or 30 ft (9144 mm) above grade plane shall be provided with approved aerial apparatus access.

503.2.1.2 Traffic Demand-based Street Widths. Where a fire apparatus access road is assigned a functional classification of local road or minor collector, or is similarly described per another classification scheme, and the road's average daily traffic volume does not routinely exceed 2000 vehicles per day, the street widths in Section 503.2.1.2.1 and Section 503.2.1.2.2 shall be permitted. Parking ratios shall comply with Section 503.2.1.2.3.

503.2.1.2.1 Two way streets parking one-side. For two-way streets where parking is permitted on one side only, and the parking spaces are unmarked, the width of fire apparatus access roads shall comply with Table 503.2.1.2.1.

Table 503.2.1.2.1 FIRE APPARATUS ACCESS ROAD WIDTH - PARKING ON ONE SIDE

Dwelling units, Sleeping units and Mixed Use

Per Gross Acre	Minimum Width (ft)	Per Gross Hectare	Minimum Width (mm)
≤ 2.0	18	≤ .8	5486
> 2 to 6	24	> .8 to 2.4	7315
> 6 to 10.0	28	>2.4 to 4.0	8534
Mixed use and > 10	32	Mixed use and > 4.0	9754

503.2.1.2.2 Two-way streets, parking both sides. For two way streets where parking is permitted on both sides, and the parking spaces are unmarked, the width of fire apparatus access roads shall comply with Table 503.2.1.2.2.

TABLE 503.2.1.2.2 FIRE APPARATUS ACCESS ROAD WIDTH - PARKING BOTH SIDES

Dwelling Units, Sleeping units and Mixed Use

Per Gross Acre	Minimum Width (ft)	Per Gross Hectare	Minimum Width (mm)
≤2.0	20	≤.8	6096
> 2 to 6.0	26	>.8 to 2.4	7925
> 6 to 10	30	> 2.4 to 4.0	9144
Mixed use and > 10	34	Mixed use and >4.0	10360

503.2.1.2.3 Parking ratios residential. In residential districts, the parking ratios shall comply with Table 503.2.1.2.3 or the widths shall comply with high density (6.1 to 10.0 DU/ac or 2.5 to 4.0 DU/ha).

TABLE 503.2.1.2.3 PARKING RATIOS

Dwelling Unit or Sleeping Unit Charactertistics	Minimum number of off-street spaces
≤ 1 bedroom	1.75
2 bedrooms	2.0
Detached housing with ≥ 3 bedrooms	2.5

Revise as follows:

503.4.1 Traffic calming. ~~Traffic calming shall be prohibited unless approved by the fire code official.~~ Traffic calming shall comply with the requirements of Table 503.4.1. Treatments shall be approved by the fire code official based on ability to accommodate the width and turning movements of fire apparatus.

Add new text as follows:

TABLE 503.4.1 TRAFFIC CALMING

Roadway Type/Location	Design to Achieve 85 percentile space mean speed not less than		Maximum Distance[a]	
	mph	km/h	ft	m
Parking lot drive aisles	10	16.09	1000	304.8
Fire Lanes closed to civilian vehicle traffic and woonerfs[b]	10	16.09	1000	304.8
Midblock pedestrian and bicycle crossings (all roadway functional classifications)	10	16.09	Immediate vicinity of crossing only	
Turning movements near urban crosswalks and bicycle path crossings (all roadway functional classifications)	5	8.05	Immediate vicinity of turn only	
Local Roads	18.6	30.00	2000	609.6
Minor collector roads	18.6	30.00	2000	609.6
Major collector, Minor arterial roads, other principle arterial freeways and expressways	Prohibited unless approved by the fire code official			
Other roads	As approved			

a. Fire services shall be provided an approved route to access all structures which does not require traveling more than 2000 ft (609.6 m)
on traffic calmed local and minor collector streets. Streets themselves shall be permitted to contain more than 2000 ft (609.6 m) of traffic
calming, provided that emergency services do not have to travel beyond 2000 ft (609.6 m) as part of their route.

b. Woonerfs shall be permitted to follow the 10 mph (16.09 km/h) design speed even if assigned a different formal functional classification.

503.4.2 Special Hazards. Fire apparatus access roads shall be permitted to be split into segments not less than 12 ft (3658 mm) wide, where necessary to address the following hazards:

1. To prevent vehicle operators from entering opposing travel lane(s) to bypass railroad or drawbridge gates.
2. To prevent vehicle operators from swerving around others stopped for pedestrians, bicyclists, or similar hazards at a crosswalk.

Exemption: The minimum width of a roadway divided in accordance with 503.4.2 shall be 10 ft (3048 mm), where the elements that divide the roadway are traversable by fire apparatus.

SECTION D102
DEFINITIONS

D102.1 DEFINITIONS. For the purpose of this appendix, certain terms are defined as follows:

Add new definition as follows:

DRIVING LANE. The portion of a fire apparatus access road which is permanently available for driving vehicles.

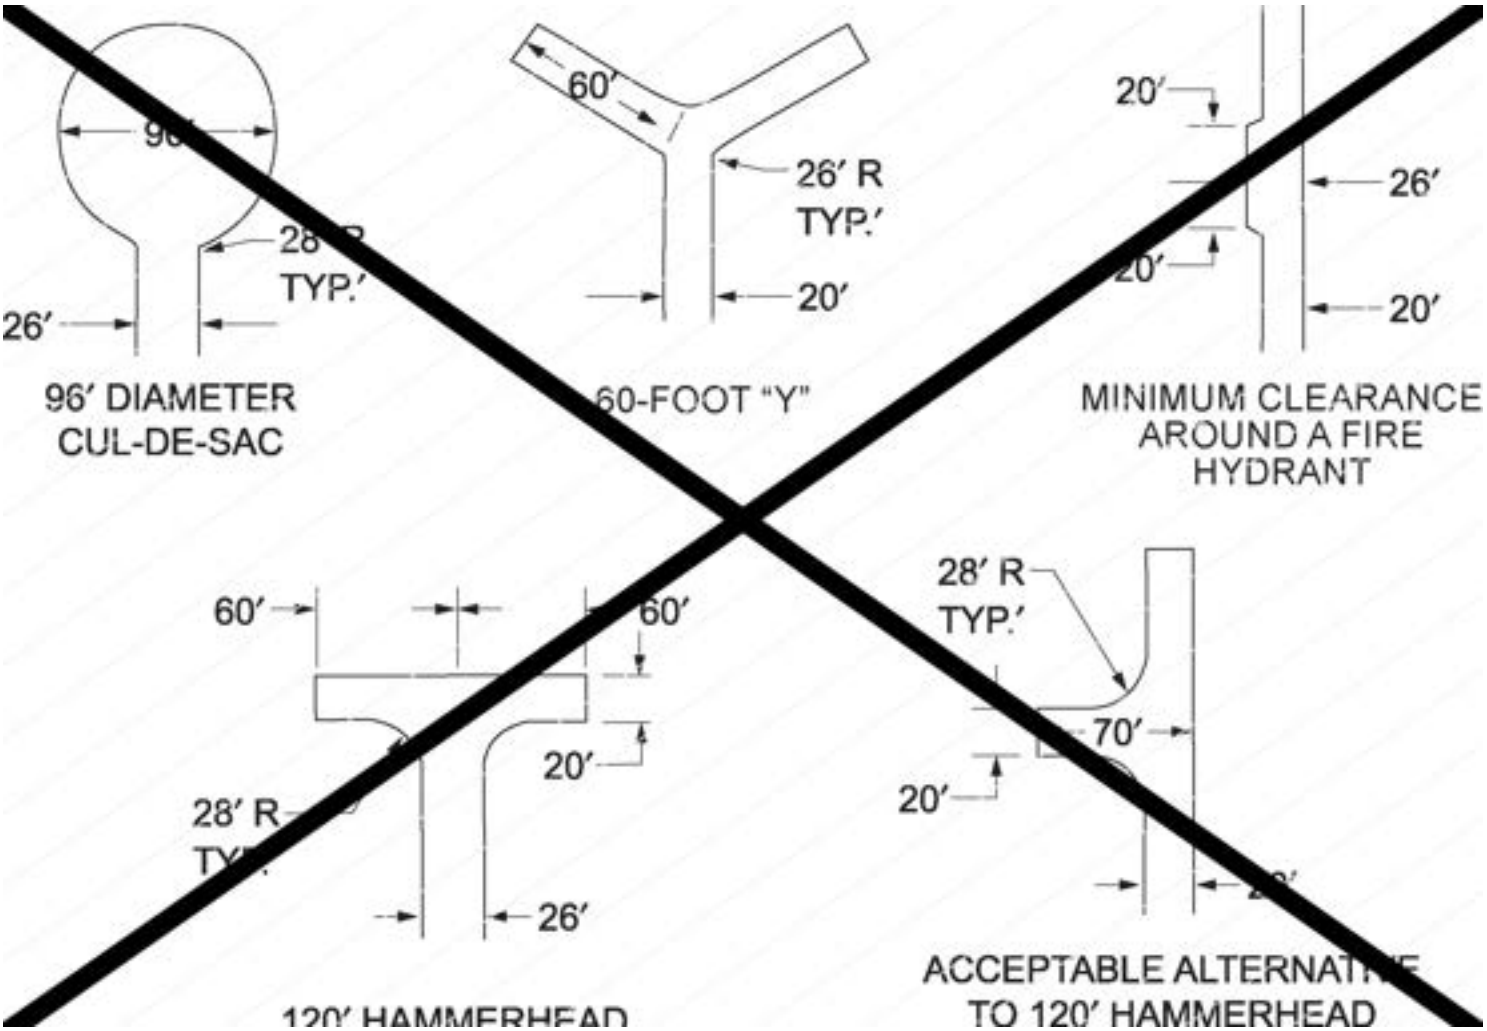
WORKING AREA. A designated area beside the fire apparatus access road, which is available for the placement of outriggers, hose lines, and other staging activates. This could be sidewalk, grass, or another surface, provided there are not excessive obstructions which would impede staging.

SECTION D103
MINIMUM SPECIFICATIONS

Revise as follows:

D103.1 Access road width with a hydrant. Where a fire hydrant is located on a fire apparatus access road, the minimum road width shall be 26 feet (7925 mm), exclusive of shoulders ~~(see Figure D103.1)~~.

Delete without substitution:



For SI: 1 foot = 304.8 mm.

FIGURE D103.1 DEAD-END FIRE APPARATUS ACCESS ROAD TURNAROUND

Add new text as follows:

D103.1.1 Hydrant access width reductions. The minimum width of fire apparatus access roads in the vicinity of hydrants shall be reduced to 21 ft (6401 mm) for two-lane roads, or 12 ft (3658 mm) for divided roads, where hydrants are placed not less than 7 ft (2134 mm) back from the nearest roadway edge.

D103.2 Grade. Fire apparatus access roads shall not exceed 10 percent in grade.

Exception: Grades steeper than 10 percent as *approved* by the *fire code official*.

D103.3 Turning radius. The minimum turning radius shall be determined by the *fire code official*.

Revise as follows:

D103.4 Dead Ends. Dead end fire apparatus access roads in excess of 150 feet (45 720 mm) shall be provided with turnaround provisions in accordance with Table D103.4. *A Policy on Geometric Design of Highways and Streets, by the American Association of State Highway and Transportation Officials.*

Delete without substitution:

TABLE D103.4 REQUIREMENTS FOR DEAD-END FIRE APPARATUS ACCESS ROADS

LENGTH (feet)	WIDTH (feet)	TURNAROUNDS REQUIRED
0-150	20	None required
151-500	20	120-foot Hammerhead, 60-foot "Y" or 96-foot diameter cul-de-sac in accordance with Figure D103.1
501-750	26	120-foot Hammerhead, 60-foot "Y" or 96-foot diameter cul-de-sac in accordance with Figure D103.1
Over 750		Special approval required

For SI: 1 foot = 304.8 mm.

D103.5 Fire apparatus access road gates. Gates securing the fire apparatus access roads shall comply with all of the following criteria:

1. Where a single gate is provided, the gate width shall be not less than 20 feet (6096 mm). Where a fire apparatus road consists of a divided roadway, the gate width shall be not less than 12 feet (3658 mm).
2. Gates shall be of the horizontal swing, horizontal slide, vertical lift or vertical pivot type.
3. Construction of gates shall be of materials that allow manual operation by one person.
4. Gate components shall be maintained in an operative condition at all times and replaced or repaired when defective.
5. Electric gates shall be equipped with a means of opening the gate by fire department personnel for emergency access. Emergency opening devices shall be *approved* by the *fire code official*.
6. Methods of locking shall be submitted for approval by the *fire code official*.
7. Electric gate operators, where provided, shall be *listed* in accordance with UL 325.
8. Gates intended for automatic operation shall be designed, constructed and installed to comply with the requirements of ASTM F2200.

D103.6 Signs. Where required by the *fire code official*, fire apparatus access roads shall be marked with permanent "NO PARKING—

FIRE LANE" signs complying with Figure D103.6. Signs shall have a minimum dimension of 12 inches (305 mm) wide by 18 inches (457 mm) high and have red letters on a white reflective background. Signs shall be posted on one or both sides of the fire apparatus road as required by Section D103.6.1 or D103.6.2.

D103.6.1 Roads 20 to 26 feet in width. *Fire lane* signs as specified in Section D103.6 shall be posted on both sides of fire apparatus access roads that are 20 to 26 feet wide (6096 to 7925 mm).

D103.6.2 Roads more than 26 feet in width. *Fire lane* signs as specified in Section D103.6 shall be posted on one side of fire apparatus access roads more than 26 feet wide (7925 mm) and less than 32 feet wide (9754 mm).

Revise as follows:

D105.1 Where required. Where the vertical distance between the *grade plane* and the highest roof surface exceeds 30 feet (9144 mm), *approved* aerial fire apparatus access roads shall be provided. For purposes of this section, the highest roof surface shall be determined by measurement to the eave of a pitched roof, the intersection of the roof to the *exterior wall*, or the top of parapet walls, whichever is greater. **Exception:** Where *approved* by the *fire code official*, buildings of Type IA, Type IB or Type IIA construction equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 and having firefighter access through an enclosed *stairway* with a Class I standpipe from the lowest level of fire department vehicle access to all roof surfaces.

D105.2 Width. Aerial fire apparatus access roads shall have a minimum unobstructed width of 26 feet (7925 mm), exclusive of shoulders, in the immediate vicinity of the building or portion thereof.

Add new text as follows:

D105.2.1 Reductions in Width Permitted with Enhanced Fire Service Equipment. Aerial apparatus access roads shall be permitted to be narrowed on account of the fire service having specialized equipment, in sufficient quantity, to negate the need for wider roadways. All solutions, or combinations thereof, shall be approved by the fire code official and the fire chief. For the purposes of this code, alternative systems shall include but not be limited to:

1. Ladder trucks with specialized capabilities, including but not limited to the following:
   - 1.1 Narrower truck bodies and/or narrower or zero spread outriggers.
   - 1.2 Aerial equipment which does not require outriggers for safe deployment.
   - 1.3 Outriggers which can fit under adjacent parked vehicles, where an adjacent parking lane is provided
   - 1.4 Outriggers which are sized to fit between parallel parked vehicles, where an adjacent parking lane is provided.
   - 1.5 Outriggers with short-jacking capabilities.
2. Vehicle dolly jacks, or other parked vehicle relocation systems, carried by responding emergency service units.
   - 2.1 Manual vehicle relocation systems shall have the capability to move a typical parked passenger vehicle in 90 seconds or less when operated by a single individual, and 60 seconds or less when operated by two individuals.
   - 2.2 Vehicle relocation robots shall have the capability to move a typical parked passenger vehicle in 60 seconds or less.
   - 2.3 Vehicle relocation systems shall not be proposed along slopes or other conditions for which the system is not safely rated.
   - 2.4 Where curbing could interfere with vehicle relocation, the fire code official is authorized to require installation of alternative roadway edge delineation.
3. Push bars mounted to emergency vehicles, for relocating disabled vehicles from the path of aerial apparatus.
   - 3.1 Design strategies which would require moving lawfully parked vehicles with push bars, shall be prohibited unless approved by the fire code official.
4. Outrigger pads with enhanced strength to deploy on non-paved surfaces.

5. Taller ground ladders, or other climbing systems.
6. Light weight or telescopic ladders, where the distance between the aerial apparatus and fire is longer.
7. Fire service aircraft, including drones.

   7.1 Where aircraft are proposed, the adjacent airspace shall be sufficiently clear of obstructions to facilitate their use.

D105.2.1.1 Procedures for Furnishing Equipment. Where the fire department does not have the necessary equipment for operating on narrower streets, the *fire code official* is authorized to require payment for new equipment, and associated expenses, as a condition of approval D105.2.1.

D105.2.2 Aerial apparatus access working areas.. Aerial apparatus access routes shall be permitted to consist of a combination of driving lanes and working areas, where *approved* by the fire code official.

D105.2.2.1 Working Area Materials. Working areas shall consist of sidewalks, geo-cell reinforced grass, or any other system which has been *approved* to provide adequate support for placement of aerial apparatus stabilizers. The system shall also provide support for emergency services to walk upon and use for other staging activities.

D105.2.2.2 Total Width. The sum of the widths for the driving lane(s) and working area shall be not less than 26 ft (7925 mm).

D105.2.2.3 Driving Lane Width. Roads open to bi-directional vehicle traffic shall contain a minimum of 21 ft (6401 mm) of driving lanes. Driving lane width for one-way roads and halves of divided roads shall a minimum of 12 ft (3658 mm). Roads with less than 21 ft (6401 mm) of driving lanes shall install passing bays at the intervals specified in 503.2.1.1, or at locations deemed necessary by the fire code official.

D105.2.2.4 Working Area Placement. Working areas shall be placed directly beside driving lanes.

D105.2.2.5 Separation Between Working Area and Driving Lane. The working area and driving lane shall be permitted to be separated by a combination of any of the following, provided the design is *approved*:

1. Tactile warning surfaces for the blind.
2. Curb with a sufficiently low slope that it will not cause damage to fire apparatus traversing it.
3. Where passing is not required, full height curb.
4. Bollards, boxed plants, or other obstructions placed at sufficiently infrequent spacing so as to provide room for aerial apparatus to deploy around them.
5. Bollards with the ability to be retracted with fire department keys, or another approved retracting system.
6. Bollards that provide the ability to be run over without causing damage to the fire apparatus.

D105.2.2.6 Signage. The fire code official shall be authorized to require the posting of signage including but not limited to the maximum load capacity of the surface, the limits of the area, instructions how to operate any systems, and notices to keep the area clear of unauthorized items.

FIGURE D105.2.2.6 EXAMPLES OF SIGNS AND GROUND TILES FOR MARKING WORKING AREAS

Add new standard(s) as follows:

AASHTO

American Association of State Highway and Transportation Officials

Washington, DC 20001

GDHS - 7th edition A Policy on Geometric Design of Highways and Streets

Reason: The US currently has a traffic crash fatality rate several times many peer nations. IFC® Section 503 and Appendix D is likely responsible for 5-10% of US traffic deaths. Every year, roughly 4,000 Americans lose their lives on non-rural neighborhood streets. That's more than the average number of people killed in all fires in a typical year. If the US adopted traffic calming and narrower streets like most of the world, data suggests over half these deaths, at least 2,000 fatalities could be prevented on local streets alone. The benefits simply outweigh the risk.

Lack of exercise causes hugely more deaths than fires. The ban on scale streets leads to neighborhoods which are less attractive for non-motorized transportation. Narrower streets could also reduce road noise and air pollution, both of which kill more persons than fires. The US has an impervious surface the size of Ohio. Wider streets have been shown to cause more ecosystem depletion, drainage problems, and vehicle-wildlife collisions.

My cost analysis analyzed 41.5 miles (66.8 km) of streets fronting nearly 5,000 dwelling units. Calculations show wider streets typically raise the cost of new housing by several thousand dollars. Wider streets further cost the economy through maintenance expenditures and diminished land productivity.IFC® Section 503 and Appendix D were made with the intention of saving lives from fire and other emergencies. However, in the years since, countless places have leapfrogged the United States in fire safety and emergency medical response, despite not having as wide roads. Wide and non-traffic calmed streets are two of the most ineffective investments for improving response time. Other measures like interconnected streets and sprinklers are more effective and proposed as an alternative pathway for compliance. There are also many tactics which can be used, and my proposed language would help fire departments deploy them. Certain fire access passages appear to have been preempted by US Federal Regulations, international treaties, UN Resolutions, and the ICC's own requirements to write standards in a fashion as internationally applicable as possible. This proposal aims to resolve conflicts between the IFC® Fire Access sections, and other laws in a fair and balanced manner.This proposal specifically allows narrower streets if they are more interconnected. For one lane roads, homes are to be sprinklered. For commercial, must provide 1-hr fire resistant construction and AEDs for large developments. This should ensure fire safety is achieved without compromising road safety.

Estimated Immediate Cost Impact:

Context sensitive, traffic-demand based, standards yielded savings in 20 of 25 neighborhoods sampled. Compared with the as-built scenario, reflexive of what is typically built in the US including some exemptions from fire code officials and legacy codes, AASHTO/ITE standards which I am proposing reduced average road surface by 18.9 m2 (204 SF) per dwelling. (IQR: 17.1 –23.3 m2). This is estimated to reduce new home cost by $5,731. Compared with a strict adherence scenario, savings is $6,839 per new home.

For single lane roads, it is estimated cost savings would be 103k$/100 meters, typical of the length of an apartment building.

Cost of sprinklers estimated at 3,501$/home for an NFPA 13R system, per NFPA data. I assume the cost of building construction upgrade to 1 hour fire resistant would be rather low, and could be to a degree offset if it is also better at providing insulation over the life cycle. Exact costs for this vary by building type.

Estimated Immediate Cost Impact Justification (methodology and variables):

To understand resource consumption differs, 66.8 km (41.5 mi) of road spread over 210 local 13 streets in 25 neighborhoods were analyzed. Sample streets fronted 4,985 dwelling units. By recording characteristics of each neighborhood, it was possible to ascertain current roadway characteristics, and how much surface would be required if the same community were built using different standards.

I used average cost per lane mile of construction per US Department of Transportation Highway Economics Requirements System, and the rate private sector pays to build roads per Home Advisor. Also counted land and utility costs. The average of these resulted in a unit price of 261.96 $/m2 (24.34$/ft2) for building a new paved surface, and 3.14 $/m2/year ($0.2918$/ft2/year) in repair costs. This is $1.12

M/lane-km or $1.80 M/lane-mile.

Considering average rates of utility service subscription (ie, what percentage subscribe to gas, electric, cable TV/fiber, public water, and sewer), each ft of road was associated with 955.49 $/m (291.23$/ft) in total utility new build costs and 14.58 $/m/yr (4.44$/ft/yr) in average repair costs.

For roads built to AASHTO/ITE context sensitive widths vs existing codes, costs per dwelling unit are shown below by density. Note immediate cost impact is shown as New Construction Sav. (paving + utilities) whereas lifecycle costs are show as annual repair.

Estimated Life Cycle Cost Impact:

Life cycle cost savings from less road repair is $72.26 per DU per year vs typical scenario, and $85.01 per DU per year comparing context sensitive streets scenario vs strict compliance with existing codes.

I am planning to publish my research on a peer reviewed journal. I can share further mythology/research with the committee outside the public meeting.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

Same as above except did not use average of public and private costs, assumed roads generally turned over to government, so only used USDOT HERS repair cost rates for the repaving.

F72-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: This was disapproved with general concern for how it would be integrated in existing communities and infrastructure. In addition communities vary widely in their needs. It was felt such specific requirements would be better located within an appendix. (Vote 13-0)

F72-24

Proponents: Scott Brody, Self (sbrody96@gmail.com) requests As Modified by Committee (AMC2)

Replace as follows:

2024 International Fire Code

SECTION 503
FIRE APPARATUS ACCESS ROADS

Revise as follows:

503.2.1 Dimensions. Fire apparatus access roads shall have an unobstructed width of not less than 20 feet (6096 mm), ~~exclusive of shoulders, exceptfor~~ *approved* ~~security gates in accordance with Section 503.6~~, and an unobstructed vertical clearance of not less than 13 feet 6 inches (4115 mm).

503.2.2 Authority. The *fire code official* shall have the authority to require or permit modifications to the required access widths where they are inadequate for fire, ~~or~~ rescue, or other emergency service operations; or where necessary to meet the public safety, health, environmental, historic preservation, or other objectives of the jurisdiction.

Revise as follows:

503.4.1 Traffic calming. Traffic calming shall be ~~prohibited unless approved by the fire code official.~~ designed to avoid excessive delay to emergency services and shall accommodate the width and turning movements of fire apparatus. Vertical deflections shall not cause fire apparatus to bottom out. Traffic calming designs, and locations of placement, shall require approval of the fire code official.

503.4.2 Special Traffic Hazards. Fire apparatus access roads shall be permitted to be split into segments not less than 12 ft (3658 mm) wide, where necessary to address the following hazards:

1. To prevent vehicle operators from entering opposing travel lane(s) to bypass railroad or drawbridge gates.
2. To prevent vehicle operators from swerving around others stopped for pedestrians, bicyclists, or similar hazards at a crosswalk.

Exemption: The minimum width of a roadway divided in accordance with 503.4.2 shall be 10 ft (3048 mm), where the elements that divide the roadway are traversable by fire apparatus.

SECTION D103
MINIMUM SPECIFICATIONS

Revise as follows:

D103.1 Access road width ~~with~~at a hydrant. Where a fire hydrant is located on a fire apparatus access road, the minimum road width in the immediate vicinity shall be ~~26 feet (7925 mm)~~ 21 feet (6401 mm) for undivided roads or 12 ft (3658 mm) for divided roads. ~~, exclusive of shoulders.~~ The hydrant shall be located at least 5 feet (1524 mm) back from the roadway edge, or the roadway width shall be increased proportionally.

D103.4 Dead Ends. Dead end fire apparatus access roads in excess of 150 feet (45 720 mm) shall be provided with turnaround provisions in accordance with ~~Table D103.4~~ *A Policy on Geometric Design of Highways and Streets, by the American Association of State Highway and Transportation Officials.*

Delete without substitution:

~~TABLE D103.4 REQUIREMENTS FOR DEAD-END FIRE APPARATUS ACCESS ROADS~~

~~LENGTH (feet)~~	~~WIDTH (feet)~~	~~TURNAROUNDS REQUIRED~~
~~0–150~~	~~20~~	~~None required~~
~~151–500~~	~~20~~	~~120-foot Hammerhead, 60-foot "Y" or 96-foot diameter cul-de-sac in accordance with Figure D103.1~~
~~501–750~~	~~26~~	~~120-foot Hammerhead, 60-foot "Y" or 96-foot diameter cul-de-sac in accordance with Figure D103.1~~
~~Over 750~~		~~Special approval required~~

GDHS - 7th edition A Policy on Geometric Design of Highways and Streets

SECTION D105

AERIAL FIRE APPARATUS ACCESS ROADS

Revise as follows:

D105.1 Where required. Where the vertical distance between the *grade plane* and the highest roof surface exceeds 30 feet (9144 mm), *approved* aerial fire apparatus access roads shall be provided. For purposes of this section, the highest roof surface shall be determined by measurement to the eave of a pitched roof, the intersection of the roof to the *exterior wall*, or the top of parapet walls, whichever is greater. ~~**Exception:** Where *approved* by the *fire code official*, buildings of Type IA, Type IB or Type IIA construction equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 and having firefighter access through an enclosed *stairway* with a Class I standpipe from the lowest level of fire department vehicle access to all roof surfaces.~~

Add new text as follows:

D105.1.1 Exemptions to Where Required. Where *approved* by the *fire code official*, buildings of Type IA, Type IB, Type IIA, or Type IV (A, B, or C) construction equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 and having firefighter access through an enclosed *stairway* with a Class I standpipe from the lowest level of fire department vehicle access to all roof surfaces.

D105.1.2 Alternative Measurement for Buildings with Enhanced Fire Resistance. The vertical distance in D105.1 shall be permitted to be measured between the ground and the highest emergency escape and rescue opening in buildings of Type IA, IB, IIA, IIIA, IV (A,B, C, or HT), or V-A construction; where approved by the fire code official; where equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1, 903.3.1.2, 903.3.1.3, or 904.11; and where firefighter access is provided to all roof surfaces via an enclosed *stairway* of Type IA, Type IB or Type IIA construction, with a Class I standpipe from the lowest level of fire department vehicle access to all roof surfaces.

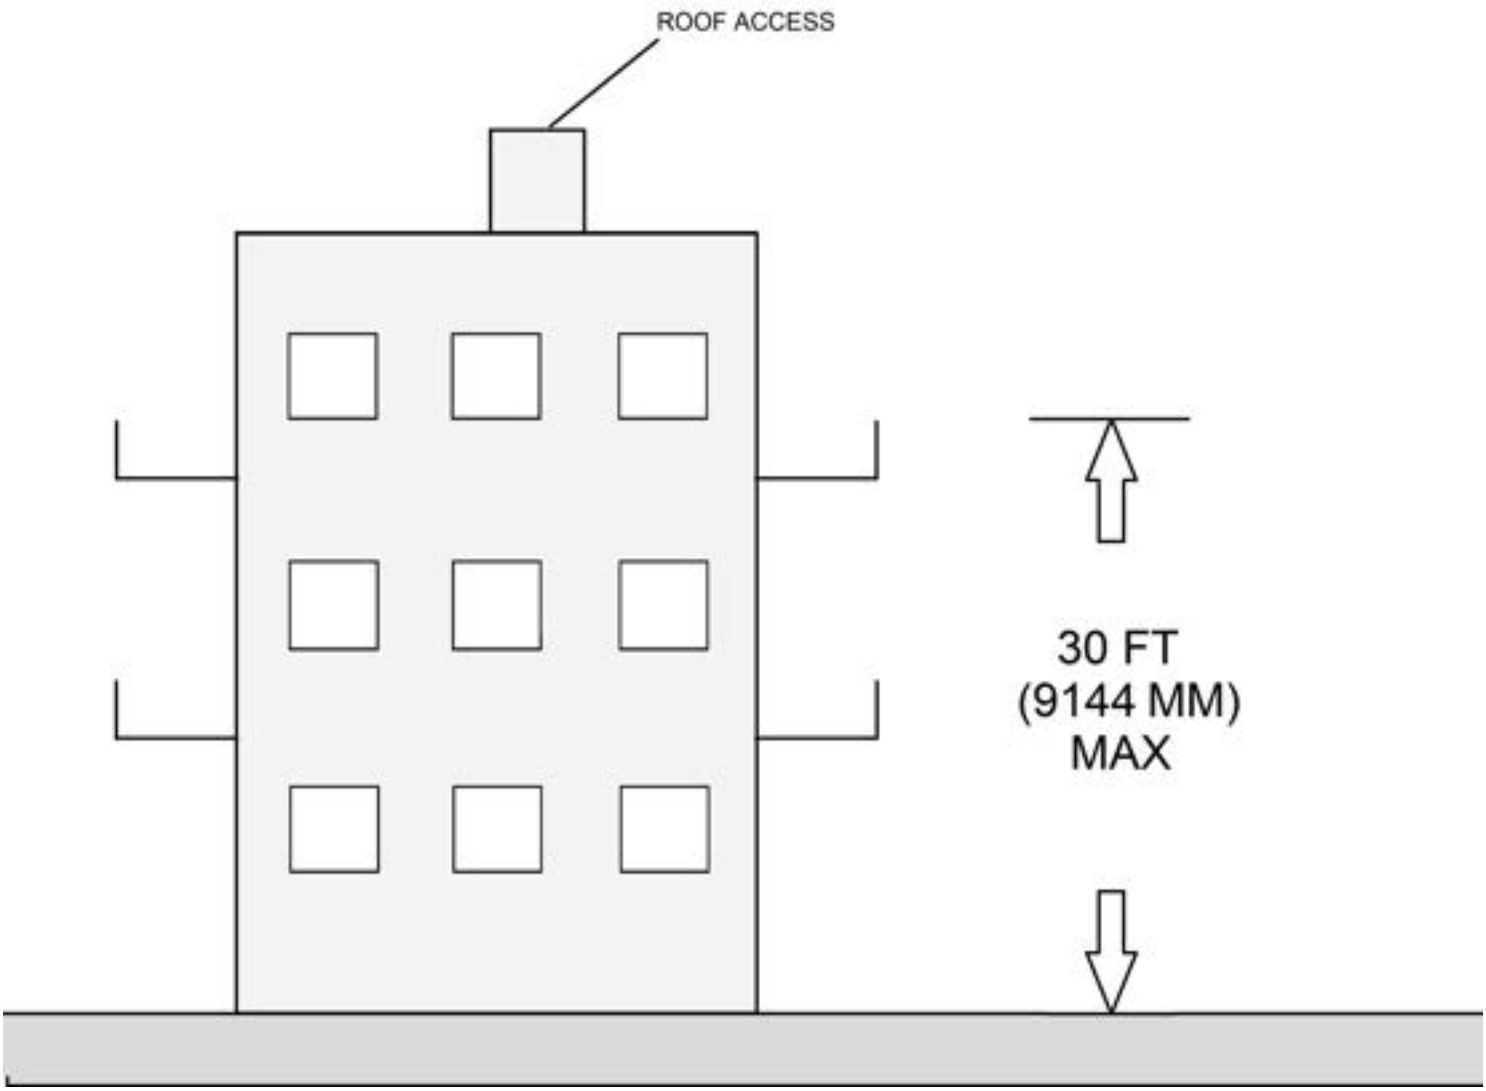

Figure showing measurement to highest balcony ledge or windowsill in accordance with D105.1 Exemption.

FIGURE D105.1 Alternative Measurement for Buildings with Enhanced Fire Resistance

Revise as follows:

D105.3 Proximity to building. One or more of the required access routes meeting this condition shall be located not less than 15 feet (4572 mm) and not greater than 30 feet (9144 mm) from the building, and shall be positioned parallel to one entire side of the building. The side of the building on which the aerial fire apparatus access road is positioned shall be *approved* by the *fire code official*.

Where approved by the fire code official, in buildings of Construction Types IA, IB, IIA, IIIA, IV (A,B, C, HT), or V-A; the minimum horizontal separation between the building and road shall be permitted to be omitted where the building is separated into compartments with not less than a 2-hour fire resistance, or a building has a narrow frontage.

Add new text as follows:

SECTION D108
SINGLE LANE FIRE APPARATUS ACCESS ROADS

D108.1.1 Travel Direction, Divided Roads, and Roads Closed to Civilian Traffic. The road shall be one-way, a one-way lane channel of a divided two-way road, or closed to ordinary motor vehicle traffic.

D108.1.2 Maximum Travel Distance via Primary Driving Route. There shall be no more than 1000 ft (304.8 m) of single lane road segments for each emergency service drive within the area, unless otherwise approved.

1. Travel via the primary access route shall not require contraflow driving.
2. The 1000 ft (304.8 m) maximum trip length shall apply to both arriving and departing trips.
3. The road which connects to the single lane fire apparatus road shall conform to 503.2.1 or D109.

D108.1.3 Secondary Access. A secondary access route shall be provided. There shall be no more than 1000 ft (304.8 m) of single lane road segments for each emergency service drive via the secondary access route, within the area, unless otherwise approved.

1. The secondary access route shall be permitted to include travel on the same road(s) as the primary route, arriving via the opposite and contraflow direction.
2. For larger developments, the fire code official shall be authorized to require single lane roads connect to a second road conforming to 503.2.1 or D109.
3. The 1000 ft (304.8 m) maximum trip length shall apply to both arriving and departing trips.

D108.1.4 Maximum Distance to Entrance via Walking Route. All buildings shall have an entrance within 650 ft (198.12 m) of a road conforming to 503.2.1 or D109, via an approved walking route, unless otherwise approved.

D108.1.5 Parking and Block Design. Parking spaces for emergency services, and block sizes, shall be in accordance with D108.1.5

D108.1.5.1 Parking Space Locations. Emergency vehicle parking spaces shall be located in accordance with Figure D108.1.5.1.

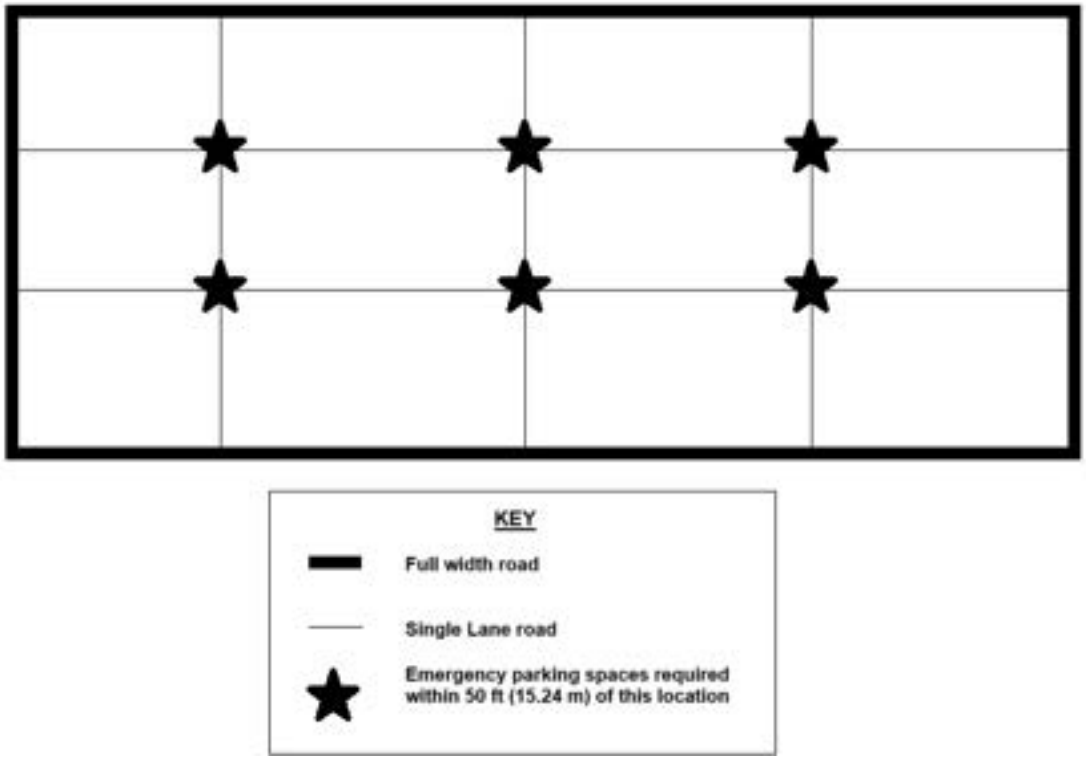

FIGURE D108.1.5.1 Intersections where Emergency Vehicle Parking Spaces Required

D108.1.5.2 Parking Space Design. Emergency vehicle parking spaces shall be designed in accordance with Figure D108.1.5.2.

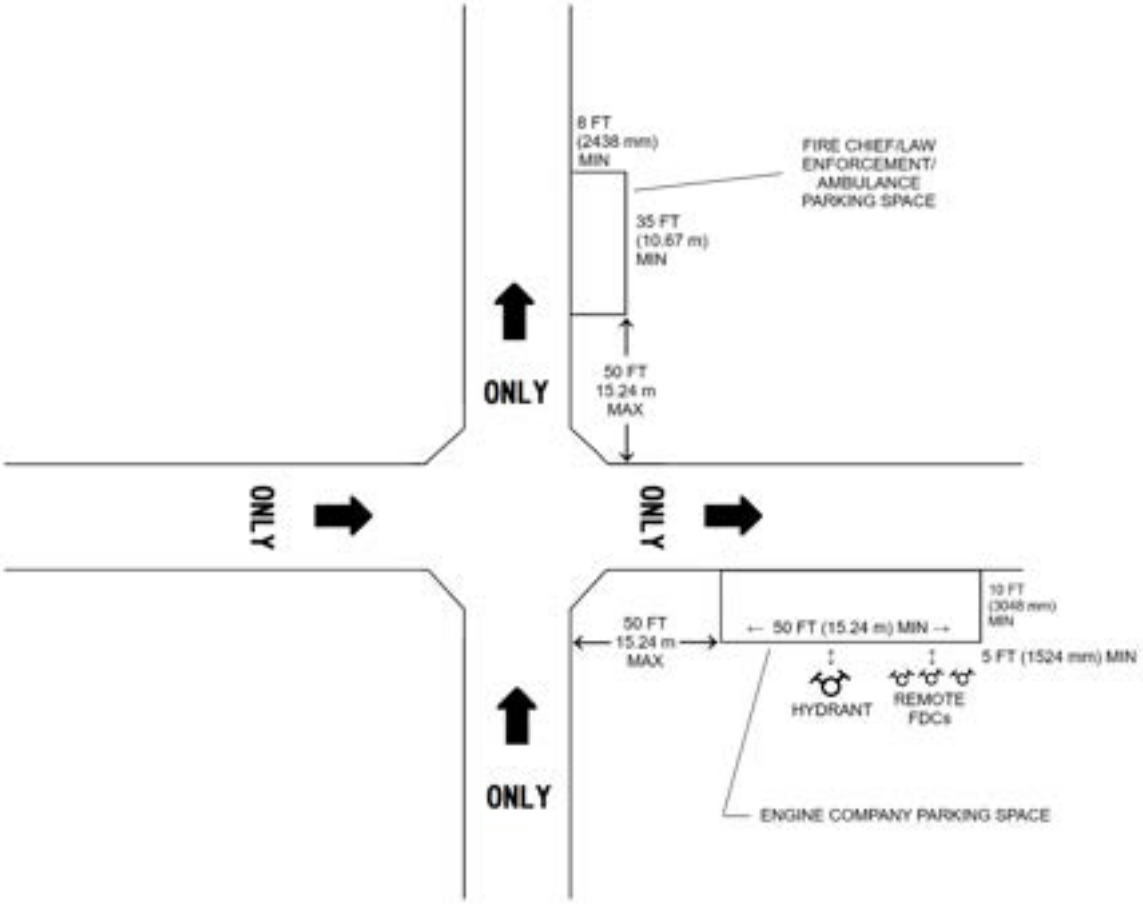

FIGURE D108.1.5.2 Emergency Vehicle Passing Space Dimensions

D108.1.5.3 Short Blocks. Where all blocks entering an intersection are 300 ft (91.4 m) or shorter in length, measured from center to center of each intersection, one of the two emergency vehicle parking spaces required per Figure D108.5.2 shall be permitted to be omitted. Where multiple short blocks are in a row, not less than every other intersection shall feature a fire engine sized parking space.

D108.1.5.4 Long Blocks. Any block longer than 500 ft (152.4 m) shall feature an additional 35 ft (10.65 m) long × 8 ft (2438 mm) wide minimum emergency vehicle parking spacelocated approximately 2/3rds of the way from the first to second intersection.

D108.1.5.5 Maximum Block Length. Blocks longer than 650 ft (198.12 m) shall be prohibited.

D108.1.5.6 Hydrants at Fire Engine Parking Spaces. Fire engine parking spaces shall contain fire hydrants, unless otherwise approved.

D108.1.5.7 Hydrant Placement. The fire hydrant shall be placed not less than 5 ft (1524 mm) back from the right edge of the fire engine parking space, or the road width shall be increased proportionally. Where approved by the fire code official, fire hydrants shall be permitted to face the opposite direction in lieu of being pushed back from the road.

D108.1.5.8 Remote FDCs. The fire code official shall be authorized to require fire engine parking spaces contain remote standpipe connections for nearby structures, and/or that remote standpipe connections be provided at the nearest two-lane fire apparatus access road.

D108.1.5.9 Passing Space Overlap. Portions of emergency vehicle parking spaces shall be permitted to overlap with sidewalk or bicycle lanes only where such are of sufficient strength to support fire apparatus loading, and any separation devices between the sidewalk/bike lane and road are approved. The fire code official shall be authorized to require enhanced marking of sidewalks/bike lanes designated as part of the fire apparatus access route in accordance with this section.

D108.1.6 Overly Circuitous Routes Prohibited. The route from the Fire Station to all buildings shall not be overly circuitous. The fire code official is authorized to modify the location and level of interconnection between fire apparatus access roads where their design is insufficient.

D108.1.7 Dead Ends Prohibited. Single lane fire apparatus access road(s) shall not terminate in a dead end.

D108.1.8 Parking Space Dimensions. All parallel parking spaces shall be a minimum width of 8 ft (2438 mm) wide in commercial and mixed-use areas, and 7.5 ft (2286 mm) wide in residential areas. Narrower parking spaces shall be permitted in spaces designated for compact cars only. Perpendicular parking, angle parking, and reverse angle parking shall be in accordance with approved dimensions and angles.

D108.1.9 Authority to Modify Dimensions. The Fire Code Official is authorized to modify these requirements based on jurisdictional needs, the level of risk for a particular structure, or the provision of specialized equipment.

D108.1.10 Specialized Equiptment. Proposals to adjust fire access requirements based on the purchase of specialized equipment shall require approval by the Fire Code Official and Fire Chief. Specialized equipment shall be provided to the fire department, or maintained on site at an approved location, as determined by the Fire Chief. The fire department shall be authorized to require payment for any expenses associated with specialized equipment, including training.

D108.2 Design Requirements for Buildings Along Single Lane Roads . Buildings along single lane fire apparatus access roads shall conform to D108.2.1 through D108.2.5

D108.2.1 Sprinklers. Buildings shall be equipped throughout with an approved automatic sprinkler system installed in accordance with Section 903.3.1.1, 903.3.1.2, 903.3.1.3, or 904.11. EXEMPTION: Buildings 400 ft^2 (37.16 m^2) or less in area shall not be required to maintain sprinkler systems for the purposes of this section.

D108.2.2 Automated External Defibrillators. Where the maximum driving distance on single lane roads exceeds 500 ft (152.4 m), and buildings sited along such road(s) have a combined occupant load of 350 persons or more, the fire code official shall be authorized to require Automated External Defibrillators (AED) be made available and maintained within 450 ft (137.16 m) of all locations on-site.

D108.2.3 Construction Type. For buildings with more than one story above ground level, construction shall be Type IA, IB, IIA, IIIA, IV (A,B, C, or HT), or V-A. EXEMPTION: One and two-family dwellings, and townhouses, shall be permitted to be any type otherwise allowed. Other types of construction shall be permitted for other building types, where approved.

D108.2.4 Authority to Restrict High Risk Structures. The fire code official shall be authorized to prohibit or restrict high-hazard occupancies, large assemblies, buildings with a high number of floors, large area buildings, or any other situation which, at the determination of the fire code official, would pose an excessive risk along single lane roads.

D108.2.5 Wildfire Prone Areas. The fire code official shall be authorized to require fire resistant landscaping be placed beside single lane roads in wildfire prone areas. The fire code official shall be authorized to restrict or prohibit single lane roads in areas of high wildfire risk.

D108.2.5 Existing Structures. The requirements of D108.2.1 through D108.2.4 shall not apply to properties which were lawfully located along an existing single lane road prior to the enactment of this code.

D108.3 Single Lane Aerial Apparatus Access Roads. Buildings over 3 stores or 30 ft (9144 mm) above grade plane, as measured in accordance with D105.1, shall be provided with aerial apparatus access in accordance with this section.

D108.3.1 Road Position. Aerial access shall be positioned parallel to one side of each building.

D108.3.2 Staging Area Required. A staging area not less than 5 feet (1524 mm) wide shall be located on both sides of the roadway. The sum of the roadway and staging area widths shall be not less than 22 ft (6706 mm). EXEMPTION: Where approved, staging area shall be permitted to be omitted on the side of a road that does not contain any structures above 30 ft (9144 mm).

D108.3.3 Staging Area Loads. The staging area shall be permitted to include roadway surface, sidewalk, bicycle paths, reinforced grass, or any other approved surface capable of supporting the imposed load of fire apparatus weighting 75,000 pounds (34 050 kg).

D108.3.4 Obstructions. The staging area shall be permitted to include streetscape items such as plants, tables, chairs, signs, and utility poles; however, the fire code official shall be authorized to limit the number of such items to ensure aerial apparatus outrigger deployment, and other emergency operations, are not compromised.

D108.3.5 Driveway Aprons. Driveway aprons shall be permitted to be included in the staging area, where designed and maintained to support the imposed loads of fire apparatus weighting 75,000 pounds (34 050 kg).

D108.3.6 Separation Devices Between Roadway and Staging Area. Curbing of an approved height shall be permitted to separate the road from sidewalk and driveways designated as part of the staging area. Where low height curb is used, bollards shall be permitted to prevent vehicle encroachment onto sidewalk. The fire code official shall be authorized to require bollards retract with a fire department key or other approved device.

D108.3.7 Marking. The fire code official shall be authorized to require making of the staging area.

FIGURE D108.3.7 EXAMPLES OF MARKINGS FOR STAGING AREAS & SEPARATION DEVICES

Add new text as follows:

D108.3.8 Parallel Parking. Use of parallel parking as a staging area for outriggers shall be permitted where approved by the fire code official and fire chief. Where parallel parking is used for outriggers, the fire code official shall be authorized to regulate space length and require 5 ft (1524 mm) gaps between the front and back of a select number of spaces, to facilitate outrigger placement.

D108.3.9 Vehicle Relocation Tools. Where a parallel parking lane is to be used as part of the staging area, the fire chief shall be authorized to require keeping approved vehicle dollies or other parked vehicle relocation tools on site or with the fire department. Vehicle dollies shall not be proposed for use on slopes beyond the safe capacity of the device.

D108.3.10 Separation from Building. The road/working area combined shall be not more than 30 ft (9144 mm) from the building. The road/working area combined shall be not less than 15 ft (4572 mm) from the building where the construction type is not IA, IB, or IV (A, B, or C). **Exemption:** In buildings of Type VA construction, having a height above grade plane not more than 60 ft (18.29 m), the 15 ft (4572 mm) minimum separation in D108.3.10 shall be permitted to be omitted where the building has not more than 60 ft (18.29 m) of frontage along the aerial apparatus access road, or where the building is divided into compartments, not more than 60 ft (18.29 m) long,

measured along the frontage of the aerial apparatus access road. Compartments shall be separated by not less than a 2-hour fire rated assembly or be an approved distance from one another.

D108.3.11 Staging Areas for Buildings Under 30 ft (9144 mm). The fire code official shall be authorized to require buildings less than 3 stories or 30 ft (9144 mm) above grade plane provide a staging area to accommodate not less than one ladder truck, from a tactically acceptable location. Multiple buildings shall be permitted to share a staging area. The fire code official shall be authorized to require additional staging areas for large buildings. Where approved, unreinforced surfaces such as grass shall be permitted to be used.

D109 Traffic Demand-based Street Widths. Where a fire apparatus access road is assigned a functional classification of local road or minor collector, or is similarly described per another classification scheme, and the road's average daily traffic volume does not routinely exceed 2000 vehicles per day, the street widths in Section 503.2.1.2.1 and Section 503.2.1.2.2 shall be permitted. Parking ratios shall comply with Section 503.2.1.2.3.

D109.1 Two way streets parking one-side. For two-way streets where parking is permitted on one side only, and the parking spaces are unmarked, the width of fire apparatus access roads shall comply with Table 503.2.1.2.1.

Table D109.1 FIRE APPARATUS ACCESS ROAD WIDTH - PARKING ON ONE SIDE

Dwelling/Sleeping Units Density			
Per Gross Acre	**Minimum Width (ft)**	**Per Gross Hectare**	**Minimum Width (mm)**
≤ 2.0	18	≤ .8	5486
> 2 to 6	24	> .8 to 2.4	7315
> 6 to 10.0	28	>2.4 to 4.0	8534
Mixed use and > 10	32	Mixed use and > 4.0	9754

D109.2 Two-way streets, parking both sides. For two way streets where parking is permitted on both sides, and the parking spaces are unmarked, the width of fire apparatus access roads shall comply with Table 503.2.1.2.2.

TABLE D109.2 FIRE APPARATUS ACCESS ROAD WIDTH - PARKING BOTH SIDES

Dwelling/Sleeping Unit Density			
Per Gross Acre	Minimum Width (ft)	Per Gross Hectare	Minimum Width (mm)
≤2.0	20	≤.8	6096
> 2 to 6.0	26	>.8 to 2.4	7925
> 6 to 10	30	> 2.4 to 4.0	9144
Mixed use and > 10	34	Mixed use and >4.0	10360

Add new text as follows:

D109.3 Parking ratios residential. In residential districts, the parking ratios shall comply with Table 503.2.1.2.3 or the widths shall comply with high density (6.1 to 10.0 DU/ac or 2.5 to 4.0 DU/ha).

TABLE D109.3 PARKING RATIOS

Dwelling Unit or Sleeping Unit Charactertistics	Minimum number of off-street spaces
≤ 1 bedroom	1.75
2 bedrooms	2.0
Detached housing with ≥ 3 bedrooms	2.5

Add new text as follows:

D109.4 Circuitous Designs Restricted. The route from the Fire Station to all buildings shall not be overly circuitous. The fire code official shall be authorized to modify the location and level of interconnection between new fire apparatus access roads designed in accordance

with D109, where their design is insufficient.

D109.5 Mountable Roadway Edge. The fire code official shall be authorized to require mountable roadway edges in low and medium density neighborhoods, as defined by the density defintionas in Tables D109.1 & D109.2.

D109.6 Wildfire Prone Areas. The fire code official shall be authorized to prohibit traffic demand-based street widths less than 20 ft (6096 mm) in wildfire prone areas.

D110 Traffic Calming. Traffic calming shall be designed in accordance with D110.

TABLE D110 TRAFFIC CALMING DESIGN SPEEDS AND TRAFFIC-CALMED ROADWAY LENGTH LIMITS

Roadway Type/Location	Design to Achieve 85 percentile space mean speed not less than		Maximum Distance[a]	
	mph	km/h	ft	m
Parking lot drive aisles	10	16.09	1000	304.8
Fire Lanes closed to civilian vehicle traffic and woonerfs[b]	10	16.09	1000	304.8
Midblock pedestrian and bicycle crossings (all roadway functional classifications)	10	16.09	Immediate vicinity of crossing only	
Turning movements near urban crosswalks and bicycle path crossings (all roadway functional classifications)	5	8.05	Immediate vicinity of turn only	
Local Roads	18.6	30.00	2000	609.6
Minor collector roads	18.6	30.00	2000	609.6
Major collector, Minor arterial roads, other principle arterial freeways and expressways	Prohibited unless approved by the fire code official			
Other roads	As approved			

a. The Fire Department shall be provided an approved route to access all structures which does not require traveling more than 2000 ft (609.6 m)
on traffic calmed local and minor collector streets. Streets themselves shall be permitted to contain more than 2000 ft (609.6 m) of traffic
calming, provided that emergency services do not have to travel beyond 2000 ft (609.6 m) as part of their route.

b. Woonerfs shall be permitted to follow the 10 mph (16.09 km/h) design speed even if assigned a different formal functional classification.

Revise as follows:

SECTION D108~~11~~
REFERENCED STANDARDS

D108~~11~~.1 General. See Table D108~~11~~.1 for standards that are referenced in various sections of this appendix. Standards are listed by the standard identification with the effective date, standard title, and the section or sections of this appendix that reference the standard.

TABLE D108~~11~~.1 REFERENCED STANDARDS

STANDARD ACRONYM	STANDARD NAME	SECTIONS HEREIN REFERENCED
ASTM F2200—14	*Standard Specification for Automated Vehicular Gate Construction*	D103.5
UL 325—02	*Door, Drapery, Gate, Louver, and Window Operators and Systems*, with Revisions through May 2015	D103.5

Reason: See attached document, updated June 2024.

User Note: D108 Single Lane Fire Apparatus Access Roads.About this Section: D108 establishes detailed criteria for the design of single lane fire apparatus access roads.

Purpose and Intent: Along neighborhood streets of the United States, traffic crashes often kill more people than fires. Converting

neighborhood streets from two unobstructed central lanes to one traffic-calmed lane has been shown to more than halve traffic casualties. Street width reduction can also reduce environmental harm and monetary costs associated with road construction. It may further be desired to create or preserve a historic feel, to discourage cut-through traffic, or to promote walkability - which improves public health. Many jurisdictions around the world achieve excellent levels of emergency response performance without wider roads. This Appendix section seeks to assist in regulating small streets and development. It does so by requiring enhanced safety features to counter possible delay and access impacts. Street widths are designed to accommodate the standard North American fire apparatus.

Bibliography: For cost impact, see ICC Building Valuation Data.

https://www.iccsafe.org/wp-content/uploads/BVD-BSJ-FEB21.pdf

Other sources in reason statement.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

Most costs will stay the same vs my previous proposal. The biggest difference is allowance of up to 1 floor of Type VB construction along new single lane roads, vs previously I required all one hour fire resistant construction. This will likely result in <5% savings per Square Foot.

Estimated Immediate Cost Impact Justification (methodology and variables):

I considered cost per square ft from ICC building valuation data. For detailed cost info on overall proposal, see previous filing submitted before CAH 1.

Estimated Life Cycle Cost Impact:

Lifecycle cost will likely be similar to my previous proposal, because although additional allowance for Type VB could reduce some maintenance expenses (especially the complexity of maintaining firestops), lightweight wood might be less insulating as well. Therefore, there might be worse thermal bridging and energy consumption, vs some other forms like if wood were insulated via natural wool in a VA assembaly.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

This is only a qualitative approximation; therefore no specific variables were used. For detailed cost info on overall proposal, see previous filing submitted before CAH 1.

Comment (CAH2)# 573

F73-24

IFC: 507.1

Proposed Change as Submitted

Proponents: Kevin Scott, KH Scott & Associates LLC, self (khscottassoc@gmail.com)

2024 International Fire Code

Revise as follows:

507.1 Required water supply. An *approved* water supply capable of supplying the required fire flow for fire protection shall be provided to premises on which facilities, buildings or portions of buildings are hereafter constructed or moved into or within the jurisdiction. Reclaimed water or recycled water shall be analyzed to evaluate any health hazard and to determine whether any materials, chemicals or contaminants in the water will be detrimental to the components of the fire water supply or fire-extinguishing systems and a report shall be submitted to the fire code official for approval prior to acceptance as fulfilling the requirement for water supply.

Reason: In recent years there has been a increased desire to utilize recycled or reclaimed water for fire fighting purposes. The long-term goal of water conservation is important to improve sustainability, but the quality of recycled or reclaimed water used for fire fighting must meet considered.

There are two aspects of concern: 1) does the water contain any contaminants that will be detrimental to the fire protection equipment and appliances used in fighting the fire, and 2) does the water present any health hazard as fire fighters are doused with water during the firefighting operations.

NFPA 13, the standard for fire sprinkler system design allows the use of recycled or reclaimed water, provided the water quality is tested and evaluated. 2022 NFPA 13 reads:

5.2.1 Water supplies for sprinkler systems shall be one of the following or any combination:

1. A connection to an approved public or private waterworks system in accordance with 5.2.2
2. A connection including a fire pump in accordance with 5.2.3
3. A connection to a water storage tank at grade or below grade installed in accordance with NFPA 22 and filled from an approved source
4. A connection to a pressure tank in accordance with 5.2.4 and filled from an approved source
5. A connection to a gravity tank in accordance with 5.2.5 and filled from an approved source
6. A penstock, flume, river, lake, pond, or reservoir in accordance with 5.2.6
7. * A source of recycled or reclaimed water where the building owner (or their agent) has analyzed the source of the water and the treatment process (if any) that the water undergoes before being made available to the sprinkler system and determined that any materials, chemicals, or contaminants in the water will not be detrimental to the components of the sprinkler system it comes in contact with

Annex A in NFPA 13 contains some additional guidance to Item 7 above, and states "…Recycled or reclaimed water should never be used in a sprinkler system until an analysis of what contaminants might be in the water has determined that nothing will be detrimental to sprinkler system performance or the expected reasonable life of the sprinkler system."

Fire fighters routinely splashed or drenched with water from fire sprinklers, fire hoses, and other fire fighting appliances. The firefighters should be wearing their structural fire-fighting personal protective equipment, but that equipment is not designed to keep water off their body, and to limit skin contact with fire fighting water.

The quality of the water must be evaluated for health reasons and for the efficacy of the fire fighting equipment. It would be foolish to install expensive automatic fire fighting systems and then run water through it that will corrode it internally, or plug the orifices of sprinklers. This proposal allows recycled water or reclaimed water to be utilized, but the quality of the water must be analyzed for provide adequate protection from health risks to fire fighters and for the longevity and reliability of the fire fighting appliances.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The requirement to analyze the water already exists, but as the desire increases to use recycled water this proposal places the requirement in the code so it is not missed.

F73-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: Though the intent was understood there was concern that water supply issues generally go beyond what NFPA 13 addresses. (Vote 11-2)

F73-24

Individual Consideration Agenda

Comment 1:

IFC: 507.1, 507.1.1 (New)

Proponents: Kevin Scott, KH Scott & Associates LLC, self (khscottassoc@gmail.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Fire Code

Revise as follows:

507.1 Required water supply. An *approved* water supply capable of supplying the required fire flow for fire protection shall be provided to premises on which facilities, buildings or portions of buildings are hereafter constructed or moved into or within the jurisdiction. ~~Reclaimed water or recycled water shall be analyzed to evaluate any health hazard and to determine whether any materials, chemicals or contaminants in the water will be detrimental to the components of the fire water supply or fire-extinguishing systems and a report shall be submitted to the fire code official for approval prior to acceptance as fulfilling the requirement for water supply.~~

Add new text as follows:

507.1.1 Reclaimed or recycled water. Where the water supply contains reclaimed water or recycled water, the water shall be analyzed to evaluate any health hazard and to determine whether any materials, chemicals or contaminants in the water will be detrimental to the components of the fire water supply or fire-extinguishing systems. A report shall be submitted to the fire code official for approval prior to acceptance as fulfilling the requirement for water supply.

Reason: This code change was Disapproved at CAH 1. Discussion from CAH 1 has been considered and this comment contains revisions as a result.

The main revision in this comment is that a new section is created to deal with reclaimed or recycled water. The use of reclaimed and recycled water is spreading across the country. Reclaimed and recycled water is being proposed for a variety of uses.

At CAH 1, it was stated that NFPA 13 provides guidance on the use of reclaimed or recycled water, this is correct. The problem is that the

criteria in NFPA 13 only applies to sprinkler systems. Reclaimed and reused water is being proposed for fire hydrant systems and other firefighting uses where NFPA 13 would not apply. NFPA 13 only covers sprinkler systems, it does not address other fire-extinguishing or fire protection systems, such as standpipes. Therefore, the inclusion of the criteria in the IFC will ensure the code official can address the situation.

It was stated that an applicant would receive a double-whammy when they had to comply with the requirements in the IFC and NFPA 13. If both the IFC and a referenced standard contain requirements on a topic, then as stated in IFC Section 102.7.1, the requirements in the IFC govern. The applicant is not required to comply with both sets of requirements.It was also stated that the fire engine would need to be flushed out after using the reclaimed water. The reality is that fire engines do not carry potable water. The water in the tank often remains in that tank for extended periods. Fire equipment often uses water from ponds, rivers, canals and lakes. The need to flush a pump on a fire engine is not new, and it certainly is not only going to occur when reclaimed or recycled water is utilized.

ICC is currently in the process of developing criteria for the use of reclaimed and recycled water. At this time, recycled water and reclaimed water will be allowed for fire protection purposes. This will ensure that the level of reclamation and filtration is adequate and safe for the firefighters and equipment.

Cost Impact: Increase

Estimated Immediate Cost Impact:

There will be a cost for testing water, but it is not mandatory. The cost will only occur where the applicant chooses to utilize reclaimed or recycled water.

Estimated Immediate Cost Impact Justification (methodology and variables):

A sample water test could run from $50 to $400.

Comment (CAH2)# 759

F74-24

IFC: 507.2, B103.3

Proposed Change as Submitted

Proponents: Chad Sievers, NYS, NYS DOS (chad.sievers@dos.ny.gov); Jeanne Rice, NYSDOS (jeanne.rice@dos.ny.gov); Kevin Duerr-Clark, NYS DOS, NYS DOS (kevin.duerr-clark@dos.ny.gov); China Clarke, New York State Dept of State, Manager Technical Support Unit (china.clarke@dos.ny.gov); John R Addario - NYS Department of State, NEW YORK STATE CODES DIVISION, New York State Department of State Division of Building Standards and Codes (john.addario@dos.ny.gov)

2024 International Fire Code

Revise as follows:

507.2 Type of water supply. A water supply shall consist of reservoirs, pressure tanks, elevated tanks, water mains or other fixed systems capable of providing the required fire flow.

Exception: In rural and suburban areas in which adequate and reliable water supply systems do not exist, the *fire code official* is authorized to approve the use of NFPA 1142 or the *International Wildland-Urban Interface Code* where it is adopted.

B103.3 Areas without water supply systems. For information regarding water supplies for firefighting purposes in rural and suburban areas in which adequate and reliable water supply systems do not exist, the *fire code official* is authorized to utilize NFPA 1142 or the *International Wildland-Urban Interface Code*.

Reason: Because of the rural character of many regions of the majority of states, strict compliance with 507.2 is not always feasible. NFPA 1142 and IWUIC accommodate some alternatives. NFPA 1142 and IWUIC are allowed in the IFC code under Appendix B, but adding the exception allows NFPA 1142 or IWUIC to be used without adopting all of Appendix B.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

Total cost savings: **$14,272** for a single-family home with an attached garage, as the building would not need to include on-site water storage.

This code change would be cost savings because it gives the code users another option to provide water to extinguish a fire. This option allows water to be supplied by the fire department instead of being kept on-site. This is common in rural areas where there's not a municipal water distribution network. Many factors will come into play in developing a water supply for fire flow. To simplify this estimate we looked at a single-family home with an attached garage and using plastic water tanks to store the water.

This cost estimate does not include any necessary maintenance of fire department equipment, nor the cost of acquiring the water (via pumping or other acquisition method).

Estimated Immediate Cost Impact Justification (methodology and variables):

NFPA 1142 states (as an acceptable method to calculate fire flow)

Eq 4.3.1
WS_{min}=VStot/OHC * CC * 1.5

WS_{min}= min Water Supply

VS_{tot}= Total volume of structure (ft^3)

OHC=Occupancy hazard Classification number

CC= Construction Classification number

For example a single-family home 2 stories with an attached garage

V_{garage} = 24' x 24' x 10'=5760

V_{house} = 2 stories x 8'H stories x 40'x 30'19200

V_{tot} = 19200+5760 = 24,960 ft^3

OHC = 7 (per NFPA 1142 5.2.5.2 dwellings)

CC = 1.5 (per NFPA 1142 Table 6.2.1 Type V)

WS_{min}= VS_{tot}/OHC * CC * 1.5=24,960 ft^3 / 7 x1.5 x1.5 = 8023 gallons

Use two 5,000 gallon tanks @ $5,136 each https://www.ntotank.com/5000gallon-norwesco-black-vertical-water-tank-x1750809

Shipping cost estimate $1,000

plumbing cost estimated $1,000

Site work estimate

$2,000

Total cost savings $14,272

F74-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: Generally it was felt that this concept belongs in an appendix. Also concern with the wording of "where it is adopted" and how it applies to the use of NFPA 1142 and the WUIC. It was noted that NFPA 1142 has good information but it is generally easy to apply when needed without being referenced in the code. (Vote 12-0)

F74-24

Individual Consideration Agenda

Comment 1:

IFC: 507.2

Proponents: Jeanne Rice, NYSDOS (jeanne.rice@dos.ny.gov); Kevin Duerr-Clark, NYS DOS, NYS DOS (kevin.duerr-clark@dos.ny.gov); Stephen Van Hoose, NYS DOS, NYS DOS (stephen.vanhoose@dos.ny.gov); China Clarke, New York State Dept of State, Manager Technical Support Unit (china.clarke@dos.ny.gov); Chad Sievers, NYS DOS, NYS DOS (chad.sievers@dos.ny.gov) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Fire Code

507.2 Type of water supply. A water supply shall consist of reservoirs, pressure tanks, elevated tanks, water mains or other fixed systems capable of providing the required fire flow.

Exception: In rural and suburban areas in which adequate and reliable water supply systems do not exist, the *fire code official* is authorized to approve the use of NFPA 1142 or, where adopted, the *International Wildland-Urban Interface Code* ~~where it is adopted~~.

Reason: The modification to this proposal clarifies that 'where it is adopted' is intended to apply only to the IWUIC.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This modification is an editorial change to clarify that the language 'where it is adopted' applies only to the IWUIC.

Comment (CAH2)# 550

F82-24

IFC: 604.3.4

Proposed Change as Submitted

Proponents: Kevin Brinkman, NEI, NEII (klbrinkman@neii.org)

2024 International Fire Code

Revise as follows:

604.3.4 Temperature Control ~~Machine room ventilation~~.. Where standby power is connected to elevators and a temperature control means is provided in accordance with Section 3005.2 of the *International Building Code*, the temperature control means ~~the machine room ventilation or air conditioning~~ shall be connected to the standby power source.

Reason: To correlate the title and requirements with IBC Section 3005.2. The current titles and language are misleading because the real purpose is to provide standby power for the means to control the temperature for proper operation of the elevator equipment. This public comment to modify the proposal correlates with the public comment and proposal for 3003.1.4.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

There is no change in the requirement for standby power, only a clarification to better align with another section in the IBC.

F82-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: This proposal was disapproved as there was concern that the machine room ventilation may be losing the necessary standby power and heating is not explicitly addressed. (Vote 14-0)

F82-24

Individual Consideration Agenda

Comment 1:

IFC: 604.3.4

Proponents: Kevin Brinkman, NEI, NEII (klbrinkman@neii.org) requests As Modified by Committee (AMC2)

Replace as follows:

2024 International Fire Code

604.3.4 ~~Machine room ventilation~~ Temperature control. Where standby power is connected to elevators, ~~the machine room ventilation~~

~~or air conditioning shall be connected to the standby power source~~ the system for temperature control of spaces containing elevator equipment provided in accordance with Section 3005.2 of the International Building Code, shall be connected to the standby power source.

Reason: The requested changes are needed to correlate the title and requirements with IBC Section 3005.2 which was updated in the 2024 edition. “Temperature Control” more accurately describes the function and avoids confusion with “venting” which refers to the removal of smoke and gases during a fire. “Temperature Control” is used in other parts of the Code. Standby power is needed not just for cooling of the equipment to prevent overheating, but also to maintain the temperature in the appropriate range to ensure proper operation of the elevator. If the temperature in the equipment rooms and spaces is allowed to drop below acceptable levels, the elevator may not function properly. The alternate language addresses a comment from committee during CAH#1 to clarify that the standby power is any system provided to comply with 3005.2.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The change is clarifying the requirement not changing it; therefore, there is no cost associated with the proposed change.

Comment (CAH2)# 482

F86-24

IFC: SECTION 611 (New), 611.1 (New), 611.1.1 (New), 611.2 (New), 611.3 (New)

Proposed Change as Submitted

Proponents: Robert Marshall, FCAC, FCAC (fcac@iccsafe.org)

2024 International Fire Code

Add new text as follows:

SECTION 611
ELECTRIC VEHICLE CHARGING STATIONS

611.1 Disconnects. Locations containing electric vehicle charging stations shall be provided with a clearly identified and readily accessible emergency disconnect installed in an approved location.

611.1.1 Alternative Disconnects. Where approved, a disconnect provided to comply with NFPA 70 can be utilized to meet the disconnect requirement when it is clearly identified, and the location is accessible to the fire department.

611.2 Height. Where provided, the height of the emergency disconnect shall be not less than 42 inches (1067 mm) and not more than 48 inches (1372 mm) measured vertically, from the floor level to the activating device. The disconnect shall be distinctly labeled EMERGENCY ELECTRIC VEHICLE CHARGER DISCONNECT.

611.3 Fire Extinguishers. Approved portable fire extinguishers complying with Section 906 with a minimum rating of 2-A:20-B:C shall be provided and located such that an extinguisher is not more than 75 feet (23 860 mm) from electric vehicle charging stations.

Reason: Electric vehicle charging stations are becoming more prominent as electric vehicles gain popularity. The fire service needs a safe means to disconnect these charging stations from their power supply to be able to safely extinguish a fire involving the charging stations and/or the vehicle being charged. This new code sections provides accessible emergency disconnects to safely shut power off to the charging stations. The new code section allows for alternative disconnect that is in compliance with NFPA 70 plus code language for the height of the disconnect, signage and fire extinguishers.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

Research was conducted and the typical immediate cost increase for each installation would be less than $50.

Estimated Immediate Cost Impact Justification (methodology and variables):

The cost impact is very small as most installation already have a means to disconnect the power from the EV Charger. A small increase may be necessary in terms on additional conduit and wire if the disconnect needs to be installed in a location the is accessible for the fire service and away from the charger. Research was conducted and the cost increase for each installation would be less than $50.

F86-24

Public Hearing Results (CAH1)

Committee Action: **As Modified by Committee**

Committee Modification:

~~611.3 Fire Extinguishers~~.

~~Approved portable fire extinguishers complying with Section 906 with a minimum rating of 2-A:20-B:C shall be provided and located such that an extinguisher is not more than 75 feet (23 860 mm) from electric vehicle charging stations.~~

Committee Reason: This proposal provides the basic requirements for emergency shutoff for electric vehicle charging stations similar to that provided for other types of fuels. The modification removes a requirement for fire extinguishers as there are currently no extinguishers available for lithium ion battery fires. Fire extinguishers will be generally be addressed by Section 906. There was some concern with the use of the term "accessible" as it may be confused with accessibility requirements for those with disabilities. (Vote 10-4)

F86-24

Individual Consideration Agenda

Comment 1:

IFC: SECTION 611, 611.1, 611.1.1, 611.2

Proponents: Shlyneice Davis, National Electrical Manufacturers Association (NEMA), National Electrical Manufacturers Association (NEMA) (shlyneice.davis@nema.org); Megan Hayes, NEMA, NEMA (megan.hayes@nema.org); Bryan Holland, National Electrical Manufacturers Association (NEMA), National Electrical Manufacturers Association (NEMA) (bryan.holland@nema.org) requests As Modified by Committee (AMC2)

Further modify as follows:

2024 International Fire Code

SECTION 611
ELECTRIC VEHICLE CHARGING STATIONS

Revise as follows:

611.1 ~~Disconnects~~ Disconnecting Means . For permanently connected electric vehicle supply equipment and wireless power transfer equipment, equipment disconnects and emergency shutoff shall be installed in accordance with NFPA 70. ~~Locations containing electric vehicle charging stations shall be provided with a clearly identified and readily accessible emergency disconnect installed in an approved location.~~

Delete without substitution:

~~**611.1.1 Alternative Disconnects.** Where approved, a disconnect provided to comply with NFPA 70 can be utilized to meet the disconnect requirement when it is clearly identified, and the location is accessible to the fire department.~~

~~**611.2 Height.** Where provided, the height of the emergency disconnect shall be not less than 42 inches (1067 mm) and not more than 48 inches (1372 mm) measured vertically, from the floor level to the activating device. The disconnect shall be distinctly labeled EMERGENCY ELECTRIC VEHICLE CHARGER DISCONNECT.~~

Reason: It is essential that requirements in the IFC are perfectly correlated with the requirements for electric vehicle power transfer systems in NFPA 70. Section 625.43 of the 2026 NEC First Draft includes very detailed requirements for both equipment disconnects and emergency shutoff. All the

concerns cited in the reason statement to Proposal F86-24 are adequately addressed in the NEC. Pointing users of the IFC to the NEC will ensure all installations are in compliance with both codes.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The change proposal points the user to the NEC for the prescriptive installation requirements therefore the cost impact neither increases or decreases.

Comment (CAH2)# 365

Comment 2:

Proponents: Steven Rosenstock, Edison Electric Institute, Edison Electric Institute (srosenstock@eei.org); Genevieve Cullen, Electric Drive Transportation Association (EDTA), EDTA (gcullen@electricdrive.org); Emily Kelly, ChargePoint (emily.kelly@chargepoint.com); Rick Tempchin, Alliance for Transportation Electrification (rick@evtransportationalliance.org); Tessa Sanchez, Tesla, Tesla, Inc. (tesanchez@tesla.com) requests As Modified by Committee (AMC1)

Reason: The Committee got it right. Any vehicle can catch on fire, but portable fire extinguishers are not required be located near gasoline or diesel or natural gas or propane vehicles.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Comment (CAH2)# 415

Comment 3:

Proponents: Abid Anwar, Tesla (aanwar@tesla.com) requests Disapproved

Reason: F-86 was Approved As Modified by Committee. The proposal provides no technical justification or risk basis to necessitate the redundancy or scope increase from NFPA 70 Section 625.43 Equipment Disconnect requirements. Whereas Article 625 of NFPA 70 requires a readily accessible disconnect located in an accessible location where equipment is rated more than 60A, this proposal would require emergency disconnects for all charging stations regardless of residential vs. commercial use or DC fast charging vs. AC charging for occupancies regulated by this code.

1. Testimony was provided indicating necessity due to the following:
2. First responders require readily accessible disconnects and current disconnects are often inaccessible without site personal to provide access Emergency disconnect requirements are common at gas stations, similar emergency disconnecting devices should be provided.

Electric vehicles and EV charging infrastructure are safe and do not constitute a previously unknown hazard. There is no risk to public safety or first responders that justifies approval of these code modifications given the requirements in NFPA 70. Article 625 of NFPA 70 already requires the installation of disconnecting means in readily accessible locations where equipment is rated more than 60A or more than 150 volts to ground. Charging cables are only energized when connected and locked to the electric vehicle and communication is established between the charging equipment and the vehicle. The flow of electricity to the charging cable is automatically shut off if the charging connector is unlocked or communication between the vehicle and charging equipment ceases. Additionally, Tesla vehicles are less likely to experience a vehicle fire than internal combustion engine (ICE) vehicles. According to data released by NFPA and U.S. Department of Transportation, in the United States there is a vehicle fire for every 19 million miles traveled. By comparison, from 2012 – 2021, there was approximately one Tesla vehicle fire for every 210 million miles traveled, which is ten times less.1

Regarding the need for consistency with gas stations, emergency response considerations for fuel dispensing stations bear no similarities with electrical fires at charging stations. Homologation with gas station disconnect requirements creates greater hazard for first responders and the general public who may attempt to intervene. Activation of the emergency disconnect when responding to a fuel fed fire is accompanied with lessening fire activity, similar positive indicators do not exist for electrical equipment providing a false sense of security. Activation of a similar disconnect at an EV charging station would not inform First Responders of what upstream proximally located equipment remains energized.

To disconnect power to a site, first responders should cut the lock on the electrical switchgear, locate the main feeder breaker, turn the handle to the OFF position, and verify the absence of AC hazard sources with available tools. Tesla provides detailed instructions for deenergizing a Supercharger site in our Emergency Response Guide. 2 Utilization of the disconnecting means at the switch gear is superior to an emergency stop button as this provides a physical break to create an open circuit.

Tesla is committed to helping fire departments and first responders safely handle emergency situations involving all Tesla products. We have trained thousands of first responders to appropriately handle Tesla vehicles and batteries through virtual and in-person training, through provision of decommissioned vehicles, support lines, and attendance at relevant safety and code conferences. While Tesla understands the intent of the proposals in keeping first responders and the public safe in the unlikely event of an electrical fire at an EV charging station, we are concerned that the proposed code language would lead to unintended consequences.

Bibliography: Reference citation 1:https://www.tesla.com/VehicleSafetyReport

Reference citation 2:https://www.tesla.com/firstresponders

Cost Impact: No change to code.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Comment (CAH2)# 553

Comment 4:

Proponents: Joseph H. Cain, P.E., Solar Energy Industries Association (SEIA), Solar Energy Industries Association (SEIA) (joecainpe@gmail.com) requests Disapproved

Reason: F86-24 should be Disapproved. It is not needed, as 2023 NFPA 70 (NEC) Article 625.43 already requires disconnecting means for EVSE and WPTE rated more than 60 amperes or more than 150 volts to ground. The NEC already requires that the disconnecting means shall be provided and installed in a readily accessible location.

F86-24 states that the disconnecting means already required by NFPA 70 can be considered an "alternative disconnect." How is a disconnect that is already required to be installed be considered alternative by the IFC?

The fire extinguisher requirement has already been removed by a modification, as the Committee Reason Statement indicated there are currently no extinguishers available for lithium ion battery fires.

ICC style has been trying to eliminate the use of the word "accessible" where it does not relate to access compliance.

Proposal F86-24 adds a a new section to the IFC, but does not seem to add any value with respect to safety for first responders or users of EVs or EV chargers, beyond the safety requirements already provided in the National Electrical Code.

Cost Impact: No change to code.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

F88-24

IFC: 705.2.4

Proposed Change as Submitted

Proponents: Kevin Scott, KH Scott & Associates LLC, self (khscottassoc@gmail.com)

2024 International Fire Code

Revise as follows:

705.2.4 Door operation. Swinging *fire doors* shall close from ~~the full open~~a door-open position of 90 degrees (1.57 rad) and latch automatically.

Reason: There is a conflict in the requirements for swinging fire doors specific to the functionality of the door closing hardware.

- The IBC §716.1 and IFC §705.2 require opening protectives to comply with NFPA 80. This includes fire doors and door-closing devices on fire doors.
- IFC §405.2 requires inspection and testing of fire doors.
- IFC §705.2.4 requires fire doors to close and latch from the **full open** position.
- NFPA 80 §5.3.5.2 states that swinging doors with fire door hardware must close from the **full open** position.
- NFPA 80 §5.3.6.2 states that swinging doors with fire door hardware must close from the **any open** position.
- NFPA 80 Chapter 7, which is specific to swinging doors with fire door hardware requires fire doors to close from **any open** position.

This proposal intends to clarify the actual requirement for initial acceptance and periodic inspection and testing. There are contradictory requirements, and as a result a multitude of interpretations and applications of the requirement.

Even if a door swings to 180 degrees, when an occupant uses that door to exit, they will not routinely open it the full 180-degree swing—more likely a 90-degree swing is what will happen. Chapter 10 requires measurement of the clear width of egress opening at 90 degrees.

Where NFPA 80 states the door must close from any open position, does that mean full open, 90 degrees open, or 1 degree open? I would be surprised to see door closers close and latch from a 1 degree position, but I would expect from 90 degrees or more.

So, if we consider “full open” to be 90 degrees or more, we can the test at 90 degrees as the worst case for that range. Testing fire doors in an existing building from a 90-degree position seems to be the logical solution.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This will not change the cost of construction. This proposal clarifies the method of inspection to ensure proper operation of the door through its life span.

F88-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee stated that the reasons for the disapproval of the proposal were: Based upon the proponent's recommendation and testimony. There are many times doors have to operate in more than just a 90° opening in order to meet the egress

requirements and therefore they should be tested in any position. (Vote: 14-4)

F88-24

Individual Consideration Agenda

Comment 1:

IFC: 705.2.4

Proponents: Kevin Scott, KH Scott & Associates LLC, self (khscottassoc@gmail.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Fire Code

Revise as follows:

705.2.4 Door operation. ~~Swinging fire doors shall close from a door-open position of 90 degrees (1.57 rad) and latch automatically.~~ Automatic-closing swinging fire doors shall close and latch from the full-open position and from any position of 30 degrees (0.52 rad) open to full-open. Self-closing swinging fire doors shall close and latch from any position of 30 degrees (0.52 rad) open to full-open.

Exception: Self-closing and automatic-closing swinging fire doors with closers utilizing cables, chains or ropes, and pulleys and counterweights shall close and latch from any open position.

Reason: This proposal was Disapproved at the request of the speakers at CAH 1. The reason for requesting disapproval was to come back with revised text which provided more details with regard to testing requirements. Communications between the proponent and the Builders Hardware Manufacturer's Association (BHMA) have resulted in this revised comment.

It was discussed at CAH 1 that the door needs to be tested at more angles than just 90 degrees, which the original proposal stated. And it was also stated that doors are not always opened to the full-open position which is the current requirement in the IFC. IFC Section 705.2.4 requires doors to close and latch from the full-open position. From the perspective of automatic-closing swinging fire doors which are held open with a magnetic release, this is appropriate. However, consider swinging fire doors which are self-closing, and swinging fire doors permitted to be automatic-closing when they are in the self-closing mode – how far open should these doors be when released to verify they close and latch automatically. Remember swinging fire doors permitted to be automatic-closing are also required by the IBC and NFPA 80 to be self-closing. BHMA recommends self-closing doors be required to close and latch when released from a door-open position of 30 degrees and greater, which is consistent with NFPA 80 requirements for swinging fire doors with spring hinges. It is well known, and summarized in the original reason statement: The IBC requires opening protectives to be installed in accordance with NFPA 80. And, the IFC requires these opening protectives to be inspected and maintained in accordance with NFPA 80.

Unfortunately, NFPA 80 has differing requirements for closing and latching of swinging door opening protectives:

- The requirements for inspection and testing of swinging doors with builders hardware or fire door hardware (the vast majority of fire doors currently being installed), in Item 7 of 5.2.3.5.2 (NFPA 80-2022) requires the door to completely close when operated from the full open position.
- The requirements for inspection and testing of swinging doors with fire door hardware (the old-style metal clad fire doors typically closed with pulleys, chains, cables, ropes, counterweights, and/or fusible links) in Item 13 of 5.2.3.6.2, requires these doors to close completely from any open position.
- The requirements for installation of swinging doors with builders hardware or fire door hardware in Chapter 6 of NFPA 80, in 6.4.1.4, state the closing mechanism is to be adjusted...so that positive latching is achieved on each door operation. And, specifically, 6.4.1.5 requires doors with spring hinges are to achieve positive latching with the door is allowed to close freely from an open position of no more than 30 degrees.

The exception covers doors which use pulleys and counterweights to provide door closure. These doors are designed to close from any

open position, so the 30-degrees does not apply.

Considering the life-safety importance of fire doors that close and latch, the variety of requirements in NFPA 80, the ambiguity of current IFC and IBC requirements, and that specificity in the code (i.e. IFC) overrides similar requirements in reference standards, it is recommended that swinging fire doors close and latch when tested at a door-open position of 30 degrees or greater and at full open.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This will not change the cost of construction. This proposal clarifies the method of inspection to ensure proper operation of the door through its life span.

Comment (CAH2)# 732

F90-24

IFC: 708.1, 708.2 (New)

Proposed Change as Submitted

Proponents: Bill McHugh, CM Services, National Fireproofing Contractors Association (bill@mc-hugh.us)

2024 International Fire Code

708.1 Maintaining protection. Where required when the building was originally permitted and constructed, spray fire-resistant materials and intumescent fire-resistant materials shall be visually inspected to verify that the materials do not exhibit exposure to the substrate.

Add new text as follows:

708.2 Repair of Spray Fire-Resistant Materials and Intumescent FIre-Resistant Materials. Where damaged, materials used to protect columns, beams and horizontal assemblies shall be repaired, replaced or restored in accordance with the listing, the manufacturer's repair instructions and with the same materials and thicknesses used in the *listing*. Where the *listing* is not known, repairs shall be made with the same material type and thickness that exists.

Reason: In the 2024 IFC it is that SFRM and IFRM Fireproofing need to be visually inspected. This proposal completes the action by adding a repair section. Because fireproofing is installed in accordance with a fire-resistance listing and manufacturers instructions, it needs to be repaired with a listed repair system. When the listing is not known, guidance is provided to repair with the same type of material an the same thickness. Too many times we see thick fireproofing repaired with skim coats over fireproofing void and not the same thickness as exists on the rest of the beam, column or assembly. It is critical the repair method have the appropriate material, material type and where possible, match new construction listing to provide continues fire-resistance protection.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The reason this proposal has no impact is that this proposal reflects what actually should happen. Anything less is a fire and life safety risk.

F90-24

Public Hearing Results (CAH1)

Committee Action: **As Submitted**

Committee Reason: The committee stated that the reasons for the approval of the proposal were: This completes the coverage of requirements from installation to repairs. This is really well written and it is a needed proposal that addresses the gap. When it says replaced or restored in accordance with this listing, it will cover everything else that you are doing. (Vote:14-0)

F90-24

Individual Consideration Agenda

Comment 1:

IFC: 708.2

Proponents: Kevin Scott, KH Scott & Associates LLC, self (khscottassoc@gmail.com) requests As Modified by Committee (AMC2)

Further modify as follows:

2024 International Fire Code

Revise as follows:

708.2 Repair of sprayed ~~fire-resistant~~ fire-resistive materials and intumescent ~~fire-resistant~~ fire-resistive materials. ~~Where damaged, materials used to protect columns, beams and horizontal assemblies shall be repaired, replaced or restored in accordance with the listing, the manufacturer's repair instructions and with the same materials and thicknesses used in the *listing*. Where the *listing* is not known, repairs shall be made with the same material type and thickness that exists.~~ Materials used to protect columns, beams and horizontal assemblies shall be securely bonded to the substrate without evidence of deterioration or damage, or delamination, cracks or voids through which the substrate is exposed. Where the original material and listing is known or can be identified, such damage shall be repaired, replaced or restored to the requirements of the listing in accordance with the manufacturer's repair instructions. Where the original material or listing is not known or is no longer available, repairs shall be made with the same material type and thickness as originally used.

Reason: This item was Approved at CAH 1. This comment intends to clarify the language and ensure that where a listing is known and available, the listing must be followed.

The title and language throughout are editorially revised to refer to sprayed fire-resistive materials.

The section is designed to address to situations: 1) where the fire-resistive material can be identified and the listing is known; and 2) where the material cannot be identified or the listing is not known or is no longer available. In the first scenario, the repair must be made in accordance with the listing and the manufacturer's repair instructions. In the second, the repair is to be accomplished with a material of the same type and to the same thickness.

The original proposal stated "where damaged". This term leaves a lot to interpretation, such as how much damage is a problem, or what if it is compressed, etc. This comment provides some guidance as to the intent with the additional language of delamination, voids and exposure of substrate. This will provide information and guidance to the inspector.

The ultimate goal of this proposal is to accomplish repair of damaged or failing sprayed fire-resistive materials. It is critical that repair be done to the appropriate level of protection to maintain an adequate level of safety for the building and occupants.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This comment is simply clarifying the application of the requirements.

Comment (CAH2)# 522

F93-24

IFC: 807.4, 807.4.1, 807.4.1.1 (New)

Proposed Change as Submitted

Proponents: Marcelo Hirschler, GBH International, GBH International (mmh@gbhint.com)

2024 International Fire Code

807.4 Artificial decorative vegetation. Artificial decorative vegetation shall comply with this section and the requirements of Sections 806.2 and 806.3. Natural decorative vegetation shall comply with Section 806. **Exception:** Testing of artificial vegetation is not required in Group I-1; Group I-2, Condition 1; Group R-2; Group R-3; or Group R-4 occupancies equipped throughout with an *approved automatic sprinkler system* installed in accordance with Section 903.3.1, where such artificial vegetation complies with the following:

1. Wreaths and other decorative items on doors shall not obstruct the door operation and shall not exceed 50 percent of the surface area of the door.
2. Decorative artificial vegetation shall be limited to not more than 30 percent of the wall area to which it is attached.
3. Decorative artificial vegetation not on doors or walls shall not exceed 3 feet (914 mm) in any dimension.

Revise as follows:

807.4.1 Flammability. ~~Artificial~~ The flammability of artificial decorative vegetation shall be assessed in accordance with one of the following:
~~meet the flame propagation performance criteria of~~

1. Where tested in accordance with NFPA 701 using Test Method 1 or Test Method 2, as appropriate, ~~of NFPA 701~~ the artificial decorative vegetation shall meet the flame propagation performance criteria. ~~Meeting such criteria shall be documented and certified by the manufacturer in an approved manner~~
2. ~~Alternatively, the artificial decorative vegetation shall be~~ Where tested in accordance with NFPA 289 ~~,~~ using the 20 kW ignition source, ~~and~~ the artificial decorative vegetation shall have a maximum heat release rate of 100 kW.

Add new text as follows:

807.4.1.1 Documentation. The test report and compliance with acceptance thresholds shall be documented and certified by the manufacturer in an approved manner.

Reason: Editorial rewrite for clarification. No change in requirements.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

No change in requirements.

F93-24

Public Hearing Results (CAH1)

Committee Action: **As Modified by Committee**

Committee Modification:
2024 International Fire Code
Revise as follows:

807.4.1 Flammability. The flammability of artificial decorative vegetation shall be ~~assessed~~ in accordance with one of the following:

1. Where tested in accordance with NFPA 701 using Test Method 1 or Test Method 2, as appropriate,the artificial decorative vegetation shall meet the flame propagation performance criteria.
2. Where tested in accordance with NFPA 289 using the 20 kW ignition source, the artificial decorative vegetation shall have a maximum heat release rate of 100 kW.

Committee Reason: The committee stated that the reason for the approval of the modification was that it deletes an unnecessary word. The stated reasons for the approval of the proposal with the modification were: It arranges it in a legible and appropriate way, and it separates the two different areas of criteria. It is editorial and does not make any modifications. The section on documentation is helpful for the code official so that they can verify code compliance. (Vote: 14-0)

F93-24

Individual Consideration Agenda

Comment 1:

IFC: 807.4

Proponents: Kevin Scott, KH Scott & Associates LLC, self (khscottassoc@gmail.com) requests As Modified by Committee (AMC2)

Further modify as follows:

2024 International Fire Code

Revise as follows:

807.4 Artificial decorative vegetation. Artificial decorative vegetation in other than Group U occupancies shall comply with this section and the requirements of Sections 806.2 and 806.3. Natural decorative vegetation shall comply with Section 806. **Exception:** Testing of artificial vegetation is not required in Group I-1; Group I-2, Condition 1; Group R-2; Group R-3; or Group R-4 occupancies equipped throughout with an *approved automatic sprinkler system* installed in accordance with Section 903.3.1, where such artificial vegetation complies with the following:

1. Wreaths and other decorative items on doors shall not obstruct the door operation and shall not exceed 50 percent of the surface area of the door.
2. Decorative artificial vegetation shall be limited to not more than 30 percent of the wall area to which it is attached.
3. Decorative artificial vegetation not on doors or walls shall not exceed 3 feet (914 mm) in any dimension.

Reason: This proposal was Approved at CAH 1. This Comment revises Section 807.4.1 by indicating the provisions do not apply to Group U occupancies.

It does not seem necessary to regulate these materials in Group U occupancies which include Barns, Carports, Communication equipment, Fences, Grain silos, Greenhouses, Livestock shelters, Private garages, Retaining walls, Sheds, Stables, Tanks, and Towers.

Group U occupancies are often not even included in a routine inspection program.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

This will reduce cost, but only in Group U occupancies. It is doubtful that artificial decorative vegetation is used in Group U occupancies, so while there is technically a decrease, it is negligible.

Estimated Immediate Cost Impact Justification (methodology and variables):

Cost of artificial decorative vegetation is less than $100 per unit.

IFC: 903.2.8, 903.2.8.1, 903.2.8.2, 903.2.8.3, 903.3.1.3; IBC: [F] 903.2.8, [F] 903.2.8.1, [F] 903.2.8.2, [F] 903.2.8.3, [F] 903.3.1.3

Proposed Change as Submitted

Proponents: Jeffrey Shapiro, International Code Consultants, Lake Travis Fire Rescue (jshapiro@LTFR.org)

2024 International Fire Code

Revise as follows:

903.2.8 Group R. An *automatic sprinkler system* installed in accordance with Section 903.3.1 shall be provided throughout all buildings with a Group R *fire area*.

Delete without substitution:

~~**903.2.8.1 Group R-3.** An *automatic sprinkler system* installed in accordance with Section 903.3.1.3 shall be permitted in Group R-3 occupancies.~~

~~**903.2.8.2 Group R-4, Condition 1.** An *automatic sprinkler system* installed in accordance with Section 903.3.1.3 shall be permitted in Group R-4, Condition 1 occupancies.~~

~~**903.2.8.3 Care facilities.** An *automatic sprinkler system* installed in accordance with Section 903.3.1.3 shall be permitted in care facilities with five or fewer individuals in a single-family *dwelling*.~~

Revise as follows:

903.3.1.3 NFPA 13D sprinkler systems. *Automatic sprinkler systems* installed in one- and two-family *dwellings* and *townhouses*; Group R-3; and Group R-4, Condition 1~~; and *townhouses*~~ shall be permitted to be installed throughout in accordance with NFPA 13D.

2024 International Building Code

Revise as follows:

[F] 903.2.8 Group R. An *automatic sprinkler system* installed in accordance with Section 903.3.1 shall be provided throughout all *buildings* with a Group R *fire area*.

Delete without substitution:

~~**[F] 903.2.8.1 Group R-3.** An *automatic sprinkler system* installed in accordance with Section 903.3.1.3 shall be permitted in Group R-3 occupancies.~~

~~**[F] 903.2.8.2 Group R-4, Condition 1.** An *automatic sprinkler system* installed in accordance with Section 903.3.1.3 shall be permitted in Group R-4, Condition 1 occupancies.~~

~~**[F] 903.2.8.3 Care facilities.** An *automatic sprinkler system* installed in accordance with Section 903.3.1.3 shall be permitted in care *facilities* with five or fewer individuals in a single-family *dwelling*.~~

Revise as follows:

[F] 903.3.1.3 NFPA 13D sprinkler systems. *Automatic sprinkler systems* installed in one- and two-family *dwellings* and *townhouses*; Group R-3; and Group R-4, Condition 1~~; and *townhouses*~~ shall be permitted to be installed throughout in accordance with NFPA 13D.

Reason: Code requirements in Section 903.2.8 and 903.3.1 currently conflict with respect to the types of sprinkler systems permitted for some residential occupancies. Subsections to 903.2.8 specify which sprinkler standards are permissible for some Group R uses, but Section 903.3.1 has different allowances for NFPA 13D to be used, particularly for townhouses which are covered in the scope of NFPA 13D but aren't always classified as Group R3. NFPA 13D as an appropriate standard for townhouse protection is currently recognized in Section 903.3.1.3 but not in Section 903.2.8. Rather than correlating these sections, it makes more sense to have the applicable requirements reside in one location in the code, and Sections 903.3.1 (including 903.3.1.1, 903.3.1.2 and 903.3.1.3) are currently sufficient to entirely support Section 903.2.8. For ease of following what this proposal accomplishes and how the sections will work together if the proposal is approved, relevant extracts from Section 903.3.1 in the 2024 IBC are reproduced below:

[F] 903.3.1 Standards. Automatic sprinkler systems shall be designed and installed in accordance with Section 903.3.1.1 unless otherwise permitted by Sections 903.3.1.2 and 903.3.1.3 and other chapters of this code, as applicable.

[F] 903.3.1.1 NFPA 13 sprinkler systems. Where the provisions of this code require that a building or portion thereof be equipped throughout with an automatic sprinkler system in accordance with this section, sprinklers shall be installed throughout in accordance with NFPA 13 except as provided in Sections 903.3.1.1.1 through 903.3.1.1.3.

[F] 903.3.1.2 NFPA 13R sprinkler systems. Automatic sprinkler systems in Group R occupancies shall be permitted to be installed throughout in accordance with NFPA 13R where the Group R occupancy meets all of the following conditions:

1. Four stories or fewer above grade plane.

2. For other than Group R-2 occupancies, the floor level of the highest story is 30 feet (9144 mm) or less above the lowest level of fire department vehicle access. For Group R-2 occupancies, the roof assembly is less than 45 feet (13 716 mm) above the lowest level of fire department vehicle access. The height of the roof assembly shall be determined by measuring the distance from the lowest required fire vehicle access road surface adjacent to the building to the eave of the highest pitched roof, the intersection of the highest roof to the exterior wall, or the top of the highest parapet, whichever yields the greatest distance.

3. The floor level of the lowest story is 30 feet (9144 mm) or less below the lowest level of fire department vehicle access. The number of stories of Group R occupancies constructed in accordance with Sections 510.2 and 510.4 shall be measured from grade plane.

[F] 903.3.1.3 NFPA 13D sprinkler systems. Automatic sprinkler systems installed in one- and two-family dwellings; Group R-3; Group R-4, Condition 1; and townhouses shall be permitted to be installed throughout in accordance with NFPA 13D.

Although I serve as a consultant to the National Fire Sprinkler Association, this proposal has not been reviewed or endorsed by NFSA, and I am not representing NFSA on this issue.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposal eliminates a conflict between code sections and duplication. Technical requirements remain unchanged.

F100-24

Public Hearing Results (CAH1)

Committee Action: **As Modified by Committee**

Committee Modification:
2024 International Fire Code

903.3.1.3 NFPA 13D sprinkler systems.
Automatic sprinkler systems installed in one- and two-family *dwellings* and *townhouses*; Group R-3; and Group R-4~~, Condition 1~~ shall be

permitted to be installed throughout in accordance with NFPA 13D.

2024 International Building Code

[F] 903.3.1.3 NFPA 13D sprinkler systems.
Automatic sprinkler systems installed in one- and two-family *dwellings* and *townhouses*; Group R-3; and Group R-4~~, Condition 1~~ shall be permitted to be installed throughout in accordance with NFPA 13D.

Committee Reason: The committee stated that the reason for the approval of the modification was based on the recommendation from the floor testimony. The stated reason for the proposal with the modification was based on the proponent's reason statement and testimony. (Vote: 11-0)

F100-24

Individual Consideration Agenda

Comment 1:

IFC: 903.3.1.2.3, 903.3.1.3, 903.3.1.3.1 (New); IBC: [F] 903.3.1.2.3, [F] 903.3.1.3, [F] 903.3.1.3.1 (New)

Proponents: Jeffrey Shapiro, Lake Travis Fire Rescue, Lake Travis Fire Rescue (jshapiro@ltfr.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Fire Code

Revise as follows:

903.3.1.2.3 Attics. Attic protection shall be provided as follows:

1. Attics that are used or intended for living purposes or storage shall be protected by an *automatic sprinkler system*.
2. Where fuel-fired equipment is installed in an unsprinklered attic, not fewer than one quick-response intermediate temperature sprinkler shall be installed above the equipment.
3. Where located in a building of Type III, Type IV or Type V construction designed in accordance with Section 510.2 or 510.4 of the International Building Code, attics not required by Item 1 to have sprinklers shall comply with one of the following if the roof assembly is located more than 55 feet (16 764 mm) above the lowest level of fire department vehicle access needed to meet the provisions in Section 503:
   3.1. Provide *automatic sprinkler system* protection.
   3.2. Construct the attic using noncombustible materials.
   3.3. Construct the attic using fire-retardant-treated wood complying with Section 2303.2 of the International Building Code.
   3.4. Fill the attic with noncombustible insulation.

. The height of the roof assembly shall be determined by measuring the distance from the lowest required fire vehicle access road surface adjacent to the building to the eave of the highest pitched roof, the intersection of the highest roof to the *exterior wall*, or the top of the highest parapet, whichever yields the greatest distance. For the purpose of this measurement, required fire vehicle access roads shall include only those roads that are necessary for compliance with Section 503.

~~4. Group R-4, Condition 2 occupancy attics not required by Item 1 to have sprinklers shall comply with one of the following:~~

~~4.1. Provide *automatic sprinkler system* protection.~~

~~4.2. Provide a heat detection system throughout the attic that is arranged to activate the building *fire alarm system*.~~

~~4.3. Construct the attic using noncombustible materials.~~

~~4.4. Construct the attic using fire-retardant-treated wood complying with Section 2303.2 of the International Building Code.~~

~~4.5. Fill the attic with noncombustible insulation.~~

903.3.1.3 NFPA 13D sprinkler systems. *Automatic sprinkler systems* installed in one- and two-family *dwellings* and *townhouses*; Group R-3; and Group R-4 shall be permitted to be installed throughout in accordance with NFPA 13D.

Add new text as follows:

903.3.1.3.1 Attic protection for Group R-4, Condition 2. Attic protection shall be provided for Group R-4, Condition 2 as follows:

1. Attics that are used or intended for living purposes or storage shall be protected by an automatic sprinkler system.
2. Where fuel-fired equipment is installed in an unsprinklered attic, not fewer than one quick-response intermediate temperature sprinkler shall be installed above the equipment.
3. Attics not required by Item 1 to have sprinklers shall comply with one of the following:
   3.1 Provide automatic sprinkler system protection.
   3.2 Provide a heat detection system throughout the attic that is arranged to activate the building fire alarm system.
   3.3 Construct the attic using noncombustible materials.
   3.4 Construct the attic using fire-retardant-treated wood complying with Section 2303.2 of the *International Building Code*.
   3.5 Fill the attic with noncombustible insulation.

2024 International Building Code

Revise as follows:

[F] 903.3.1.2.3 Attics. *Attic* protection shall be provided as follows:

1. *Attics* that are used or intended for living purposes or storage shall be protected by an *automatic sprinkler system.*
2. Where fuel-fired equipment is installed in an unsprinklered *attic*, not fewer than one quick-response intermediate temperature sprinkler shall be installed above the equipment.

3. Where located in a *building* of Type III, Type IV or Type V construction designed in accordance with Section 510.2 or 510.4, *attics* not required by Item 1 to have sprinklers shall comply with one of the following if the roof assembly is located more than 55 feet (16 764 mm) above the lowest level of fire department vehicle access needed to meet the provisions in Section 503.

   3.1. Provide *automatic sprinkler system* protection.

   3.2. Construct the *attic* using noncombustible materials.

   3.3. Construct the *attic* using *fire-retardant-treated wood* complying with Section 2303.2.

   3.4. Fill the *attic* with noncombustible insulation.
   The height of the roof assembly shall be determined by measuring the distance from the lowest required fire vehicle access road surface adjacent to the building to the eave of the highest pitched roof, the intersection of the highest roof to the exterior wall, or the top of the highest parapet, whichever yields the greatest distance. For the purpose of this measurement, required fire vehicle access roads shall include only those roads that are necessary for compliance with Section 503 of the *International Fire Code*.

~~4. Group R-4, Condition 2 occupancy *attics* not required by Item 1 to have sprinklers shall comply with one of the following:~~

~~4.1. Provide *automatic sprinkler system* protection.~~

~~4.2. Provide a heat detection system throughout the *attic* that is arranged to activate the building *fire alarm system.*~~

~~4.3. Construct the *attic* using noncombustible materials.~~

~~4.4. Construct the *attic* using *fire-retardant-treated wood* complying with Section 2303.2.~~

~~4.5. Fill the *attic* with noncombustible insulation.~~

[F] 903.3.1.3 NFPA 13D sprinkler systems. *Automatic sprinkler systems* installed in one- and two-family *dwellings* and *townhouses*; Group R-3; and Group R-4 shall be permitted to be installed throughout in accordance with NFPA 13D.

Add new text as follows:

[F] 903.3.1.3.1 Attic protection for Group R-4, Condition 2. Attic protection shall be provided as follows:

1. Attics that are used or intended for living purposes or storage shall be protected by an automatic sprinkler system.
2. Where fuel-fired equipment is installed in an unsprinklered attic, not fewer than one quick-response intermediate temperature sprinkler shall be installed above the equipment.
3. Group R-4, Condition 2 occupancy attics not required by Item 1 to have sprinklers shall comply with one of the following:

   3.1 Provide automatic sprinkler system protection.

   3.2 Provide a heat detection system throughout the attic that is arranged to activate the building fire alarm system.

   3.3 Construct the attic using noncombustible materials.

   3.4 Construct the attic using fire-retardant-treated wood complying with Section 2303.2 of the *International Building Code*.

   3.5 Fill the attic with noncombustible insulation.

Reason: In hindsight, I don't feel that it was clearly disclosed to the Fire Code Committee that the floor modification that was introduced to consolidate F100-24 with F101-24 had the consequence of moving R-4 Condition 2 from NFPA 13R to NFPA 13D protection. I am submitting this comment to ensure that this change is known as intentional and understood, and assuming that the Committee continues to support that path, the provisions for attic protection that were previously under NFPA 13R for R-4 Condition 2 occupancies need to be moved to NFPA 13D. This comment accomplishes that. However, if there is a desire to put R-4 Condition 2 back under NFPA 13R, a floor modification would need to be made to accomplish that.

As a reminder, Group R-4, is as follows:

> Residential Group R-4 occupancy shall include buildings, structures or portions thereof for more than five but not more than 16 persons, excluding staff, who reside on a 24-hour basis in a supervised residential environment and receive custodial care. Buildings of Group R-4 shall be classified as one of the occupancy conditions specified in Section 310.5.1 or 310.5.2. This group shall include, but not be limited to, the following:
>
> - Alcohol and drug centers
> - Assisted living facilities
> - Congregate care facilities
> - Group homes
> - Halfway houses
> - Residential board and care facilities
> - Social rehabilitation facilities

And, Condition 2 includes buildings in which there are any persons receiving custodial care who require limited verbal or physical assistance while responding to an emergency situation to complete building evacuation.

The code states "Group R-4 occupancies shall meet the requirements for construction as defined for Group R-3, except as otherwise provided for in this code." Given the construction and use of Condition 2 occupancies and the fact that Condition 1 occupancies are already permitted to use NFPA 13D, I don't believe that NFPA 13R truly offers a justifiable increase in protection vs what is provided by NFPA 13D for this application, with the possible exceptions of 1) Requiring a system to be monitored and/or have an exterior alarm (which I've not proposed in this comment, but could add as a floor modification if others feel strongly about this), and 2) Adding attic protection, which I recall was placed in the code a number of years ago following a fatal fire that involved an attic (which this comment provides for).

Disclosure: I am a consultant to the National Fire Sprinkler Association, but I have not consulted NFSA and do not represent NFSA on this comment.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Given that the committee has already recommended the cost reduction associated with moving R4 Condition 2 to NFPA 13D from NFPA 13R, this proposal simply moves the previously applicable attic protection provisions to NFPA 13D to stay with R4 Condition 2.

Comment (CAH2)# 778

F102-24

IFC: 903.2.8.4 (New); IBC: [F] 903.2.8.4 (New)

Proposed Change as Submitted

Proponents: Ken Brouillette, Seattle Fire Department, Seattle Fire Department (ken.brouillette@seattle.gov)

2024 International Fire Code

Add new text as follows:

903.2.8.4 Group R-3 occupancies less than 60 feet in height. Group R-3 occupancies referenced in Table 504.4 of the *International Building Code* shall be permitted to install an automatic sprinkler system in accordance with Section 903.3.1.3 when the building height does not exceed 60 feet above grade plane.

2024 International Building Code

Add new text as follows:

[F] 903.2.8.4 Group R-3 occupancies less than 60 feet in height. Group R-3 occupancies referenced in Table 504.4 shall be permitted to install an automatic sprinkler system in accordance with Section 903.3.1.3 when the building height does not exceed 60 feet above grade plane.

Reason: One- and two-family dwellings, manufactured homes, and townhouses are all within the scoping of NFPA 13D. This standard does not restrict the height of these structures. These types of occupancies should not be treated as equivalent to other types of residential type occupancies such as apartments or hotels and therefore should not be required to install an equivalent designed automatic sprinkler system.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

$0 or less. The design and installation of a NFPA 13D automatic sprinkler system is less than a NFPA 13R or NFPA 13 system.

Estimated Immediate Cost Impact Justification (methodology and variables):

The size and amounts of underground and overhead piping and other materials including labor cost would be less with a NFPA13D system.

F102-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee stated that the reasons for the disapproval of the proposal were: A Group R-3 occupancy may be a one- and two-family dwelling and be outside the scope of NFPA13D. There was also concern that the not exceeding 60 feet might be too low or a bad limitation. (Vote: 14-0)

F102-24

Individual Consideration Agenda

Comment 1:

IFC: 903.2.8.4; IBC: [F] 903.2.8.4

Proponents: Ken Brouillette, Seattle Fire Department, Seattle Fire Department (ken.brouillette@seattle.gov) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Fire Code

Revise as follows:

903.2.8.4 Group R-3 occupancies less than 60 feet in height. Buildings that do not contain more than two *dwelling units* ~~Group R-3 occupancies referenced in Table 504.4 of the *International Building Code*~~ shall be permitted to install an automatic sprinkler system in accordance with Section 903.3.1.3 when the building height does not exceed 60 feet above grade plane.

2024 International Building Code

Revise as follows:

[F] 903.2.8.4 Group R-3 occupancies less than 60 feet in height. Buildings that do not contain more than two *dwelling units* ~~Group R-3 occupancies referenced in Table 504.4~~ shall be permitted to install an automatic sprinkler system in accordance with Section 903.3.1.3 when the building height does not exceed 60 feet above grade plane.

Reason: The committee may not have understood the proposal because the proponent was unable to present in person. Their reasoning for disapproval was " A Group R-3 occupancy may be a one- and two-family dwelling and be outside the scope of NFPA13D." They have this wrong. NFPA 13D scoping is as follows: "This standard shall cover the design, installation, and maintenance of automatic sprinkler systems for protection against the fire hazards in one- and two-family dwellings, manufactured homes, and townhouses."

When a one-and two-family dwelling or townhouse falls out of the scoping of the International Residential Code because it is 4 stories, it then is a Group R-3 occupancy under the International Building Code. This one- or two-family dwelling or townhouse should be allowed to be built to 4 stories or 60 feet in height without having to change the automatic fire sprinkler system from a NFPA13D to 13R which is required per Table 503.4 and 503.4 of the IBC.

I have clarified with the language change that only buildings with no more than two dwelling units and are Group R-3 from the IBC are allowed to use NFPA 13D sprinkler systems.

The second reason the committee stated for disapproval was "There was also concern that the not exceeding 60 feet might be too low or a bad limitation."

I would agree that if NFPA 13D does not have a height or story restriction, then why limit it to 60 feet?

Please reconsider this cost saving proposal to allow a NFPA 13D in lieu of a NFPA 13R system as required in Tables 503.4 and 503.4 of the IBC for *Buildings* that do not contain more than two *dwelling units.*

Cost Impact: Decrease

Estimated Immediate Cost Impact:

Labor and materials will be reduced.

Estimated Immediate Cost Impact Justification (methodology and variables):

Less materials and labor cost will result in the decrease in cost.

Comment (CAH2)# 663

F103-24

IFC: 903.2.8.5 (New); IBC: [F] 903.2.8.5 (New)

Proposed Change as Submitted

Proponents: Ken Brouillette, Seattle Fire Department, Seattle Fire Department (ken.brouillette@seattle.gov)

2024 International Fire Code

Add new text as follows:

903.2.8.5 Group R-3 occupancies 4 stories or less above grade plane.. Group R-3 occupancies referenced in Table 504.4 of the *International Building Code* shall be permitted to install an *automatic sprinkler system* in accordance with Section 903.3.1.3 when the number of stories above grade plane does not exceed 4.

2024 International Building Code

Add new text as follows:

[F] 903.2.8.5 Group R-3 occupancies 4 stories or less above grade plane.. Group R-3 occupancies referenced in Table 504.4 shall be permitted to install an *automatic sprinkler system* in accordance with Section 903.3.1.3 when the number of stories above grade plane does not exceed 4.

Reason: One- and two-family dwellings, manufactured homes, and townhouses are all within the scoping of NFPA 13D. This standard does not restrict the number of stories of these structures. These types of occupancies should not be treated as equivalent to other types of residential type occupancies such as apartments or hotels and therefore should not be required to install an equivalent designed automatic sprinkler system.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

$0 or less. The installation of a NFPA 13D system is less expensive than the installation of a NFPA 13 or 13R system.

Estimated Immediate Cost Impact Justification (methodology and variables):

The cost of materials and labor are less for these types of systems.

F103-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee stated that the reason for the disapproval of the proposal was based on the previous action on F102. (Vote: 13-1)

F103-24

Proposed Change as Submitted

Proponents: Robert J Davidson, Davidson Code Concepts LLC, Self (rjd@davidsoncodeconcepts.com)

2024 International Fire Code

SECTION 903
AUTOMATIC SPRINKLER SYSTEMS

903.2 Where required. *Approved automatic sprinkler systems* in new buildings and structures shall be provided in the locations described in Sections 903.2.1 through 903.2.12. **Exception:** Spaces or areas in telecommunications buildings used exclusively for telecommunications equipment, associated electrical power distribution equipment, batteries not required to have an *automatic sprinkler system* by Section 1207 for energy storage systems and standby engines, provided that those spaces or areas are equipped throughout with an *automatic smoke detection system* in accordance with Section 907.2 and are separated from the remainder of the building by not less than 1-hour *fire barriers* constructed in accordance with Section 707 of the International Building Code or not less than 2-hour *horizontal assemblies* constructed in accordance with Section 711 of the International Building Code, or both.

Add new text as follows:

903.2.10.3 Lithium-ion or lithium metal powered vehicles.. An *approved automatic sprinkler system* shall be provided throughout fire areas used for the parking or storage of lithium-ion or lithium metal powered vehicles where the fire area exceeds 500 square feet (46.4 m2).

2024 International Building Code

SECTION 903
AUTOMATIC SPRINKLER SYSTEMS

[F] 903.2 Where required. *Approved automatic sprinkler systems* in new *buildings* and *structures* shall be provided in the locations described in Sections 903.2.1 through 903.2.12. **Exception:** Spaces or areas in telecommunications *buildings* used exclusively for telecommunications equipment, associated electrical power distribution equipment, batteries not required to have an *automatic sprinkler system* by Section 1207 of the *International Fire Code* for energy storage systems and standby engines, provided that those spaces or areas are equipped throughout with an *automatic smoke detection system* in accordance with Section 907.2 and are separated from the remainder of the *building* by not less than 1-hour *fire barriers* constructed in accordance with Section 707 or not less than 2-hour *horizontal assemblies* constructed in accordance with Section 711, or both.

Add new text as follows:

903.2.10.3 Lithium-ion or lithium metal powered vehicles . An *approved automatic sprinkler system* shall be provided throughout fire areas used for the parking or storage of lithium-ion or lithium metal powered vehicles where the fire area exceeds 500 square feet (46.4 m2).

Reason: Last cycle the hazards presented by lithium-ion or lithium metal battery powered vehicle s was addressed by adding the following two sections to the IFC and IBC.

903.2.9 Group S-1.

5. A Group S-1 fire area used for the storage of lithium-ion or lithium metal powered vehicles where the fire area exceeds 500 square

feet (46.4 m2).

902.2.9.1 Repair garages.

5. A Group S-1 fire area used for the storage of lithium-ion or lithium metal powered vehicles where the fire area exceeds 500 square feet (46.4 m2).

The hazard addressed is the same when located in a Group S-2 parking garage. This proposal uses the previously approved language to add the protection to S-2 parking garages for consistency.

It should be noted that NFPA 88A: Standard for Parking Structures, 2023, requires all parking garages to be protected by an automatic fire sprinkler system installed in accordance with NFPA 13.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

This proposal would require the same protection for S-2 parking garages that is required for S-1 occupancies currently. It will increase new construction costs of S-2 parking garages. The exact cost cannot be estimated but $4 per square foot can be used.

Estimated Immediate Cost Impact Justification (methodology and variables):

To provide an exact cost a set of detailed plans for the installation of the automatic sprinkler system in a given parking structure is necessary, then the unit costs for all of the parts required including manhours would need to be calculated for a given cost region, then a cost multiplier would need to be added or subtracted for every other cost region where the I-Codes are applied.

F108-24

Public Hearing Results (CAH1)

Errata: This proposal includes published errata https://www.iccsafe.org/wp-content/uploads/2024-Group-A-Consolidated-Monograph-Updates.pdf

Committee Action: **As Submitted**

Committee Reason: The committee stated that the reason for the approval of the proposal was that it provides consistency in the sprinkler requirements for parking garages. (Vote: 8-5)

F108-24

Individual Consideration Agenda

Comment 1:

Proponents: Steven Rosenstock, Edison Electric Institute, Edison Electric Institute (srosenstock@eei.org); Genevieve Cullen, Electric Drive Transportation Association (EDTA), EDTA (gcullen@electricdrive.org); Emily Kelly, ChargePoint (emily.kelly@chargepoint.com); Rick Tempchin, Alliance for Transportation Electrification (rick@evtransportationalliance.org); Tessa Sanchez, Tesla, Tesla, Inc. (tesanchez@tesla.com) requests Disapproved

Reason: In the IBC, S-2 facilities include “public parking garages, open or enclosed” and the category covers “Storage Group S-2 occupancies include, among others, buildings used for the storage of noncombustible materials such as products on wood pallets or in

paper cartons with or without single thickness divisions; or in paper wrappings." (source: ICC website at https://codes.iccsafe.org/s/CABC2022P1/chapter-3-occupancy-classification-and-use/CABC2022P1-Ch03-Sec311.3).

In public parking garages, lithium-ion vehicles are likely to be parked next to gasoline or diesel vehicles. Only in garages with multiple EV charging stations all next to each other serving the same row of parking will lithium-ion vehicles possibly be parked. For a public parking garage without EV charging stations, it will not be known where EV's will be parked.

Also, not all EV's will have lithium-ion batteries. Some include nickel-metal hydride batteries, while other vehicles use Lithium-Iron Phosphate (LFP) batteries or sodium-ion batteries. There are car companies working on developing solid-state batteries for EV in the near future.

Also, as the proponent stated, the 2023 edition of NFPA88A already contains "New requirements pertaining to emergency plans, pre-incident planning, mixing fans, and sprinklers". (source: https://www.nfpa.org/product/nfpa-88a-standard/p0088acode#2023-edition-details).

Also, according to the National Fire Sprinkler Association (https://nfsa.org/2024/04/30/fire-protection-for-parking-garages/).

"The 2023 NFPA 88A Standard for Parking Structures Section 6.4.1 now requires all new parking structures to be fully protected with fire sprinklers. This would include both open and closed structures regardless of size but does not affect existing parking structures already built.

What Does the NFPA 1 Fire Code Say About Fire Protection for Parking Garages?

The 2024 edition of NFPA 1 Fire Code Section 29.1.2 and the 2024 NFPA 101 Life Safety Code Section 42.8.3.5 both require all new parking garages to be fully sprinklered without any exception to size while once again not affecting existing structures."

In other words, all new parking garages, regardless of the type of vehicle that is parked or stored, have to install sprinklers.

This proposal could cause confusion, since it implies that only vehicles with lithium-ion vehicles have to have sprinklers.

Therefore, this language is not needed and should be disapproved.

Cost Impact: No change to code.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Comment (CAH2)# 416

F110-24

IFC: 903.3.1.1.2; IBC: [F] 903.3.1.1.2

Proposed Change as Submitted

Proponents: Jeffrey M Hugo, CBO, NFSA, National Fire Sprinkler Association (hugo@nfsa.org)

2024 International Fire Code

Revise as follows:

903.3.1.1.2 Bathrooms. In Group R occupancies, sprinklers shall not be required in bathrooms that do not exceed 55 square feet (5 m^2) in area and are located within individual *dwelling units* or *sleeping units*, provided that wall~~s~~ and ceiling~~s~~ coverings, including the walls and ceilings behind a shower enclosure or tub, are of noncombustible ~~or limited-combustible~~ materialsin accordance with Section 703.3.1 of the I*nternational Building Code* and providing ~~with~~ a 15-minute thermal barrier rating.

2024 International Building Code

Revise as follows:

[F] 903.3.1.1.2 Bathrooms. In Group R occupancies sprinklers shall not be required in bathrooms that do not exceed 55 square feet (5 m^2) in area and are located within individual *dwelling units* or *sleeping units*, provided that walls and ceilings, including the wall~~s~~ and ceiling~~s~~ coverings behind a shower enclosure or tub, are of noncombustible ~~or limited-combustible~~ materials in accordance with Section 703.3.1 and providing ~~with~~ a 15-minute thermal barrier rating.

Reason: The current IBC/IFC text is nearly identical to the requirement in found in NFPA 13. This proposal adjusts the intent of the text from NFPA 13 in the IBC/IFC and removes the term limited combustible, as it is not defined in the IBC/IFC (or the family of ICC codes) but is incorporated into IBC Section 703.3.1.

This change is important because the construction type in NFPA 13 is different than the type of construction in the IBC/IFC. NFPA 13 construction type addresses the protected space as the type of construction, for example, as combustible, noncombustible or limited-combustible, whereas the IBC type of construction addresses the structural components of the building as combustible or noncombustible (per 703.3.1). Currently, without this change, a literal read of this section would require the wall and ceiling construction to be entirely noncombustible, i.e., steel studs steel bar joists, concrete plank, etc.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

Source: Actual estimates and RS Means.

Noncombustible wall, 3 5/8 in steel stud, 16 in oc, 5/8 in. Type X each side: $4.33 - $4.40 sf

Combustible wall, 3 ½ in. wood stud, 16 in oc, 5/8 in. Type X, each side: $5.34 - $6.25 sf

Estimated Immediate Cost Impact Justification (methodology and variables):

Analogous methodology using actual current cost estimates and data from RS Means to create a range of cost for combustible and noncombustible walls. This proposal does lower the cost of construction as it clarifies the bathroom walls enclosing of the tub/shower unit can match the type of construction, such as Type V, with drywall versus constructing a totally noncombustible wall behind the tub/shower unit.

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason:
The committee stated that the reason for the disapproval of the proposal was that it was identified by the proponent and others in testimony that it needed additional revisions. It was expected to be followed up with further revisions for the second committee action hearing. (Vote: 13-0)

F110-24

Individual Consideration Agenda

Comment 1:

IFC: 903.3.1.1.2, NFPA Chapter 80 (New); IBC: [F] 903.3.1.1.2

Proponents: Marcelo Hirschler, GBH International, GBH International (mmh@gbhint.com); Jeffrey M Hugo, CBO, NFSA, National Fire Sprinkler Association (hugo@nfsa.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Fire Code

903.3.1.1.2 Bathrooms. In Group R occupancies, sprinklers shall not be required in bathrooms that do not exceed 55 square feet (5 m^2) in area and are located within individual *dwelling units* or *sleeping units*, provided that wall and ceiling coverings, including the walls and ceilings behind a shower enclosure or tub, ~~are of noncombustible materials in accordance with Section 703.3.1 of the *International Building Code* and providing a 15-minute thermal barrier rating.~~ are sheathed with one of the following:

1. A noncombustible material complying with Section 703.3.1 of the *International Building Code*.
2. An approved 15-minute thermal barrier that has been tested in accordance with and has met the acceptance criteria of both the temperature transmission fire test and the integrity fire test of NFPA 275.
3. 1/2-inch (12.7 mm) *gypsum wallboard.*

Add new standard(s) as follows:

NFPA

National Fire Protection Association
1 Batterymarch Park
Quincy, MA 02169-7471

275—22 Standard Method of Fire Tests for the Evaluation of Thermal Barriers

2024 International Building Code

[F] 903.3.1.1.2 Bathrooms. In Group R occupancies, sprinklers shall not be required in bathrooms that do not exceed 55 square feet (5 m2) in area and are located within individual *dwelling units* or *sleeping units*, provided that wall and ceiling coverings, including the walls and ceilings behind a shower enclosure or tub, ~~are of noncombustible materials in accordance with Section 703.3.1 of the *International Building Code* and providing a 15-minute thermal barrier rating.~~ are sheathed with one of the following:

1. A noncombustible material complying with Section 703.3.1.

2. An approved 15-minute thermal barrier that has been tested in accordance with and has met the acceptance criteria of both the temperature transmission fire test and the integrity fire test of NFPA 275.

3. 1/2-inch (12.7 mm) *gypsum wallboard*.

Reason: The current IBC/IFC text is nearly identical to the requirement in found in NFPA 13. This comment adjusts the intent of the text from NFPA 13 in the IBC/IFC and removes the term limited combustible, as it is not defined in the IBC/IFC (or the family of ICC codes) but is indirectly associated with the exception in IBC Section 703.3.1.

This change is important because the construction type in NFPA 13 is different than the type of construction in the IBC/IFC. NFPA 13 construction type addresses the protected space as the type of construction, for example, as combustible, noncombustible or limited-combustible, whereas the IBC type of construction addresses the structural components of the building as combustible or noncombustible (per 703.3.1). Currently, without this change, a literal read of this section would require the wall and ceiling construction to be entirely noncombustible, i.e., steel studs steel bar joists, concrete plank, etc.

The intent of the section is to permit materials (either noncombustible or complying with the thermal barrier criteria, with the original intent being to use gypsum wallboard) that are adequate to eliminate the need for sprinklers. In order to allow this sprinkler exception, the material needs to be applied to the studs before the tub and shower enclosure installation.

Note that the section was intending to refer to a thermal barrier (see IBC section 2603.4), which does not provide a "rating" but provides protection for 15 minutes because NFPA 275 requires the material to pass 2 tests, both of which are conducted for 15 minutes: NFPA 286 and a test based on the ASTM E119 time-temperature curve.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

see information with original proposal

Estimated Immediate Cost Impact Justification (methodology and variables):

see original proposal

Comment (CAH2)# 314

F111-24

IFC: 903.3.1.1.3; IBC: [F] 903.3.1.1.3

Proposed Change as Submitted

Proponents: Robert Marshall, FCAC, FCAC (fcac@iccsafe.org); Robert J Davidson, Davidson Code Concepts LLC, Self (rjd@davidsoncodeconcepts.com)

2024 International Fire Code

Revise as follows:

903.3.1.1.3 Lithium-Ion or lithium metal batteries. Where *automatic sprinkler systems* are required by this code for areas containing lithium-ion or lithium metal batteries, the design of the system shall be based on a series of fire tests. Such tests shall be conducted or witnessed and reported by an approved testing laboratory ~~involving test scenarios.~~ A report prepared by a registered design professional with expertise in fire protection engineering shall be provided to the fire code official for review and approval in accordance with Section 104.2.2 and shall that address the range of variables associated with the intended arrangement of the hazards to be protected.

2024 International Building Code

Revise as follows:

[F] 903.3.1.1.3 Lithium-ion or lithium metal batteries. Where *automatic sprinkler systems* are required by this code for areas containing lithium-ion or lithium metal batteries, the design of the system shall be based on a series of fire tests. Such tests shall be conducted or witnessed and reported by an *approved* testing laboratory ~~involving test scenarios that~~ . A report prepared by a registered design professional with expertise in fire protection engineering shall be provided to the fire code official for review and approval in accordance with Section 104.2.2 and shall address the range of variables associated with the intended arrangement of the hazards to be protected.

Reason: FCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and early 2024 the FCAC has held several virtual meetings and one in-person meeting open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the **FCAC Website**

There currently is a lack of full-size testing of battery arrangements in buildings. This leads to difficulties for the designer, builder and code official. There is design guidance from an approved laboratory based upon some large-scale burn testing, Factory Mutual, on sprinkler design and there are lab reports for many cells and/or modules that a designer could utilize in determining the correct level of sprinkler protection. This modification would provide for use of the information available provided a report prepared by a registered design professional with expertise in fire protection engineering is submitted for review and approval.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

$0.00

Estimated Immediate Cost Impact Justification (methodology and variables):

This proposal may reduce the cost of construction as it allows other ways of justifying performance where no testing data exists.

Public Hearing Results (CAH1)

Committee Action: **As Submitted**

Committee Reason: The committee stated that the reasons for the approval of the proposal were: It provides a good reminder because of the lack of guidance out there for the sprinkler protection criteria and typically for the storage of lithium-ion batteries alternate methods are used with jurisdictions. While there is no testing data there are also not really good methods to extend the module level test out, so that is almost as inaccurate as the testing data, but there is nothing better right now. (Vote: 14-0)

F111-24

Individual Consideration Agenda

Comment 1:

Proponents: Elley Klausbruckner, Klausbruckner & Associates, Self (jm@klausbruckner.com) requests Disapproved

Reason: We keep increasing the quantities and decreasing the requirements for lithium battery storage/use in the codes, without any sprinkler testing or justification. In the meantime, more lithium fires (some fatal) are occurring throughout the country. This is highly unprecedented. A fire in an energy storage system facility in San Diego in May took nearly 17 days to control and put out. There is no analysis a design profession can perform for a scenario such as this. There is no justification for the sprinkler criteria anyone can specify, design professional or otherwise, without actual testing.

The proponents suggest that a design professional can gather data and address fire sprinkler system criteria using FM Data Sheets. FM Data Sheet 5-33 only addresses Energy Storage Systems and not all lithium battery storage and use scenarios (e.g. batteries stacked high in manufacturing of cars, electric bikes in a retail store, etc.). Additionally, FM Data Sheet 5-33 states:

"*Provide automatic sprinkler protection designed to a 0.3 gpm/ft2 over 2500 ft2 or the room area, whichever is larger, with an additional allowance of 250 gal/min for hose stream.*"

The above is the only sprinkler criteria found for energy storage systems. The Data Sheet provides the following additional explanation:

"Limited research has been performed on lithium ion-based ESS systems to assess fire propagation characteristics and protection schemes. The report Development of Sprinkler Protection Guidance for Lithium Ion Based Energy Storage Systems, published in June 2019 on the FM Global Website, is the basis for recommendations on fire protection and separation distances from both noncombustible and combustible materials. However, it must be recognized that the research was limited in scope, and the effect of rack design, materials-of-construction, battery specifications and chemistry, and other design features are not well understood. Because of these issues, it does not appear possible to extrapolate the results obtained with the tested lithium iron phosphate (LFP) and Li-nickel manganese cobalt oxide (NMC) systems to other ESS. The recommendations in DS 5-33 represent the current state of knowledge. The data sheet will be updated as additional information is available."

Implying that a registered design professional can address sprinkler criteria without testing is highly inappropriate and misleading. Putting on the impossible decision of what is appropriate for these scenarios on the shoulders of design professionals, subjects the design professional to high liability. Additionally, under cost impact, the proponents state that this change allows other ways of justifying performance where no test data exists. In reality, by approving this code change, we are effectively discouraging manufacturers to run full scale testing on their lithium battery products, when test data is very much needed.

Bibliography: FM Data Sheet 5-33 [2020Ed.], Factory Mutual,, FM Global.

Cost Impact: No change to code.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

F116-24

IFC: 904.3.5; IBC: [F] 904.3.5

Proposed Change as Submitted

Proponents: James Carver, Self, Southern California Fire Prevention Officer's Association

2024 International Fire Code

Revise as follows:

904.3.5 Monitoring. Where a building *fire alarm system* or a dedicated function fire alarm system is installed, *automatic fire-extinguishing systems* shall be monitored by the building *fire alarm system* or dedicated function fire alarm system in accordance with NFPA 72.

2024 International Building Code

Revise as follows:

[F] 904.3.5 Monitoring. Where a building *fire alarm system* or a dedicated function fire alarm system is installed, *automatic fire-extinguishing systems* shall be monitored by the building *fire alarm system* or dedicated function fire alarm system in accordance with NFPA 72.

Reason: A proposal to require pre-engineered fire extinguishing systems and other alternative automatic fire-extinguishing systems to be connected to a Dedicated Function fire alarm system when the building does not have a fire alarm system installed. Currently, the IFC only requires automatic fire-extinguishing systems to be monitored by a building fire alarm system.

Some agencies have interpreted that a dedicated function fire alarm system meets the requirement for a building fire alarm system. IFC Section 202 has the following definition for a fire alarm system:

FIRE ALARM SYSTEM.

A system or portion of a combination system consisting of components and circuits arranged to monitor and annunciate the status of fire alarm or supervisory signal-initiating devices and to initiate the appropriate response to those signals.

NFPA 72, 2022 edition has the following definition for a fire alarm system and a building fire alarm system:

3.3.118 Fire Alarm System.

A system or portion of a combination system that consists of components and circuits arranged to monitor and annunciate the status of fire alarm or supervisory signal-initiating devices and to initiate the appropriate response to those signals. (SIG-FUN)

3.3.118.4.1 Building Fire Alarm System.

A protected premises fire alarm system that includes any of the features identified in 23.3.3.1 and that serves the general fire alarm needs of a building or buildings and provides notification. (SIG-PRO)

With NFPA 72 providing a definition for a building fire alarm system, I believe it is the current intent of the IFC to not require a Dedicated Function fire alarm system to monitor a pre-engineered fire extinguishing system, or other alternative automatic fire-extinguishing system. This proposal would clarify the requirement for monitoring of automatic fire extinguishing systems. In most cases, automatic fire extinguishing systems activate prior to activation for the sprinkler system. A pre-engineered fire extinguishing system protecting a commercial kitchen hood activates when the hood system senses fire, prior to, and often without activation of the sprinkler system. When

the automatic fire extinguishing system is monitored, there would be earlier notification to the fire department.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

The proposal could have an increase in construction cost for installation of a dedicated function fire alarm system. If the automatic fire extinguishing system is located near the fire alarm control unit or the fire alarm system initiating circuit wiring, there would be no significant cost impact. An example of increased cost would be a strip mall, where the automatic fire extinguishing system is located at one end of the strip mall and the fire alarm control unit is located at the other end. In this case, a 5% increase in system cost could be expected.

Based upon a $1.00-$3.00 estimate from Chat GPT this would increase by $0.05 to $0.15 per sq ft.

Estimated Immediate Cost Impact Justification (methodology and variables):

The proposal could have an increased system cost of approximately 5% for the installation of additional fire alarm initiating device circuit wiring to the automatic fire extinguishing system.

Estimated Life Cycle Cost Impact:

There is not estimated additional life cycle cost for this proposal.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

There is not estimated additional life cycle cost for this proposal.

F116-24

Public Hearing Results (CAH1)

Errata: This proposal includes published errata https://www.iccsafe.org/wp-content/uploads/2024-Group-A-Consolidated-Monograph-Updates.pdf

Committee Action: **Disapproved**

Committee Reason: The committee stated the reasons for the disapproval of the proposal were: It gives a bad option. If you do have a building fire alarm and a dedicated functional fire alarm you are actually permitted to monitor them separately, and that is not the intent. NFPA 72 covers dedicated function fire alarm systems, and it is referenced there, and also it is not a defined term in the IFC. (Vote: 14-0)

F116-24

Individual Consideration Agenda

Comment 1:

IFC: 904.3.5, 904.3.5.1 (New); IBC: [F] 904.3.5, [F] 904.3.5.1 (New)

Proponents: James Carver, Self, Southern California Fire Prevention Officer's Association (james90245@pacbell.net) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Fire Code

904.3.5 Monitoring. Where a building *fire alarm system* ~~or a dedicated function fire alarm system~~ is installed, *automatic fire-extinguishing systems* shall be monitored by the building *fire alarm system* ~~or dedicated function fire alarm system~~ in accordance with NFPA 72.

Add new text as follows:

904.3.5.1 Alternative automatic fire extinguishing systems. Where a dedicated function fire alarm system is installed, alternative automatic fire-extinguishing systems shall be monitored by the dedicated function fire alarm system in accordance with NFPA 72.

2024 International Building Code

[F] 904.3.5 Monitoring. Where a building *fire alarm system* ~~or a dedicated function fire alarm system~~ is installed, *automatic fire-extinguishing systems* shall be monitored by the building *fire alarm system* ~~or dedicated function fire alarm system~~ in accordance with NFPA 72.

Add new text as follows:

[F] 904.3.5.1 Alternative automatic fire extinguishing systems. Where a dedicated function fire alarm system is installed, alternative automatic fire-extinguishing systems shall be monitored by the dedicated function fire alarm system in accordance with NFPA 72.

Reason: During the 1st Committee Hearing in Orlando, The Committee expressed concern that the code proposal would require a separate fire alarm system for the alternative automatic fire extinguishing system monitoring. This revised proposal identifies a separate code requirement when a building only has a dedicated function fire alarm system monitoring the fire sprinkler system to also monitor the alternative automatic fire extinguishing system.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The revised proposal provides clarification for the initial proposal, there is no increase or decrease in construction costs from the initial proposal.

Comment (CAH2)# 179

F117-24

IFC: 904.7, 904.7.1 (New), 904.7.1, 904.7.3 (New); IBC: [F] 904.7, [F] 904.7.1 (New)

Proposed Change as Submitted

Proponents: Kevin Scott, KH Scott & Associates LLC, self (khscottassoc@gmail.com)

2024 International Fire Code

904.7 Foam systems. Foam-extinguishing systems shall be installed, maintained, periodically inspected and tested in accordance with NFPA 11 and their listing. Records of inspections and testing shall be maintained.

Add new text as follows:

904.7.1 Foam concentrate type. The foam concentrate type utilized in foam-extinguishing systems shall be in accordance with NFPA 11 and shall not contain intentionally-added polyfluoroalkyl substances or perfluoroalkyl substances (PFAS).

Revise as follows:

~~**904.7.1**~~ **904.7.2 System test.** Foam-extinguishing systems shall be inspected and tested at intervals in accordance with NFPA 25.

Add new text as follows:

904.7.3 Existing foam systems. Existing supplies of firefighting foam containing PFAS shall be replaced with a foam concentrate type complying with Section 904.7.1 based on the following schedule, whichever occurs first:

1. The tank containing AFFF is due for a hydrostatic test in accordance with Section 11.3.5 of NFPA 25.
2. The foam concentrate fails the annual quality condition test required in Section 11.3.1.1 of NFPA 25. The owner shall notify the fire code official after a failed quality condition test and establish a timeframe for replacement foam concentrate and necessary components that is acceptable to the fire code official.

2024 International Building Code

[F] 904.7 Foam systems. *Foam-extinguishing systems* shall be installed, maintained, periodically inspected and tested in accordance with NFPA 11 and their listing. Records of inspections and testing shall be maintained.

Add new text as follows:

[F] 904.7.1 Foam concentrate type. The foam concentrate type utilized in foam-extinguishing systems shall be in accordance with NFPA 11 and shall not contain intentionally-added polyfluoroalkyl substances or perfluoroalkyl substances (PFAS).

Reason: Aqueous film-forming foam concentrates (AFFF) contain PFAS (polyfluoroalkyl substances or perfluoroalkyl substances). PFAS is referred to as a “forever chemical”, and U.S. EPA has determined that exposure to PFAS can have detrimental health effects. To address this situation, this proposal is one of three code changes addressing AFFF in fire-extinguishing systems.

Thousands of existing foam fire-extinguishing systems exist across the country. EPA and some states have already taken actions to remove or reduce materials containing PFAS that could present an exposure. This proposal is designed to replace the current AFFF supplies, and have the foam concentrate supply replaced with a nonfluorinated foam concentrate.

Section 904.7.2 is added to the code to specify that the type of foam concentrate must be in accordance with NFPA 11 and must not contain any intentionally added PFAS. The 2021 edition of NFPA 11 now includes criteria for protection with nonfluorinated foam.

Section 904.7.3 is added to set a trigger replacement of existing AFFF foam concentrate supplies with a nonfluorinated foam supply. Along with the items listed in Section 904.7.2, EPA and states may specify a certain date for replacement. The items listed in Section 904.7.2 represent occurrences in the life of the foam-extinguishing system. When either of these situations occur, it is time to replace the foam concentrate supply. This section refers back to Section 904.7.2 for approval of the type of foam concentrate used as the new supply.

Replacement with the newer nonfluorinated foam concentrates is not a simple swap of tank contents—much or all of the existing system equipment and piping may need to be replaced. Usually, the quantity of foam will increase resulting in the need for a larger supply and tank. Often, the foam-water sprinklers or nozzles need to be replaced for this new concentrate. Nonfluorinated foam concentrates are typically more viscous than AFFF, so a different eductor or foam pump is required. With all of this time, work, supplies of concentrate and equipment needed, it is not possible to replace all of these systems in a short time. It is not uncommon for a single facility to have thousands of gallons of product ready for system activation, and another stock of AFFF for replenishment after system activation.

Item 1 states that when the AFFF bladder tank is due for hydrostatic testing, the foam is to be replaced. The requirement for testing is every ten years. During hydrostatic testing, the foam concentrate is removed from the tank presenting an obvious opportunity to refill the tank with nonfluorinated foam. The date for hydrostatic retesting is known years in advance. This advance notice provides time to determine what other components of the extinguishing system must also be replaced, with the intent to ensure a minimal down time.

Item 2 states that when the foam concentrate fails the annual quality condition testing, it shall be replaced. The real-world practice when the foam concentrate fails the quality condition test is to test it again. Once it is confirmed that the concentrate has failed, the next step is to establish a plan for replacement. At this point, the fire code official is involved in determining the timeframe for replacement. There have been incidents where foam, that has failed the quality condition testing, has successfully controlled and extinguished a fire. The decision on the urgency should be based on whether quality condition tests have been completed annually and what portion of the piping and appurtenances must be replaced at the same time the foam is replaced. This will allow the transition to nonfluorinated foam to occur with the least down time.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

This proposal does not increase the cost of construction, but it will increase the cost of maintenance of an existing AFFF system. U.S. EPA has placed a ban on use of AFFF for new installations and many manufacturers are no longer producing AFFF.

Estimated Immediate Cost Impact Justification (methodology and variables):

The estimate for construction costs is for little change in cost. An internet search on January 8, 2023 found the following product costs:

1. Chemguard 3%/6% AR-AFFF 5 gallons at $266.95
2. Chemguard 3%/3% AR-NFFF 5 gallons at $266.48

It is obvious that the cost of the product will have little impact.

The increase on maintenance costs could be significant depending on the size of the system, and whether the existing piping network needs to be replaced. There are too many variables to develop an accurate estimate.

F117-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee stated that the reasons for the disapproval of the proposal were: This is a big concern, but it should be handled on the state or EPA level. It is not the position of the fire code to regulate environmental substances. The time frame is problematic. It is being adjusted on the local level, and there are probably a lot more things that need to be done when you replace these

systems. There is no foam for big tank fires now. (Vote: 13-0)

F117-24

Individual Consideration Agenda

Comment 1:

IFC: 904.7.1, 904.7.2, 904.7.2.1 (New), 904.7.3; IBC: [F] 904.7.1

Proponents: Kevin Scott, KH Scott & Associates LLC, self (khscottassoc@gmail.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Fire Code

Revise as follows:

904.7.1 Foam concentrate type. The foam concentrate type utilized in foam-extinguishing systems shall be in accordance with NFPA 11 and shall ~~not contain intentionally added polyfluoroalkyl substances or perfluoroalkyl substances (PFAS)~~be approved by the fire code official and the fire chief.

904.7.2 System test. Foam-extinguishing systems shall be inspected and tested at intervals in accordance with NFPA 25.

Add new text as follows:

904.7.2.1 Foam concentrate test. Where the foam concentrate supply fails the annual quality condition test required in Section 11.3.1.1 of NFPA 25, the owner shall notify the fire code official. The foam concentrate shall be replaced in a manner approved by the fire code official and the fire chief.

Delete without substitution:

~~**904.7.3 Existing foam systems.** Existing supplies of firefighting foam containing PFAS shall be replaced with a foam concentrate type complying with Section 904.7.1 based on the following schedule, whichever occurs first:~~

1. ~~The tank containing AFFF is due for a hydrostatic test in accordance with Section 11.3.5 of NFPA 25.~~
2. ~~The foam concentrate fails the annual quality condition test required in Section 11.3.1.1 of NFPA 25. The owner shall notify the fire code official after a failed quality condition test and establish a timeframe for replacement foam concentrate and necessary components that is acceptable to the fire code official.~~

2024 International Building Code

Revise as follows:

[F] 904.7.1 Foam concentrate type. The foam concentrate type utilized in foam-extinguishing systems shall be in accordance with NFPA 11 and shall ~~not contain intentionally added polyfluoroalkyl substances or perfluoroalkyl substances (PFAS)~~be approved by the fire code official and the fire chief.

Reason: This item was Disapproved at CAH 1. This comment has been revised based on comments received at CAH 1.

This comment simplifies the proposal and ensures that the proper officials are involved in the selection and replacement of foam concentrate. Section 904.7.2 is revised to require that the foam concentrate must be approved by the code official and the fire chief. There are certain times when the fire chief needs to be involved; this is one of those times, because the fire department will be using the foam concentrate during firefighting operations.

There was also a concern about the replacement of existing systems. It is true that there is not yet a straight exchange foam concentrate for AFFF. Therefore, when the foam concentrate is replaced, typical some or most of the piping and appurtenances must be replaced also. Section 904.7.3 is deleted and in its place Section 904.7.2.1 is inserted. Section 904.7.2.1 states that when the foam concentrate fails the annual quality assurance test, that the code official is notified. The code does not state what the resolution is to be, rather it states that whatever the resolution is it must be approved by the fire code official and the fire chief.

The resolution could be to replace establish a plan for replacement of the system and transition to a new foam concentrate; or other alternate temporary solutions. But the code official and fire chief will be involved in that decision.

Cost Impact: Increase

Estimated Immediate Cost Impact:

This proposal does not increase the cost of construction, but it will increase the cost of maintenance of an existing AFFF system. U.S. EPA has placed a ban on use of AFFF for new installations and most manufacturers are no longer producing AFFF.

Estimated Immediate Cost Impact Justification (methodology and variables):

The estimate for construction costs is for little change in cost. An internet search on January 8, 2023 found the following product costs:

1. Chemguard 3%/6% AR-AFFF 5 gallons at $266.95
2. Chemguard 3%/3% AR-NFFF 5 gallons at $266.48

It is obvious that the cost of the product will have little impact.
The increase on maintenance costs could be significant depending on the size of the system, and whether the existing piping network needs to be replaced. There are too many variables to develop an accurate estimate.

Proposed Change as Submitted

Proponents: Rick Trieste, Consolidated Edison Company of New York, Consolidated Edison Company of New York (triester@coned.com)

2024 International Fire Code

Add new definition as follows:

FUEL GAS ALARM . A single- or multiple-station alarm intended to detect fuel gas and alert occupants by a distinct audible signal. It incorporates a sensor, control components and an alarm notification appliance in a single unit.

FUEL GAS DETECTOR. A device with an integral sensor to detect fuel gas and transmit an alarm signal to a connected alarm control unit and is part of a fuel gas detection system.

FUEL GAS DETECTION SYSTEM. A system or portion of a combination system consisting of components and circuits arranged to monitor and annunciate the status of fuel gas detectors and to initiate the appropriate response to those signals.

FUEL-GAS SOURCE. Any combustion equipment that utilizes a gas that, when combined with an oxidizer (typically air or oxygen), could be burned to produce thermal energy. Examples of fuel gases include, but are not limited to, natural gas, methane, or liquefied petroleum gases (LP-Gas) such as propane and butane.

Add new text as follows:

SECTION 918
FUEL-GAS DETECTION

918.1 General. New and existing buildings shall be provided with fuel-gas detection in accordance with Section 918.

918.2 Where required. Fuel-gas detection shall be provided in Group R occupancies that are served by a fuel-gas source.

918.2.1 Dwelling units and sleeping units. Fuel-gas detection for *dwelling units* and *sleeping units* shall comply with Sections 918.2.1.2 and 918.2.1.3.

918.2.1.2 Fuel-Gas source. Where a *fuel-gas source* is located outside of a bedroom or sleeping room, fuel-gas detection shall be installed in *dwelling units* and *sleeping units* either outside of each separate sleeping area in the immediate vicinity of the bedrooms or sleeping room or within each bedroom or sleeping room. Where a fuel-gas source is located within a bedroom or sleeping room, or a bathroom attached to either, fuel-gas detection shall be installed within the bedroom or sleeping room.

918.2.1.3 Environmental limitations for detection devices. Where environmental conditions in an enclosed room or space are incompatible with fuel-gas detection devices, fuel-gas detection shall be provided in an approved adjacent location.

918.3 Detection devices. Fuel-gas detection shall be provided by fuel-gas alarms complying with Section 918.3.1 or a fuel-gas detection system complying with Section 918.3.2.

918.3.1 Fuel-gas alarms. Fuel-gas alarms complying with Sections 918.3.1 through 918.3.1.3 and installed in accordance with NFPA 715 and the manufacturer's instructions shall be provided in either of the following:

1. In dwelling units and sleeping units in accordance with 918.2.1.
2. In normally occupied locations other than dwelling units or sleeping units, where approved by the fire code official and the manufacturer's instructions, fuel-gas alarms shall be annunciated by an audible and visual signal in an approved location.

918.3.1.1 Power source. Fuel-gas alarms shall receive their primary power from the building wiring where such wiring is served from a commercial source and shall be provided with a battery backup. Wiring shall be permanent and without a disconnecting switch other than that required for overcurrent protection. **Exception:** Fuel-gas alarms shall be permitted to be battery powered in buildings without a power source.

918.3.1.2 Listings. Fuel-gas alarms shall be listed in accordance with UL 1484.

918.3.1.3 Interconnection. Where more than one fuel-gas alarm is installed, actuation of any alarm shall cause all alarms to signal an alarm condition.

918.3.2 Fuel-gas detection systems. Fuel-gas detection systems shall be installed in accordance with NFPA 715 and the manufacturer's instructions.

918.3.2.1 Fire alarm system integration. Where a building fire alarm system or combination fire alarm system, as defined in NFPA 72, is provided, fuel-gas detection shall be provided by connecting fuel-gas detectors to the fire alarm system.

918.3.2.2 Listings. Fuel-gas detectors shall be listed in accordance with UL 2075.

918.3.2.3 Alarm notification. Activation of a fuel-gas detector shall initiate audible and visible alarm notification throughout the building and annunciate the alarm signal at the control unit. **Exception:** Notification shall be permitted to be limited to the area where the fuel-gas alarm signal originated and other signaling zones specified in an approved fire safety plan, provided that an approved on-site or off-site location is automatically notified.

918.4 Maintenance. Fuel-gas alarms and fuel-gas detection systems shall be maintained in accordance with NFPA 715 and the manufacturer's instructions.

Add new standard(s) as follows:

1484-2022	Residential Gas Detectors

2024 International Building Code

Add new definition as follows:

[F] FUEL GAS ALARM. A single- or multiple-station alarm intended to detect fuel gas and alert occupants by a distinct audible signal. It incorporates a sensor, control components and an alarm notification appliance in a single unit.

[F] FUEL GAS DETECTOR. A device with an integral sensor to detect fuel gas and transmit an alarm signal to a connected alarm control

unit and is part of a fuel gas detection system.

[F] FUEL GAS DETECTION SYSTEM. A system or portion of a combination system consisting of components and circuits arranged to monitor and annunciate the status of fuel gas detectors and to initiate the appropriate response to those signals.

[F] FUEL-GAS SOURCE. Any combustion equipment that utilizes a gas that, when combined with an oxidizer (typically air or oxygen), could be burned to produce thermal energy. Examples of fuel gases include, but are not limited to, natural gas, methane, or liquefied petroleum gases (LP-Gas) such as propane and butane.

Add new text as follows:

SECTION 918
FUEL-GAS DETECTION

[F] 918.1 General. New and existing buildings shall be provided with fuel-gas detection in accordance with Section 918.

[F] 918.2 Where required. Fuel-gas detection shall be provided in Group R occupancies that are served by a fuel-gas source.

[F] 918.2.1 Dwelling units and sleeping units. Fuel-gas detection for *dwelling units* and *sleeping units* shall comply with Sections 918.2.1.2 and 918.2.1.3.

[F] 918.2.1.2 Fuel-Gas source. Where a *fuel-gas source* is located outside of a bedroom or sleeping room, fuel-gas detection shall be installed in *dwelling units* and *sleeping units* either outside of each separate sleeping area in the immediate vicinity of the bedrooms or sleeping room or within each bedroom or sleeping room. Where a fuel-gas source is located within a bedroom or sleeping room, or a bathroom attached to either, fuel-gas detection shall be installed within the bedroom or sleeping room.

[F] 918.2.1.3 Environmental limitations for detection devices. Where environmental conditions in an enclosed room or space are incompatible with fuel-gas detection devices, fuel-gas detection shall be provided in an approved adjacent location.

[F] 918.3 Detection devices. Fuel-gas detection shall be provided by fuel-gas alarms complying with Section 918.3.1 or a fuel-gas detection system complying with Section 918.3.2.

[F] 918.3.1 Fuel-gas alarms. Fuel-gas alarms complying with Sections 918.3.1 through 918.3.1.3 and installed in accordance with NFPA 715 and the manufacturer's instructions shall be provided in either of the following:

1. In dwelling units and sleeping units in accordance with 918.2.1.
2. In normally occupied locations other than dwelling units or sleeping units, where approved by the fire code official and the manufacturer's instructions, fuel-gas alarms shall be annunciated by an audible and visual signal in an approved location.

[F] 918.3.1.1 Power source. Fuel-gas alarms shall receive their primary power from the building wiring where such wiring is served from a commercial source and shall be provided with a battery backup. Wiring shall be permanent and without a disconnecting switch other than that required for overcurrent protection. **Exception:** Fuel-gas alarms shall be permitted to be battery powered in buildings without a power source.

[F] 918.3.1.2 Listings. Fuel-gas alarms shall be listed in accordance with UL 1484.

[F] 918.3.1.3 Interconnection. Where more than one fuel-gas alarm is installed, actuation of any alarm shall cause all alarms to signal an alarm condition.

[F] 918.3.2 Fuel-gas detection systems. Fuel-gas detection systems shall be installed in accordance with NFPA 715 and the manufacturer's instructions.

[F] 918.3.2.1 Fire alarm system integration. Where a building fire alarm system or combination fire alarm system, as defined in NFPA 72, is provided, fuel-gas detection shall be provided by connecting fuel-gas detectors to the fire alarm system.

[F] 918.3.2.2 Listings. Fuel-gas detectors shall be listed in accordance with UL 2075.

[F] 918.3.2.3 Alarm notification. Activation of a fuel-gas detector shall initiate audible and visible alarm notification throughout the building and annunciate the alarm signal at the control unit. **Exception:** Notification shall be permitted to be limited to the area where the fuel-gas alarm signal originated and other signaling zones specified in an approved fire safety plan, provided that an approved on-site or off-site location is automatically notified.

[F] 918.4 Maintenance. Fuel-gas alarms and fuel-gas detection systems shall be maintained in accordance with NFPA 715 and the manufacturer's instructions.

715-2023 Standard for the Installation of Fuel Gases Detection and Warning Equipment

UL

UL LLC
333 Pfingsten Road
Northbrook, IL 60062

1484-2022 Residential Gas Detectors

Reason: This Proposal seeks to protect occupants in Group-R occupancies from fires caused by natural gas or propane explosions or leaks. The proposal is in response to recommendation by the National Transportation Safety Board (NTSB) in NTSB Report NTSB/PAR-19/01 PB2019-100722 *Building Explosion and Fire Silver Spring, Maryland* that the ICC "….. requires methane detection systems for all types of residential occupancies with gas service." The recommendation by the NTSB is supported by a 2018 NFPA report, *Natural Gas and Propane Fires, Explosions and Leaks Estimates and Incidents - Marty Ahrens and Ben Evarts October 2018:*

- Between 2012 and 2016 an estimated average of 4,200 U.S. home structure fires per year started with the ignition of natural gas that caused an average of 40 deaths per year. The report classifies homes as one- and two-family homes, including manufactured homes, and apartments and other multi-family housing.
- Natural gas or LP-Gas leaks have generally been increasing since 2007

The requirements in this proposal are based on the 2023 edition of NFPA 715 standard, *Installation for Fuel Gas Detection and Warning Equipment*. The technical requirements in NFPA 715 were based on the Fire Protection Research Foundation (FPRF) report, *Combustible Gas Dispersion in Residential Occupancies and Detector Location Analysis.* The report studied combustible gas leaks and dispersion in residential buildings, as well as an analysis of combustible gas detector placement.

Con Edison recognizes the life-saving benefit of fuel gas detection devices and as such is installing gas detection devices in every building served with natural gas with over 275,000 devices in service to date of a program that will install about 375,000 devices. The in-service devices report all detection alarms wirelessly to the Company. The program is the US largest case study for safety benefit of fuel gas detection devices and has demonstrated the reliability of the technology and the safety benefit. The Company devices have detected multiple atmospheric natural gas readings that posed a risk of fire/explosion, which was avoided by an immediate action by first responders that arrive in under 5 minutes of first detection. New York City through its Local Law 157 requires natural gas detection devices in residential occupancies served with natural gas.

Additionally, this proposal is adding new definitions for fuel gas alarm, fuel gas detector and fuel gas detection system to clarify what is intended by these terms.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

The installation of fuel gas detection as part of building construction is estimated to be approximately $500.

Estimated Immediate Cost Impact Justification (methodology and variables):

Estimated detector unit cost: $50 ea.

Estimated electric box/wiring installation cost based on NYC licensed electrical contractor cost when being installed as part of new construction or renovation: $120 ea.

Estimate based on three (3) wired detectors: One (1) unit by cooking appliances; one (1) unit by heating/clothes drying equipment; one (1) outside sleeping area as required in proposal.

Estimated cost of 3 units installed in 3 wired boxes: Approximately $500

F152-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason:
The committee stated that the reasons for the disapproval of the proposal were: The cost justification is not there to require these throughout all Group R occupancies. It is not ready to be demanded at that level. While there is going to be a potential for such protection, especially as systems age, the approach should be incremental for existing buildings. Instead of a blanket requirement to retroactively require there should be some sort of program such as when it is being sold or as rentals occur where protection is required.

The justification of cost versus the number of incidents. The words gas alarm and gas detector are used interchangeably but they are very different. The terminology needs to be clarified and additional justification for these requirements is needed. There is confusion about interconnection and then connection to an alarm and annunciate the alarm. There is going to be a lot that goes with this to educate people regarding the different signal of the gas detection versus from their carbon monoxide alarm or smoke alarm. What do you do when it goes off if it is just interconnected within the home?

There are a lot of unresolved issues. The reference to NFPA 715 may be appropriate. This is not something that is new. This has been around for a long time. There is data about incidents, but NFPA 715 is not complete yet. This is not an instance where we want to have the codes getting ahead of the standard, instead let the standard be finished first. It can be evaluated where they are and then decide if it is appropriate. This should be in the IFGC and not in the IFC and IBC. The proposal is lumping LP gas with natural gas and there are some inherent differences between those two gases. There are inherent safety benefits to natural gas. In the future, there may be a benefit if they are separated out in the statistics and look at these as two separate hazards. (Vote: 13-0)

Proponents: Rick Trieste, Consolidated Edison Company of New York, Consolidated Edison Company of New York (triester@coned.com) requests As Modified by Committee (AMC2)

Replace as follows:

2024 International Fire Code

Add new definition as follows:

FUEL GAS ALARM . A single- or multiple-station alarm intended to detect fuel gas and alert occupants by a distinct audible signal. It incorporates a sensor, control components and an alarm notification appliance in a single unit.

FUEL GAS DETECTOR. A device with an integral sensor to detect fuel gas and transmit an alarm signal to a connected alarm control unit and is part of a fuel gas detection system.

FUEL GAS DETECTION SYSTEM. A system or portion of a combination system consisting of components and circuits arranged to monitor and annunciate the status of fuel gas detectors and to initiate the appropriate response to those signals.

FUEL-GAS SOURCE. Any combustion equipment that utilizes a gas that, when combined with an oxidizer (typically air or oxygen), could be burned to produce thermal energy. Examples of fuel gases include, but are not limited to, natural gas, methane, or liquefied petroleum gases (LP-Gas) such as propane and butane.

Add new text as follows:

SECTION 918
FUEL-GAS DETECTION

918.1 General. Where required, fuel gas detection shall be installed in accordance with Section 918.

918.2 Where required. Fuel-gas detection shall be provided in Group R occupancies that are served by a fuel-gas source.

918.2.1 Dwelling units and sleeping units. Fuel-gas detection for *dwelling units* and *sleeping units* shall comply with Sections 918.2.1.2 and 918.2.1.3.

918.2.1.2 Fuel-Gas source. Where a *fuel-gas source* is located within a residential Group R building, but not in *dwelling units and sleeping units*, fuel-gas detection shall be installed in accordance with NFPA 715 or in accordance with an approved plan that complies with the manufacturer's instructions. Where a fuel-gas source is located within a dwelling unit or sleeping unit, or a bathroom attached to either, fuel-gas detection shall be installed within the dwelling unit or sleeping unit in accordance with NFPA 715

918.2.1.3 Environmental limitations for detection devices. Where a physical space or environmental conditions in an enclosed room or space are incompatible with fuel-gas detection devices, fuel-gas detection shall be provided in an approved adjacent location.

918.3 Detection devices. Fuel-gas detection shall be provided by fuel-gas alarms complying with Section 918.3.1 or a fuel-gas detection system complying with Section 918.3.2.

918.3.1 Fuel-gas alarms. Fuel-gas alarms shall be installed in accordance with NFPA 715 and the manufacturer's instructions shall be provided in either of the following:

1. In dwelling units and sleeping units in accordance with 918.2.1.

2. In normally occupied locations other than dwelling units or sleeping units, where required by the fire code official, fuel-gas alarms shall be annunciated by an audible and visual signal in an approved location and in accordance with the manufacturer's instructions.

918.3.1.1 Power source. Fuel-gas alarms shall receive their primary power from the building wiring where such wiring is served from a commercial source and shall be provided with a battery backup. Wiring shall be permanent and without a disconnecting switch other than that required for overcurrent protection. **Exception:** Fuel-gas alarms shall be permitted to be battery powered in buildings without a power source.

918.3.1.2 Listings. Fuel-gas alarms shall be listed in accordance with UL 1484.

918.3.1.3 Interconnection. Where more than one fuel-gas alarm is installed, actuation of any alarm shall cause all alarms to signal an alarm condition.

918.3.2 Fuel-gas detection systems. Fuel-gas detection systems shall be installed in accordance with NFPA 715 or in accordance with an approved plan that complies with the manufacturer's instructions.

918.3.2.1 Fire alarm system integration. Where a building fire alarm system or combination fire alarm system, as defined in NFPA 72, is provided, fuel-gas detection shall be provided by connecting fuel-gas detectors to the fire alarm system.

918.3.2.2 Listings. Fuel-gas detectors shall be listed in accordance with UL 2075.

918.3.2.3 Alarm notification. Activation of a fuel-gas detector shall initiate audible and visible alarm notification throughout the building and annunciate the alarm signal at the control unit. **Exception:** Notification shall be permitted to be limited to the area where the fuel-gas alarm signal originated and other signaling zones specified in an approved fire safety plan, provided that an approved on-site or off-site location is automatically notified.

918.4 Maintenance. Where the maintenance of fuel-gas alarms and fuel-gas detection systems is required, they shall be maintained in accordance with NFPA 715 and the manufacturer's instructions.

Add new standard(s) as follows:

NFPA

National Fire Protection Association
1 Batterymarch Park
Quincy, MA 02169-7471

715-2023	Standard for the Installation of Fuel Gases Detection and Warning Equipment

UL

Underwriters Laboratories LLC
333 Pfingsten Road
Northbrook, IL 60062

1484-2022	Residential Gas Detectors

2024 International Building Code

Add the same as above.

Reason: This revised proposal provides guidance for AHJs who seek to utilize fuel gas detection as a life-saving device and limits installation to Group R new buildings as a starting point for consumer application with the ultimate need to ensure the safe distribution of a fuel gas being widescale consumer adoption in any occupancy that utilizes a fuel gas.

There are two companion proposals that add new definitions for fuel gas alarm, fuel gas detector and fuel gas detection system to clarify these terms. There is also a proposal that adds NFPA 715 Standard for the Installation of Fuel Gases Detection and Warning Equipment as a reference standard. Regarding NFPA 715, the standard is published and out in the public domain, has followed NFPA's standards-making process including input from stakeholders and the public, and has been approved by the Standards Council, and will continue to be revised on 3-year cycles.

Though the US Department of Transportation requires fuel gases to be odorized so as to be readily detectible by a normal sense of smell, the need to add a supplemental means of detection through devices is a new subject to the majority of society. Many in society simply do not understand the immediate urgency that is needed to respond to a gas odor or that a combustible level of a fuel gas can be present in a space without an odor due to odor fade issues. Simply, there is widescale lack of understanding of the safety issue posed by a leak rampant through society and opponents to their application of fuel gas detectors as life saving devices. This lack of understanding is evidenced by the multitude of fuel gas incidents that are the result from both consumer and contractor errors and fuel gas system failures.

Between the years of 2012 and 2016 local fire departments responded to an estimated 125,000 gas leaks (natural gas or LPG) per year in or on home properties. Home properties include one- and two-family homes, including manufactured homes and apartments and other multi-family housing. An estimated average of 4,200 home structure fires per year started with the ignition of natural gas. These fires caused an average of 40 deaths per year. The statistics, incident descriptions from NFPA publications (ref 1), and reports from the National Transportation Safety Board show that most major gas incidents involved some type of leak. Leaks or breaks in piping were the leading factors contributing to home structure fires per year that began with the ignition of natural gas. Cooking equipment was involved in 54% of the natural gas fires, and heating equipment, including water heaters, was involved in 25%. The report recognizes the data could not determine whether the source of the leak was from an inside pipe or outside pipe. That said, the location does not diminish the benefit of fuel gas detection installed per NFPA 715, whereas the standard requires a detection device be located where the fuel gas enters the building, which would serve to detect fuel gas migrating into the building from an outside source.

In the U.S., local fire departments respond to an average of 340 natural gas or LP-Gas leaks per day with no ignition (Ref 1). Although gas leaks are much more common than gas ignitions, they can be precursors to devastating fires and/or explosions. The installation of even a single fuel gas alarm would provide advanced warning to building occupants of imminent danger and would almost certainly reduce the number of annual deaths.

A **search of publicly available** information of fuel gas incidents (Ref. 3) resulting in a building explosion was undertaken to provide additional insights to Ref. 1 for the potential benefit impact of fuel gas detection devices to enhance safety for consumers utilizing a fuel gas. That review of public data from 2012 to June 2024 found 684 fuel gas incidents (130 were propane) of which 507 incidents resulted in injury and/or fatality. For those incidents, there were 312 fatalities reported averaging 24 per year. For those incidents, 1,229 injuries were reported averaging 95 per year. The data subset for the 130 propane is 77 fatalities with 155 injuries per year. This data does not represent an exhaustive review and is included to provide an indication of the profound impact on life and property that may result from utilizing fuel gas detection inside buildings.

Regarding reliability and availability of the devices, residential gas detection devices for natural gas and propane are readily available (ref 2) at Home Centers and installing and operating these life safety devices are the same as installing and operating commercially available carbon monoxide and smoke detectors.

Con Edison recognizes the life-saving benefit of fuel gas detection devices and as such is installing gas detection devices in every building the Company serves with natural gas with over 290,000 devices in service to date of a program that will eventually install about 375,000 devices. The Con Ed devices are installed where the natural gas service enters the building and report all detection alarms wirelessly to the Company. The program is the US largest case study for safety benefit of fuel gas detection devices and has demonstrated the reliability of the technology and the safety benefit. The Company devices have detected over 3,800 gas leaks of which about 80% are from piping leaks INSIDE the building. Of those gas detections, multiple leaks were of the magnitude where First Responders reported they posed an immediate risk of fire/explosion, which was avoided by an immediate action by First Responders that arrived in under 5 minutes of first detection.

New York City through Local Law 157 requires natural gas detection devices in EVERY RESIDENTIAL occupancy served with natural gas beginning in 2024. This requirement is for NEW and EXISITING buildings alike.

State of Maine on 2/8/21 through Legislative Document No. 346 requires gas detection for buildings with natural or LP gas in all group R occupancies and residential rental units.

The following States have submittals for pending regulations requiring fuel gas detection:

- CT – Residential new buildings
- IL – Group R & residential rental properties
- NC – Residential new and existing buildings
- NYS – Residential new & existing buildings up to 3 family
- TN – Residential rental properties

The lifesaving value of smoke and carbon monoxide detection devices is recognized and required by this standard. Actions taken or seeking to be taken by AHJs are now recognizing the safety value of fuel gas detection. The National Transportation Safety Board through its investigations of a multitude of natural gas incidents involving fatalities continues to seek mandate for their application. The inclusion of fuel gas detection to this standard is the next logical safety device addition to ensure the safe distribution of fuel gases to provide safety when piping systems and safety devices fail, when actions by the public/contractors precipitate a release of a fuel gas, and when the public detects an odor of a fuel gas inside a building and does not respond or take action to protect from its ignition.

Ref 1: NATURAL GAS AND PROPANE FIRES, EXPLOSIONS AND LEAKS ESTIMATES AND INCIDENT DESCRIPTIONS, NFPA Research, Aherns and Evarts, October 2018.

Ref 2: COMBUSTIBLE GAS DISPERSION IN RESIDENTIAL OCCUPANCIES AND DETECTOR LOCATION ANALYSIS, Gexcon US for NFPA Research; Davis, Engel, Pagliaro; *August 2020*

Ref 3: Public Data Summary of Gas Explosion Incidents from 2012 to June 2024.pdf

Cost Impact: Increase

Estimated Immediate Cost Impact:

The estimated installation cost per fuel gas detector should be equal to the installation cost of similar smoke and carbon monoxide detection systems in both the cost of the individual detector/alarm unit and the cost of permanent electrical wiring. In that case, the cost impact of each fuel gas detection/alarm system installed is estimated to be between $100 to $200/unit (based on manufacturer's estimate).

Estimated Immediate Cost Impact Justification (methodology and variables):

The proposal allows the building owner to install fuel gas detection systems that meet the needs of the affected building residents, the fuel gas system configuration within the building, and local regulations. In general, the need for fuel gas detection is different for nursing homes, boarding houses, apartments, and dormitories (to name a few) than for motels and lodging buildings. The number of fuel gas detectors can vary greatly depending on the location of the gas piping and type of gas appliance installed. The installation of fuel gas detection system should not be required to meet a one-size-fits-all approach. Therefore, the cost to install a fuel gas detection system can vary greatly depending on building type, how fuel gas is used, and local fire code requirements.

Comment (CAH2)# 528

F153-24

IFC: SECTION 1032, 1032.1, 1032.2 (New), 1032.3 (New)

Proposed Change as Submitted

Proponents: Jonathan Flannery, Pandemic Task Force Code Development Working Group, PTF CDWG (jflannery@aha.org)

2024 International Fire Code

SECTION 1032
MAINTENANCE OF THE MEANS OF EGRESS

1032.1 General. The *means of egress* for buildings or portions thereof shall be maintained in accordance with this section.

Add new text as follows:

1032.2 Maximum Occupant Load. For temporary events, where the occupant load for a building or space is greater than that specified by Section 1004, the fire code official shall be authorized to allow a higher occupant load, provided health, life, and safety requirements are maintained. The fire code official is authorized to require a public safety plan in accordance with Section 403.11.2.

1032.3 Reduced Occupant Load. For declared public emergencies, where the occupant load for a building or space is required to be less than that specified by Section 1004 the means of egress shall be maintained. Any alterations to the means of egress shall be *approved* by the *building official* or *fire code official*.

Reason: This added section would accomplish two things: under normal circumstances, the occupant load shall not be exceeded; and where circumstance dictate, an occupant loads greater than, or in some circumstances less than, would only be allowed to be modified by the fire code official.

A search for a requirement in the fire code that the occupant load cannot be exceeded did not appear readily available. Under normal operations, without any special considerations for public safety, the occupancy load should not be exceeded.

Where special considerations are provided, such as outlined in this section of the fire code, and where approved by the fire code official, occupant loads may be exceeded with provision such as a fire watch, a public safety plan for gatherings, and/or crowd managers as noted in this section. When approved by the fire code official implies other hazards or risks to both occupants and first responder not readily obvious would be addressed by the approval.

Also, as discovered during the COVID-19 pandemic, public health officials declared reduced occupancy as a function of “social distancing” or by a percentage that occupancy would need be limited to protect public health and safety. The code provides no ability to enforce a limited occupancy in such cases. Although a smaller overall occupant load represents a lower risk to egress components and other compliance issues, in some cases exits were compromised that may affect code compliance and public safety.

As examples, in certain applications doors that serve both ingress and egress were modified to ingress only without consideration of the overall egress requirements of the building. Portions of buildings were closed off, possibly altering total travel distance and/or common path of travel. Where egress travel is modified existing exit signage may cause confusion in emergency scenarios delaying egress of occupants to the public way.

In other cases, building owners created alternative arrangements to provide full services without consideration to public safety, including using sidewalks, parking lots, and other areas that may impede egress to the public way and/or the ability for first responders to provide emergency services in a manner intended by the codes.

In this scenario, the fire code official may employ one or more of the provisions of 403.11 to ensure compliance or evaluate any other hazards to improve the code compliance in circumstance where reduced occupant load may impose alternative risks to occupants, first responders, and provide overall safety in the built environment.

The ICC/NEHA Pandemic Task Force (PTF) was organized and tasked with researching the effects of the COVID-19 pandemic on the built environment and developing a roadmap and proposing needed resources – including guidelines, recommended practices, publications and updates to the International Codes® (I-Codes®) – that are necessary to overcome the numerous challenges that may be faced during future pandemics and to construct and manage safe, sustainable and affordable occupancy of the built environment. The ICC Pandemic Task Force Code Development Work Group (PTF CDWG) has conducted a comprehensive review of current code requirements as they relate to the prevention of the transmission of diseases and other serious health concerns and suggested revisions to current code requirements based on this assessment.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This new section will not impact construction and therefore will not increase the cost of construction.

F153-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee stated that the reasons for the disapproval of the proposal were: Concern about the charging language of 1032.2 where it says for temporary events. This is for any temporary event, not just one that is connected with the pandemic, and many building owners will be using this for just about anything they want to do in their building which is dangerous. Disagreement with the wording. For the reduced occupant load, there is a dependence on a declared public emergency in order to enforce that section, which might be an issue. Also, the text of provided health, life and safety requirements are maintained, is a little vague and can be interpreted in a number of different ways. There should be some language that the plan has to be approved, not just submitted. (Vote: 11-1)

F153-24

Individual Consideration Agenda

Comment 1:

IFC: SECTION 1032, 1032.1, 1032.2, 1032.3

Proponents: Jonathan Flannery, Pandemic Task Force Code Development Working Group, PTF CDWG (jflannery@aha.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Fire Code

SECTION 1032
MAINTENANCE OF THE MEANS OF EGRESS

1032.1 General. The *means of egress* for buildings or portions thereof shall be maintained in accordance with this section.

1032.2 Maximum Occupant Load. ~~For temporary~~ When approved by the fire code official time certain events, ~~where~~ the occupant load for a building or space may be greater than that specified by Section 1004, the fire code official shall be permitted to authorize~~d to allow~~ a higher occupant load, provided a reasonable level of safety, health, property protection and general welfare is ~~health, life, and safety requirements are~~ maintained. The fire code official is authorized to require a public safety plan in accordance with Section 403.11.2.

1032.3 Reduced Occupant Load. For declared public emergencies, where the occupant load for a building or space is required to be less than that specified by Section 1004 the means of egress shall be maintained. Any non-permanent alterations associated with the public emergency to the means of egress shall be *approved* by the ~~*building official or fire*~~ *code official.*

Reason: ·

The proposed modifications are submitted based on the following requests from the committee and opponents:

Committee Question. What is in the Public Safety Plan?

The public safety plan contains 10 elements that need to be considered from 403.11.3.

Committee Question: The public safety plan should be required to be approved.

It is implied by noting the section 403.11.2, this section requires to be approved is follows:

> *…the fire code official shall have the authority to order the development of or prescribe a public safety plan* ***that provides an approved level of public safety*** *and addresses the following items:…*

Testifier comment (committee supported by motion to modify): The alterations to the means of egress should be approved by both the building and fire code official.

The commenter is correct that both the BO and FCO both interest in the means of egress. However, we didn't want to dictate both of them need to approve. The Building Code (and Building Official by proxy) generally addresses new construction and the Fire Code (and the Fire Code Official by proxy) addresses fire prevention and maintenance of the building. It is possible that some jurisdictions, the BO is involved only new construction, alternation, change of occupancy and other permanent applications; where the FCO is the primary official to deal fire prevention methods and post C of O (non-construction activities). The updated code change for CAH #2, uses the general term "code official" allowing the adopting jurisdiction to decide who approves the non-permanent changes to the MOE, either the fire code official, the building official, or both. During some emergencies the flexibility to have either official approve the temporary alternative to the original MOE may be beneficial, as opposed to two officials required to make the approval. Additional language was added to clarify that the alteration to the MOE is NOT permanent in nature and only associated with the public emergency for which the required reduced occupant load is specified.

Committee Comment: Why health, life and safety?

As noted at the hearings, the PTF was focused on the public health crisis. The comment was noted, and the language modified to reflect the same language in the purpose in the IBC (Section 101.3), as the intent of the provision.

Committee Comment: Could the reduced occupancy be used for other scenarios besides declared public emergencies?

It is possible that other events may facilitate a required reduced occupancy, however, in our evaluation the only historical event that mandated a reduced usage in the built environment was the pandemic. That was a declared public health emergency, at the federal, state, and local levels. The term "declared public emergency" was used as it would be decided by policy makers through a significant political act.

Committee Comment: Building owners may use this new provision to exceed the maximum occupant load in appropriately. Also related is the term "temporary" in the original proposal.

The "event" was first qualified to be "approved by the FCO" meaning that an application or request must be submitted in some manner to the FCO for this to be considered. In addition, the temporary was replaced by "time certain" with the implication that for these unique and/or special events that would be approved as for a specific event for a given time period. This should close the

possibility for this application not to be abused by an rogue building owner or tenant to randomly apply a greater occupancy than which would be considered safe. Consultation and approval of the AHJ is required for this application to occur.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This new section will not impact construction and therefore will not increase the cost of construction.

Comment (CAH2)# 638

F159-24

IFC: TABLE 1105.4; IBC: [F] TABLE 509.1

Proposed Change as Submitted

Proponents: Kevin Scott, KH Scott & Associates LLC, self (khscottassoc@gmail.com)

2024 International Fire Code

Revise as follows:

TABLE 1105.4 INCIDENTAL USES IN EXISTING GROUP I-2 OCCUPANCIES

Portions of table not shown remain unchanged.

ROOM OR AREA	SEPARATION AND/OR PROTECTION
~~Paint shops~~Spray rooms not classified as Group H	2 hours; or 1 hour and provide an automatic sprinkler system

For SI: 1 square foot = 0.0929 m^2, 1 pound per square inch (psi) = 6.9 kPa, 1 British thermal unit (Btu) per hour = 0.293 watts, 1 horsepower = 746 watts, 1 gallon = 3.785 L.

2024 International Building Code

Revise as follows:

[F] TABLE 509.1 INCIDENTAL USES

Portions of table not shown remain unchanged.

ROOM OR AREA	SEPARATION AND/OR PROTECTION
~~Paint shops, not classified as Group H, located in occupancies other than Group F~~Spray rooms	2 hours and provide an automatic sprinkler system[a]

a. In a building equipped throughout with an automatic sprinkler system, the fire separation can be reduced to 1-hour.

For SI: 1 square foot = 0.0929 m^2, 1 pound per square inch (psi) = 6.9 kPa, 1 British thermal unit (Btu) per hour = 0.293 watts, 1 horsepower = 746 watts, 1 gallon = 3.785 L, 1 cubic foot = 0.0283 m^3.

Reason: This proposal is designed to correlate requirements in the IFC Chapter 24, IBC Section 307.1.1, IBC Section 416 and IBC Table 509.1.

Table 509.1 allows an incidental use area to contain a “paint shop” provided it is separated by 2-hour construction. Table 509.1 only requires sprinklers where a 1-hour separation is provided. Other code sections read as follows:

1. IBC Section 307.1.1 Item 1 states that the application of flammable finishes is not classified as a Group H occupancy provided that the operation and use comply with the IFC and IBC.
2. IFC Section 2404.2 states that spray rooms shall be constructed under the IBC and shall have a minimum 1-hour separation.
3. IBC Section 416.2 states that spray rooms shall have a minimum 1-hour separation.
4. IFC Section 2404.4 states that spray rooms shall be protected with sprinklers or a fire-extinguishing system.
5. IBC Section 2404.4 states that spray rooms shall be protected with sprinklers or a fire-extinguishing system.

The inconsistency occurs in Table 509.1 which allows an incidental use area to have 2-hour separation without sprinklers or a fire-extinguishing system. Since the spray room is not a Group H, then it would be classified as Group F-1. The only time a 2-hour separation is required is when the spray room is located in an unsprinklered building according to IBC Table 508.4. But even when the spray room is located within an unsprinklered building, the spray room is required to be protected with sprinklers or a fire-extinguishing system.

Table 509.1 implies that an spray room is acceptable if it is separated by 2-hour construction without any type of fire-extinguishing system.

The term “paint shop” is not used anywhere else in the IBC, and only appears once in IFC Table 1105.4, and does not appear at all in NFPA 33 or NFPA 34. It is an outdated term and is not appropriate. This term will be replaced with spray room in IFC Table 1105.4 and IBC Table 509.1. IFC Table 1105.4 retains the language of “not classified as Group H” to address existing facilities that may have been

designed as a Group H occupancy.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal simply clarifies the text and correlates the terminology.

F159-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: This proposal was disapproved as the change in terminology would remove correlation with NFPA. The intent is specific to "paint rooms." (Vote14-0)

F159-24

Individual Consideration Agenda

Comment 1:

IFC: TABLE 1105.4; IBC: [F] TABLE 509.1

Proponents: Kevin Scott, KH Scott & Associates LLC, self (khscottassoc@gmail.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Fire Code

TABLE 1105.4 INCIDENTAL USES IN EXISTING GROUP I-2 OCCUPANCIES

ROOM OR AREA	SEPARATION AND/OR PROTECTION
~~Spray rooms~~ Paint shops not classified as Group H	2 hours; or 1 hour and provide an automatic sprinkler system

For SI: 1 square foot = 0.0929 m^2, 1 pound per square inch (psi) = 6.9 kPa, 1 British thermal unit (Btu) per hour = 0.293 watts, 1 horsepower = 746 watts, 1 gallon = 3.785 L.

2024 International Building Code

[F] TABLE 509.1 INCIDENTAL USES

ROOM OR AREA	SEPARATION AND/OR PROTECTION
Spray rooms	2 hours and provide an automatic sprinkler system[a]
In Group I-2, paint shops not classified as Group H	1 hour

a. In a building equipped throughout with an automatic sprinkler system, the fire separation can be reduced to 1-hour.
For SI: 1 square foot = 0.0929 m^2, 1 pound per square inch (psi) = 6.9 kPa, 1 British thermal unit (Btu) per hour = 0.293 watts, 1 horsepower = 746 watts, 1 gallon = 3.785 L, 1 cubic foot = 0.0283 m^3.

Reason: This proposal was disapproved at CAH 1 because the term "paint shop" is used in NFPA 101 for in Group I-2 occupancies. This comment revises the proposal to include the term paint shop for Group I-2.

Table 1105.4 is specific to existing Group I-2 occupancies. The term paint shop is reinserted in this table and spray room is deleted.

Table 509.1 applies to new so a new row is added to address paint shops in Group I-2. New Group I-2 will be provided with sprinklers, so the paint room requirement is to add 1-hour separation for the paint room. This is consistent with NFPA 101.

Spray rooms is retained in Table 509.1 as it is a defined term in the IBC/IFC and has specific requirements in IBC Section 416 and IFC Section 2404.5.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal clarifies the text and correlates the terminology.

Comment (CAH2)# 520

F161-24

IFC: SECTION 1107, 1107.1, 1107.1.1, 1107.1.2

Proposed Change as Submitted

Proponents: Robert Marshall, FCAC, FCAC (fcac@iccsafe.org); Robert J Davidson, Davidson Code Concepts LLC, Self (rjd@davidsoncodeconcepts.com)

2024 International Fire Code

Delete without substitution:

~~SECTION 1107~~
~~ENERGY STORAGE SYSTEMS~~

Revise as follows:

~~1107.1~~ **1207.12 Pre-existing Lithium-ion technology energy storage systems.** The owner of an energy storage system (ESS) utilizing lithium-ion battery technology having capacities exceeding the values in Table 1207.1.3 and ~~installed prior to the jurisdiction's adoption of the 2018 or later edition of the *International Fire Code*~~that are not listed to UL 9540 shall provide the *fire code official* a ~~failure modes and effects analysis (FMEA) or other *approved* hazard mitigation analysis~~ technical report in accordance with Section 104.2.2 for review and approval.

~~**Exception:** Detached one- and two-family *dwellings* and *townhouses*.~~

~~1107.1.1~~ **1207.12.1 Early detection.** In addition to ~~the requirements of Sections 1207.1.8.1 and 1207.1.8.2~~ identifying potential failure events, the ~~analysis~~ report shall include an assessment of the ability of the installed protection systems to provide for early detection and notification of ~~a thermal runaway event in relation to the ability of~~ emergency responders ~~to safely mitigate the size and impact of a thermal runaway event~~.

~~1107.1.2~~ **1207.12.2 Corrective action plan.** Where hazards are identified by the analysis, a plan that includes a timetable for corrective action shall be submitted to the *fire code official* for review and approval. The plan shall include actions and system improvements necessary for eliminating or mitigating any identified hazards, including listed methods for early detection and notification of a thermal runaway event.

Reason: FCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and early 2024 the FCAC has held several virtual meetings and one in-person meeting open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the **FCAC Website**

The main purpose of this proposal is to move the language from Chapter 11 over to Section 1207. The issue is not a building feature retrofit topic, it is one of ongoing operation and maintenance of energy storage systems which requires an operational permit from the fire code official. As an operational issue the language belongs in Section 1207 for application to the existing systems before operational permits are issued or renewed.

If the Committee approves the proposal to have 1207 point to NFPA 855, the reference to Table 1207.1.3 would be changed to a reference to the thresholds Table in NFPA 855, Chapter 1.

The exception for one- and two-family dwelling and townhouses has been deleted. The exception conflicts with over all application of the IFC pursuant to Chapter 1, the IFC generally applies to all occupancies, any exceptions are based upon the adopting authority. The hazards presented by unlisted ESS are similar and the AHJ needs the flexibility to rely on this requirement if they have an active program for these occupancies, and more importantly, when they become aware of a potential problem with an existing installation.

In Section 1207.12 The use of the IFC edition date has been eliminated and replaced with the lack of a UL 9540 listing as the more accurate trigger relative to system safety. The language referring to an FMEA or other approved HMA has been replaced with “Technical Report, with what is to be covered by the technical report provided in the following subsections.

In Section 1207.12.1 The reference to Sections 1207.1.6.1 and 1207.1.8.2 have been deleted to eliminate a conflict, both sections are geared to assessing new installations and Section 1207.1.6.1 could lead one to believe if none of those listed items apply, they are done. Replacing the language with “identifying potential failure events” provides clearer instruction within the section itself. The language referring to the emergency responders' abilities has been removed as subjective and unpredictable in many cases. The intent of the requirements is to assess potential hazards and take action to correct the hazards preventing an event.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The change proposed is to move an existing requirement addressing operational activities subject to an annual permit from Chapter 11 to Section 1207 for ESS. The additional changes made clarifies the language and eliminated a conflict. The end result of application has not changed.

F161-24

Public Hearing Results (CAH1)

Committee Action: **As Modified by Committee**

Committee Modification: 1207.12.1 Early detection. In addition to identifying potential failure events, the report shall include an assessment of the ability of the installed protection systems to provide for early detection and notification to ~~of~~ emergency responders.

Committee Reason: This was approved as it is more appropriately located within Chapter 12 versus Chapter 11 which is focused on construction retrofit requirements. This is operational and maintenance in nature. The modification is simply using the correct wording to make it clear that detection and notification is "to" the emergency responders. (Vote 13-0)

F161-24

Individual Consideration Agenda

Comment 1:

IFC: 1207.12

Proponents: Joseph H. Cain, P.E., Solar Energy Industries Association (SEIA), Solar Energy Industries Association (SEIA) (joecainpe@gmail.com) requests As Modified by Committee (AMC2)

Further modify as follows:

2024 International Fire Code

1207.12 Pre-existing Lithium-ion technology energy storage systems. The owner of an energy storage system (ESS) utilizing lithium-ion battery technology having capacities exceeding the values in Table 1207.1.3 and that are not listed to UL 9540 shall provide the *fire code official* a technical report in accordance with Section 104.2.2 for review and approval.

Exception: Detached one- and two-family *dwellings* and *townhouses.*

Reason: This Public Comment for CAH #2 seeks to un-strike the exception for detached one- and two-family dwellings, to maintain consistency with the intent of this section when it was created last cycle for the 2024 IFC, and consistency with other Committee action in CAH #1 for the 2027 IFC.

Section 1107 originated with Proposal F121-21, just one cycle ago. The Reason Statement for F121-21 speaks about commercial ESS only, and lists as one individual example the large-scale ESS facility incident in Surprise, Arizona. The language of the 2024 IFC states that in cases where ESS was installed prior to AHJ adoption of the 2018 or later IFC, the owner shall provide to the fire code official a failure modes and effects analysis (FMEA) or other approved hazard mitigation analysis. Apparently recognizing that FMEA analysis, assessment of the ability for early detection and notification, and a corrective action plan were overly restrictive for residential applications, the F121-21 Reason Statement states: "An exception for one- and two-family dwellings and townhouses is included."

Proposal F161-24 changes the compliance trigger to ESS "that are not listed to UL 9540" and changes the first requirement from FMEA to "a technical report," and includes requirements that the owner shall provide analysis of the system for identifying potential failure events, for early detection and notification of first responders. While this is likely appropriate for commercial ESS, it is still overly restrictive for residential ESS. The owners of residential systems might or might not have any awareness of when their ESS was installed or under what conditions of listing, and they are highly unlikely to have the knowledge needed to hire a consultant to prepare a technical report. We should be hesitant to include in the code provisions that are very unlikely to be implemented or enforced, and would most likely surface only through expert testimony during court cases should an incident occur. In the absence of any incident for residential ESS, the fire code official might be in the unfortunate position of trying to explain the technical report requirements to a homeowner, or forcing a homeowner to remove the ESS if early detection and notification systems are not present.

It is especially noteworthy that the Reason Statement for F161-24 states: "The issue is not a building feature retrofit topic, it is one of ongoing operation and maintenance of energy storage systems which requires an operational permit from the fire code official." During CAH #1, Proposal F4-24 was Approved As Modified with a new second sentence: "Operational permits shall not be required for ESS located at detached one and two-family dwellings and townhouses, other than Group R-4."

Further, during CAH #1, Proposal F170-24 was Approved As Modified, with the following exception to Section 1207.1: "These requirements shall not apply to ESS in buildings and structures designed and constructed in accordance with the International Residential Code."

To be consistent with the original intent of F121-21; to avoid overly restrictive provisions for residential ESS; and to remain consistent with CAH #1 Committee action on F4-24 and F170-24, the exception for detached one- and two-family dwellings and townhouses should be restored in this section of the IFC.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

For residential ESS only, to un-strike and restore the exception for detached one- and two-family dwellings and townhouses will result in avoided costs up to the value of the existing energy storage system or the cost of new replacement ESS, should the fire code official require existing ESS to be removed from the residence.

Comment (CAH2)# 734

Comment 2:

IFC: 1207.12

Proponents: William Koffel, Koffel Associates, Inc., California Solar and Storage Association (CALSSA) (wkoffel@koffel.com) requests As Modified by Committee (AMC2)

Further modify as follows:

2024 International Fire Code

Revise as follows:

1207.12 Pre-existing Lithium-ion technology energy storage systems. The owner of an energy storage system (ESS) utilizing lithium-ion battery technology having capacities exceeding the values in Table 1207.1.3 and that are not listed to UL 9540 shall provide the *fire code official* a technical report in accordance with Section 104.2.2 for review and approval.

Exception: Detached one- and two-family dwellings and townhouses.

Reason: As Approved by the Committee, 1207.12 applies to all existing ESS, including those installed in one- and two-family dwellings. Furthermore, technically the section will require that the ESS be listed to the edition of UL 9540 referenced in the 2027 IFC. Most likely, this will be the third edition and current equipment will not be listed to that edition and may or may not comply with that edition. For the existing equipment that is not listed to the current edition of UL 9540 a technical report will be required. The impact of this is that all existing ESS installed in one- and two-family dwellings will require a technical report.

CALSSA is not aware of significant adverse fire experience that would justify the need for a technical report for all existing ESS. Furthermore, most jurisdictions are probably not set-up to process the quantity of technical reports that would be required by this section and may have no way of identifying where existing residential systems are that require a technical report.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

$2500-$3500 per system

Estimated Immediate Cost Impact Justification (methodology and variables):

Each system would potential required at least a day of time for an engineer to evaluate the existing system, the differences between the system and the current edition of UL 9540, and to prepare a report acceptable to the code official.

Comment (CAH2)# 519

F162-24

IFC: SECTION 1108 (New), 1108.1 (New)

Proposed Change as Submitted

Proponents: Jeffrey Shapiro, International Code Consultants, Lake Travis Fire Rescue (jshapiro@ltfr.org)

2024 International Fire Code

Add new text as follows:

SECTION 1108
FIRE PROTECTION FOR POST-FIRE REPAIR OR RECONSTRUCTION

1108.1 Institutional and residential occupancies. Where an unsprinklered Group I, Group R-1, Group R-2 or Group R-4 Occupancy is repaired or reconstructed following a fire incident that caused more than 25-percent of a *fire area* to remain unoccupiable for a period of 60 or more days, an automatic sprinkler system complying with Section 903.3 shall be installed throughout such *fire area* or *fire areas* as part of the repair or reconstruction.

Reason: This proposal reflects the progress of a FCAC task group on the topic of retrofitting certain occupancies that have suffered a catastrophic fire. There was insufficient time to further discussion and consideration that might have yielded a consensus proposal, so I am submitting this as a basis for continued discussion.

Although I serve as a consultant to the National Fire Sprinkler Association, this proposal has not been reviewed or endorsed by NFSA, and I am not representing NFSA on this issue. My motivation comes from many years in the fire service observing reconstruction of unsprinklered buildings without sprinklers following a catastrophic fire, which has always struck me as illogical. If a newly built occupancy requires sprinklers, repair or reconstruction of a previously existing occupancy that suffered a catastrophic fire, particularly residential and institutional uses where occupants will be sleeping, should not be permitted by code.

During task group discussions, there was broad agreement that something could be done to address this concern in the code, but reaching agreement on code text was challenging. Essentially, the questions are, 1) what should be the trigger, or level of loss, warranting the addition of fire sprinklers in repair or reconstruction, and 2) what portion of a building should be required to be sprinklered?

Discussion explored the possibility of using fire fatalities as a Step 1 trigger, but consensus on a number of fatalities could not be reached. Some believed that a single fire fatality should be enough, while others looked at two or more or didn't support the concept. Also, defining a "fire fatality" in the code is challenging as an enforcement tool because the term might refer to individuals who were deceased at the scene, or it might also include individuals who are injured and later die as a result of such injuries. And, severe injuries might be regarded by those who deal with burn injuries as an equally sufficient justification vs. a fatality. For these reasons, the life-loss and injury triggers were abandoned in this proposal, in favor of trying to define a level of property damage that could be reasonably associated with a catastrophic fire.

Another Step 1 trigger that was considered was "multiple offender" buildings, or buildings that experience repeated fire incidents. This approach was also abandoned because consensus could not be reached on the number of fires over a time period, the damage level that should be considered as a contributing fire, or how a jurisdiction would keep track of a repeating fire incident history over time.

The approach that did gain sufficient traction was looking at a "fire area" as defined in the code to require a minimum 2-hour separation from other portions of a building, and a level of damage to a fire area that should be considered as sufficient to warrant requiring sprinklers as part of repair or reconstruction. There is not a scientific basis for establishing a threshold of this nature, so the threshold must ultimately be decided by a consensus of stakeholders. The suggested 25% of a fire area being unhabitable for a period of 90 or more days seems sufficient to serve as a benchmark. It was pointed out during discussion that, due to permitting delays, 30 days could be a very short timeframe for construction to be completed. However, it's difficult to argue that a fire wasn't a major incident if 25% of a fire area remains uninhabitable for 60 days. For example, an 8-unit fire area in an apartment building would require 3 or more units to be

vacated for 60 days to trigger this section. A 40-room hotel would require 11 rooms to be vacated for more than 60 days to trigger this section. True, this might encourage a rapid pace of reconstruction by some to avoid the sprinkler requirement, but so be it. It's better to have this requirement as a starting point in the code, and if someone can beat the clock, that should not be a reason to do nothing in the code.

With regard to Step 2, the portion of a building that should be required to be sprinklered where Step 1 has been satisfied, there were two discussion paths, either the entire building or only a sufficiently damaged fire area. This proposal suggests the latter based on feedback from the task group. Considering that a fire area might be a floor or section of a large building, much of which might not have been affected by the fire incident, some would regard it as excessive to require retrofitting sprinklers in those unaffected areas since such areas would not otherwise undergo repair or reconstruction. Hence, the suggested path of only requiring sufficiently impacted fire areas to be sprinklered. Such areas would probably experience substantial removal of drywall due to smoke and water damage, allowing for sprinkler system installation when the structure is exposed.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

The best estimate is approximately $2.00 to $10.00 a square foot which is the range of cost related to the installation of automatic sprinkler systems in existing buildings.

Estimated Immediate Cost Impact Justification (methodology and variables):

Please see the following websites for the basis of the square footage costs.

https://www.angi.com/articles/home-fire-sprinklers-are-affordable.htm

https://nfsa.org/wp-content/uploads/2019/08/Retrofit-Guide-July-2019-v6-COLOR.pdf

F162-24

Public Hearing Results (CAH1)

Errata: This proposal includes published errata https://www.iccsafe.org/wp-content/uploads/2024-Group-A-Consolidated-Monograph-Updates.pdf

Committee Action: **As Submitted**

Committee Reason: This proposal was approved as submitted as it was felt a reasonable trigger for the installation of an automatic sprinkler system after a fire based upon the type of occupancy and the extent of damage. It was noted that many jurisdictions in California already require this. There was concern that this will often trigger an entire infrastructure that did not exist previously and questions remain as to what the 60 days will include. Some also felt a better understanding how this will work with tax credits and the insurance industry is needed. (Vote 11-3)

F162-24

Individual Consideration Agenda

Comment 1:

IFC: 1108.1

Proponents: Jonathan Humble, Jonathan Humble, FAIA, LLC, National Multi-Family Housing Council (festeel@att.net) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Fire Code

1108.1 Institutional and residential occupancies. Where an unsprinklered Group I, Group R-1, Group R-2 or Group R-4 Occupancy is repaired or reconstructed following a fire incident that caused more than ~~25 percent~~ 50 percent of a *fire area* to remain ~~unoccupiable~~ unsafe for occupancy for a period of ~~60~~ 180 or more days, an automatic sprinkler system complying with Section 903.3 shall be installed throughout ~~such~~ the affected *fire area* ~~or fire areas~~ as part of the repair or reconstruction.

Reason: The modifications shown attempt to further modify the proposal based on the testimony at the 2024 CAH-1 and other resources, as follows: The original 25 percent was arbitrarily chosen,. This proposal increases the value to 50 percent, a value that NMHC believes more suitable in determining the outcome of the future project that would include an automatic fire suppression systems (e.g., repair or reconstruction).

The NMHC preferred to have a scale that could better justify what constitutes the fire area not being occupiable, or habitable in the case of apartment buildings. Since the term "unoccupiable" is not defined and could mean anything to anyone at any time, the NMHC recommends the use of the phrase "unsafe for occupancy" which is defined in both the International Building and Fire Codes (Chapter One).

The change from 60 to 180 days is being proposed to reflect the current amount of time for seeking multiple approvals necessary to initiation and complete the repair or reconstruction. The additional days also provides additional time for the building owner to discuss the long term opportunities, such as seeking and acquiring approvals from other parties directly involved such as: banks and insurance companies, government subsidy programs, affordable housing, etc.

The phrase “or fire areas” was deleted to be consistent with the start of this provision which identified a single fire area. Any other fire areas, unless impacted by the same fire, are expected to received minor alterations for the water line to pass through to the affected fire area.

Further, the original cost impact statement contained construction values for one- and two-family dwellings only. For apartments the additional cost would include the installation of a new water supply line from the street, a new reduced pressure back-flow preventer, new floor drain or drains for the RPBP, and sprinkler supply lines/risers to the individual affected apartments, or, if a local municipal water supply is not available the installation of a tank, pump, and related power, alarm, and other systems necessary to make the new system work.

Bibliography: No material for the bibliogrpahy.

Cost Impact: Increase

Estimated Immediate Cost Impact:

The cost impact will increase because of the caveat of requiring the installation of an automatic fire suppression system as part of a repair project, which was the intent of the original code change proposal. For apartments this will include the installation of a new water supply line from the street, a new reduced pressure back-flow preventer, new floor drain or drains for the RPBP, and sprinkler supply lines/risers to the individual affected apartments. For those apartment buildings located outside of a reliable metropolitan water service the additional costs could include the installation of a water pump and tank as the other option. Further, in areas of the US, there is the opportunity for the jurisdiction to increase the appraised value of the building because there exist jurisdictions where anything beyond a repair is considered new construction and therefore subject to an increase in appraised or taxable value.

Estimated Immediate Cost Impact Justification (methodology and variables):

Specific cost impacts will be dependent upon the amount of damage overall as a result of the fire. In regard to financial off-set programs to assist in subsidizing repair costs, that will vary depending upon availability of such programs and their limitations, if in fact they are

available for such repairs.

Comment (CAH2)# 495

F168-24 Part I

PART I - IFC: SECTION 1205.6 (NEW)

PART II - IMC: SECTION 805.9 (NEW), 806.2 (NEW)

Proposed Change as Submitted

Proponents: Ali Fattah, City of San Diego Development Services Department, San Diego Area Chapter of ICC (afattah@sandiego.gov)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE INTERNATIONAL FIRE CODE COMMITTEE AND PART II WILL BE HEARD BY THE INTERNATIONAL MECHANICAL CODE.

2024 International Fire Code

Add new text as follows:

1205.6 Pathways adjacent to chimneys. Where a solar photovoltaic (PV) system located adjacent to a chimney that is constructed to comply with Section 2113 of the *International Building Code*, or Section 805 or 806 of the *International Mechanical Code*, a 36-inch-wide (914 mm) pathway shall be provided between the chimney and a solar photovoltaic (PV) system. The pathway adjacent to a chimney shall continue and access other pathways.

Reason: The proposed code changes address a regulatory gap in the IBC, IRC and IMC where the interaction of rooftop solar PV systems with chimneys serving solid fuel-burning fireplaces and appliances is not addressed. Chimneys convey heat and products of combustion that include glowing sparks, which can land on solar PV systems and pose a fire hazard. The IBC, IRC and IMC do not require spark arrestors; however, the IBC addresses the construction of spark arrestors when added atop a chimney primarily to address possible interference with drafting a chimney.

The IBC, IRC and IMC also do not address working clearance around chimneys since it was not envisioned that structures occupying large portions of the roof area would be placed on the roof near chimneys. Solar photovoltaic systems are becoming very common, and the proposed code changes address clearances adjacent to the chimney necessary for firefighting access and for servicing a chimney.

The proposed code change will be processed in three parts since the IBC Structural Committee and the IRC Building Committee convene in the Group B cycle in 2025. The International Fire Code Committee and the International Mechanical Code Committee in Group A will consider the first two parts during 2024. In an effort to show participants in Group A the totality of the proposal, the following two bullet points show proposed Group B code changes.

- IBC Ch 21 is proposed to be amended in Group B and considered by the IBC Structural Committee as follows.

  2113.9.4 Spark Arrestor Required. Chimneys shall be protected with a spark arrestor complying with Section 2113.9.2 of the International Building Code when solar photovoltaic (PV) systems are located within 10 feet (3048 mm) of a chimney.

  IRC Ch 10 is proposed to be amended in Group B and considered by the IBC Structural Committee as follows. Note that prior to the submittal deadline for Group A, the 2024 IRC was not available for review through ICC's digital codes premium service, so text from the 2021 IRC is shown below.R1003.9.4 Spark Arrestor Required. Chimneys shall be protected with a spark arrestor complying with Section R1003.9.2 of the International Residential Code when solar photovoltaic (PV) systems are located within 10 feet (3048 mm) of a chimney.

Code change RB285-22 was submitted for the 2024 IRC, and the submitted public comment, similar to this proposed code change, was not considered during the PCH since insufficient votes were available to overturn the Committee. Several IRC Building Committee members were receptive to the issue, which in the initial submittal focused on treating the solar PV installation as a part of the building and, therefore, requiring the chimney to extend 2 ft higher than solar PV within 10 ft the chimney. The report of the CAH states in part, " When you add the roof-mounted photovoltaic system to a building, it becomes a portion of the building.", which styles the initial issue.

This code change addresses another problem identified during the CAH: firefighting and maintenance access to a Chimney. Plumbing vents and mechanical equipment had been the most common roof projections until the popularity of solar PV systems, with the latter occupying large areas of the roof when compared to discreet items that the plumbing code and mechanical regulates in proximity to product conveying ducts.

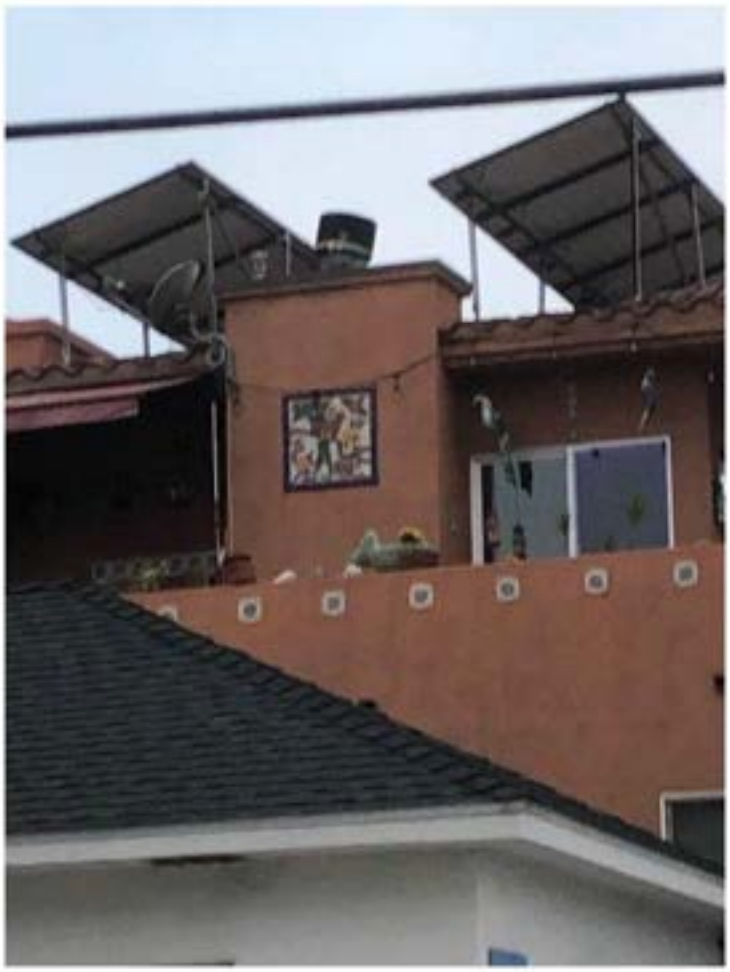
The proposed code change addresses the fire hazards and roof access issues the two independently regulated rooftop components pose. It is worth noting that the IBC, IRC, and IMC do not require spark arrestors and that the two building codes only address the construction of spark arrestors; the proposed code changes will address this regulatory gap. Additionally, chimney requirements have not changed for decades, and documentation regarding their functioning is not available or proprietary.

The proposal includes photos showing three cases (photos 3 to 5 spark arrestors would be required as well as 3 ft pathways) of what could happen when solar PV installations adjacent to the chimney are not regulated. Two photos (1 and 2) of a chimney fire to highlight why roof clearance should be required.

https://www.cdpaccess.com/proposal/9918/30619/files/download/4135/

https://www.cdpaccess.com/proposal/9918/30619/files/download/4780/

Chimney Fire



Bibliography:

- Rockfort Chimney Supply
- Forbes

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

The average cost of a spark arrestor is approximately $300, and it can easily be installed by a solar contractor unable to set back rooftop-mounted photovoltaic panel systems. Additionally, the average cost of a rooftop solar system is approximately $11,278 after solar tax credits.

Estimated Immediate Cost Impact Justification (methodology and variables):

I went online to search the cost of spark arrestors at Rockfort Chimney Supply and went to Forbes for the cost of solar systems in California.

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: This was not seen as necessary and does not align with the IRC. There is no evidence that this will assist with fire fighter safety. (Vote 14-0)

F168-24 Part I

Individual Consideration Agenda

Comment 1:

IFC: 1205.6

Proponents: Ali Fattah, City of San Diego Development Services Department, San Diego Area Chapter of ICC (afattah@sandiego.gov) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Fire Code

1205.6 Pathways adjacent to chimneys. ~~Where a solar photovoltaic (PV) system located adjacent to a chimney that is constructed to comply with Section 2113 of the *International Building Code*, or Section 805 or 806 of the *International Mechanical Code*, a 36-inch-wide (914 mm) pathway shall be provided between the chimney and a solar photovoltaic (PV) system. The pathway adjacent to a chimney shall continue and access other pathways.~~ A 36-inch wide (914 mm wide) pathway shall be provided between a chimney and a solar photovoltaic (PV) system where a solar photovoltaic (PV) system is located adjacent to a chimney constructed in accordance with either Section 2113 of the International Building Code or Sections 805 or 806 of the International Mechanical Code. The pathway adjacent to the chimney shall continue and provide access to other pathways.

Reason: This modification is being submitted by a proponent who could not participate in discussing the code change at CAH1. The submittal has been prepared after viewing the thoughtful comments provided by two speakers in support, one of whom submitted an editorial Floor Modification F168-24 Part I-HIRSCHLER-MP1 that was ruled out of order by the chair. Four speakers spoke in opposition, mainly to the spark arrestor issue proposed in Part II of the code change heard by the IMC Committee.

Confusion has resulted from ICC's decision, based on Committee responsibilities, to split the original code change into parts I and II, with each part being heard by a separate Committee; the reason statement for each part was not separated by the proponent. Persons who spoke about the proposal at the International Fire Code Committee hearing, mainly those in opposition, were mostly speaking regarding the Part II portion addressing spark arrestors that were to be heard later in the schedule by the International Mechanical Code Committee.

The proposal was purposefully added in a separate section since it addresses a condition different than the fire-fighting access necessary to ventilate the attic and areas below the roof addressed in Section 1205.2. The Section was added as proposed and not included in the Mechanical Code and Building Code due to stakeholder input during code development during the 2024 IRC hearing to allow the solar installers to know of the requirement's existence. A similar code change will be proposed to the IRC in Group B as the reason statement for the original code change is clarified.

The proposal purposefully addresses all chimneys correctly based on input from one of the speakers in opposition since all chimneys, especially solid fuel-burning chimneys, must be serviced at some point. Chimney sweeps need access to remove soot from solid fuel-burning chimneys. The proposal was submitted

based on discussions with stakeholders from the chimney industry. Solar arrays occupy more space than rooftop mechanical equipment required by the mechanical code to be separated from chimneys used to exhaust combustion products. It would be accurate that the proponent cannot point to a case of rooftop solar arrays that impeded access to a chimney fire, neither were the issues that led to the development of Section 1205.2. Yes, the chimney is commonly present first, and the rooftop solar arrays come later, as was pointed out, which is precisely why this code change is being proposed since chimney installers are never consulted. Ironically, more extensive pathways required in Section 1205.2 did not pose an issue, causing difficulty in providing sufficient solar energy yield.

The IBC, IRC, and IMC also do not address working clearance around chimneys since it was not envisioned that structures occupying large portions of the roof area would be placed on the roof near chimneys. The solar industry is relatively new, a speaker mentioned 10 years, and building standards have been progressively added in reaction to new solar innovations such as BIPV, etc; the proposal addresses a regulatory gap that was not addressed since the chimney industry does not participate regularly.

Solar photovoltaic systems are becoming very common, and the proposed code changes address clearances adjacent to the chimney necessary for firefighting access and servicing the chimney. However, as one of the speakers in opposition incorrectly raised, the code change proposal does not address ember escape. Spark arrestors protect against ember escape and not the proposed pathway. An attachment includes photos extracted from the web to highlight access issues necessary to maintaining chimneys that includes waterproofing and cleaning as well as repairs.

The Building Official can address conditions where an abandoned chimney occurs, presumably when the fuel burning appliance is removed. The proposed code change will be processed in three parts, the last in the IRC Building and IRC Mechanical/Plumbing Committee.

General summary of Testimony

Speaker	Organization	Support/Opposition	Issue
James Carver	So Cal FPO	Support	Spoke on behalf of proponent who was absent
Marcello Hirschler	GBH International	Floor modification	Proposed an editorial floor modification
Joe Cain	CALSEIA	Oppose	There are no widespread concerns, and the code change is a solution in search of a solution. Most of the presentation addressed the spark arrestor but failed to address the concern regarding access to the chimney for maintenance and fire-fighting access.
Paul Armstrong	CALSEIA	Oppose	Me too wave
Bill Koffel	Koffel Assoc	Oppose	The I codes do not require such access; they only address rooftop solar, and not other items.
A	TESLA	Oppose	Fire service never addressed the pathway for gas-burning appliances in the past 10 years. Access is not necessary due to ember escape and chimneys not necessary for serving gas appliances. This raised an issue with non-functional closed-off chimneys. The speaker spoke to spark arrestors getting clogged, impacting chimney drafting, and questioned the effectiveness of Section 2113.9.2 without justification.
Robert Davidson	Davidson Code Concepts	Oppose	Discussed fire classification of roof and solar panels. Difficult to get what you need to get the job done.

One comment provided by sympathetic stakeholders is that the code change is not necessary since there are no known problems. I code changes are often not reactionary and seek to address regulatory gaps before incidents occur; an example is the fire hazards due to the interaction of rooftop solar and roof coverings from the standpoint of fire classification of roof coverings; the code change was prompted due to lab testing and not real-life wildfire observation and data gathering.

Attachment 1 offers photos of local installations in San Diego within five City blocks of one another, showing that a clear space is actually being provided, most likely to facilitate the removal/replacement of panels and maintenance access for the solar arrays and chimney. Attachment 2 offers photos showing the need for access to chimney maintenance.

A minor editorial change was made in the last sentence to require that the proposed maintenance and fire fighting pathway connect with other pathways

The Committee voted 14-0 to disapprove based on testimony in opposition stating that the code change is unnecessary and would not align with the IBC or IRC. The proponent does not agree.

Cost Impact: Increase

Estimated Immediate Cost Impact:

It can be assumed that the code change will minimally increase the cost of construction due to the elimination of a limited roof area if the chimney is surrounded by roof on all sides. If the chimney is on a roof edge, the fire access pathway can be concurrent. Ridge setbacks also are concurrent with fire access pathways.

Estimated Immediate Cost Impact Justification (methodology and variables):

Quantitatiley determined.

Comment (CAH2)# 69

F168-24 Part II

PART II - IMC: SECTION 805.9 (NEW), 806.2 (NEW)

Proposed Change as Submitted

Proponents: Ali Fattah, City of San Diego Development Services Department, San Diego Area Chapter of ICC (afattah@sandiego.gov)

2024 International Mechanical Code

Add new text as follows:

805.9 Spark arrestor required. Factory-built *chimneys* serving solid fuel-burning *appliances* shall be protected with a spark arrestor complying with Section 2113.9.2 of the *International Building Code* where solar photovoltaic (PV) systems are located within 10 feet (3048 mm) of a chimney.

806.2 Spark arrestor required. Metal *chimneys* serving solid fuel-burning *appliances* shall be protected with a spark arrestor complying with Section 2113.9.2 of the *International Building Code* where solar photovoltaic (PV) systems are located within 10 feet (3048 mm) of a chimney.

Reason: The proposed code changes address a regulatory gap in the IBC, IRC and IMC where the interaction of rooftop solar PV systems with chimneys serving solid fuel-burning fireplaces and appliances is not addressed. Chimneys convey heat and products of combustion that include glowing sparks, which can land on solar PV systems and pose a fire hazard. The IBC, IRC and IMC do not require spark arrestors; however, the IBC addresses the construction of spark arrestors when added atop a chimney primarily to address possible interference with drafting a chimney.

The IBC, IRC and IMC also do not address working clearance around chimneys since it was not envisioned that structures occupying large portions of the roof area would be placed on the roof near chimneys. Solar photovoltaic systems are becoming very common, and the proposed code changes address clearances adjacent to the chimney necessary for firefighting access and for servicing a chimney.

The proposed code change will be processed in three parts since the IBC Structural Committee and the IRC Building Committee convene in the Group B cycle in 2025. The International Fire Code Committee and the International Mechanical Code Committee in Group A will consider the first two parts during 2024. In an effort to show participants in Group A the totality of the proposal, the following two bullet points show proposed Group B code changes.

- IBC Ch 21 is proposed to be amended in Group B and considered by the IBC Structural Committee as follows.

  2113.9.4 Spark Arrestor Required. Chimneys shall be protected with a spark arrestor complying with Section 2113.9.2 of the International Building Code when solar photovoltaic (PV) systems are located within 10 feet (3048 mm) of a chimney.

  IRC Ch 10 is proposed to be amended in Group B and considered by the IBC Structural Committee as follows. Note that prior to the submittal deadline for Group A, the 2024 IRC was not available for review through ICC's digital codes premium service, so text from the 2021 IRC is shown below.R1003.9.4 Spark Arrestor Required. Chimneys shall be protected with a spark arrestor complying with Section R1003.9.2 of the International Residential Code when solar photovoltaic (PV) systems are located within 10 feet (3048 mm) of a chimney.

Code change RB285-22 was submitted for the 2024 IRC, and the submitted public comment, similar to this proposed code change, was not considered during the PCH since insufficient votes were available to overturn the Committee. Several IRC Building Committee members were receptive to the issue, which in the initial submittal focused on treating the solar PV installation as a part of the building and, therefore, requiring the chimney to extend 2 ft higher than solar PV within 10 ft the chimney. The report of the CAH states in part, " When you add the roof-mounted photovoltaic system to a building, it becomes a portion of the building.", which styles the initial issue.

This code change addresses another problem identified during the CAH: firefighting and maintenance access to a Chimney. Plumbing

vents and mechanical equipment had been the most common roof projections until the popularity of solar PV systems, with the latter occupying large areas of the roof when compared to discreet items that the plumbing code and mechanical regulates in proximity to product conveying ducts.

The proposed code change addresses the fire hazards and roof access issues the two independently regulated rooftop components pose. It is worth noting that the IBC, IRC, and IMC do not require spark arrestors and that the two building codes only address the construction of spark arrestors; the proposed code changes will address this regulatory gap. Additionally, chimney requirements have not changed for decades, and documentation regarding their functioning is not available or proprietary.

The proposal includes photos showing three cases (photos 3 to 5 spark arrestors would be required as well as 3 ft pathways) of what could happen when solar PV installations adjacent to the chimney are not regulated. Two photos (1 and 2) of a chimney fire to highlight why roof clearance should be required.

F168-24 Part II

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee voted 14-0 to disapprove of this proposal. The committee's reasoning is that this proposal would require a solar PV system, which is not necessary for buildings built to IBC and is a concern from the IRC perspective.

F168-24 Part II

Individual Consideration Agenda

Comment 1:

Proponents: Ali Fattah, City of San Diego Development Services Department, San Diego Area Chapter of ICC (afattah@sandiego.gov) requests As Submitted

Reason: This modification is being submitted by a proponent who could not participate in the discussion of the code change at CAH1. The submittal has been prepared after viewing the thoughtful comments provided by speakers who spoke in opposition, mainly to the spark arrestor issue proposed in Part II of the code change heard by the IMC Committee. The proponent was not able to be present at the hearing.

The spark arrestor proposed in this code change prevents the roof-top solar system from igniting, not to protect the integrity of the roof.

Fire classification of roof assemblies is meant for emergency unforeseen conditions and not the regular use of a chimney.

Spark arrestors are not a hazard, as one speaker in opposition stated they are optional, and if used, the IBC provides standards to allow them to function by reducing sparks exterior to the chimney and to allow the free venting of the products of combustion from the fire chamber below. The spark arrestor can easily be installed without tools simply by twisting a wing nut. They cost about $70 from Home Depot. These spark arrestors also offer a collateral benefit, keeping rodents and birds out of the building.

One opposing speaker stated that the code does not address the combination of solar systems adjacent to chimneys, so the proposal is submitted to close the regulatory gap. When a lack of fire history is discussed, numerous code changes of the past decades have been adopted prospectively in advance of a condition rather than being reactionary.

Collaboration in the 2022 Group B Cycle included some of the opponents in the current cycle. At the time, the focus was the extension of the chimney above the solar system, which was settled by the IRC Building committee. The original proposal was submitted without change after the proponent reviewed the video of the recorded testimony.
The proponent requests approval as submitted if constructed comments are not submitted by opponents to the code change.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

F175-24

IFC: SECTION 202 (New), SECTION 1208 (New), 1208.1 (New), 1208.2 (New), 1208.3 (New), 1208.4 (New), UL Chapter 80 (New)

Proposed Change as Submitted

Proponents: Jonathan Roberts, UL Solutions, UL Solutions (jonathan.roberts@ul.com)

2024 International Fire Code

Add new definition as follows:

ELECTRIC VEHICLE POWER EXPORT EQUIPMENT (EVPE). The electrical equipment, including the outlet on the vehicle, that is used to provide electrical power at voltages equal to or greater than 30 volts AC or 60 volts DC to an external load(s) from the vehicle, where the vehicle is the source of supply.

Add new text as follows:

SECTION 1208
ELECTRIC VEHICLE POWER EXPORT EQUIPMENT

1208.1 General. The use, operation and maintenance of *electric vehicle power export equipment* shall comply with this section.

1208.2 Listing. *Electric vehicle power export equipment* shall comply with one of the following:

1. *Electric vehicle power export equipment* that performs both functions of an inverter and an electric vehicle charger shall be *listed* and *labeled* in accordance with UL 9741.
2. *Electric vehicle power export equipment*, that monitors and oversees electric vehicles with onboard AC inverter/converters, shall be *listed* and *labeled* in accordance with UL 1741.

1208.3 Installation and use. *Electric vehicle power export equipment* shall be installed and used in accordance with their listing, the manufacturer's installation instructions, and NFPA 70.

1208.4 Utility interactive. *Electric vehicle power export equipment connected* to the electric utility grid shall use inverters listed for utility interaction.

Add new standard(s) as follows:

UL

Underwriters Laboratories LLC
333 Pfingsten Road
Northbrook, IL 60062

9741-2023 Electric Vehicle Power Export Equipment (EVPE)

Reason: Electric vehicle power export equipment (EVPE) is a new trend to use an electric vehicle to provide power to the building. EVPE can be unidirectional or bidirectional. Unidirectional equipment exports power from the vehicle to an offboard load, such as a receptacle bank. Bidirectional equipment provides power to the vehicle for charging of the onboard battery, and exports power to the grid, premise or load, but export and charging do not occur at the same time. There are three manufacturers with listed equipment.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The cost for obtaining listed EV power export equipment may or may not represent increased product costs over obtaining non-listed equipment that have not

been independently investigated to applicable standards for determining product safety and performance.

Obtaining and maintaining a listing for EV power export equipment involves both product investigation costs and costs for periodic inspection of production, as required by the definition of “listed”. However, the impact of any potential cost increase can be weighed by the code development committee against the user and code official safety benefits derived from requiring listed equipment, as well as the additional benefit of less effort needed to demonstrate or determine compliance.

F175-24

Public Hearing Results (CAH1)

Errata: This proposal includes unpublished errata The standard analysis for UL 9741-2023 has been updated and can be found here. https://www.iccsafe.org/wp-content/uploads/2024-Proposed-Standards_Group-A.pdf

Committee Action: **Disapproved**

Committee Reason: This proposal would create an unsafe situation and negate the safety that is required by UL 9540. There was some concern that this needs to be acknowledged and addressed with the need for additional approval requirements. (Vote 13-0)

F175-24

Individual Consideration Agenda

Comment 1:

Northbrook, IL 60062

9741-2023 Electric Vehicle Power Export Equipment (EVPE)

Reason: In response to comments raised at the CAH, this proposal recognizes that the fire code official cannot regulate outlets on the vehicle.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is a simple change to the definition for Electric Vehicle Power Equipment, therefore there is no additional cost associated with this proposed change.

Comment (CAH2)# 662

Comment 2:

Proponents: Abid Anwar, Tesla (aanwar@tesla.com) requests As Submitted

Reason: F-175 should be approved as submitted. The proposed code change promotes public safety and enables Fire Officials to enforce the utilization of listed and labeled equipment for an activity already permitted by NFPA 70, NFPA 855 and the IFC. UL 9540 is not the appropriate or applicable standard to address the safety of an EV's rechargeable electrical energy storage system (REESS) used to power premises wiring. The utilization of an EV for bi-directional applications does not meet the definition of Mobile ESS in either NFPA 855, NFPA 70, IFC and UL 9540.

Electric vehicles are safe and do not constitute a previously unknown hazard. EV manufacturers are required to integrate far more robust protections in EV's than stationary energy storage given their exposure to increased shock, vibration, battery use profiles and impact forces associated with potential collisions. In fact, Tesla vehicles are less likely to experience a vehicle fire than internal combustion engine (ICE) vehicles. According to data released by NFPA and U.S. Department of Transportation, in the United States there is a vehicle fire for every 19 million miles traveled. By comparison, from 2012 – 2021, there was approximately one Tesla vehicle fire for every 210 million miles traveled, which is ten times less.[1] EVPE equipment is also extremely safe. EVPE cables are only energized when connected and locked to the electric vehicle and communication is established between the EVPE equipment and the vehicle. The bi-directional flow of electricity to the EVPE cable is automatically shut off if the connector is unlocked or communication between the vehicle and charging equipment ceases.

Safety requirements associated with the REESS are regulated by UN 38.3 and the Department of Transportation (DOT) National Highway Traffic Safety Administration (NHTSA) Federal Motor Vehicles Safety Standards (FMVSS). EV manufacturers are required to

address the hazards associated with the EV REESS and are subject to enforcement action where safety related defects are identified. Inherent to their function, EV REESS require far more robust protection systems to account for the increased mechanical, shock, absorption, vibration, crush and impact hazards associated with their non-stationary application.

Tesla is committed to helping fire departments and first responders safely handle emergency situations involving all Tesla products. We have trained thousands of first responders to appropriately handle Tesla vehicles and batteries through virtual and in-person training, through provision of decommissioned vehicles, support lines, and attendance at relevant safety and code conferences. While Tesla understands the intent of the committee in disapproval of this proposal in keeping first responders and the public safe, the belief that EV batteries are unsafe and pose a greater hazard than UL 9540 listed energy storage systems is fundamentally flawed.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Comment (CAH2)# 536

Comment 3:

Proponents: Joseph H. Cain, P.E., Solar Energy Industries Association (SEIA), Solar Energy Industries Association (SEIA) (joecainpe@gmail.com) requests As Submitted

Reason: This public comment for CAH #2 requests Approval As Submitted for F175-24. The proposal seeks to fill a gap in safety standards in the IFC. The Committee Reason states "This proposal would create an unsafe situation and negate the safety that is required by UL 9540."

Based on testimony during CAH #1, there seemed to be differences of opinion about whether Electric Vehicles (EVs) that export power to a building or a load might fit within the definition of "mobile ESS," and might therefore be subject to UL 9540 requirements. We strongly disagree with this overly broad interpretation of the definition of mobile ESS. In fact, the definition of mobile ESS found in the 2023 NFPA 855 standard seems to be problematic itself, as it is cryptic and overly broad. The definition of mobile ESS found in the 2024 IFC provides additional language that speaks to the intent of mobile ESS.

When we think of examples of mobile ESS, one common example would be ESS on a trailer that is temporarily moved to provide power to an outdoor concert. When we see an EV driving down the road or parked somewhere, we don't generally ask whether it has a power export system and then say it is unsafe if it is not listed to UL 9540, which is not an EV standard. For convenience, the two referenced definitions of mobile ESS are displayed below.

2023 NFPA 855 definition:

Mobile Energy Storage System. An energy storage system capable of being moved and utilized as a temporary source of power.

2024 IFC definition:

Energy Storage System, Mobile. An energy storage system capable of being moved and utilized for temporary energy storage applications, and not installed as fixed or stationary electrical equipment. The system can include integral wheels for transportation or be loaded on a trailer and unloaded for charging, storage and deployment.

When we look at the 2023 National Electrical Code, we find a definition specific to EV Power Export Equipment, shown below. Further, NEC Article 625 is titled Electrical Vehicle Power Transfer System.

2023 NFPA 70 (NEC) definition:

Electric Vehicle Power Export Equipment (EVPE). The equipment, including the outlet on the vehicle, that is used to provide electrical power at voltages great than or equal to 30 Vac or 60 Vdc to loads external to the vehicle, using the vehicle as the source of supply.

Proposal F175-24 seeks to provide additional safety for this specific use case, by specifically referencing UL 9741-2023, Electric Vehicle Power Export Equipment (EVPE). The Reason Statement for F175-24 states: "There are three manufacturers with listed equipment." By the time the 2027 IFC is adopted and in effect, there certainly will be many more manufacturers of EV that support this equipment. We should not wait through another three-year code cycle before they have a product safety standard for testing and listing.

This type of power export equipment is becoming commonly known as Vehicle to X (V2x), and will be much more common in the future. The Sustainable Energy Action Committee (SEAC) is very near publishing and posting a paper related to several use cases of V2x.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Comment (CAH2)# 784

F176-24

IFC: SECTION 202 (New), SECTION 1208 (New), 1208.1 (New), 1208.2 (New), 1208.3 (New), UL Chapter 80 (New)

Proposed Change as Submitted

Proponents: Jonathan Roberts, UL Solutions, UL Solutions (jonathan.roberts@ul.com)

2024 International Fire Code

Add new definition as follows:

PORTABLE POWER PACK. A moveable device that contains an integral or removable battery, or batteries, that when charged are intended to provide temporary power to various outputs of the device. This includes hand portable or wheeled devices. Portable power packs are not intended to include devices regulated as mobile or portable *Energy Storage Systems (ESS).*

Add new text as follows:

SECTION 1208
SECTION PORTABLE POWER PACKS

1208.1 General. The use, operation and maintenance of *portable power packs* with an energy capacity of 1 kWh or greater shall comply with this section. **Exception:** Portable and mobile electrical energy storage systems (ESS) that are regulated by Section 1207

1208.2 Listing. *Portable power packs* shall be *listed* and *labeled* in accordance with UL 2743.

1208.3 Operation and maintenance. *Portable power packs* shall be used and maintained in accordance with the *listing* and the manufacturer's instructions. Units marked for "indoor use only" shall not be used outdoors.

Add new standard(s) as follows:

UL

Underwriters Laboratories LLC
333 Pfingsten Road
Northbrook, IL 60062

2743-2023 Portable Power Packs

Reason: Portable power packs that typically utilize lithium-ion batteries are used to provide temporary and portable power in applications that often previously used fuel-fired portable generators. This proposal includes safety requirements intended to address hazards associated with the use of these devices. There are currently more than eight manufacturers with listed portable power packs. The threshold of 1 kWh would not impose requirements on small battery storage devices typically used to charge personal electronic devices.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The cost for obtaining listed portable power packs may or may not represent increased product costs over obtaining non-listed equipment that have not been independently investigated to applicable standards for determining product safety and performance.

Obtaining and maintaining a listing for portable power packs involves both product investigation costs and costs for periodic inspection of production, as required by the definition of "listed". However, the impact of any potential cost increase can be weighed by the code development committee against the user and code official safety benefits derived from requiring listed products, as well as the additional benefit of less effort needed to demonstrate or determine compliance.

Public Hearing Results (CAH1)

Errata: This proposal includes unpublished errata The standard analysis for UL 2743-2023 has been updated and can be found here. https://www.iccsafe.org/wp-content/uploads/2024-Proposed-Standards_Group-A.pdf

Committee Action: **Disapproved**

Committee Reason: More information is needed as to what kind of equipment this proposal is intending to to address. (Vote 10-3)

~~Exception:~~ ~~Portable and mobile electrical energy storage systems (ESS) that are regulated by Section 1207~~

1208.1.1 Capacity Limit. Portable power packs with an energy capacity exceeding 20 kWh shall comply with Section 1207

1208.2 Listing. *Portable power packs* shall be *listed* and *labeled* in accordance with UL 2743.

1208.3 Operation and maintenance. *Portable power packs* shall be used and maintained in accordance with the *listing* and the manufacturer's instructions. Units marked for "indoor use only" shall not be used outdoors.

UL

Underwriters Laboratories LLC
333 Pfingsten Road
Northbrook, IL 60062

2743-2023 Portable Power Packs

Reason: This proposal sets an upper limit of 20 kWh on the size of portable power packs regulated by this section. This was a specific concern that was raised by the Committee at CAH #1. The upper limit of 20 kWh correlates with the trigger set for regulation as an ESS by Section 1207.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The cost for obtaining listed portable power packs may or may not represent increased product costs over obtaining non-listed equipment that have not been independently investigated to applicable standards for determining product safety and performance.

Obtaining and maintaining a listing for portable power packs involves both product investigation costs and costs for periodic inspection of production, as required by the definition of “listed”. However, the impact of any potential cost increase can be weighed by the code development committee against the user and code official safety benefits derived from requiring listed products, as well as the additional benefit of less effort needed to demonstrate or determine compliance.

Proposed Change as Submitted

Proponents: Rex Alexander, Five-Alpha LLC, Self (rex@five-alpha.com)

2024 International Fire Code

Add new definition as follows:

EMERGENCY HELICOPER LANDING AREA (EHLF). A clear area at ground level or on the roof of a building capable of accommodating helicopters engaged in fire fighting and/or emergency evacuation operations.

VERTIPORT. A generic reference to the area of land, water, or structure used or intended to be used, for the landing and takeoff of vertical takeoff and landing (VTOL) aircraft, together with associated buildings and facilities.

VERTISTOP. A vertiport, where no refueling, recharging, maintenance, repairs, or storage of aircraft is permitted, except for unscheduled maintenance.

Revise as follows:

105.5.48 ~~Rooftop heliports~~ Heliports, helistops, EHLFs, vertiports, and vertistops. An operational permit is required for the operation of a ~~rooftop~~ heliport, helistop, EHLFs, vertiport, or vertistop.

1103.6.2 Existing ~~helistops and~~ heliports, helistops, EHLFs, vertiports, and vertistops. Existing buildings with a rooftop ~~helistop or~~ heliport, helistop, EHLFs, vertiport, or vertistop located more than 30 feet (9144 mm) above the lowest level of fire department access to the roof level on which the ~~helistop or~~ heliport, helistop, EHLFs, vertiport, or vertistop is located shall be equipped with standpipes in accordance with Section 2007.5.

2001.1 Scope. Airports, heliports, helistops,EHLFs, vertiports, vertistops, and aircraft hangars shall be in accordance with this chapter.

2002.1 Definitions. The following terms are defined in Chapter 2:
AIRCRAFT OPERATION AREA (AOA).

AIRPORT.

HELIPORT.

HELISTOP.

EMERGENCY HELICOPTER LANDING AREA (EHLF).

VERTIPORT.

VERTISTOP.

SECTION 2007
~~HELISTOPS AND~~ HELIPORTS, ~~AND~~ HELISTOPS, EHLF, VERTIPORTS, AND VERTISTOPS

2007.1 General. ~~Helistops and heliports.~~ Heliports, helistops, EHLFs, vertiports, and vertiports shall be maintained in accordance with

Sections 2007.2 through 2007.8. ~~Helistops and heliports,~~ Heliports, helistops, EHLFs, vertiports, and vertistops ~~on buildings~~ shall be constructed in accordance with the *International Building Code*~~.~~, US DOT/FAA AC 150/5390-2D, US DOT/FAA Engineering Brief No. 105, and NFPA 418, ASTM F3423, as applicable.

2007.2 Clearances. ~~The touchdown area shall be surrounded on all sides by a clear area having minimum average width at roof level of 15 feet (4572 mm) and not less than 5 feet (1524 mm) at any point. The clear area shall be maintained.~~ Heliports, helistops, EHLFs, vertiports, and vertistops shall maintain the required clearances as specified in U.S DOT/FAA AC 150/5390-2D and U.S. DOT/FAA Engineering Brief No. 105.

2007.3 Flammable and Class II combustible liquid spillage. Landing areas on structures shall be maintained so as to confine *flammable* or Class II *combustible liquid* spillage to the landing area itself, and provisions shall be made to drain such spillage away from *exits* or *stairways* serving the ~~helicopter~~ aircraft landing area or from a structure housing such *exit* or *stairway*.

2007.5 Standpipe systems. A building with a rooftop ~~helistop or~~ heliport, helistop, EHLF, vertiport, or vertistop shall be provided with a Class I or III standpipe system extended to the roof level on which the ~~helistop or~~ heliport, helistop, EHLF, vertiport or vertistop is located. All portions of the ~~helistop and~~ heliport, helistop, EHLF, vertiport, or vertistop area shall be within 150 feet (45 720 mm) of a $2\,^{1}/_{2}$-inch (63.5 mm) outlet on the standpipe system.

2007.6 Foam protection. Foam fire-protection capabilities shall be provided for rooftop ~~heliports~~ landing areas that accommodate aircraft with liquid fuel. Such systems shall be designed, installed and maintained in accordance with the applicable provisions of Sections 903, 904 and 905.

2007.7 Fire extinguishers. ~~Not less than one portable fire extinguisher having a minimum 80-B:C rating shall be provided for each permanent takeoff and landing area and for the aircraft parking areas. Installation, inspection and maintenance of these extinguishers shall be in accordance with Section 906.~~ Fire extinguishers at heliports, helistops, EHLFs, vertiports, vertistops, aircraft parking areas, refueling sites, and charging sites shall comply with NFPA 418 and NFPA 10.

2007.8 Federal approval. Before operating helicopters or VTOL aircraft from a ~~helistops and~~ heliport~~s~~, helistop, EHLFs, vertiport, or vertiport ~~approval shall be obtained~~ a favorable airspace determination shall be obtained from the Federal Aviation Administration.

Add new standard(s) as follows:

F3423-23	Standard Specification for Vertiport Design

Revise as follows:

905.3.5 ~~Helistops, and heliports~~ Heliports, helistops, EHLF, vertiports, and vertistops. Buildings with a rooftop *~~helistop,~~ heliport, helistop,* EHLF, *vertiport, or vertistop* shall be equipped with a Class I or III standpipe system extended to the roof level on which the

~~*helistop* or~~ *heliport, helistop,* EHLF, *vertiport, or vertistop* is located in accordance with Section 2007.5.

2024 International Building Code

Add new definition as follows:

EMERGENCY HELICOPER LANDING AREA (EHLF). A clear area at ground level or on the roof of a building capable of accommodating helicopters engaged in fire fighting and/or emergency evacuation operations.

VERTIPORT. A generic reference to the area of land, water, or structure used or intended to be used, for the landing and takeoff of vertical takeoff and landing (VTOL) aircraft, together with associated buildings and facilities.

VERTISTOP. A vertiport, where no refueling, recharging, maintenance, repairs, or storage of aircraft is permitted, except for unscheduled maintenance.

Revise as follows:

[F] 905.3.5 ~~Helistops and heliports~~ Heliports, Helistops, EHLFs, Vertiports, and Vertistops. *Buildings* with a rooftop ~~*helistop* or~~ *heliport* , *helistop,* EHLFs, *vertiport, or vertistop* shall be equipped with a Class I or III *standpipe system* extended to the roof level on which the ~~*helistop* or~~ *heliport* , *helistop,* EHLFs, *vertiport, or vertistop* is located in accordance with Section 2007.5 of the *International Fire Code.*

[F] 412.7 Heliports, ~~and~~ helistops, EHLF, vertiports, vertistops. *Heliports,* ~~and~~ *helistops,* EHLFs, vertiports *and vertistops* shall be permitted to be erected on *buildings* or other locations where they are constructed in accordance with Sections 412.7.1 through 412.7.5.

[F] 412.7.1 ~~Size~~ Design. ~~The landing area for helicopters less than 3,500 pounds (1588 kg) shall be not less than 20 feet (6096 mm) in length and width. The landing area shall be surrounded on all sides by a clear area having an average width at roof level of 15 feet (4572 mm), and all widths shall be not less than 5 feet (1524 mm).~~Heliport, helistop, EHLF, vertiport, and vertistop landing areas shall be designed in accordance with U.S. DOT/FAA Heliport Design AC 150/5390-2D. Veriports and veristops shall comply with ASTM F3423-23.

[F] 412.7.2 ~~Design~~ Rooftop landing areas. Helicopter and VTOL landing areas and the supports thereof on the roof of a *building* shall be noncombustible construction. Landing areas shall be designed to confine any *flammable liquid* spillage to the landing area itself and provisions shall be made to drain such spillage away from any *exit* or *stairway* serving the helicopter or VTOL landing area or from a *structure* housing such *exit* or *stairway*. For structural design requirements, see Section 1607.6.

[BE] 412.7.3 Means of egress. The *means of egress* from *heliports* ~~and ,~~ *helistops, EHLFs, vertiports and vertistops* shall comply with the provisions of Chapter 10. Landing areas located on *buildings* or *structures* shall have two or more *exits or access to exits*. For landing areas less than 60 feet (18 288 mm) in length or less than 2,000 square feet (186 m^2) in area, the second *means of egress* is permitted to be a fire escape, *alternating tread device* or ladder leading to the floor below.

[F] 412.7.4 ~~Rooftop heliports~~ Heliports, ~~and~~ helistops, EHLFs, vertiports and vertistops. ~~Rooftop~~ *Heliports, ~~heliports~~* and ~~*helistops,*~~ *EHLFs, vertiports and vertistops* shall comply with NFPA 418, US DOT/FAA AC 150/5390-2D and FAA Engineering Brief No. 105, ASTM F3423, as applicable.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

Minimally $0.00 if currently complying. The cost impact justification provide more detail on possible costs.

Estimated Immediate Cost Impact Justification (methodology and variables):

To calculate the potential cost impact that these recommendations may have, it is first necessary to understand how the ICC references FAA and NFPA standards, then how the NFPA references FAA standards, how FAA referenced NFPA and ICC standards, and finally how long these references have been in place.

ICC 2021 Reference to NFPA-418:

IFC 2021:

2007.1 General. Helistops and heliports shall be maintained in accordance with Sections 2007.2 through 2007.8. Helistops and heliports on buildings **shall** be constructed in accordance with the International Building Code.

IBC 2021:

[F] 412.7.4 Rooftop heliports and helistops. Rooftop heliports and helistops **shall** comply with NFPA 418.

**Based on a review of past ICC standards the above language has not changed since at least the release of the 2012 revisions.*

NFPA-418, Reference to FAA Heliport Standards: *Listed by revision year.

NFPA*418 was first published in 1967.

NFPA-418 (2011):

4.2.2 The design of the heliport, including all the aeronautical components, shall be in accordance with FAA AC 150/5390-2B, Heliport Design Advisory Circular.

NFPA-418 (2016) & (2021): **Updated to reflect FAA AC revision 2C (2021)*

4.2.2 The design of the heliport, including all the aeronautical components, shall be in accordance with FAA AC 150/5390-2C, Heliport Design Advisory Circular.

NFPA-418 (2024): **Updated to reflect FAA AC revision 2D (2024), include the term "Helistop", and add reference to FAA Engineering Brief No. 105 and include the terms "Vertiport" & "Vertistop".*

6.2.2 The design of the heliport or helistop, including all the aeronautical components, shall be in accordance with FAA AC 150/5390-2D, Heliport Design Advisory Circular, or equivalent criteria.

6.2.3 The design of the vertiport or vertistop, including all aeronautical components, shall be in accordance with FAA Engineering Brief No. 105 for Vertiports, or equivalent design criteria.

FAA AC 150/5390 Reference to NFPA and ICC:

First published in 1959 the FAA Heliport Design Advisory Circular AC 150/5390 has referenced NFPA-418 and other NFPA standards since 1977. To date the FAA Heliport Advisory Circulars has not referenced any International Code Council documents. The following statement on code is made in FAA AC 2D (2024):

Applicability

"Other federal agencies, states, or other authorities having jurisdiction over the construction of heliports not funded with AIP, CARES Act, or PFC funds have discretion in establishing the extent to which these standards apply."

1.18 Local Role and Building Code.

"Some communities have enacted zoning laws, building codes, fire regulations, etc., that can affect heliport establishment and operation. Most municipalities have a formal process such as a "Conditional Use Permit" in place for the establishment of a heliport. Check with your local Planning and Zoning Commission for details. Some have or are in the process of developing codes or ordinances regulating environmental issues such as noise and air pollution. A few localities have enacted specific rules governing the establishment of a heliport. Therefore, make early contact with officials or agencies representing the local zoning board, the fire, police, or sheriff's department, and elected personnel who represent the area where the heliport is to be located."

Cost Impact to Rooftop Heliports, Helistops, Vertiports, and Vertistops

Due to current and past referencing, those states and/or municipalities who have adopted and follow ICC Building Code and Fire Code criteria, as written, should see little to no impact in the overall cost associated with rooftop heliports or helistops. Given that the FAA is using the same physical geometry and airspace criteria for vertiports and vertistops as used by heliports and helistops in the development of those standards, it is expected that the inclusion of vertiports and vertistops into the ICC will not have an impact on overall costs associated with these rooftop use cases as well.

Cost Impact to Ground Heliports, Helistops, Vertiports, and Vertistops

Dimensional Standard

The one significant change proposed to the ICC is in deleting the word "rooftop" therefore the standard will encompass ALL heliports, helistops, vertiports, and vertiports. In so doing, the following associated costs for ground-based sites may in fact increase.

The overall size of a heliport designed to FAA standards is based on the overall length of the largest helicopter expected to operate at that site. Current FAA standards dictate that the landing area known as the Touchdown and Liftoff (TLOF), i.e., *"A load-bearing (generally*

paved) area normally centered in the FATO, on which the helicopter performs a touchdown or liftoff" should be designed to 0.83 X the overall length (OL) of the largest helicopter that will potentially land at that site. In those case where the heliport is associated with a hospital, which make up approximately 65% of all the heliports in the U.S., the minimum size for a TLOF is 40' X 40'.

Given the average size of a standard Helicopter Air Ambulance has a controlling dimensions between 39.2 feet (Bell-206B) and 45.1 feet (AS-365 Dauphin) respectively, the following cost increases would apply in those cases where the heliport would need to be increased. Provided that the current cost of poured concrete to the standard depth for a heliport range between $6.00./ sq ft to $10.00/ sq ft.

Heliport Size Increase Cost Analysis:

Bell-206B	39.2'	32.5'	1,056'	544 ft^2	$3,264	$5,440
AS-365	45.1	37.4'	1,399'	201 ft^2	$1,206	$2,010

At those location that support helicopters larger than those identified above, any cost increase would be based on how much larger the helicopter's overall length may be in comparison to the minimum 40' X 40' standard.

The largest non-military helicopter generally operated in the United States is currently the Sikorsky S-92 which has an overall length of 68.5 feet with a maximum takeoff weight of 26,500 lbs. For these larger helicopters additional consideration for weight capacity also needs to be considered, which will in turn increase cost. For this helicopter the minimum TLOF dimension would be 68.5' X 68.5' with an overall square footage of 4,692'.
Overall cost estimate at $20/$ft^2$ for the increased material would be approximately $93,840.

It should be pointed out that for both personal and public heliports may utilize a Turf surface, i.e., grass in lieu of concrete when deemed appropriate.

Potential Fire Safety Equipment Cost Increase

For ground-based heliports, NFPA-418 identifies the acceptable size and number of fire extinguishers that shall be required to meet the standard. With the deletion of the term "rooftop" all heliports, helistops, vertiports, and vertistop would be required to have a fire extinguisher of the appropriate size and category on site. The size of the fire extinguisher is dictated by the overall length of the largest helicopter, see applicable chart, that the heliport is required to accommodate. The category of fire extinguisher is dictated by NFPA-10, Standard for Portable Fire Extinguishers.

NFPA-418 Minimum Requirement. At least one portable fire extinguisher as specified in Table 11.2 shall be provided for each takeoff and landing area, parking area, and fuel storage area.

Fire Extinguisher Size Based on helicopters Overall Length

Helicopter Model	Overall Length (ft)	Overall Length (m)	Category
Brantly/Hynes B-2B	28.1	8.6	H-1
Robinson R-22 Beta	28.8	8.8	H-1

Eurocopter SA/AS-332 Super Puma	61.3	18.7	H-2
Bell B214 ST	62.2	19.0	H-2
Sikorsky S-55 / H19	62.6	19.1	H-2
Eurocopter EC-224	64.0	19.5	H-2
Sikorsky S-70i/UH-60L Blackhawk	64.8	19.8	H-2
Sikorsky S-58 / H34	65.8	20.1	H-2
Sikorsky S-92	68.5	20.9	H-2
Sikorsky S-61 / H-3	72.8	22.2	H-2
Agusta Westland AW - 101	74.8	22.8	H-2
Boeing 107/CH-46E	84.3	25.7	H-3
Erickson S-64E Air Crane	88.5	27.0	H-3
Erickson S-64F Air Crane	88.5	27.0	H-3

Depending on the size and type of fire extinguisher required the cost can range from as little as $500.00 for a 30 lb. ABC fire extinguisher to upwards of $12,000 and above for a wheeled 250 lb. Purple K.

Cost Impact: Potential Cost Savings

INCLUSION OF EMERGENCY HELICOPTER LANDING FACILITY

By defining and including the term Emergency Helicopter Landing Facility (EHLF) it provides the Authority Having Jurisdiction the ability to apply those FAA standards in lieu of those for heliports, helistops, vertiports, and vertistops. This will in turn means that less stringent criteria can now be used and the cost associated will decrease.

ACCIDENT PREVENTION

Heliport Accident Research

In the Vertical Flight Society research paper entitled “A Retrospective & Historical Analysis of Vertical Lift Infrastructure Accidents for the Purpose of Operational Risk Identification and Accident Prevention”, published May 2021, see included material, it was found that 93% of all heliport accidents occurred at heliports that did not follow FAA standards.

Price of Human Life on a Helicopter

In 2011, the FAA reported that the U.S. Government equated each human life on board a helicopter to be worth approximately $6 million.

Link to quote: https://www.aviationlawmonitor.com/2011/01/airlines/faa-human-life-worth-6-million/

Based on standard inflation, in 2024 that same amount would equate to $8.1 million.

Heliport Accident Research

2021 Grand Canyon Accident Report

In a recent out of court settlement involving a helicopter accident in Peach Springs, Arizona (NTSB Accident Number WPR18MA087)

where the heliport being utilized did not meet basic FAA standards, i.e., and approach departure path that avoids downwind operations, a jury awarded one of the familys involved $100 million dollars.

F180-24

Public Hearing Results (CAH1)

Committee Action: **As Submitted**

Committee Reason: The committee appreciated the intent of this proposal to provide more detail on how to address these emerging technologies but felt it needed further refinement. In particular, there were concerns with how fire fighting foam should be addressed as the agents are changing. Also, as written foam systems are being applied beyond that required by NFPA 318. Associated loss history does not seem to justify. (Vote 9-5)

F180-24

Individual Consideration Agenda

Comment 1:

IFC: SECTION 202; IBC: SECTION 202

Proponents: Robert Sullivan, NFPA Southwest Regional Director, National Fire Protection Association (NFPA) (bsullivan@nfpa.org)

requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Fire Code

Revise as follows:

VERTIPORT. As defined in NFPA 418. ~~A generic reference to the area of land, water, or structure used or intended to be used, for the landing and takeoff of vertical takeoff and landing (VTOL) aircraft, together with associated buildings and facilities.~~

VERTISTOP. As defined in NFPA 418. ~~A vertiport, where no refueling, recharging, maintenance, repairs, or storage of aircraft is permitted, except for unscheduled maintenance.~~

2024 International Building Code

Revise as follows:

VERTIPORT. As defined in NFPA 418. ~~A generic reference to the area of land, water, or structure used or intended to be used, for the landing and takeoff of vertical takeoff and landing (VTOL) aircraft, together with associated buildings and facilities.~~

VERTISTOP. As defined in NFPA 418. ~~A vertiport, where no refueling, recharging, maintenance, repairs, or storage of aircraft is permitted, except for unscheduled maintenance.~~

Reason: The terms and definitions "Vertiport" and "Vertistop" were first created, developed and published in the 2021 Edition of NFPA 418, Standard for Heliports and Vertiports. Those definitions were brought forward and published again, without any changes to the wording of those two definitions, in the 2024 Edition of NFPA 418. Those two definitions have now been added and included in Proposal F180-24, without any changes to the wording of either of those two definitions.

The intent of this modification to the wording of Proposal F180-24 is to add a reference to each of those definitions, in the next editions of both the International Fire Code and the International Building Code, to indicate proper credit and reference to NFPA 418, 2024 Edition, as the document from which those two definitions originated. This modification has been briefly discussed with the proponent of Proposal F180-24, and there is not expected to be any objection from him regarding this proposed modification. Additional discussions with the proponent about this modification will be held prior to CAH#2 in October, 2024.

Bibliography: NFPA 418, 2024 Edition, Sections 3.3.23 (Vertiport) and 3.3.24 (Vertistop).

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is a slight modification to Proposal F180-24 to add a reference to an NFPA standard. There is no cost impact as a result of this slight modification. See cost impact for the original proposal which may increase cost.

Comment (CAH2)# 790

F181-24

IFC: SECTION 202, CHAPTER 22

Proposed Change as Submitted

Proponents: Robert Marshall, FCAC, FCAC (fcac@iccsafe.org); Robert J Davidson, Davidson Code Concepts LLC, Self (rjd@davidsoncodeconcepts.com)

2024 International Fire Code

CHAPTER 2
DEFINITIONS

SECTION 202
GENERAL DEFINITIONS

Revise as follows:

COMBUSTIBLE DUST. Finely divided solid material which ~~is 420 microns or less in diameter and which~~, when dispersed in air or oxidizing medium in the proper proportions, could be ignited by a flame, spark or other source of ignition. ~~*Combustible dust* will pass through a US No. 40 standard sieve.~~

DEFLAGRATION. An exothermic reaction, such as the extremely rapid oxidation of a flammable dust or vapor in air or oxidizing medium, in which the reaction progresses through the unburned material at a rate less than the velocity of sound. A deflagration can have an explosive effect.

EXPLOSION. ~~An effect produced by the sudden violent expansion of gases, which may be accompanied by a shock wave or disruption, or both,~~ The failure of enclosing materials or structures due to an increase in internal pressure from deflagration or detonation. An explosion could result from any of the following:

1. Chemical changes such as rapid oxidation, *deflagration* or *detonation*, decomposition of molecules and runaway polymerization (usually *detonations*).

2. Physical changes such as pressure tank ruptures.

3. Atomic changes (nuclear fission or fusion).

Add new definition as follows:

FLASH FIRE. A fire that spreads by means of a flame front rapidly through a diffuse fuel, such as dust, gas, or the vapors of an ignitible liquid, without the production of damaging pressure.

CHAPTER 22
COMBUSTIBLE DUST-PRODUCING OPERATIONS

SECTION 2201
GENERAL

Revise as follows:

2201.1 Scope. The facilities, equipment, processes and operations ~~involving~~ in which combustible dust explosion, deflagration, fire or flash fire hazards ~~and use or handling of *combustible dust*~~ exist shall comply with the provisions of this chapter.

Exceptions:

1. Storage and use of consumer materials in Group B or R occupancies.
2. Storage and use of commercially packaged materials in Group M occupancies.
3. Materials displayed in original packaging in Group M occupancies and intended as building materials or for personal or household use.
4. Storage of sealed containers of *combustible dust* at facilities not associated with an operation that uses, handles or generates *combustible dust*.
5. Materials stored or used in farm buildings or similar occupancies intended for on-premises agricultural purposes.
6. When the facility or use is outside the scope of NFPA 652.
7. Restaurants, retail bakeries, coffee shops, and similar occupancies that have limited use of flour, sugar, coffee grinds, and other finely divided combustible dust or particulate solid ingredients in preparation of foods, snacks, and similar.

2201.2 Permits. Permits shall be required for *combustible dust*-producing operations as set forth in Section 105.5.

SECTION 2202
DEFINITIONS

Revise as follows:

2202.1 Definition. The following terms are defined in Chapter 2:
COMBUSTIBLE DUST.

DUST COLLECTION SYSTEM.

FLASH FIRE.

SECTION 2203
DUST EXPLOSION ~~PREVENTION~~ CONTROL

2203.1 ~~Critical depth layer~~ Combustible Dust Hazard Identification. ~~The maximum dust layer on all surfaces, including but not limited to walls, ceilings, beams, equipment, furniture, pipes and ducts, shall not exceed the critical depth layer specified in Table 2203.1. The critical depth layer is permitted to be adjusted for explosion hazard where further evaluated in accordance with one of the following:~~

1. ~~Section 7.2.1.3 of NFPA 654.~~
2. ~~Section 4.1.3.3 of NFPA 664 for wood flour.~~

~~Accumulated *combustible dust* shall be collected by one of the methods listed in Section 2203.5.~~Where the smallest dimension of the material is less than or equal to 500 µm, the owner/operator shall be responsible for determining whether the material is combustible or explosible. Where the combustibility of a dust or particulate solid is not determined by an *approved* source, the owner/operator shall test representative samples in accordance with NFPA 652. A copy of the test results shall be provided to the *fire code official* upon request.

Delete without substitution:

~~TABLE 2203.1 CRITICAL DEPTH LAYER~~

TYPE OF DUST	CRITICAL DEPTH LAYER (INCHES)
Wood flour	1/8
All other dusts	1/32

For SI: 1 inch = 25.4 mm.

Revise as follows:

2203.2 Dust Hazard Analysis -producing and dust-handling equipment. Dust producing equipment and dust handling equipment, including but not limited to vacuums, dust collection systems, dryers, mixers, blenders, separators, conveyors, storage containers, silos or other similar devices, shall be *listed* and shall be maintained in accordance with the manufacturer's recommended standards. Where a dust is combustible or *explosible*, a dust hazard analysis (DHA) shall be performed and documented for new or existing facilities in accordance with NFPA 652. A copy of the DHA shall be provided to the *fire code official* upon request.

Exception: Woodworking operations that occupy areas smaller than 5000 ft (465 m2), and where dust-producing equipment requires an aggregate dust collection flow rate less than 1500 ft3/min (2549 m3/hr) and the equipment is installed in accordance with the International Mechanical Code. (NFPA 664 1.1.2)

2203.3 Dust control and management system -collection and dust-conveying systems. Dust collection and dust conveying systems shall be in accordance with Sections 2203.3.1 through 2203.3.3. Facilities where combustible dusts or powders are used, handled, generated shall have dust control, cleaning, training, operations procedures, and management procedures to prevent conditions, operations, or accumulations of combustible dusts that could pose a fire, flashfire, or explosion hazard.

2203.3.1 Housekeeping and cleaning Dust-collection systems. Dust collection systems shall be designed to collect dust emissions from dust producing equipment at the point of generation. Dust collection systems shall be in accordance with Section 510 of the *International Mechanical Code*. **Exception:** *Closed systems* using *listed* equipment and designed in accordance with manufacturer's recommendations and specifications, where cleanouts are provided in accordance with Section 2203.3.3. Heating, ventilation, and air conditioning (HVAC) systems shall not be used as the means to collect dusts from localized sources. Facilities where combustible dusts or powders are used, handled, generated shall have regular housekeeping and cleaning procedures to prevent accumulations of combustible dusts that could pose a fire, flash fire, or explosion hazard. Dust shall be maintained at 1/8" inch or less, or as otherwise required in standards listed in Table 2205.1

Delete without substitution:

2203.3.1.1 Location. Dust collectors shall be located outside of buildings. **Exceptions:**

1. Dust collectors inside buildings complying with Section 510 of the *International Mechanical Code*.
2. Wet type dust collectors specifically *listed* for the type of dust conveyed shall be permitted inside buildings where in accordance with the manufacturer's instructions and specifications.
3. Dust collectors designed to specific NFPA standards listed in Table 2205.1 for the specific type of dust conveyed.

2203.3.1.2 Minimum conveying velocities. The minimum velocities within ducts used as part of the dust collection system shall be in accordance withTable 2203.3.1.2.

TABLE 2203.3.1.2 MINIMUM CONVEYING VELOCITIES

TYPE OF PRODUCT	FEET PER MINUTE

Fine light dust such as cotton, lint and wood flour (100 mesh and under)	2,000
Dry dust such as fine rubber molding powder	2,500
Average dust such as sawdust, grinding dust and coal dust	3,500
Heavy dust such as metal turnings, including aluminum and magnesium powder	4,000

For SI: 1 foot per minute = 0.00508 m/s.

2203.3.2 Plastic ducts and conveying systems. Plastic, fiberglass, other nonconductive ducts, duct liners or pipes shall not be used as part of ducts and conveying systems. Ductwork utilizing a combustible lining shall be permitted only in high-impact areas and where *approved*. Flexible hose shall be permitted if designed and installed in accordance with the following requirements:

1. Manufactured of static dissipative construction.
2. Used only for connections and isolation purposes.
3. Limited to 18 inches (457 mm) in length.
4. Properly grounded.

Add new text as follows:

2203.3.2 Management systems, training, and operation procedures. The owner / operator shall maintain management systems in accordance with Chapter 8 of NFPA 652 to ensure the facility and equipment is safely maintained and operated.

Delete without substitution:

2203.3.3 Cleanouts. Openings in enclosed equipment and conveyors shall be provided to allow access to all parts of the equipment and conveyors to permit inspection, cleaning, maintenance and the effective use of portable fire extinguishers or hose streams. Cleanouts for ducts used as part of the dust collection system shall be in accordance with the *International Mechanical Code*.

Add new text as follows:

2203.3.3 Documentation. A copy of the required documentation shall be maintained in accordance with NFPA 652.

Revise as follows:

2203.4 Sources of ignition. Sources of ignition shall be controlled in accordance with NFPA 652 and NFPA 70 Sections 2203.4.1 through 2203.4.9.5.

Delete without substitution:

2203.4.1 Classified electrical. Classified electrical shall be in accordance with NFPA 70. Electrical motors and electrical components of the equipment shall not be installed in the dust laden airstream unless *listed* for Class II, Division 1, locations.

2203.4.2 Static electricity. Bonding and grounding is required to minimize accumulation of static electric charge in the following locations:

1. Dust producing equipment.
2. Dust collection system.

3. Pneumatic dust conveying systems conveying *combustible dust* from one location to another, *combustible dust* conveyors, piping and conductive components. Conveying systems include transport modes such as railcars, hopper cars, boxcars, tank cars and trucks into which or from which commodities or products are pneumatically conveyed.

4. Conveying systems using metallic piping.

2203.4.3 Hot works. Hot work and similar spark-producing operations shall not be conducted in or adjacent to *combustible dust* producing areas unless precautions have been taken to provide safety. Hot work shall be permitted only in safe, designated areas in accordance with Chapter 35. Hot work is prohibited on equipment that is operating.

2203.4.3.1 Signs. Conspicuous signs with the following warning shall be posted in the vicinity of *combustible dust* producing areas or in the vicinity of *combustible dust* use: NO WELDING. THE USE OF WELDING OR CUTTING EQUIPMENT IN OR NEAR THIS AREA IS DANGEROUS BECAUSE OF FIRE AND EXPLOSION HAZARDS.
WELDING AND CUTTING SHALL BE DONE ONLY UNDER THE SUPERVISION OF THE PERSON IN CHARGE.

2203.4.4 Hot surfaces and hot equipment. In areas where a dust explosion hazard or dust flash fire hazard exists, the temperature (in degrees Celsius) of external surfaces shall be maintained below 80 percent of the lower of the dust surface ignition temperature or the dust cloud ignition temperature for worst case dusts. External surfaces shall include but are not limited to:

1. Compressors.
2. Steam, water or process piping.
3. Ducts.
4. Conveyors.
5. Process equipment.

Where steam pipes or hot surfaces occur in dust producing or dust handling areas, accumulation of dust on the surfaces shall be minimized by an *approved* method.

Exception: Drying apparatus *listed* for the intended use and installed in accordance with the manufacturer's instructions.

2203.4.5 Powered industrial trucks. Powered industrial trucks used in electrically classified areas shall be *listed* for such use.

2203.4.6 Smoking prohibited. Smoking shall be prohibited in or adjacent to dust producing or dust handling areas. "No Smoking" signs complying with Section 310 shall be conspicuously posted in such areas. Smoking shall be permitted only in designated areas.

2203.4.7 Spark-producing devices. Spark-producing devices shall not be located within 20 feet (6096 mm) of areas requiring classified electrical unless separated by a permanent partition.

2203.4.8 Self-heating materials. Materials in silos and other large storage piles of particulates prone to self-heating shall be in accordance with Section 9.4.11 of NFPA 652.

2203.4.9 Open flames and fuel-fired equipment. Open flames and fuel-fired equipment shall be in accordance with Sections 2203.4.9.1 through 2203.4.9.5.

2203.4.9.1 Release ofairborne combustible dust. Production, maintenance or repair activities that have the potential to release or force *combustible dust* to become airborne shall not be conducted within 35 feet (11 m) of an open flame or pilot flame.

2203.4.9.2 Space heaters. Fuel-fired space heaters drawing local ambient air shall not be located within electrically classified areas.

Space-heating appliances in dust-producing or dust-handling areas shall be located where not subject to the accumulation of deposits of *combustible dust.*

2203.4.9.3 Equipment listing. Fuel-fired process equipment shall be *listed* for its intended use and shall be operated and maintained in accordance with the manufacturer's instructions.

2203.4.9.4 Inspection and preventive maintenance. Inspection and maintenance of fuel-fired process equipment shall include verification that significant *combustible dust* accumulations do not exist within or around the equipment.

2203.4.9.5 Sources of combustion air. In Class II electrically classified locations, heating units shall be provided with a source of combustion air ducted directly from the building exterior or from an unclassified location.

2203.5 Housekeeping. Accumulation of *combustible dust* on surfaces inside buildings shall be maintained below the critical depth layer in Section 2203.1. Pressurized air or similar methods shall not be used to remove dust from surfaces. Accumulated *combustible dust* shall be collected by one of the following methods:

1. Portable vacuum cleaners *listed* for use in Class II, Group G, Division 1, atmospheres as defined in NFPA 70.
2. Dust collection systems.
3. Other *approved* means that will not place *combustible dust* into suspension in air.

Exception: Forced-air or similar methods shall be permitted to remove dust in accordance with NFPA 652, NFPA 654 or NFPA 664.

2203.6 Standard operational procedures. Dust-producing equipment and all associated equipment, including dust collection equipment, shall be maintained in accordance with the manufacturer's instructions and specifications and applicable codes. The inspection, testing and maintenance program shall include the following, as applicable:

1. Fire and explosion protection and prevention equipment, as applicable, in accordance with the appropriate NFPA standards.
2. Dust control equipment.
3. Control of potential ignition sources.
4. Electrical, process and mechanical equipment, including applicable process interlocks.
5. Lubrication of bearings for dust collection, dust handling and dust producing equipment.
6. Additional maintenance in accordance with the manufacturer's instructions and specifications for dust collection, dust handling and dust producing equipment.

Records shall be kept of maintenance and repairs performed. The standard operating procedures shall be submitted to the *fire code official* for review and approval. The written standard operating procedures shall be signed by the person responsible for facility operations.

2203.7 Emergency response plan. A written emergency response plan shall be developed for preventing, preparing for and responding to work-related emergencies, including but not limited to fire and explosion. The following information shall be developed into the plan:

1. Identification of dust hazards.
2. Identification and location of all utilities to affected areas.
3. Site plans or floor plans locating utility shutoff controls, including water, gas and power.
4. The potential for explosion.
5. Locations of fire-extinguishing equipment compatible with the hazards present.

6. Any additional information required by the *fire code official* .

2203.8 Training. The plans and procedures required in Sections 2203.5, 2203.6 and 2203.7 shall be *approved* by the *fire code official*. The plans and procedures shall be reviewed annually and updated as required by process changes. Initial and annual refresher training shall be provided to employees who are involved in operating, maintaining and supervising facilities that handle *combustible dust*. Initial and annual refresher training shall include:

1. Workplace hazards.
2. General orientation, plant diagrams and plant safety rules.
3. Process description or flowchart.
4. Equipment operation, safe startup and shutdown, and response to hazard conditions or an incident.
5. The location and use of all related fire and explosion protection and prevention systems.
6. Equipment maintenance requirements and practices, including visual inspections of conveyors and ducts.
7. Housekeeping requirements, including the maintenance of the critical depth layer in Section 2203.1.
8. Emergency response plans as required in Section 2203.7.

The employer shall maintain records of initial and annual training and review.

SECTION 2204
DUST EXPLOSION SCREENING TESTS

2204.1 Combustibility and explosivity tests. Where combustibility or explosivity screening tests are required to analyze the *combustible dust* as part of compliance with Section 104.9 and Section 414.1.3 of the *International Building Code*, they shall be in accordance with Section 5.4 of NFPA 652.

2204.2 Samples. Representative samples for the screening test shall be obtained in accordance with Section 5.5 of NFPA 652.

Add new text as follows:

SECTION 2204
FACILITIES, EQUIPMENT, AND OPERATIONS

2204.1 Facilities, equipment, and operations. Facilities, equipment and operations with combustible dust hazards shall be in accordance with Sections 2204.1 through 2204.4.

2204.1.1 Dust-producing and dust-handling equipment. Dust-producing equipment and dust-handling equipment, including but not limited to vacuums, dust collection systems, dryers, mixers, blenders, separators, conveyors, storage containers, silos or other similar devices, shall be designed, installed and maintained in accordance with the International Mechanical Code and applicable standards listed in Table 2205.1

2204.1.2 Dust-collection systems. Dust-collection systems shall be designed to collect dust emissions from dust-producing equipment at the point of generation. Dust-collection systems shall be in accordance with Section 511 of the *International Mechanical Code* and applicable standards listed in Table 2205.1.

2204.2 HVAC systems. Heating, ventilation, and air conditioning (HVAC) systems shall not be used as the means to collect dusts from localized sources.

Revise as follows:

~~2203.2.1~~ **2204.3 Signages and markings.** Signages and markings shall be provided in accordance with Sections 2204.3 and applicable standards listed in Table 2205.1 ~~2203.2.1.1 through 2203.2.1.3~~.

~~2203.2.1.1~~ **2204.3.1 Deflagration vent discharge area markings.** Where dust collection systems and other equipment, systems or system components are provided with *deflagration* vents , the area within the *deflagration* vent's discharge area shall be marked in an *approved*manner.

~~2203.2.1.2~~ **2204.3.2 Caution signs.** Signs that read as follows shall be posted near the dust-containing equipment with deflagration vents:CAUTION: THIS EQUIPMENT CAN CONTAIN EXPLOSIVE DUST.
KEEP OUTSIDE THE MARKED AREA WHILE EQUIPMENT IS OPERATING.

~~2203.2.1.3~~ **2204.3.3 Warning signs.** Where dust collection systems and other equipment, systems or system components are provided with deflagration vents, vent closures shall be clearly marked as follows:WARNING: EXPLOSION RELIEF DEVICE. STAY CLEAR.

Add new text as follows:

2204.4 Exhaust system and ducts. Exhaust systems and ducts shall be designed, constructed and maintained in accordance with the International Mechanical Code and applicable standards listed in Table 2205.1.

SECTION 2205
STANDARDS

Revise as follows:

2205.1 Specific hazards standards. The owner/operator of a facility with a combustible dust hazard shall be responsible for following the ~~*fire code official* is authorized to enforce~~ additional industry- or material-specific provisions of the codes and standards listed in Table 2205.1 to prevent and control dust explosions, as applicable. Mission continuity requirements found in NFPA standards are not required by this code.

TABLE 2205.1 EXPLOSION PROTECTION STANDARDS

STANDARD	SUBJECT
NFPA 61	Standard for the Prevention of Fires and Dust Explosions in Agricultural and Food Processing Facilities
NFPA 68	Standard on Explosion Protection by Deflagration Venting
NFPA 69	Standard on Explosion Prevention Systems
NFPA 70	National Electrical Code
NFPA 77	Recommended Practice on Static Electricity
NFPA 85	Boiler and Combustion System Hazards Code
NFPA 120	Standard for Fire Prevention and Control in Coal Mines
NFPA 484	Standard for Combustible Metals
NFPA 652	The Fundamentals of Combustible Dust
NFPA 654	Standard for Prevention of Fire and Dust Explosions from the Manufacturing, Processing and Handling of Combustible Particulate Solids
NFPA 655	Standard for the Prevention of Sulfur Fires and Explosions
NFPA 664	Standard for the Prevention of Fires and Explosions in Wood Processing and Woodworking Facilities

2205.1.1 Dust hazard analysis. If a dust hazard analysis (DHA) is required by the *fire code official* for new or existing facilities and operations, it shall be in accordance with NFPA 652. The DHA for existing facilities shall be in accordance with Section 7.1.1 of NFPA 652.

Reason: The chapter has been completely rewritten for consistency with updated NFPA standards, to ensure that correct standards are

requirements are followed (as recommended by Chemical Safety Board and OSHA), and to provide users with an simple, organized approach for applying the correct provisions and standards. The proposed chapter is simpler and easier for users to follow and apply. The new chapter follows the same basic recognized and methodical approach found in NFPA standards:

1) Identify whether dusts or particulates are combustible or explosible, including testing where necessary.

2) Perform a DHA if combustible or explosible dusts are present. The DHA identifies where dust hazards exist and how to safely prevent and mitigate incidents.

3) Ensure that dust control and management (housekeeping, training, management-of-change, etc.) systems are in place.

4) Ensure that facilities, equipment, and operations are designed in accordance with IMC, NFPA, and related reference standards.

Importantly, this proposal also includes the reference to NFPA 652 which was missing in the prior language.

The existing Chapter 22 language included a large number of isolated details specific applications, which was misleading for users, potentially resulting in dangerous conditions and lack of compliance with referenced standards. The safe use and handling of combustible dusts is extremely complicated, with hundreds of pages of material specific standards. It does not make sense to recreate hundreds or thousands of code sections in IFC that already exist in recognized standards. However, it was also not appropriate to only list some, while ignoring many more. Therefore, most detailed items were deleted – instead requiring a DHA to determine the specific requirements, which is how the NFPA and other related standards are intended to work.

Notes on specific sections:

Explosion definition: Revised for consistency with NFPA and to reflect the context of how it is used in this chapter and elsewhere in the code.

2203.2 Woodworking Exception: For the convenience of the user, and consistency with NFPA standards, the long standing NFPA 664 exception is specifically included. This is likely the most common application that AHJs and code users will encounter. It will save users time by highlighting this common exception.

2204.1.2 The exception did not make sense.

As some text was moved between sections, in CDPACCES it appears deleted in the original location and as new language in the new location. In truth it is often existing text moved. Below shows how the chapter will appear in approved.

SECTION 2201 GENERAL

2201.1 Scope. The facilities, equipment, processes and operations involving in which combustible dust explosion, deflagration, fire or flash fire hazards and use or handling of *combustible dust* may exist shall comply with the provisions of this chapter.

Exceptions:

1. Storage and use of consumer materials in Group B or R occupancies.
2. Storage and use of commercially packaged materials in Group M occupancies.
3. Materials displayed in original packaging in Group M occupancies and intended as building materials or for personal or household use.
4. Storage of sealed containers of combustible dust at facilities not associated with an operation that uses, handles or generates combustible dust.

5. Materials stored or used in farm buildings or similar occupancies intended for on-premises agricultural purposes.
6. When the facility or use is outside the scope of NFPA 652.
7. Restaurants, retail bakeries, coffee shops, and similar occupancies that have limited use of flour, sugar, coffee grinds, and other finely divided combustible dust or particulate solid ingredients in preparation of foods, snacks, and similar.

2201.2 Permits.

Permits shall be required for combustible dust-producing operations as set forth in Section 105.5.

SECTION 2202 DEFINITIONS

2202.1 Definition. The following terms are defined in Chapter 2:

COMBUSTIBLE DUST.

DUST COLLECTION SYSTEM.

FLASH FIRE

SECTION 2203 DUST EXPLOSION

PREVENTION CONTROL

2203.1. Combustible Dust Hazard Identification. Where the smallest dimension of the material is less than or equal to 500 µm, the owner/operator shall be responsible for determining whether the material is combustible or explosible. Where the combustibility of a dust or particulate solid is not determined by an *approved* source, the owner/operator shall test representative samples in accordance with NFPA 652. A copy of the test results shall be provided to the *fire code official* upon request.

2203.2 Dust hazard analysis. Where a dust is combustible or *explosible*, a dust hazard analysis (DHA) shall be performed and documented for new or existing facilities in accordance with NFPA 652. A copy of the DHA shall be provided to the fire code official upon request.

Exception: Woodworking operations that occupy areas smaller than 5000 ft (465 m2), and where dust-producing equipment requires an aggregate dust collection flow rate less than 1500 ft3/min (2549 m3/hr) and the equipment is installed in accordance with the International Mechanical Code. (NFPA 664 1.1.2)

2203.3 Dust Control and management Systems. Facilities where combustible dusts or powders are used, handled, generated shall have dust control, cleaning, training, operations procedures, and management procedures to prevent conditions, operations, or accumulations of combustible dusts that could pose a fire, flashfire, or explosion hazard.

2203.3.1. Housekeeping and cleaning. Facilities where combustible dusts or powders are used, handled, generated shall have regular housekeeping and cleaning procedures to prevent accumulations of combustible dusts that could pose a fire, flash fire, or explosion hazard. Dust shall be maintained at 1/8” inch or less, or as otherwise required in standards listed in Table 2205.1

2203.3..2 Management systems, training, and operating procedures. The owner / operator shall maintain management systems in accordance with Chapter 8 of NFPA 652 to ensure the facility and equipment is safely maintained and operated.

2203.3.3 Documentation. A copy of the required documentation shall be maintained in accordance with NFPA 652**.**

2203.4 Sources of ignition. Sources of ignition shall be controlled in accordance with NFPA 652 and NFPA 70.

SECTION 2204

DUST EXPLOSION SCREENING TESTS FACILITIES, EQUIPMENT AND OPERATIONS

2204.1 Facilities, equipment, and operations. Facilities, equipment and operations with combustible dust hazards shall be in accordance with Sections 2204.1 through 2204.4.

2204.1.1 Dust-producing and dust-handling equipment. Dust-producing equipment and dust-handling equipment, including but not limited to vacuums, dust collection systems, dryers, mixers, blenders, separators, conveyors, storage containers, silos or other similar devices, shall be *listed* and shall be maintained in accordance with the manufacturer's recommended standards. designed, installed and maintained in accordance with the International Mechanical Code and applicable standards listed in Table 2205.1

2204.1.2 Dust-collection systems. Dust-collection systems shall be designed to collect dust emissions from dust-producing equipment at the point of generation. Dust-collection systems shall be in accordance with Section 511 of the *International Mechanical Code* and applicable standards listed in Table 2205.1.

Exception: Closed systems using listed equipment and designed in accordance with manufacturer's recommendations and specifications, where cleanouts are provided in accordance with Section 2203.3.3.

2204.2 HVAC Systems. Heating, ventilation, and air conditioning (HVAC) systems shall not be used as the means to collect dusts from localized sources.

2204.3 Signages and markings. Signages and markings shall be provided in accordance with Sections 2203.2.1.1 through 2203.2.1.32204.3 and applicable standards listed in Table 2205.1.

2204.3.1 Deflagration vent discharge area markings. Where dust collection systems and other equipment, systems or system components are provided with deflagration vents, the area within the deflagration vent's discharge area shall be marked in an *approved* manner.

2204.3.2 Caution signs. Signs that read as follows shall be posted near the dust-containing equipment with deflagration vents:

CAUTION: THIS EQUIPMENT CAN CONTAIN EXPLOSIVE DUST.

KEEP OUTSIDE THE MARKED AREA WHILE EQUIPMENT IS OPERATING.

2204.3.3 Warning signs. Where dust collection systems and other equipment, systems or system components are provided with deflagration vents, vent closures shall be clearly marked as follows:

WARNING: EXPLOSION RELIEF DEVICE. STAY CLEAR.

2204.4 Exhaust Systems and ducts. Exhaust systems and ducts shall be designed, constructed and maintained in accordance with the International Mechanical Code and applicable standards listed in Table 2205.1.

Section 2205 Standards2205.1 Specific hazards standards.

The owner/operator of a facility with combustible dust hazards shall be responsible for following the *fire code official* is authorized to enforce additional industry- or material-specific provisions of the codes and standards listed in Table 2205.1 to prevent and control dust explosions, as applicable. Mission continuity requirements found in NFPA standards are not required by this code.

TABLE 2205.1 EXPLOSION PROTECTION STANDARDSSTANDARD SUBJECT

NFPA 61 Standard for the Prevention of Fires and Dust Explosions in Agricultural and Food Processing Facilities

NFPA 68 Standard on Explosion Protection by Deflagration Venting

NFPA 69 Standard on Explosion Prevention Systems

NFPA 70 National Electrical Code

NFPA 77 Recommended Practice on Static Electricity

NFPA 85 Boiler and Combustion System Hazards Code

NFPA 120 Standard for Fire Prevention and Control in Coal Mines

NFPA 484 Standard for Combustible Metals

NFPA 652 The Fundamentals of Combustible Dust

NFPA 654 Standard for Prevention of Fire and Dust Explosions from the Manufacturing, Processing and Handling of Combustible Particulate Solids

NFPA 655 Standard for the Prevention of Sulfur Fires and Explosions

NFPA 664 Standard for the Prevention of Fires and Explosions in Wood Processing and Woodworking Facilities

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The chapter has been completely rewritten for consistency with updated NFPA standards, to ensure that correct standards are requirements are followed as recommended by the Chemical Safety Board, and to provide users with an organized approach for applying the correct provisions.

F181-24

Public Hearing Results (CAH1)

Committee Action: **As Modified by Committee**

Committee Modification: 2203.1 Combustible dust hazard identification. Where the smallest dimension of the material is less than or equal to 500 µm, the owner/operator shall be responsible for determining whether the material is combustible or explosible. Where the combustibility of a dust or particulate solid is not determined by an approved source, the owner ~~owner/operator~~ shall test representative samples in accordance with NFPA 652. A copy of the test results shall be provided to the *fire code official* upon request.
2203.3.2 Management systems, training, and operation procedures. The owner ~~owner/operator~~ shall maintain management systems in accordance with Chapter 8 of NFPA 652 to ensure the facility and equipment is safely maintained and operated.

2205.1 Specific hazards standards. The owner ~~owner/operator~~ of a facility with a combustible dust hazard shall be responsible for following the additional industry- or material-specific provisions of the codes and standards listed in Table 2205.1 to prevent and control dust explosions, as applicable. Mission continuity requirements found in NFPA standards are not required by this code.

Committee Reason: This proposal was approved as this rewrite was seen as essential due to the complexity and hazards associated with combustible dusts. There was some concern with the expansion of the requirements with the reference more broadly to NFPA standards. The modification was simply to remove the term owner/operator and replace with simply owner. The term "operator" is found in the definition for "owner." (Vote 14-0)

F181-24

Individual Consideration Agenda

Comment 1:

Proponents: Geoffrey Raifsnider, Global Finishing Solutions, Self (graifsnider@globalfinishing.com) requests As Modified by Committee (AMC1)

Reason: This is a good code change. It sets up the chapter for alignment with the new NFPA consolidated standard on combustible dusts (NFPA 660) when it becomes available.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Comment (CAH2)# 702

Comment 2:

Proponents: Elley Klausbruckner, Klausbruckner & Associates, Self (jm@klausbruckner.com) requests Disapproved

Reason: We urge the committee to disapprove this code change. While our objection is not with referencing NFPA standards in general, it is how NFPA 652 is referenced in this particular code change that is concerning. This code change is effectively removing the regulations for classified electrical, dust collection, etc. and all the details a fire inspector should have access to in the field. When referencing (as an example) NFPA 30 in Chapter 57, we do not send the users to NFPA 30 for all code regulations, but surgically send the user to specific sections of NFPA 30. An example of the language used in Chapter 57 is "*In all cases, nonmetallic piping shall be used in accordance with Section 27.4.6 of NFPA 30*." This allows fire inspectors easy access to the regulations they need to apply in the field and leaves the design details to plan checkers where access to NFPA Standards is easier.

While the reason provided in the reason statement by the code change proponent states "due to the complexity and hazard of combustible dust," combustible dust is no more complex or hazardous than flammable finish applications, as an example. General (not specific to a single material), but clear and robust regulations have been working as part of the flammable finish Chapter 22. As an example, when applying ethanol spray versus isopropanol spray, the regulations are the same regardless of flash point, flammability etc. The regulations also remain the same regardless of droplet size. The current combustible dust chapter applies the same format and general (not specific to a single material) but clear and robust regulations to protection of combustible dust. The only exception is that the combustible dust chapter has some additional regulations addressing housekeeping to prevent secondary ignitions/explosions/deflagration. The difference between this approach and sending users to NFPA 652 is that a fire inspector walking into a facility can see and understand the current regulations versus sending the fire inspector (for the most part) blanketly to a NFPA Standard. See below for objections to NFPA 652 language.

Please also note that the Combustible Dust definition in the proposed code change states "*Finely divided solid material which when dispersed in air or oxidizing medium in the proper proportions, could be ignited by a flame, spark or other source of ignition*." The current definition states "*Finely divided solid material which is 420 microns or less in diameter and which, when dispersed in air in the proper proportions, could be ignited by a flame, spark or other source of ignition. Combustible dust will pass through a US No. 40 standard sieve*." The current definition better defines combustible dust. Additionally, there is no fire history provided that merits this change or expansion of the definition.

Please also note that the justification of cost impact is erroneous and misleading. This is NOT editorial AT ALL. All the chapters in NFPA 652 and the additional referenced standards contain a plethora of regulations that will increase the cost of construction. The expansion of the definition of combustible dust also is not considered in the cost impact. The single change of the definition will add numerous materials and operations which previously did not fall under the combustible dust definition because of particle size. The retroactivity Sections in NFPA 652 (see below) alone will severely cause an increased cost to construction for existing businesses. If the proponents chose to bring this code change, they should provide an appropriate cost impact or at least admit to the increase in cost impact to all business with the exception of some smaller woodworking shops. This is extremely unfair and does not meet ICC's Cost Impact Guide.

Additional Objections to NFPA 652 Standard being referenced blanketly:

1. Retroactivity: NFPA 652 (Section 7.1.12) requires that "Dust hazard analysis for ALL EXISTING facilities SHALL be performed retroactively prior to September 7, 2020." As soon as this code is adopted all existing facilities are rendered illegal and non-compliant creating a major liability issue for both business owners and enforcing agencies. The current language (IFC Section

2205.1.1) states “If a dust hazard analysis (DHA) is required by the *fire code official* for new or existing facilities and operations, it shall be in accordance with NFPA 652. The DHA for existing facilities shall be in accordance with Section 7.1.1 of NFPA 652.”, thereby leaving it up to the AHJ if they see any serious concern that merits retroactive application for a specific business.

2. Combustible Fibers: Inclusion of combustible fibers in NFPA 652 will create a lot of confusion since combustible fibers are addressed under a completely separate chapter and separate regulations in the fire code.

3. Standards Adopted by Reference: Proposed IFC Section 2203.2 requires a Dust Hazard Analysis (DHA) in accordance with NFPA 652. DHA is addressed in Chapter 7 of NFPA 652. Chapter 7 is simply a pointer to Section 4.2. Section 4.2 sends users to Chapters 4, 5, 6, 7, 8, 9. Effectively we have adopted the entire standard. These chapters send users to 34 other standards (including 10 new ones that haven’t been adopted before). Based on a recent interpretation by ICC Staff, if the codes send users to a standard, and those standards send the users to other standards, the users have to carry through all the criteria in the different standards all the way down that chain, thereby adopting a plethora of standards. By adopting NFPA 652, we are effectively adopting a large number of standards that THIS user cannot count.

4. Inappropriate Code Language: The following are a few examples of inappropriate language:

   - “reasonably protect occupants not in immediate proximity,”
   - “reasonably prevent serious injury from flash fires,”
   - “reasonably prevent injury from explosions,”
   - “reasonably protect adjacent properties and the public”
   - “The retroactive requirements of this standard shall be permitted to be modified if their application clearly would be impractical in the judgment of the authority having jurisdiction, and only where it is clearly evident that the modification does not result in an unacceptable degree of risk.”
   - "In those cases where the authority having jurisdiction (AHJ) determines that the existing situation presents an unacceptable degree of risk, the AHJ shall be permitted to apply retroactively any portions of this standard that, based on the application of clear criteria derived from the objectives in this standard, the AHJ determines to be necessary to achieve an acceptable degree of risk."

The above language used (only a few examples) is highly inappropriate, yet we are choosing to adopt this standard subjecting AHJs, consultants, and business owners to high degree of liability.

Cost Impact: No change to code.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Comment (CAH2)# 741

F184-24

Chapter 24

Proposed Change as Submitted

Proponents: Geoffrey Raifsnider, Global Finishing Solutions, Self (graifsnider@globalfinishing.com)

2024 International Fire Code

CHAPTER 24
FLAMMABLE FINISHES

SECTION 2401
GENERAL

Revise as follows:

2401.1 Scope. This chapter shall apply to locations or areas where any of the following activities are conducted:

1. The application of flammable finishes to articles or materials by means of spray apparatus.
2. The application of flammable finishes by dipping or immersing articles or materials into the contents of tanks, vats or containers of *flammable* or *combustible liquids* for coating, finishing, treatment or similar processes.
3. The application of flammable finishes by applying combustible powders to articles or materials utilizing powder spray guns, electrostatic powder spray guns, fluidized beds or electrostatic fluidized beds.
4. Floor surfacing or finishing operations using Class I or II liquids in areas exceeding 350 square feet (32.5 m^2).
5. The application of flammable finishes consisting of dual-component coatings or Class I or II liquids where applied by brush or roller in quantities exceeding 1 gallon (4 L).
6. The application of waterborne finishes that contain ignitable liquids or that produce combustible deposits.

2401.2 Nonapplicability. This chapter shall not apply to spray finishing utilizing *flammable* or *combustible liquids* that do not sustain combustion, including:

1. Liquids that do not have a fire point when tested in accordance with ASTM D92.
2. Liquids with a flashpoint greater than 95°F (35°C) in a water-miscible solution or dispersion with a water and inert (noncombustible) solids content of more than 80 percent by weight.

2401.3 Permits. Permits shall be required as set forth in Sections 105.5 and 105.6.

SECTION 2402
DEFINITIONS

2402.1 Definitions. The following terms are defined in Chapter 2:
DETEARING.

DIP TANK.

ELECTROSTATIC FLUIDIZED BED.

FLAMMABLE FINISHES.

FLAMMABLE VAPOR AREA.

FLUIDIZED BED.

LIMITED SPRAYING SPACE.

RESIN APPLICATION AREA.

ROLL COATING.

SPRAY BOOTH.

SPRAY ROOM.

SPRAYING SPACE.

Revise as follows:

SECTION ~~2404~~ 2403
SPRAY FINISHING

~~**2404.1**~~ **2403.1 General.** The application of *flammable* or *combustible liquids* by means of spray apparatus in continuous or intermittent processes shall be in accordance with the requirements of Sections 2403.2 through 2403.9.4, 2409, 2410 and NFPA 33. ~~2403 and 2404.4 through 2404.11.4~~.

~~**2404.2 Prohibited enclosures for spray application operations.** Inflatable or portable enclosures shall not be used for spray application of flammable finishes. **Exception:** Enclosures for the spray application of flammable finishes in marinas, dry docking areas or construction areas shall comply with Section 2404.3.~~

~~**2404.4**~~ **2403.2 Location of spray-finishing operations.** Spray-finishing operations conducted in buildings used for Group A, E, I or R occupancies shall be located in a spray room protected with an *approved automatic sprinkler system* installed in accordance with Section 903.3.1.1 and separated vertically and horizontally from the remainder of the building by *fire barrier* walls and *horizontal assemblies* with not less than a 1-hour *fire-resistance rating* in accordance with the *International Building Code*. In other occupancies, spray-finishing operations shall be conducted in a spray room, spray booth or limited spraying space *approved* for such use. **Exceptions:**

1. Automobile undercoating spray operations and spray-on automotive lining operations conducted in areas with *approved* natural or mechanical ventilation shall be exempt from the provisions of Section ~~2404~~ 2403 when *approved* and where utilizing Class IIIA or IIIB *combustible liquids*.
2. In buildings other than Group A, E, I or R occupancies, *approved* limited spraying space in accordance with Section ~~2404.11~~ 2403.4.
3. Resin application areas used for manufacturing of reinforced plastics complying with Section ~~2409~~ 2408 shall not be required to be located in a spray room, spray booth or spraying space.

~~**2404.5**~~ **2403.3 Design and construction.** Design and construction of spray rooms, spray booths, limited finishing workstations, inflatable finishing workstations, membrane enclosures and spray spaces shall be in accordance with Sections ~~2404.5.1~~ 2403.3.1through ~~2494.5.5.1~~ 2403.3.6.1.

~~**2404.5.1**~~ **2403.3.1 Spray rooms.** The design, construction, protection, operation and maintenance of spray rooms shall be in accordance with NFPA 33. ~~Spray rooms shall be constructed and designed in accordance with~~ Section 416 of the International Building Code and Sections 2403.3.1.1 and 2403.3.1.2 of this code. ~~2404.5.2 of this code, and shall comply with Sections 2404.6 through 2404.10 of this~~

~~code~~.

Add new text as follows:

2403.3.1.1 Ventilation. The ventilation system shall be designed, installed and maintained so that the flammable contaminates are diluted in noncontaminated air to maintain concentrations in the exhaust airflow below 25 percent of the contaminant's lower flammable limit (LFL).

Revise as follows:

~~**2404.5.2**~~ **2403.3.1.2 Floor.** Combustible floor construction in spray rooms shall be covered by *approved*, noncombustible, nonsparking material, except where combustible coverings, including but not limited to thin paper or plastic and strippable coatings, are utilized over noncombustible materials to facilitate cleaning operations in spray rooms.

~~**2404.5.3**~~ **2403.3.2 Spray booths.** ~~The design and construction of spray booths~~The design, construction, protection, operation and maintenance of spray booths shall be in accordance with NFPA 33, and ~~shall be in accordance with~~ Sections 2403.3.1 through 2403.3.3 ~~2404.5.3.1 through 2404.5.3.6, Sections 2404.6 through 2404.10 and NFPA 33~~.

~~**2404.5.3.1 Construction.** Spray booths shall be constructed of *approved* noncombustible materials. Aluminum shall not be used. Where walls or ceiling assemblies are constructed of sheet metal, single-skin assemblies shall be not thinner than 0.0478 inch (18 gage) (1.2 mm) and each sheet of double-skin assemblies shall be not thinner than 0.0359 inch (20 gage) (0.9 mm). Structural sections of spray booths are allowed to be sealed with latex-based or similar caulks and sealants.~~

~~**2404.5.3.2 Surfaces.** The interior surfaces of spray booths shall be smooth; shall be constructed so as to permit the free passage of exhaust air from all parts of the interior, and to facilitate washing and cleaning; and shall be designed to confine residues within the booth. Aluminum shall not be used.~~

~~**2404.5.3.3 Floor.** Combustible floor construction in spray booths shall be covered by *approved*, noncombustible, nonsparking material, except where combustible coverings, including but not limited to thin paper or plastic and strippable coatings, are utilized over noncombustible materials to facilitate cleaning operations in spray booths.~~

~~**2404.9**~~ **2403.3.2.1 Ventilation.** Mechanical ventilation of flammable vapor areas shall be provided in accordance with NFPA 33, Section 2403.3.2.1.1 and Section 502.7 of the *International Mechanical Code*.

~~**2404.9.3**~~ **2403.3.2.1.1 Air velocity.** The ventilation system shall be designed, installed and maintained so that the flammable contaminants are diluted in noncontaminated air to maintain concentrations in the exhaust airflow below 25 percent of the contaminant's lower flammable limit (LFL). In addition, the spray booth shall be provided with mechanical ventilation so that the average air velocity through openings is in accordance with Sections ~~2404.9.1 and 2404.9.3.2~~ 2403.3.2.1.1.1 and 2403.3.2.1.1.2.

~~**2404.9.3.1**~~ **2403.3.2.1.1.1 Open-face or open-front spray booth.** For spray application operations conducted in an open-face or open-front spray booth, the ventilation system shall be designed, installed and maintained so that the average air velocity into the spray booth through all openings is not less than 100 feet per minute (0.51 m/s).

Exception: For fixed or automated electrostatic spray application equipment, the average air velocity into the spray booth through all openings shall be not less than 50 feet per minute (0.25 m/s).

~~**2404.9.3.2**~~ **2403.3.2.1.1.2 Enclosed spray booth or spray room with openings for product conveyance.** For spray application operations conducted in an enclosed spray booth or spray room with openings for product conveyance, the ventilation system shall be designed, installed and maintained so that the average air velocity into the spray booth through openings is not less than 100 feet per minute (0.51 m/s).

Exceptions:

1. For fixed or automated electrostatic spray application equipment, the average air velocity into the spray booth through all openings shall be not less than 50 feet per minute (0.25 m/s).

2. Where methods are used to reduce cross drafts that can draw vapors and overspray through openings from the spray booth or spray room, the average air velocity into the spray booth or spray room shall be that necessary to capture and confine vapors and overspray to the spray booth or spray room.

~~2404.9.4~~ 2403.3.2.1.2 **Ventilation obstruction.** Articles being sprayed shall be positioned in a manner that does not obstruct collection of overspray.

~~2404.9.8.4~~ 2403.3.2.1.3 **Filter rolls.** Spray booths equipped with a filter roll that is automatically advanced when the air velocity is reduced to less than 100 feet per minute (0.51 m/s) shall be arranged to shut down the spraying operation if the filter roll fails to advance automatically.

~~2404.5.3.4~~ 2403.3.2.2 **Means of egress.** *Means of egress* shall be provided in accordance with Chapter 10.

Exception: *Means of egress* doors from premanufactured spray booths shall be not less than 30 inches (762 mm) in width by 80 inches (2032 mm) in height.

~~2404.5.3.5~~ 2403.3.2.3 **Clear space.** Spray booths shall be installed so that all parts of the booth are able to be accessed for cleaning. A clear space of not less than 3 feet (914 mm) shall be maintained on all sides of the spray booth. This clear space shall be kept free of any storage or combustible construction.

Exceptions:

1. This requirement shall not prohibit locating a spray booth closer than 3 feet (914 mm) to or directly against an interior partition, wall or floor/ceiling assembly that has a *fire-resistance rating* of not less than 1 hour, provided that the spray booth can be adequately maintained and cleaned.
2. This requirement shall not prohibit locating a spray booth closer than 3 feet (914 mm) to an *exterior wall* or a roof assembly, provided that the wall or roof is constructed of noncombustible material and the spray booth can be adequately maintained and cleaned.

~~2404.5.3.6 Size. The aggregate area of spray booths in a building shall not exceed the lesser of 10 percent of the area of any floor of a building or the basic area allowed for a Group H-2 occupancy without area increases, as set forth in the *International Building Code*.~~
~~**Exception:** One individual booth not exceeding 500 square feet (46 m^2).~~

~~2404.5.4~~ 2403.3.3 **Limited finishing workstation.** The design, construction, protection, operation and maintenance of a~~A~~ limited finishing workstation shall be in accordance with ~~comply with the applicable provisions of~~ NFPA 33 ~~and Sections 2404.6 through 2404.10~~.

Add new text as follows:

2403.3.4 **Inflatable Finishing Workstation.** The design, construction, protection, operation and maintenance of an inflatable finishing workstation shall be in accordance with NFPA 33.

Revise as follows:

~~2404.3~~ 2403.3.5 **Membrane enclosures.** The design, construction, protection, operation and maintenance of membrane enclosures shall be in accordance with NFPA 33.

~~2404.5.5~~ 2403.3.6 **Spraying spaces.** Spraying spaces shall be designed and constructed in accordance with the *International Building Code*, and Section ~~2404.5.5.1 and Sections 2404.6 through 2404.10~~ 2403.3.6.1 of this code.

~~2404.5.5.1~~ 2403.3.6.1 **Floor.** Combustible floor construction in spraying spaces shall be covered by *approved*, noncombustible,

nonsparking material, except where combustible coverings, such as thin paper or plastic and strippable coatings, are utilized over noncombustible materials to facilitate cleaning operations in spraying spaces.

Delete without substitution:

~~**2404.6 Fire protection.** Spray booths and spray rooms shall be protected by an *approved automatic fire-extinguishing system* complying with Chapter 9. Protection shall extend to exhaust plenums, exhaust ducts and both sides of dry filters where such filters are used.~~

~~**2404.6.1 Fire extinguishers.** Portable fire extinguishers complying with Section 906 shall be provided for spraying areas in accordance with the requirements for an extra (high) hazard occupancy.~~

~~**2404.7 Housekeeping, maintenance and storage of hazardous materials.** Housekeeping, maintenance, storage and use of hazardous materials shall be in accordance with Sections 2403.3, 2403.4, 2404.7.1 and 2404.7.2.~~

~~**2404.7.1 Different coatings.** Spray booths, spray rooms and spraying spaces shall not be alternately utilized for different types of coating materials where the combination of materials is conducive to spontaneous ignition, unless all deposits of one material are removed from the booth, room or space and exhaust ducts prior to spraying with a different material.~~

~~**2404.7.2 Protection of sprinklers.** Automatic sprinklers installed in flammable vapor areas shall be protected from the accumulation of residue from spraying operations in an *approved* manner. Bags used as a protective covering shall be 0.003-inch-thick (0.076-mm) polyethylene or cellophane or shall be thin paper. Automatic sprinklers contaminated by overspray particles shall be replaced with new automatic sprinklers.~~

~~**2404.8 Sources of ignition.** Control of sources of ignition shall be in accordance with Section 2403.2 and Sections 2404.8.1 through 2404.8.2.4.~~

~~**2404.8.1 Drying operations.** Spray booths and spray rooms shall not be alternately used for the purpose of drying by arrangements or methods that could cause an increase in the surface temperature of the spray booth or spray room except in accordance with Sections 2404.8.1.1 and 2404.8.1.2. Except as specifically provided in this section, drying or baking units utilizing a heating system having open flames or that are capable of producing sparks shall not be installed in a flammable vapor areas.~~

~~**2404.8.1.1 Spraying procedure.** The spraying procedure shall use low-volume spray application.~~

~~**2404.8.1.2 Drying apparatus.** Fixed drying apparatus shall comply with this chapter and the applicable provisions of Chapter 30. Where recirculation ventilation is provided in accordance with Section 2404.9.2, the heating system shall not be within the recirculation air path.~~

~~**2404.8.1.2.1 Interlocks.** The spraying apparatus, drying apparatus and ventilating system for the spray booth or spray room shall be equipped with interlocks arranged to accomplish all of the following:~~

1. ~~Prevent operation of the spraying apparatus while drying operations are in progress.~~
2. ~~Where the drying apparatus is located in the spray booth or spray room, prevent operation of the drying apparatus until a timed purge of spray vapors from the spray booth or spray room is complete. This purge time shall be based on completing not fewer than four air changes of spray booth or spray room volume or for a period of not less than 3 minutes, whichever is greater.~~
3. ~~Have the ventilating system maintain a safe atmosphere within the spray booth or spray room during the drying process and automatically shut off drying apparatus in the event of a failure of the ventilating system.~~
4. ~~Shut off the drying apparatus automatically if the discharge temperature of the air heater exceeds the maximum discharge air temperature allowed in accordance with the heater's listing or 221°F (105°C).~~

~~**2404.8.1.2.2 Portable infrared apparatus.** Where a portable infrared drying apparatus is used, electrical wiring and portable infrared drying equipment shall comply with NFPA 70. Electrical equipment located within 18 inches (457 mm) of floor level shall be *approved* for~~

Class I, Division 2, hazardous locations. Metallic parts of drying apparatus shall be electrically bonded and grounded. During spraying operations, portable drying apparatus and electrical connections and wiring thereto shall not be located within spray booths, spray rooms or other areas where spray residue would be deposited thereon.

2404.8.2 Illumination. Where spraying spaces, spray rooms or spray booths are illuminated through glass panels or other transparent materials, only fixed luminaires shall be utilized as a source of illumination.

2404.8.2.1 Glass panels. Panels for luminaires or for observation shall be of heat treated glass, wired glass or hammered wire glass and shall be sealed to confine vapors, mists, residues, dusts and deposits to the flammable vapor area. Panels for luminaires shall be separated from the luminaire to prevent the surface temperature of the panel from exceeding 221°F (105°C).

2404.8.2.2 Exterior luminaires. Luminaires attached to the walls or ceilings of a flammable vapor area, but outside of any classified area and separated from the flammable vapor areas by vapor tight glass panels, shall be suitable for use in ordinary hazard locations. Such luminaires shall be serviced from outside the flammable vapor areas.

2404.8.2.3 Integral luminaires. Luminaires that are an integral part of the walls or ceiling of a flammable vapor area are allowed to be separated from the flammable vapor area by glass panels that are an integral part of the luminaire. Such luminaires shall be *listed* for use in Class I, Division 2, or Class II, Division 2, locations, whichever is applicable, and shall be suitable for accumulations of deposits of combustible residues. Such luminaires are allowed to be serviced from inside the flammable vapor area.

2404.8.2.4 Portable electric lamps. Portable electric lamps shall not be used in flammable vapor areas during spraying operations. Portable electric lamps used during cleaning or repairing operations shall be of a type *approved* for hazardous locations.

2404.9.1 Operation. Mechanical ventilation shall be kept in operation at all times while spraying operations are being conducted and for a sufficient time thereafter to allow vapors from drying coated articles and finishing material residue to be exhausted. Spraying equipment shall be interlocked with the ventilation of the flammable vapor areas such that spraying operations cannot be conducted unless the ventilation system is in operation.

2404.9.2 Recirculation. Air exhausted from spraying operations shall not be recirculated. **Exceptions:**

1. Air exhausted from spraying operations is allowed to be recirculated as makeup air for unmanned spray operations, provided that all of the following conditions exist:
   1.1. The solid particulate has been removed.
   1.2. The vapor concentration is less than 25 percent of the LFL.
   1.3. *Approved* equipment is used to monitor the vapor concentration.
   1.4. When the vapor concentration exceeds 25 percent of the LFL, both of the following shall occur:
      1.4.1. An alarm shall sound.
      1.4.2. Spray operations shall automatically shut down.
   1.5. In the event of shutdown of the vapor concentration monitor, 100 percent of the air volume specified in Section 509 of the International Mechanical Code is automatically exhausted.
2. Air exhausted from spraying operations is allowed to be recirculated as makeup air to manned spraying operations where all of the conditions provided in Exception 1 are included in the installation and documents have been prepared to show that the installation does not pose a life safety hazard to personnel inside the spray booth, spraying space or spray room.

2404.9.5 Independent ducts. Each spray booth and spray room shall have an independent exhaust duct system discharging to the outside. **Exceptions:**

1. Multiple spray booths having a combined frontal area of 18 square feet (1.67 m^2) or less are allowed to have a common exhaust where identical spray finishing material is used in each booth. If more than one fan serves one booth, fans shall be interconnected such that all fans will operate simultaneously.
2. Where treatment of exhaust is necessary for air pollution control or for energy conservation, ducts shall be allowed to be manifolded if all of the following conditions are met:
    2.1. The sprayed materials used are compatible and will not react or cause ignition of the residue in the ducts.
    2.2. Nitrocellulose-based finishing material shall not be used.
    2.3. A filtering system shall be provided to reduce the amount of overspray carried into the duct manifold.
    2.4. Automatic sprinkler protection shall be provided at the junction of each booth exhaust with the manifold, in addition to the protection required by this chapter.

2404.9.6 Termination point. The termination point for exhaust ducts discharging to the atmosphere shall be not less than the following distances:

1. Ducts conveying explosive or flammable vapors, fumes or dusts: 30 feet (9144 mm) from the *lot line*; 10 feet (3048 mm) from openings into the building; 6 feet (1829 mm) from *exterior walls* and roofs; 30 feet (9144 mm) from combustible walls or openings into the building that are in the direction of the exhaust discharge; 10 feet (3048 mm) above adjoining grade.
2. Other product-conveying outlets: 10 feet (3048 mm) from the *lot line*; 3 feet (914 mm) from *exterior walls* and roofs; 10 feet (3048 mm) from openings into the building; 10 feet (3048 mm) above adjoining grade.

2404.9.7 Fan motors and belts. Electric motors driving exhaust fans shall not be placed inside booths or ducts. Fan rotating elements shall be nonferrous or nonsparking or the casing shall consist of, or be lined with, such material. Belts shall not enter the duct or booth unless the belt and pulley within the duct are tightly enclosed.

2404.9.8 Filters. Air intake filters that are part of a wall or ceiling assembly shall be *listed* as Class I or II in accordance with UL 900. Exhaust filters shall be required.

2404.9.8.1 Supports. Supports and holders for filters shall be constructed of noncombustible materials.

2404.9.8.2 Attachment. Overspray collection filters shall be readily removable and able to be accessed for cleaning or replacement.

2404.9.8.3 Maintaining air velocity. Visible gauges, audible alarms or pressure-activated devices shall be installed to indicate or ensure that the required air velocity is maintained.

2404.9.8.5 Filter disposal. Discarded filter pads shall be immediately removed to a safe, detached location or placed in a noncombustible container with a tight fitting lid and disposed of properly.

2404.9.8.6 Spontaneous ignition. Spray booths using dry filters shall not be used for spraying materials that are highly susceptible to spontaneous heating and ignition. Filters shall be changed prior to spraying materials that could react with other materials previously collected. An example of a potentially reactive combination includes lacquer when combined with varnishes, stains or primers.

2404.9.8.7 Waterwash spray booths. Waterwash spray booths shall be of an *approved* design so as to prevent excessive accumulation of deposits in ducts and residue at duct outlets. Such booths shall be arranged so that air and overspray are drawn through a continuously flowing water curtain before entering an exhaust duct to the building exterior.

2404.10 Interlocks. Interlocks for spray application finishes shall be in accordance with Sections 2404.10.1 through 2404.10.2.

~~**2404.10.1 Automated spray application operations.** Where protecting automated spray application operations, *automatic fire-extinguishing systems* shall be equipped with an *approved* interlock feature that will, upon discharge of the system, automatically stop the spraying operations and workpiece conveyors into and out of the flammable vapor areas. Where the building is equipped with a *fire alarm system*, discharge of the *automatic fire-extinguishing system* shall also activate the building alarm notification appliances.~~

~~**2404.10.1.1 Alarm station.** A manual fire alarm and emergency system shutdown station shall be installed to serve each flammable vapor area. When activated, the station shall accomplish the functions indicated in Section 2404.10.1.~~

~~**2404.10.1.2 Alarm station location.** Not less than one manual fire alarm and emergency system shutdown station shall be provided with *ready access* for operating personnel. Where access to this station is likely to involve exposure to danger, an additional station shall be located adjacent to an *exit* from the area.~~

~~**2404.10.2 Ventilation interlock prohibited.** Air makeup and flammable vapor area exhaust systems shall not be interlocked with the fire alarm system and shall remain in operation during a fire alarm condition. **Exception:** Where the type of fire-extinguishing system used requires such ventilation to be discontinued, air makeup and exhaust systems shall shut down and dampers shall close.~~

Revise as follows:

~~**2404.11**~~ **2403.4 Limited spraying spaces.** Limited spraying spaces shall comply with Sections ~~2404.11.1 through 2404.11.4~~ 2403.4.1 through 2403.4.4.

~~**2404.11.1**~~ **2403.4.1 Job size.** The aggregate surface area to be sprayed shall not exceed 9 square feet (0.84 m^2).

~~**2404.11.2**~~ **2403.4.2 Frequency.** Spraying operations shall not be of a continuous nature.

~~**2404.11.3**~~ **2403.4.3 Ventilation.** Positive mechanical ventilation providing not fewer than six complete air changes per hour shall be installed. Such system shall meet the requirements of this code for handling flammable vapor areas. Explosion venting is not required.

~~**2404.11.4**~~ **2403.4.4 Electrical wiring.** Electrical wiring within 10 feet (3048 mm) of the floor and 20 feet (6096 mm) horizontally of the limited spraying space shall be designed for Class I, Division 2 locations in accordance with NFPA 70.

SECTION ~~2406~~ 2404
POWDER COATING

~~**2406.1**~~ **2404.1 General.** The design, construction, protection, operation and maintenance of powder coating operations and equipment shall be in accordance with NFPA 33.~~Operations using finely ground particles of protective finishing material applied in dry powder form by a fluidized bed, an electrostatic fluidized bed, powder spray guns or electrostatic powder spray guns shall comply with Sections 2406.2 through 2406.7. In addition, Section 2407 shall apply to fixed electrostatic equipment used in powder coating operations.~~

~~**2406.2**~~ **2404.2 Location.** Powder coating operations shall be conducted in enclosed powder coating rooms, enclosed powder coating facilities that are ventilated or ventilated spray booths.

~~**2406.4**~~ **2404.2 Fire protection.** Areas used for powder coating shall be protected by an *approved automatic fire-extinguishing system* complying with Chapter 9 and NFPA 33.

~~**2406.3 Construction of powder coating rooms and booths.** Powder coating rooms shall be constructed of noncombustible materials. Spray booths shall be constructed in accordance with Section 2404.5.3. **Exception:** *Listed* spray booth assemblies that are constructed of other materials shall be allowed.~~

~~**2406.4.1 Additional protection for fixed systems.** Automated powder application equipment shall be protected by the installation of an *approved*, supervised flame detection apparatus that shall react to the presence of flame within 0.5 second and shall accomplish all of~~

~~the following:~~

1. ~~Shutting down of energy supplies (electrical and compressed air) to conveyor, ventilation, application, transfer and powder collection equipment.~~
2. ~~Closing of segregation dampers in associated ductwork to interrupt airflow from application equipment to powder collectors.~~
3. ~~Activation of an alarm that is audible throughout the powder coating room or booth.~~

~~2406.4.2 Fire extinguishers.~~ ~~Portable fire extinguishers complying with Section 906 shall be provided for areas used for powder coating in accordance with the requirements for an extra-hazard occupancy.~~

~~2406.5 Operation and maintenance.~~ ~~Powder coating areas shall be kept free from the accumulation of powder coating dusts, including horizontal surfaces such as ledges, beams, pipes, hoods, booths and floors.~~

~~2406.5.1 Cleaning.~~ ~~Surfaces shall be cleaned in such a manner so as to avoid scattering dusts to other places or creating dust clouds. Vacuum sweeping equipment shall be of a type *approved* for use in hazardous locations.~~

~~2406.6 Sources of ignition.~~ ~~Control of sources of ignition shall be in accordance with Section 2403.2 and Sections 2406.6.1 through 2406.6.4.~~

~~2406.6.1 Drying, curing and fusion equipment.~~ ~~Drying, curing and fusion equipment shall comply with Chapter 30.~~

~~2406.6.2 Spark-producing metals.~~ ~~Iron or spark-producing metals shall be prevented from being introduced into the powders being applied by magnetic separators, filter-type separators or by other *approved* means.~~

~~2406.6.3 Preheated parts.~~ ~~When parts are heated prior to coating, the temperature of the parts shall not exceed the ignition temperature of the powder to be used.~~

~~2406.6.4 Grounding and bonding.~~ ~~Precautions shall be taken to minimize the possibility of ignition by static electrical sparks through static bonding and grounding, where possible, of powder transport, application and recovery equipment.~~

~~2406.7 Ventilation.~~ ~~Exhaust ventilation shall be sufficient to maintain the atmosphere below one-half the minimum explosive concentration for the material being applied. Nondeposited, air-suspended powders shall be removed through exhaust ducts to the powder recovery system.~~

SECTION 2405
DIPPING OPERATIONS

Revise as follows:

2405.1 General. The design, construction, protection, operation and maintenance of dipping operations and equipment~~Dip-tank operations~~ shall comply with the requirements of NFPA 34 ~~Section 2403 and Sections 2405.2 through 2405.11~~.

2405.2 Location of dip-tank operations. Dip-tank operations conducted in buildings used for Group A, I or R occupancies shall be located in a room designed for that purpose, equipped with an *approved automatic sprinkler system* and separated vertically and horizontally from other areas in accordance with the *International Building Code*.

Revise as follows:

~~2405.3 Construction of dip tanks.~~ ~~Dip tanks shall be constructed in accordance with Sections 2405.3.1 through 2405.3.4.3 and NFPA 34. Dip tanks, including drain boards, shall be constructed of noncombustible material and their supports shall be of heavy metal, reinforced concrete or masonry.~~

2405.3.1 Overflow. Dip tanks greater than 150 gallons (568 L) in capacity or 10 square feet (0.93 m^2) in liquid surface area shall be equipped with a trapped overflow pipe leading to an *approved* location outside the building. The bottom of the overflow connection shall be not less than 6 inches (152 mm) below the top of the tank.

2405.3.2 Bottom drains. Dip tanks greater than 500 gallons (1893 L) in liquid capacity shall be equipped with bottom drains that are arranged to automatically and manually drain the tank quickly in the event of a fire unless the viscosity of the liquid at normal atmospheric temperature makes this impractical. Access to the manual operation shall be from a safe location. Where gravity flow is not practicable, automatic pumps shall be provided. Such drains shall be trapped and discharged to a closed, vented salvage tank or to an *approved* outside location.

Exception: Dip tanks containing Class IIIB *combustible liquids* where the liquids are not heated above room temperature and the process area is protected by automatic sprinklers.

2405.3.3 Dipping liquid temperature control. Protection against the accumulation of vapors, self ignition and excessively high temperatures shall be provided for dipping liquids that are heated directly or heated by the surfaces of the object being dipped.

2405.3.4 Dip tank covers. Dip tank covers allowed by Section 2405.4.1 shall be capable of manual operation and shall be automatic closing by *approved* automatic closing devices designed to operate in the event of a fire.

2405.3.4.1 Construction. Covers shall be constructed of noncombustible material or be of a tin clad type with enclosing metal applied with locked joints.

2405.3.4.2 Supports. Chain or wire rope shall be utilized for cover supports or operating mechanisms.

2405.3.4.3 Closed covers. Covers shall be kept closed when tanks are not in use.

2405.4 Fire protection. Dip tank operations shall be protected in accordance with Sections 2405.4.1 through 2405.4.2.

2405.4.1 Fixed fire-extinguishing equipment. An *approved automatic fire-extinguishing system* or dip tank cover in accordance with Section 2405.3.4 shall be provided for the following dip tanks:

1. Dip tanks less than 150 gallons (568 L) in capacity or 10 square feet (0.93 m^2) in liquid surface area.
2. Dip tanks containing a liquid with a *flash point* below 110°F (43°C) used in such manner that the liquid temperature could equal or be greater than its *flash point* from artificial or natural causes, and having both a capacity of more than 10 gallons (37.9 L) and a liquid surface area of more than 4 square feet (0.37 m^2).

2405.4.1.1 Fire-extinguishing system. An *approved automatic fire-extinguishing system* shall be provided for dip tanks with a 150-gallon (568 L) or more capacity or 10 square feet (0.93 m^2) or larger in a liquid surface area. Fire-extinguishing system design shall be in accordance with NFPA 34.

2405.4.2 Portable fire extinguishers. Areas in the vicinity of dip tanks shall be provided with portable fire extinguishers complying with Section 906 and suitable for *flammable* and *combustible liquid* fires as specified for extra (high) hazard occupancies.

2405.5 Housekeeping, maintenance and storage of hazardous materials. Housekeeping, maintenance, storage and use of hazardous materials shall be in accordance with Sections 2403.3 and 2403.4.

2405.6 Sources of ignition. Control of sources of ignition shall be in accordance with Section 2403.2.

2405.7 Ventilation of flammable vapor areas. Flammable vapor areas shall be provided with mechanical ventilation adequate to prevent the dangerous accumulation of vapors. Required ventilation systems shall be arranged such that the failure of any ventilating fan shall automatically stop the dipping conveyor system.

2405.8 Conveyor interlock. Dip tanks utilizing a conveyor system shall be arranged such that in the event of a fire, the conveyor system

~~shall automatically cease motion and the required tank bottom drains shall open.~~

~~**2405.9 Hardening and tempering tanks.** Hardening and tempering tanks shall comply with Sections 2405.3 through 2405.3.3, 2405.9.4 and 2405.8, but shall be exempt from other provisions of Section 2405.~~

~~**2405.9.1 Location.** Tanks shall be located as far as practical from furnaces and shall not be located on or near combustible floors.~~

~~**2405.9.2 Hoods.** Tanks shall be provided with a noncombustible hood and vent or other *approved* venting means, terminating outside of the structure to serve as a vent in case of a fire. Such vent ducts shall be treated as flues and proper clearances shall be maintained from combustible materials.~~

~~**2405.9.3 Alarms.** Tanks shall be equipped with a high-temperature limit switch arranged to sound an alarm when the temperature of the quenching medium reaches 50°F (10°C) below the *flash point*.~~

~~**2405.9.4 Fire protection.** Hardening and tempering tanks greater than 500 gallons (1893 L) in capacity or 25 square feet (2.3 m^2) in liquid surface area shall be protected by an *approved automatic fire-extinguishing system* complying with Chapter 9.~~

~~**2405.9.5 Use of air pressure.** Air under pressure shall not be used to fill or agitate oil in tanks.~~

~~**2405.10 Flow-coating operations.** Flow-coating operations shall comply with the requirements for dip tanks. The area of the sump and any areas on which paint flows shall be considered to be the area of a dip tank.~~

~~**2405.10.1 Paint supply.** Paint shall be supplied by a gravity tank not exceeding 10 gallons (38 L) in capacity or by direct low-pressure pumps arranged to shut down automatically in case of a fire by means of *approved* heat-actuated devices.~~

~~**2405.11 Roll-coating operations.** Roll-coating operations shall comply with Section 2405.10. In roll-coating operations utilizing *flammable* or *combustible liquids*, sparks from static electricity shall be prevented by electrically bonding and grounding all metallic rotating and other parts of machinery and equipment and by the installation of static collectors, or by maintaining a conductive atmosphere such as a high relative humidity.~~

SECTION ~~2407~~ 2406
ELECTROSTATIC APPARATUS

~~**2407.1**~~ **2406.1 General.** Electrostatic apparatus and devices used in connection with paint-spraying and paint-*detearing* operations shall be ~~of an *approved* type~~ in accordance with the requirements of NFPA 33.

~~**2407.2 Location and clear space.** A space of not less than twice the sparking distance shall be maintained between goods being painted or *deteared* and electrodes, electrostatic atomizing heads or conductors. A sign stating the sparking distance shall be conspicuously posted near the assembly.~~

~~**Exception:** Portable electrostatic paint spraying apparatus *listed* for use in Class I, Division 1, locations.~~

~~**2407.3 Construction of equipment.** Electrodes and electrostatic atomizing heads shall be of *approved* construction, rigidly supported in permanent locations and effectively insulated from ground. Insulators shall be nonporous and noncombustible.~~

~~**Exception:** Portable electrostatic paint spraying apparatus *listed* for use in Class I, Division 1, locations.~~

~~**2407.3.1 Barriers.** Booths, fencing, railings or guards shall be placed about the equipment such that either by their location or character, or both, isolation of the process is maintained from plant storage and personnel. Railings, fencing and guards shall be of conductive material, adequately grounded, and not less than 5 feet (1524 mm) from processing equipment.~~

~~**Exception:** Portable electrostatic paint spraying apparatus *listed* for use in Class I, Division 1, locations.~~

~~**2407.4 Fire protection.** Areas used for electrostatic spray finishing with fixed equipment shall be protected with an *approved automatic*~~

~~*fire-extinguishing system* complying with Chapter 9 and Section 2407.4.1.~~

~~**2407.4.1 Protection for automated liquid electrostatic spray application equipment.** Automated liquid electrostatic spray application equipment shall be protected by the installation of an *approved*, supervised flame detection apparatus that shall, in the event of ignition, react to the presence of flame within 0.5 second and shall accomplish all of the following:~~

1. ~~Activation of a local alarm in the vicinity of the spraying operation and activation of the building alarm system, if such a system is provided.~~
2. ~~Shutting down of the coating material delivery system.~~
3. ~~Termination of all spray application operations.~~
4. ~~Stopping of conveyors into and out of the flammable vapor areas.~~
5. ~~Disconnection of power to the high-voltage elements in the flammable vapor areas and disconnection of power to the system.~~

~~**2407.5 Housekeeping, maintenance and storage of hazardous materials.** Housekeeping, maintenance, storage and use of hazardous materials shall be in accordance with Sections 2403.3, 2403.4 and Sections 2407.5.1 and 2407.5.2.~~

~~**2407.5.1 Maintenance.** Insulators shall be kept clean and dry. Drip plates and screens subject to paint deposits shall be removable and taken to a safe place for cleaning. Grounds and bonding means for the paint spraying apparatus and all associated equipment shall be periodically cleaned and maintained free of overspray.~~

~~**2407.5.2 Signs.** Signs shall be posted to provide the following information:~~

1. ~~Designate the process zone as dangerous with respect to fire and accident.~~
2. ~~Identify the grounding requirements for all electrically conductive objects in the flammable vapor area, including persons.~~
3. ~~Restrict access to qualified personnel only.~~

~~**2407.6 Sources of ignition.** Transformers, power packs, control apparatus and all other electrical portions of the equipment, except high-voltage grids and electrostatic atomizing heads and connections, shall be located outside of the flammable vapor areas or shall comply with Section 2403.2.~~

~~**2407.7 Ventilation.** The flammable vapor area shall be ventilated in accordance with Section 2404.9.~~

~~**2407.8 Emergency shutdown.** Electrostatic apparatus shall be equipped with automatic controls operating without time delay to disconnect the power supply to the high-voltage transformer and signal the operator under any of the following conditions:~~

1. ~~Stoppage of ventilating fans or failure of ventilating equipment from any cause.~~
2. ~~Stoppage of the conveyor carrying articles past the high-voltage grid.~~
3. ~~Occurrence of a ground or an imminent ground at any point of the high-voltage system.~~
4. ~~Reduction of clearance below that required in Section 2407.2.~~

~~**2407.9 Ventilation interlock.** Hand electrostatic equipment shall be interlocked with the ventilation system for the spraying area so that the equipment cannot be operated unless the ventilating system is in operation.~~

SECTION ~~2408~~ 2407
ORGANIC PEROXIDES AND DUAL-COMPONENT COATINGS

~~**2408.1**~~ **2407.1 General.** Spraying operations involving the use of *organic peroxides* and other dual-component coatings shall be in accordance with the requirements of NFPA 33~~Section 2403 and Sections 2408.2 through 2408.5~~.

~~**2408.2 Use of organic peroxide coatings.** Spraying operations involving the use of *organic peroxides* and other dual-component coatings shall be conducted in *approved* sprinklered spray booths complying with Section 2404.5.3.~~

~~**2408.3 Equipment.** Spray guns and related handling equipment used with *organic peroxides* shall be of a type manufactured for such use.~~

~~**2408.3.1 Pressure tanks.** Separate pressure vessels and inserts specifically for the application shall be used for the resin and for the *organic peroxide*, and shall not be interchanged. Organic peroxide pressure tank inserts shall be constructed of stainless steel or polyethylene.~~

~~**2408.4 Housekeeping, maintenance, storage and use of hazardous materials.** Housekeeping, maintenance, storage and use of hazardous materials shall be in accordance with Sections 2403.3 and 2403.4 and Sections 2408.4.1 through 2408.4.7.~~

~~**2408.4.1 Contamination prevention.** *Organic peroxide* initiators shall not be contaminated with foreign substances.~~

~~**2408.4.2 Spilled material.** Spilled *organic peroxides* shall be promptly removed and any residue thereof promptly eliminated. Spilled material absorbed by using a noncombustible absorbent shall be promptly disposed of in accordance with the manufacturer's recommendation.~~

~~**2408.4.3 Residue control.** Materials shall not be contaminated by dusts and overspray residues resulting from the sanding or spraying of finishing materials containing *organic peroxides.*~~

~~**2408.4.4 Handling.** Handling of *organic peroxides* shall be conducted in a manner that avoids shock and friction that produces decomposition and violent reaction hazards.~~

~~**2408.4.5 Mixing.** *Organic peroxides* shall not be mixed directly with accelerators or promoters.~~

~~**2408.4.6 Personnel qualifications.** Personnel working with *organic peroxides* and dual-component coatings shall be specifically trained to work with these materials.~~

~~**2408.4.7**~~ **2407.2 Storage.** The storage of *organic peroxides* shall comply with Chapter 62.

~~**2408.5 Sources of ignition.** Only nonsparking tools shall be used in areas where *organic peroxides* are stored, mixed or applied.~~

SECTION ~~2409~~ 2408
INDOOR MANUFACTURING OF REINFORCED PLASTICS

~~**2409.1**~~ **2408.1 General.** Indoor manufacturing processes involving spray or hand application of reinforced plastics and using more than 5 gallons (19 L) of resin in a 24-hour period shall be in accordance with NFPA 33~~Sections 2409.2 through 2409.6.1~~.

~~**2409.2 Resin application equipment.** Equipment used for spray application of resin shall be installed and used in accordance with Section 2408 and Sections 2409.3 through 2409.6.1.~~

~~**2409.3 Fire protection.** Resin application areas shall be protected by an *automatic sprinkler system*. The sprinkler system design shall be not less than that required for Ordinary Hazard, Group 2, with a minimum design area of 3,000 square feet (279 m^2). Where the materials or storage arrangements are required by other regulations to be provided with a higher level of sprinkler system protection, the higher level of sprinkler system protection shall be provided.~~

~~**2409.4 Housekeeping, maintenance, storage and use of hazardous materials.** Housekeeping, maintenance, storage and use of hazardous materials shall be in accordance with Sections 2403.3 and 2403.4 and Sections 2409.4.1 through 2409.4.3.~~

~~**2409.4.1 Handling of excess catalyzed resin.** A noncombustible, open-top container shall be provided for disposal of excess catalyzed resin. Excess catalyzed resin shall be drained into the container while still in the liquid state. Enough water shall be provided in the container to maintain a minimum 2-inch (51-mm) water layer over the contained resin.~~

~~**2409.4.2 Control of overchop.** In areas where chopper guns are used, exposed wall and floor surfaces shall be covered with paper, polyethylene film or other *approved* material to allow for removal of overchop. Overchop shall be allowed to cure for not less than 4 hours prior to removal.~~

~~**2409.4.2.1 Disposal.** Following removal, used wall and floor covering materials required by Section 2409.4.2 shall be placed in a noncombustible container and removed from the facility.~~

240~~8~~.2~~9~~.4.3 Storage ~~and use of hazardous materials~~. Storage ~~and use of~~ *organic peroxides* shall be in accordance with ~~Section 2408 and~~Chapter 62. Storage and use of *flammable* and *combustible liquids* shall be in accordance with Chapter 57. Storage and use of unstable (reactive) materials shall be in accordance with Chapter 66.

~~**2409.5 Sources of ignition in resin application areas.** Sources of ignition in resin application areas shall comply with Section 2403.2.~~

~~**2409.6 Ventilation.** Mechanical ventilation shall be provided throughout resin application areas in accordance with Section 2404.9. The ventilation rate shall be adequate to maintain the concentration of flammable vapors in the resin application area at or below 25 percent of the LFL. **Exception:** Mechanical ventilation is not required for buildings that have 75 percent of the perimeter unenclosed.~~

~~**2409.6.1 Local ventilation.** Local ventilation shall be provided inside of workpieces where personnel will be under or inside of the workpiece.~~

SECTION ~~2410~~ 2409
FLOOR SURFACING AND FINISHING OPERATIONS

~~**2410.1**~~ **2409.1 Scope.** Floor surfacing and finishing operations exceeding 350 square feet (33 m^2) and using Class I or II liquids shall comply with Sections ~~2410.2 through 2410.5~~ 2409.2 through 2409.5.

~~**2410.2**~~ **2409.2 Mechanical system operation.** Heating, ventilation and air-conditioning systems shall not be operated during resurfacing or refinishing operations or within 4 hours of the application of *flammable* or *combustible liquids*.

~~**2410.3**~~ **2409.3 Business operation.** Floor surfacing and finishing operations shall not be conducted while an establishment is open to the public.

~~**2410.4**~~ **2409.4 Ignition sources.** The power shall be shut down to all electrical sources of ignition within the flammable vapor area, unless those devices are classified for use in Class I, Division 1, hazardous locations.

~~**2410.5**~~ **2409.5 Ventilation.** To prevent the accumulation of flammable vapors, mechanical ventilation at a minimum rate of 1 cubic foot per minute per square foot [0.00508 $m^3/(s \times m^2)$] of area being finished shall be provided. Such exhaust shall be by *approved* temporary or portable means. Vapors shall be exhausted to the exterior of the building.

SECTION ~~2403~~ 2410
STORAGE, HANDLING AND USE OF FLAMMABLE OR COMBUSTIBLE LIQUIDS ~~PROTECTION OF OPERATIONS~~

~~**2403.3**~~ **2410.1 Storage, use and handling of flammable and combustible liquids.** The storage, use and handling of *flammable* and *combustible liquids* shall be in accordance with this section~~, and~~ Chapter 57 and NFPA 33.

~~2403.3.1~~ 24010.1.1 **Use.** Containers supplying spray nozzles shall be of a closed type or provided with metal covers that are kept closed. Containers not resting on floors shall be on noncombustible supports or suspended by wire cables. Containers supplying spray nozzles by gravity flow shall not exceed 10 gallons (37.9 L) in capacity.

~~2403.3.2~~ 2410.1.2 **Valves.** Containers and piping to which a hose or flexible connection is attached shall be provided with a shutoff valve at the connection. Such valves shall be kept shut when hoses are not in use.

~~2403.3.3~~ 2410.1.3 **Pumped liquid supplies.** Where *flammable* or *combustible liquids* are supplied to spray nozzles by positive displacement pumps, pump discharge lines shall be provided with an *approved* relief valve discharging to pump suction or a safe detached location.

~~2404.3.4~~ 2410.1.4 **Liquid transfer.** Where a flammable mixture is transferred from one portable container to another, a bond shall be provided between the two containers. Not less than one container shall be grounded. Piping systems for Class I and II liquids shall be permanently grounded.

~~2403.3.5~~ 2410.1.5 **Class I liquids as solvents.** Class I liquids used as solvents shall be used in spray gun and equipment cleaning machines that have been *listed* and *approved* for such purpose or shall be used in spray booths or spray rooms in accordance with Sections ~~2403.3.5.1 and 2403.3.5.2~~ 2410.1.5.1 and 2410.1.5.2.

~~2403.3.5.1~~ 2410.1.5.1 **Listed devices.** Cleaning machines for spray guns and equipment shall not be located in areas open to the public and shall be separated from ignition sources in accordance with their listings or by a distance of 3 feet (914 mm), whichever is greater. The quantity of solvent used in a machine shall not exceed the design capacity of the machine.

~~2403.3.5.2~~ 2410.1.5.2 **Within spray booths and spray rooms.** Where solvents are used for cleaning spray nozzles and auxiliary equipment within spray booths and spray rooms, the ventilating equipment shall be operated during cleaning.

~~2403.3.6~~ 2410.1.6 **Class II and III liquids.** Solvents used outside of spray booths, spray rooms or *listed* and *approved* spray gun and equipment cleaning machines shall be restricted to Class II and III liquids.

~~**2403.1 General.** Operations covered by this chapter shall be protected as required by Sections 2403.2 through 2403.4.4.~~

~~**2403.2 Sources of ignition.** Protection against sources of ignition shall be provided in accordance with Sections 2403.2.1 through 2403.2.8.~~

~~**2403.2.1 Electrical wiring and equipment.** Electrical wiring and equipment shall comply with this chapter and NFPA 70.~~

~~**2403.2.1.1 Flammable vapor areas.** Electrical wiring and equipment in flammable vapor areas shall be of an explosionproof type *approved* for use in such hazardous locations. Such areas shall be considered to be Class I, Division 1, or Class II, Division 1, hazardous locations in accordance with NFPA 70.~~

~~**2403.2.1.2 Areas subject to deposits of residues.** Electrical equipment, flammable vapor areas or drying operations that are subject to splashing or dripping of liquids shall be specifically *approved* for locations containing deposits of readily ignitable residue and explosive vapors.~~ **Exceptions:**

1. ~~This provision shall not apply to wiring in rigid conduit, threaded boxes or fittings not containing taps, splices or terminal connections.~~
2. ~~This provision shall not apply to electrostatic equipment allowed by Section 2407.~~

~~In resin application areas, electrical wiring and equipment that is subject to deposits of combustible residues shall be *listed* for such exposure and shall be installed as required for hazardous (classified) locations. Electrical wiring and equipment not subject to deposits of combustible residues shall be installed as required for ordinary hazard locations.~~

2403.2.1.3 Areas adjacent to spray booths. Electrical wiring and equipment located outside of, but within 3 feet (914 mm) of openings in a spray booth or a spray room, shall be *approved* for Class I, Division 2, or Class II, Division 2, hazardous locations, whichever is applicable.

2403.2.1.4 Areas subject to overspray deposits. Electrical equipment in flammable vapor areas located such that deposits of combustible residues could readily accumulate thereon shall be specifically *approved* for locations containing deposits of readily ignitable residue and explosive vapors in accordance with NFPA 70. **Exceptions:**

1. Wiring in rigid conduit.
2. Boxes or fittings not containing taps, splices or terminal connections.
3. Equipment allowed by Sections 2404 and 2407 and Chapter 30.

2403.2.2 Open flames and sparks. Open flames and spark-producing devices shall not be located in flammable vapor areas and shall not be located within 20 feet (6096 mm) of such areas unless separated by a permanent partition. **Exception:** Drying and baking apparatus complying with Section 2404.8.1.2.

2403.2.3 Hot surfaces. Heated surfaces having a temperature sufficient to ignite vapors shall not be located in flammable vapor areas. Space-heating appliances, steam pipes or hot surfaces in a flammable vapor area shall be located such that they are not subject to accumulation of deposits of combustible residues. **Exception:** Drying apparatus complying with Section 2404.8.1.2.

2403.2.4 Equipment enclosures. Equipment or apparatus that is capable of producing sparks or particles of hot metal that would fall into a flammable vapor area shall be totally enclosed.

2403.2.5 Grounding. Metal parts of spray booths, exhaust ducts and piping systems conveying Class I or II liquids shall be electrically grounded in accordance with NFPA 70. Metallic parts located in resin application areas, including but not limited to exhaust ducts, ventilation fans, spray application equipment, workpieces and piping, shall be electrically grounded.

2403.2.6 Smoking prohibited. Smoking shall be prohibited in flammable vapor areas and hazardous materials storage rooms associated with flammable finish processes. "No Smoking" signs complying with Section 310 shall be conspicuously posted in such areas.

2403.2.8 Powered industrial trucks. Powered industrial trucks used in electrically classified areas shall be *listed* for such use.

2403.2.7 Welding warning signs. Welding, cutting and similar spark-producing operations shall not be conducted in or adjacent to flammable vapor areas or dipping or coating operations unless precautions have been taken to provide safety. Conspicuous signs with the following warning shall be posted in the vicinity of flammable vapor areas, dipping operations and paint storage rooms:

NO WELDING
THE USE OF WELDING OR CUTTING
EQUIPMENT IN OR NEAR THIS AREA
IS DANGEROUS BECAUSE OF FIRE
AND EXPLOSION HAZARDS. WELDING
AND CUTTING SHALL BE DONE ONLY
UNDER THE SUPERVISION OF THE
PERSON IN CHARGE.

2403.4 Operations and maintenance. Flammable vapor areas, exhaust fan blades and exhaust ducts shall be kept free from the accumulation of deposits of combustible residues. Where excessive residue accumulates in such areas, spraying operations shall be discontinued until conditions are corrected.

2403.4.1 Tools. Scrapers, spuds and other tools used for cleaning purposes shall be constructed of nonsparking materials.

~~**2403.4.2 Residue.** Residues removed during cleaning and debris contaminated with residue shall be immediately removed from the premises and properly disposed.~~

~~**2403.4.3 Waste cans.** *Approved* metal waste cans equipped with self closing lids shall be provided wherever rags or waste are impregnated with finishing material. Such rags and waste shall be deposited therein immediately after being utilized. The contents of waste cans shall be properly disposed of not less than once daily and at the end of each shift.~~

~~**2403.4.4 Solvent recycling.** Solvent distillation equipment used to recycle and clean dirty solvents shall comply with Section 5705.4.~~

NFPA

NFPA
NFPA
1 Batterymarch Park
Quincy, MA 02169-7471

33— ~~21~~ 24	Standard for Spray Application Using Flammable or Combustible Materials
34— ~~21~~ 24	Standard for Dipping, Coating, and Printing Processes Using Flammable or Combustible Liquids

Reason: The current chapter includes some, but not all of the safety requirements for spray finishing, powder coating, and dipping. This edit removed items that are duplicated in NFPA 33 and NFPA 34 and directs the user to the complete set of safety requirements in the appropriate NFPA standard that would be challenging to repeat within this Chapter.

Specific fire protection requirements for the various operations and enclosures that involve spray and dipping operations can be found in the referenced NFPA documents and have been removed from this chapter.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The change is editorial in that the requirements removed already exist in an NFPA standard that fully addresses the hazards.

F184-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: This proposal was disapproved as the committee was not in favor of such a wholesale reference to NFPA 33 and 34. Such revisions need to be incremental. (Vote 14-0)

F184-24

Individual Consideration Agenda

Comment 1:

IFC: 2403.2, 2403.2.1, 2403.2.1.1, 2403.2.1.2, 2403.2.1.3, 2403.2.1.4, 2403.2.2, 2403.2.3, 2403.2.4, 2403.2.6, 2403.2.7, 2403.2.8, 2403.2.5

Proponents: Geoffrey Raifsnider, Global Finishing Solutions, Self (graifsnider@globalfinishing.com) requests As Modified by Committee (AMC2)

Replace as follows:

2024 International Fire Code

Revise as follows:

2403.2 Sources of ignition. Protection against sources of ignition shall be provided in accordance with Sections 2403.2.1 through 2403.2.4~~8~~.

2403.2.1 Electrical wiring and equipment. Electrical wiring and equipment shall comply with this chapter and the applicable provisions of NFPA 33, NFPA 34 and NFPA 70.

Delete without substitution:

~~**2403.2.1.1 Flammable vapor areas.** Electrical wiring and equipment in flammable vapor areas shall be of an explosionproof type *approved* for use in such hazardous locations. Such areas shall be considered to be Class I, Division 1, or Class II, Division 1, hazardous locations in accordance with NFPA 70.~~

~~**2403.2.1.2 Areas subject to deposits of residues.** Electrical equipment, flammable vapor areas or drying operations that are subject to splashing or dripping of liquids shall be specifically *approved* for locations containing deposits of readily ignitable residue and explosive vapors. **Exceptions:**~~

1. ~~This provision shall not apply to wiring in rigid conduit, threaded boxes or fittings not containing taps, splices or terminal connections.~~
2. ~~This provision shall not apply to electrostatic equipment allowed by Section 2407.~~

~~In resin application areas, electrical wiring and equipment that is subject to deposits of combustible residues shall be *listed* for such exposure and shall be installed as required for hazardous (classified) locations. Electrical wiring and equipment not subject to deposits of combustible residues shall be installed as required for ordinary hazard locations.~~

~~**2403.2.1.3 Areas adjacent to spray booths.** Electrical wiring and equipment located outside of, but within 3 feet (914 mm) of openings in a spray booth or a spray room, shall be *approved* for Class I, Division 2, or Class II, Division 2, hazardous locations, whichever is applicable.~~

~~**2403.2.1.4 Areas subject to overspray deposits.** Electrical equipment in flammable vapor areas located such that deposits of combustible residues could readily accumulate thereon shall be specifically *approved* for locations containing deposits of readily ignitable residue and explosive vapors in accordance with NFPA 70. **Exceptions:**~~

1. ~~Wiring in rigid conduit.~~
2. ~~Boxes or fittings not containing taps, splices or terminal connections.~~
3. ~~Equipment allowed by Sections 2404 and 2407 and Chapter 30.~~

~~**2403.2.2 Open flames and sparks.** Open flames and spark-producing devices shall not be located in flammable vapor areas and shall not be located within 20 feet (6096 mm) of such areas unless separated by a permanent partition. **Exception:** Drying and baking apparatus complying with Section 2404.8.1.2.~~

~~**2403.2.3 Hot surfaces.** Heated surfaces having a temperature sufficient to ignite vapors shall not be located in flammable vapor areas. Space-heating appliances, steam pipes or hot surfaces in a flammable vapor area shall be located such that they are not subject to accumulation of deposits of combustible residues. **Exception:** Drying apparatus complying with Section 2404.8.1.2.~~

~~**2403.2.4 Equipment enclosures.** Equipment or apparatus that is capable of producing sparks or particles of hot metal that would fall into~~

~~a flammable vapor area shall be totally enclosed.~~

Revise as follows:

2403.2.2 ~~**2403.2.6**~~ **Smoking prohibited.** Smoking shall be prohibited in flammable vapor areas and hazardous materials storage rooms associated with flammable finish processes. “No Smoking” signs complying with Section 310 shall be conspicuously posted in such areas.

2403.2.3 ~~**2403.2.7**~~ **Welding warning signs.** Welding, cutting and similar spark-producing operations shall not be conducted in or adjacent to flammable vapor areas or dipping or coating operations unless precautions have been taken to provide safety. Conspicuous signs with the following warning shall be posted in the vicinity of flammable vapor areas, dipping operations and paint storage rooms:NO WELDING
THE USE OF WELDING OR CUTTING
EQUIPMENT IN OR NEAR THIS AREA
IS DANGEROUS BECAUSE OF FIRE
AND EXPLOSION HAZARDS. WELDING
AND CUTTING SHALL BE DONE ONLY
UNDER THE SUPERVISION OF THE
PERSON IN CHARGE.

2403.2.4 ~~**2403.2.8**~~ **Powered industrial trucks.** Powered industrial trucks used in electrically classified areas shall be *listed* for such use.

Delete without substitution:

~~**2403.2.5 Grounding.** Metal parts of spray booths, exhaust ducts and piping systems conveying Class I or II liquids shall be electrically grounded in accordance with NFPA 70. Metallic parts located in resin application areas, including but not limited to exhaust ducts, ventilation fans, spray application equipment, workpieces and piping, shall be electrically grounded.~~

Reason: The current section includes some, but not all of the safety requirements for protection of operations. This edit removed items that are duplicated in NFPA 33 and directs the user to the complete set of safety requirements in NFPA 33 that would be challenging to repeat within this Chapter.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The change is editorial in that the requirements removed already exist in NFPA 33 that fully addresses the hazards.

Comment (CAH2)# 592

Comment 2:

IFC: 2405.1

Proponents: Geoffrey Raifsnider, Global Finishing Solutions, Self (graifsnider@globalfinishing.com) requests As Modified by Committee (AMC2)

Replace as follows:

2024 International Fire Code

Revise as follows:

2405.1 General. Dip-tank operations shall comply with the requirements of Section 2403 and Sections 2405.2 through 2405.11 and the applicable provisions of NFPA 34.

Reason: This change is part of a targeted approach to the changes initially proposed in F184-24. This change pulls in the applicable provisions of NFPA 34 which addresses dipping and coating.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

NFPA 34 is the standard for dipping and coating operations. This change only provides a pointer to the standard.

Comment (CAH2)# 595

Comment 3:

IFC: 2406.1, 2406.2, 2406.3, 2406.4, 2406.4.1, 2406.4.2, 2406.5, 2406.5.1, 2406.6, 2406.6.1, 2406.6.2, 2406.6.3, 2406.6.4, 2406.7

Proponents: Geoffrey Raifsnider, Global Finishing Solutions, Self (graifsnider@globalfinishing.com) requests As Modified by Committee (AMC2)

Replace as follows:

2024 International Fire Code

Revise as follows:

2406.1 General. Powder coating operations and equipment shall be in accordance with this Section and the applicable provisions of NFPA 33.

2406.2 Location of powder coating operations.. Powder coating operations conducted in buildings used for Group A, E, I or R occupancies shall be located in a spray room protected with an approved automatic sprinkler system installed in accordance with Section 903.3.1.1 and separated vertically and horizontally from the remainder of the building by fire barrier walls and horizontal assemblies with not less than a 1-hour fire-resistance rating in accordance with the International Building Code. In other occupancies, powder coating operations shall be conducted in enclosed powder coating rooms, enclosed powder coating facilities that are ventilated or ventilated spray booths.

Delete without substitution:

~~**2406.3 Construction of powder coating rooms and booths.** Powder coating rooms shall be constructed of noncombustible materials. Spray booths shall be constructed in accordance with Section 2404.5.3. **Exception:** *Listed* spray booth assemblies that are constructed of other materials shall be allowed.~~

Revise as follows:

2406.3 Fire protection. Areas used for powder coating shall be protected by an *approved automatic fire-extinguishing system* complying with Chapter 9 and the applicable provisions of NFPA 33.

Delete without substitution:

~~**2406.4.1 Additional protection for fixed systems.** Automated powder application equipment shall be protected by the installation of an *approved*, supervised flame detection apparatus that shall react to the presence of flame within 0.5 second and shall accomplish all of~~

~~the following:~~

1. ~~Shutting down of energy supplies (electrical and compressed air) to conveyor, ventilation, application, transfer and powder collection equipment.~~
2. ~~Closing of segregation dampers in associated ductwork to interrupt airflow from application equipment to powder collectors.~~
3. ~~Activation of an alarm that is audible throughout the powder coating room or booth.~~

Revise as follows:

2406.3.1 Fire extinguishers. Portable fire extinguishers complying with Section 906 shall be provided for areas used for powder coating in accordance with the requirements for an extra-hazard occupancy.

2406.4 Operation and maintenance. Powder coating areas shall be kept free from the accumulation of powder coating dusts, including horizontal surfaces such as ledges, beams, pipes, hoods, booths and floors.

2406.4.1 Cleaning. Surfaces shall be cleaned in such a manner so as to avoid scattering dusts to other places or creating dust clouds. Vacuum sweeping equipment shall be of a type *approved* for use in hazardous locations.

2406.5 Sources of ignition. Control of sources of ignition shall be in accordance with the applicable provisions of NFPA 70.

Delete without substitution:

~~**2406.6.1 Drying, curing and fusion equipment.** Drying, curing and fusion equipment shall comply with Chapter 30.~~

~~**2406.6.2 Spark-producing metals.** Iron or spark-producing metals shall be prevented from being introduced into the powders being applied by magnetic separators, filter-type separators or by other *approved* means.~~

~~**2406.6.3 Preheated parts.** When parts are heated prior to coating, the temperature of the parts shall not exceed the ignition temperature of the powder to be used.~~

~~**2406.6.4 Grounding and bonding.** Precautions shall be taken to minimize the possibility of ignition by static electrical sparks through static bonding and grounding, where possible, of powder transport, application and recovery equipment.~~

2406.7 Ventilation. Exhaust ventilation shall be sufficient to maintain the atmosphere below one-half the minimum explosive concentration for the material being applied. Nondeposited, air-suspended powders shall be removed through exhaust ducts to the powder recovery system.

Reason: The current section includes some, but not all of the safety requirements for powder coating. This edit removed items that are duplicated in NFPA 33 and directs the user to the complete set of safety requirements in NFPA 33 that would be challenging to repeat within this Chapter.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The change is editorial in that the requirements removed already exist in NFPA 33 that fully addresses the hazards.

Comment (CAH2)# 597

Comment 4:

IFC: 2404.1

Proponents: Geoffrey Raifsnider, Global Finishing Solutions, Self (graifsnider@globalfinishing.com) requests As Modified by Committee (AMC2)

Replace as follows:

2024 International Fire Code

Revise as follows:

2404.1 General. The application of *flammable* or *combustible liquids* by means of spray apparatus in continuous or intermittent processes shall be in accordance with ~~the requirements of~~ this Section, Section~~s~~ 2403 and the applicable provisions of NFPA 33 ~~2404.4 through 2404.11.4~~.

Reason: The current section includes some, but not all of the safety requirements for spray finishing. This edit, in addition to pointing to the appropriate sections in this code, also directs the user to the complete set of safety requirements in NFPA 33 that would be challenging to repeat within this Chapter.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The change is editorial in that change more clearly directs the user to NFPA 33 for additional requirements that fully addresses the hazards.

Comment (CAH2)# 599

Comment 5:

IFC: 2404.5.3, 2404.5.3.1, 2404.5.3.2, 2404.5.3.3, 2404.5.3.4, 2404.5.3.5, 2404.5.3.6

Proponents: Geoffrey Raifsnider, Global Finishing Solutions, Self (graifsnider@globalfinishing.com) requests As Modified by Committee (AMC2)

Replace as follows:

2024 International Fire Code

Revise as follows:

2404.5.3 Spray booths. The design and construction of spray booths shall be in accordance with Sections 2404.5.3.1 through 2404.5.3.3~~6~~, Sections 2404.6 through 2404.10 and NFPA 33.

Delete without substitution:

~~**2404.5.3.1 Construction.** Spray booths shall be constructed of *approved* noncombustible materials. Aluminum shall not be used. Where walls or ceiling assemblies are constructed of sheet metal, single-skin assemblies shall be not thinner than 0.0478 inch (18 gage) (1.2 mm) and each sheet of double-skin assemblies shall be not thinner than 0.0359 inch (20 gage) (0.9 mm). Structural sections of spray booths are allowed to be sealed with latex-based or similar caulks and sealants.~~

~~**2404.5.3.2 Surfaces.** The interior surfaces of spray booths shall be smooth; shall be constructed so as to permit the free passage of exhaust air from all parts of the interior, and to facilitate washing and cleaning; and shall be designed to confine residues within the booth. Aluminum shall not be used.~~

~~**2404.5.3.3 Floor.** Combustible floor construction in spray booths shall be covered by *approved*, noncombustible, nonsparking material, except where combustible coverings, including but not limited to thin paper or plastic and strippable coatings, are utilized over noncombustible materials to facilitate cleaning operations in spray booths.~~

Revise as follows:

2404.5.3.1 ~~2404.5.3.4~~ Means of egress. *Means of egress* shall be provided in accordance with Chapter 10.

Exception: *Means of egress* doors from premanufactured spray booths shall be not less than 30 inches (762 mm) in width by 80 inches (2032 mm) in height.

2404.5.3.2 ~~2404.5.3.5~~ Clear space. Spray booths shall be installed so that all parts of the booth are able to be accessed for cleaning. A clear space of not less than 3 feet (914 mm) shall be maintained on all sides of the spray booth. This clear space shall be kept free of any storage or combustible construction.

Exceptions:

1. This requirement shall not prohibit locating a spray booth closer than 3 feet (914 mm) to or directly against an interior partition, wall or floor/ceiling assembly that has a *fire-resistance rating* of not less than 1 hour, provided that the spray booth can be adequately maintained and cleaned.
2. This requirement shall not prohibit locating a spray booth closer than 3 feet (914 mm) to an *exterior wall* or a roof assembly, provided that the wall or roof is constructed of noncombustible material and the spray booth can be adequately maintained and cleaned.

2404.5.3.3 ~~2404.5.3.6~~ Size. The aggregate area of spray booths in a building shall not exceed the lesser of 10 percent of the area of any floor of a building or the basic area allowed for a Group H-2 occupancy without area increases, as set forth in the *International Building Code*.**Exception:** One individual booth not exceeding 500 square feet (46 m^2).

Reason: The current section includes some, but not all of the safety requirements for spray finishing. This edit removed items that are duplicated in NFPA 33 and directs the user to the complete set of safety requirements in NFPA 33 that would be challenging to repeat within this Chapter.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The change is editorial in that the requirements removed already exist in NFPA 33 that fully addresses the hazards.

Comment (CAH2)# 601

Comment 6:

IFC: 2404.6

Proponents: Geoffrey Raifsnider, Global Finishing Solutions, Self (graifsnider@globalfinishing.com) requests As Modified by Committee (AMC2)

Replace as follows:

2024 International Fire Code

Revise as follows:

2404.6 Fire protection. Spray booths and spray rooms shall be protected by an *approved automatic fire-extinguishing system* complying with Chapter 9 and NFPA 33. Protection shall extend to exhaust plenums, exhaust ducts and both sides of dry filters where such filters are used.

Reason: The current section includes some, but not all of the fire protection requirements for spray finishing. This edit directs the users to the complete set of fire protection requirements in NFPA 33 that would be challenging to repeat within this Chapter.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The change is editorial in that the requirements already exist in NFPA 33 that fully addresses the hazards.

Comment 7:

IFC: 2404.8.1, 2404.8.1.1, 2404.8.1.2, 2404.8.1.2.1, 2404.8.1.2.2

Proponents: Geoffrey Raifsnider, Global Finishing Solutions, Self (graifsnider@globalfinishing.com) requests As Modified by Committee (AMC2)

Replace as follows:

2024 International Fire Code

Revise as follows:

2404.8.1 Drying operations. Spray booths and spray rooms ~~shall not be alternately~~ used for the purpose of drying by arrangements or methods that could cause an increase in the surface temperature of the spray booth or spray room shall comply with the applicable provisions of Chapter 30 and NFPA 33.~~except in accordance with Sections 2404.8.1.1 and 2404.8.1.2. Except as specifically provided in this section, drying or baking units utilizing a heating system having open flames or that are capable of producing sparks shall not be installed in a flammable vapor areas~~.

Delete without substitution:

~~**2404.8.1.1 Spraying procedure.** The spraying procedure shall use low-volume spray application.~~

~~**2404.8.1.2 Drying apparatus.** Fixed drying apparatus shall comply with this chapter and the applicable provisions of Chapter 30. Where recirculation ventilation is provided in accordance with Section 2404.9.2, the heating system shall not be within the recirculation air path.~~

~~**2404.8.1.2.1 Interlocks.** The spraying apparatus, drying apparatus and ventilating system for the spray booth or spray room shall be equipped with interlocks arranged to accomplish all of the following:~~

1. ~~Prevent operation of the spraying apparatus while drying operations are in progress.~~
2. ~~Where the drying apparatus is located in the spray booth or spray room, prevent operation of the drying apparatus until a timed purge of spray vapors from the spray booth or spray room is complete. This purge time shall be based on completing not fewer than four air changes of spray booth or spray room volume or for a period of not less than 3 minutes, whichever is greater.~~

3. Have the ventilating system maintain a safe atmosphere within the spray booth or spray room during the drying process and automatically shut off drying apparatus in the event of a failure of the ventilating system.
4. Shut off the drying apparatus automatically if the discharge temperature of the air heater exceeds the maximum discharge air temperature allowed in accordance with the heater's listing or 221°F (105°C).

2404.8.1.2.2 Portable infrared apparatus. Where a portable infrared drying apparatus is used, electrical wiring and portable infrared drying equipment shall comply with NFPA 70. Electrical equipment located within 18 inches (457 mm) of floor level shall be *approved* for Class I, Division 2, hazardous locations. Metallic parts of drying apparatus shall be electrically bonded and grounded. During spraying operations, portable drying apparatus and electrical connections and wiring thereto shall not be located within spray booths, spray rooms or other areas where spray residue would be deposited thereon.

Reason: The current section includes some, but not all of the safety requirements for drying operations in a spray booth or spray room. This edit removed items that are duplicated in NFPA 33 and directs the user to the complete set of safety requirements in NFPA 33 that would be challenging to repeat within this Chapter.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The change is editorial in that the requirements removed already exist in NFPA 33 that fully addresses the hazards.

Proponents: Geoffrey Raifsnider, Global Finishing Solutions, Self (graifsnider@globalfinishing.com) requests As Modified by Committee (AMC2)

Replace as follows:

2024 International Fire Code

Delete without substitution:

2404.8.2 Illumination. Where spraying spaces, spray rooms or spray booths are illuminated through glass panels or other transparent materials, only fixed luminaires shall be utilized as a source of illumination.

2404.8.2.1 Glass panels. Panels for luminaires or for observation shall be of heat treated glass, wired glass or hammered wire glass and shall be sealed to confine vapors, mists, residues, dusts and deposits to the flammable vapor area. Panels for luminaires shall be separated from the luminaire to prevent the surface temperature of the panel from exceeding 221°F (105°C).

2404.8.2.2 Exterior luminaires. Luminaires attached to the walls or ceilings of a flammable vapor area, but outside of any classified area and separated from the flammable vapor areas by vapor tight glass panels, shall be suitable for use in ordinary hazard locations. Such luminaires shall be serviced from outside the flammable vapor areas.

2404.8.2.3 Integral luminaires. Luminaires that are an integral part of the walls or ceiling of a flammable vapor area are allowed to be separated from the flammable vapor area by glass panels that are an integral part of the luminaire. Such luminaires shall be *listed* for use in Class I, Division 2, or Class II, Division 2, locations, whichever is applicable, and shall be suitable for accumulations of deposits of

~~combustible residues. Such luminaires are allowed to be serviced from inside the flammable vapor area.~~

~~**2404.8.2.4 Portable electric lamps.** Portable electric lamps shall not be used in flammable vapor areas during spraying operations. Portable electric lamps used during cleaning or repairing operations shall be of a type *approved* for hazardous locations.~~

Reason: These requirements, and other equally important requirements, exist in both NFPA 33 and NFPA 70 which are incorporated by reference in this chapter.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The change is editorial in that the requirements removed already exist in NFPA 33 and NFPA 70 that fully addresses the hazards.

Comment (CAH2)# 606

Comment 9:

IFC: 2404.10, 2404.10.1, 2404.10.1.1, 2404.10.1.2, 2404.10.2

Proponents: Geoffrey Raifsnider, Global Finishing Solutions, Self (graifsnider@globalfinishing.com) requests As Modified by Committee (AMC2)

Replace as follows:

2024 International Fire Code

Delete without substitution:

~~**2404.10 Interlocks.** Interlocks for spray application finishes shall be in accordance with Sections 2404.10.1 through 2404.10.2.~~

~~**2404.10.1 Automated spray application operations.** Where protecting automated spray application operations, *automatic fire-extinguishing systems* shall be equipped with an *approved* interlock feature that will, upon discharge of the system, automatically stop the spraying operations and workpiece conveyors into and out of the flammable vapor areas. Where the building is equipped with a *fire alarm system*, discharge of the *automatic fire-extinguishing system* shall also activate the building alarm notification appliances.~~

~~**2404.10.1.1 Alarm station.** A manual fire alarm and emergency system shutdown station shall be installed to serve each flammable vapor area. When activated, the station shall accomplish the functions indicated in Section 2404.10.1.~~

~~**2404.10.1.2 Alarm station location.** Not less than one manual fire alarm and emergency system shutdown station shall be provided with *ready access* for operating personnel. Where access to this station is likely to involve exposure to danger, an additional station shall be located adjacent to an *exit* from the area.~~

~~**2404.10.2 Ventilation interlock prohibited.** Air makeup and flammable vapor area exhaust systems shall not be interlocked with the fire alarm system and shall remain in operation during a fire alarm condition. **Exception:** Where the type of fire-extinguishing system used requires such ventilation to be discontinued, air makeup and exhaust systems shall shut down and dampers shall close.~~

Reason: The current section includes some, but not all of the interlock requirements for spray finishing. These requirements exist in NFPA 33 and are already incorporated by reference as the chapter directs users to NFPA 33.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The change is editorial in that the requirements removed already exist in NFPA 33 that fully addresses the hazards.

Comment (CAH2)# 607

Comment 10:

IFC: 2404.5.3.6

Proponents: Geoffrey Raifsnider, Global Finishing Solutions, Self (graifsnider@globalfinishing.com) requests As Modified by Committee (AMC2)

Replace as follows:

2024 International Fire Code

Delete without substitution:

~~**2404.5.3.6 Size.** The aggregate area of spray booths in a building shall not exceed the lesser of 10 percent of the area of any floor of a building or the basic area allowed for a Group H-2 occupancy without area increases, as set forth in the *International Building Code*.~~

~~**Exception:** One individual booth not exceeding 500 square feet (46 m^2).~~

Reason: This section does not seem to take into account that regardless of the footprint of the spray booth the safety ventilation increases as the amount of spray increases in order to meet the requirements of the flammable concentration in the exhaust. In addition, the amount of paint stored within a spray booth does not increase with size. Therefore, size should not be a factor in determining the hazard level. A spray booth, regardless of size, that meets the requirements of Chapter 24 provides a safe and reliable piece of equipment which should not result in a change in the occupancy classification for the booth or the building. NFPA 33 does not have a size limitation. The proposed change brings this section in alignment with current edition of NFPA 33.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

Unknown.

Estimated Immediate Cost Impact Justification (methodology and variables):

This change will allow use of spray booth construction which may be less expensive than fire rated construction.

Comment (CAH2)# 608

Comment 11:

IFC: 2404.9.8

Proponents: Geoffrey Raifsnider, Global Finishing Solutions, Self (graifsnider@globalfinishing.com) requests As Modified by Committee (AMC2)

Replace as follows:

2024 International Fire Code

Revise as follows:

2404.9.8 Filters. Air intake filters that are part of a wall or ceiling assembly shall be *listed* ~~as Class I or II~~ in accordance with UL 900. Exhaust filters shall be required.

Reason: UL removed the designations Class I and Class II in November of 2009. The current edition (2015) does not reference Class I and Class II.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This change does not affect the cost of the filters.

Comment (CAH2)# 616

Comment 12:

IFC: 2404.5.2

Proponents: Geoffrey Raifsnider, Global Finishing Solutions, Self (graifsnider@globalfinishing.com) requests As Modified by Committee (AMC2)

Replace as follows:

2024 International Fire Code

Revise as follows:

2404.5.1.1 ~~**2404.5.2**~~ **Floor.** Combustible floor construction in spray rooms shall be covered by *approved*, noncombustible, nonsparking material, except where combustible coverings, including but not limited to thin paper or plastic and strippable coatings, are utilized over noncombustible materials to facilitate cleaning operations in spray rooms.

Reason: This section is a requirement for floors of spray rooms and should be a subsection.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is a numbering change only.

Comment (CAH2)# 699

F190-24

IFC Chapter 27

Proposed Change as Submitted

Proponents: William Koffel, Koffel Associates, Inc., Semiconductor Industry Association (wkoffel@koffel.com)

2024 International Fire Code

CHAPTER 27
SEMICONDUCTOR FABRICATION FACILITIES

SECTION 2701
GENERAL

Revise as follows:

2701.1 Scope. Semiconductor fabrication facilities and comparable research and development areas classified as Group H-5 shall comply with ~~this chapter~~NFPA 318 and the *International Building Code*. The use, storage and handling of hazardous materials in Group H-5 shall comply with NFPA 318, this chapter, other applicable provisions of this code and the *International Building Code*.

2701.2 Application. The requirements set forth in this chapter are requirements specific only to Group H-5 and shall be applied as exceptions or additions to applicable requirements set forth elsewhere in this code.

2701.3 Multiple hazards. Where a material poses multiple hazards, all hazards shall be addressed in accordance with Section 5001.1.

2701.4 Existing buildings and existing fabrication areas. Existing buildings and existing *fabrication areas* shall comply with this chapter, except that transportation and handling of HPM in *corridors* and enclosures for *stairways* and *ramps* shall be allowed where in compliance with Section 2705.3.2 and the *International Building Code*.

2701.5 Permits. Permits shall be required as set forth in Section 105.5.

SECTION 2702
DEFINITIONS

2702.1 Definitions. The following terms are defined in Chapter 2:
EMERGENCY CONTROL STATION.

FABRICATION AREA.

GAS DETECTION SYSTEM.

HAZARDOUS PRODUCTION MATERIAL (HPM).

HPM.

HPM ROOM.

PASS-THROUGH.

SEMICONDUCTOR FABRICATION FACILITY.

SERVICE CORRIDOR.

TOOL.

WORKSTATION.

SECTION 2703
GENERAL SAFETY PROVISIONS

Revise as follows:

2703.1 Emergency control station. An *emergency control station* shall be provided in accordance with Sections 2703.1.1 through 2703.1.2.

2703.1.1 Location. ~~The *emergency control station* shall be located on the premises at an *approved* location outside the fabrication area.~~

2703.1.~~2~~1 Staffing. Trained personnel shall continuously staff the *emergency control station*.

2703.1.~~3~~2 Signals. The *emergency control station* shall receive signals from emergency equipment and alarm and detection systems. Such emergency equipment and alarm and detection systems shall include, but not be limited to, the following where such equipment or systems are required to be provided either in this chapter or elsewhere in this code:

1. *Automatic sprinkler system* alarm and monitoring systems.
2. Manual fire alarm systems.
3. *Emergency alarm systems*.
4. *Gas detection systems*.
5. Smoke detection systems.
6. Emergency power systems.
7. Automatic detection and alarm systems for *pyrophoric* liquids and Class 3 water-reactive liquids required by Section 2705.2.3.4.
8. Exhaust ventilation flow alarm devices for *pyrophoric* liquids and Class 3 water-reactive liquids and cabinet exhaust ventilation systems required by Section 2705.2.3.4.

2703.2 Systems, equipment and processes. Systems, equipment and processes shall be in accordance with Sections 2703.2.1 through 2703.2.3.2.

2703.2.1 Application. Systems, equipment and processes shall include, but not be limited to, containers, cylinders, tanks, piping, tubing, valves and fittings.

2703.2.2 General requirements. In addition to the requirements in Section 2703.2, systems, equipment and processes shall comply with Section 5003.2, other applicable provisions of this code, the *International Building Code* and the *International Mechanical Code*.

2703.2.3 Additional requirements for HPM supply piping. In addition to the requirements in Section 2703.2, HPM supply piping and tubing for HPM gases and liquids shall comply with this section.

2703.2.3.1 General requirements. The requirements set forth in Section 5003.2.2.2 shall apply to supply piping and tubing for HPM gases and liquids.

2703.2.3.2 Health-hazard ranking 3 or 4 HPM. Supply piping and tubing for HPM gases and liquids having a health-hazard ranking of 3 or 4 shall be welded throughout, except for connections located within a ventilation enclosure if the material is a gas, or an *approved*

method of drainage or containment provided for connections if the material is a liquid.

2703.3 Construction requirements. Construction of semiconductor fabrication facilities shall be in accordance with Sections 2703.3.1 through 2703.3.9.

2703.3.1 Fabrication areas. Construction and location of *fabrication areas* shall comply with the *International Building Code*.

2703.3.2 Pass-throughs in exit access corridors. Pass-throughs in *exit access corridors* shall be constructed in accordance with the *International Building Code*.

2703.3.3 Liquid storage rooms. Liquid storage rooms shall comply with Chapter 57 and the *International Building Code*.

2703.3.4 HPM rooms. HPM rooms shall comply with the *International Building Code*.

2703.3.5 Gas cabinets. Gas cabinets shall comply with Section 5003.8.6.

2703.3.6 Exhausted enclosures. Exhausted enclosures shall comply with Section 5003.8.5.

2703.3.7 Gas rooms. Gas rooms shall comply with Section 5003.8.4.

2703.3.8 Service corridors. Service corridors shall comply with Section 2705.3 and the *International Building Code*.

2703.3.9 Cabinets containing pyrophoric liquids or water-reactive Class 3 liquids. Cabinets in *fabrication areas* containing *pyrophoric* liquids or Class 3 water-reactive liquids in containers or in amounts greater than $^{1}/_{2}$ gallon (2 L) shall comply with Section 2705.2.3.4.

2703.4 Emergency plan. An emergency plan shall be established as set forth in Section 403.6.1.

2703.5 Maintenance of equipment, machinery and processes. Maintenance of equipment, machinery and processes shall comply with Section 5003.2.6.

2703.6 Security of areas. Areas shall be secured in accordance with Section 5003.9.2.

Delete without substitution:

~~**2703.7 Electrical wiring and equipment.** Electrical wiring and equipment in HPM facilities shall comply with Sections 2703.7.1 through 2703.7.3.~~

~~**2703.7.1 Fabrication areas.** Electrical wiring and equipment in *fabrication areas* shall comply with NFPA 70.~~

~~**2703.7.2 Workstations.** Electrical equipment and devices within 5 feet (1524 mm) of workstations in which flammable or *pyrophoric* gases or *flammable liquids* are used shall comply with NFPA 70 for Class I, Division 2 hazardous locations. Workstations shall not be energized without adequate exhaust ventilation in accordance with Section 2703.14. **Exception:** Class I, Division 2 hazardous electrical equipment is not required where the air removal from the workstation or dilution will prevent the accumulation of flammable vapors and fumes on a continuous basis.~~

~~**2703.7.3 Hazardous production material (HPM) rooms, gas rooms and liquid storage rooms.** Electrical wiring and equipment in HPM rooms, gas rooms and liquid storage rooms shall comply with NFPA 70.~~

2703.8 Corridors and enclosures for stairways and ramps. Hazardous materials shall not be used or stored in *corridors* or enclosures for *stairways* and *ramps*.

2703.9 Service corridors. Hazardous materials shall not be used in an *open-system* use condition in service corridors.

Delete without substitution:

2703.10 Automatic sprinkler system. An *approved automatic sprinkler system* shall be provided in accordance with Sections 2703.10.1 through 2703.10.5 and Chapter 9.

2703.10.1 Workstations and tools. The design of the sprinkler system in the area shall take into consideration the spray pattern and the effect on the equipment.

2703.10.1.1 Combustible workstations. A sprinkler head shall be installed within each branch exhaust connection or individual plenums of workstations of combustible construction. The sprinkler head in the exhaust connection or plenum shall be located not more than 2 feet (610 mm) from the point of the duct connection or the connection to the plenum. Where necessary to prevent corrosion, the sprinkler head and connecting piping in the duct shall be coated with *approved* or *listed* corrosion-resistant materials. Access to the sprinkler head shall be provided for periodic inspection. **Exceptions:**

1. *Approved* alternative *automatic fire-extinguishing systems* are allowed. Activation of such systems shall deactivate the related processing equipment.
2. Process equipment that operates at temperatures exceeding 932°F (500°C) and is provided with automatic shutdown capabilities for hazardous materials.
3. Exhaust ducts 10 inches (254 mm) or less in diameter from flammable gas storage cabinets that are part of a workstation.
4. Ducts *listed* or *approved* for use without internal automatic sprinkler protection.

2703.10.1.2 Combustible tools. Where the horizontal surface of a combustible tool is obstructed from ceiling sprinkler discharge, automatic sprinkler protection that covers the horizontal surface of the tool shall be provided. **Exceptions:**

1. An automatic gaseous fire-extinguishing local surface application system shall be allowed as an alternative to sprinklers. Gaseous extinguishing systems shall be actuated by infrared (IR) or ultraviolet/infrared (UV/IR) optical detectors.
2. Tools constructed of materials that are *listed* as Class 1 or Class 2 in accordance with UL 2360 or *approved* for use without internal fire-extinguishing system protection.

2703.10.2 Gas cabinets and exhausted enclosures. An *approved automatic sprinkler system* shall be provided in gas cabinets and exhausted enclosures containing HPM *compressed gases*. **Exception:** Gas cabinets located in an HPM room other than those cabinets containing *pyrophoric* gases.

2703.10.3 Pass-throughs in existing exit access corridors. Pass-throughs in existing *exit access corridors* shall be protected by an *approved automatic sprinkler system*.

2703.10.4 Exhaust ducts for HPM. An *approved automatic sprinkler system* shall be provided in exhaust ducts conveying gases, vapors, fumes, mists or dusts generated from HPM in accordance with this section and the *International Mechanical Code*.

2703.10.4.1 Metallic and noncombustible nonmetallic exhaust ducts. An *approved automatic sprinkler system* shall be provided in metallic and noncombustible nonmetallic exhaust ducts where all of the following conditions apply:

1. Where the largest cross-sectional diameter is equal to or greater than 10 inches (254 mm).
2. The ducts are within the building.
3. The ducts are conveying flammable gases, vapors or fumes.

~~**2703.10.4.2 Combustible nonmetallic exhaust ducts.** An *approved automatic sprinkler system* shall be provided in combustible nonmetallic exhaust ducts where the largest cross-sectional diameter of the duct is equal to or greater than 10 inches (254 mm).~~

~~**Exceptions:**~~

1. ~~Ducts *listed* or *approved* for applications without *automatic sprinkler system* protection.~~
2. ~~Ducts not more than 12 feet (3658 mm) in length installed below ceiling level.~~

~~**2703.10.4.3 Exhaust connections and plenums of combustible workstations.** *Automatic fire-extinguishing system* protection for exhaust connections and plenums of combustible workstations shall comply with Section 2703.10.1.1.~~

~~**2703.10.4.4 Exhaust duct sprinkler system requirements.** Automatic sprinklers installed in exhaust duct systems shall be hydraulically designed to provide 0.5 gallon per minute (gpm) (1.9 L/min) over an area derived by multiplying the distance between the sprinklers in a horizontal duct by the width of the duct. Minimum discharge shall be 20 gpm (76 L/min) per sprinkler from the five hydraulically most remote sprinklers.~~

~~**2703.10.4.4.1 Sprinkler locations.** Automatic sprinklers shall be installed at 12-foot (3658 mm) intervals in horizontal ducts and at changes in direction. In vertical runs, automatic sprinklers shall be installed at the top and at alternate floor levels.~~

~~**2703.10.4.4.2 Control valve.** A separate indicating control valve shall be provided for sprinklers installed in exhaust ducts.~~

~~**2703.10.4.4.3 Drainage.** Drainage shall be provided to remove sprinkler water discharged in exhaust ducts.~~

~~**2703.10.4.4.4 Corrosive atmospheres.** Where corrosive atmospheres exist, exhaust duct sprinklers and pipe fittings shall be manufactured of corrosion-resistant materials or coated with *approved* materials.~~

~~**2703.10.4.4.5 Maintenance and inspection.** Access to sprinklers in exhaust ducts shall be provided for periodic inspection and maintenance.~~

~~**2703.10.5 Sprinkler alarms and supervision.** *Automatic sprinkler systems* shall be electrically supervised and provided with alarms in accordance with Chapter 9. *Automatic sprinkler system* alarm and supervisory signals shall be transmitted to the *emergency control station.*~~

~~**2703.11 Manual fire alarm system.** A manual *fire alarm system* shall be installed throughout buildings containing a Group H-5 occupancy. Activation of the alarm system shall initiate a local alarm and transmit a signal to the *emergency control station.* Manual fire alarm systems shall be designed and installed in accordance with Section 907.~~

2703.12 Emergency alarm system. *Emergency alarm systems* shall be provided in accordance with Sections 2703.12.1 through 2703.12.3, Section 5004.9 and Section 5005.4.4. The *maximum allowable quantity per control area* provisions of Section 5004.1 shall not apply to *emergency alarm systems* required for HPM.

2703.12.1 Where required. *Emergency alarm systems* shall be provided in the areas indicated in Sections 2703.12.1.1 through 2703.12.1.3.

2703.12.1.1 Service corridors. An *approved emergency alarm system* shall be provided in service corridors, with not less than one alarm device in the service corridor.

2703.12.1.2 Corridors and interior exit stairways and ramps. Emergency alarms for *corridors*, *interior exit stairways* and *ramps* and *exit passageways* shall comply with Section 5005.4.4.

2703.12.1.3 Liquid storage rooms, HPM rooms and gas rooms. Emergency alarms for liquid storage rooms, HPM rooms and gas

rooms shall comply with Section 5004.9.

2703.12.2 Alarm-initiating devices. An *approved* emergency telephone system, local alarm manual pull stations, or other *approved* alarm-initiating devices are allowed to be used as emergency alarm-initiating devices.

2703.12.3 Alarm signals. Activation of the *emergency alarm system* shall sound a local alarm and transmit a signal to the *emergency control station*.

2703.13 Gas detection systems. A *gas detection system* complying with Section 916 shall be provided for HPM gases where the physiological warning threshold level of the gas is at a higher level than the accepted permissible exposure limit (PEL) for the gas and for flammable gases in accordance with Sections 2703.13.1 through 2703.13.2.2.

2703.13.1 Where required. A *gas detection system* shall be provided in the areas identified in Sections 2703.13.1.1 through 2703.13.1.4.

2703.13.1.1 Fabrication areas. A *gas detection system* shall be provided in *fabrication areas* where HPM gas is used in the *fabrication area*.

2703.13.1.2 HPM rooms. A *gas detection system* shall be provided in HPM rooms where HPM gas is used in the room.

2703.13.1.3 Gas cabinets, exhausted enclosures and gas rooms. A *gas detection system* shall be provided in gas cabinets and exhausted enclosures for HPM gas. A *gas detection system* shall be provided in gas rooms where HPM gases are not located in gas cabinets or exhausted enclosures.

2703.13.1.4 Corridors. Where HPM gases are transported in piping placed within the space defined by the walls of a *corridor* and the floor or roof above the *corridor*, a *gas detection system* shall be provided where piping is located and in the *corridor*.

Exception: A *gas detection system* is not required for occasional transverse crossings of the *corridors* by supply piping that is enclosed in a ferrous pipe or tube for the width of the *corridor*.

2703.13.2 Gas detection system operation. The *gas detection system* shall be capable of monitoring the room, area or equipment in which the HPM gas is located at or below all the following gas concentrations:

1. Immediately dangerous to life and health (IDLH) values where the monitoring point is within an exhausted enclosure, ventilated enclosure or gas cabinet.
2. Permissible exposure limit (PEL) levels where the monitoring point is in an area outside an exhausted enclosure, ventilated enclosure or gas cabinet.
3. For flammable gases, the monitoring detection threshold level shall be vapor concentrations in excess of 25 percent of the lower flammable limit (LFL) where the monitoring is within or outside an exhausted enclosure, ventilated enclosure or gas cabinet.
4. Except as noted in this section, monitoring for highly toxic and toxic gases shall also comply with Chapter 60.

2703.13.2.1 Alarms. The *gas detection system* shall initiate a local alarm and transmit a signal to the *emergency control station* when a short-term hazard condition is detected. The alarm shall be both visible and audible and shall provide warning both inside and outside the area where the gas is detected. The audible alarm shall be distinct from all other alarms.

2703.13.2.2 Shut off of gas supply. The *gas detection system* shall automatically close the shutoff valve at the source on gas supply piping and tubing related to the system being monitored for which gas is detected when a short-term hazard condition is detected. Automatic closure of shutoff valves shall comply with the following:

1. Where the gas-detection sampling point initiating the *gas detection system* alarm is within a gas cabinet or exhausted enclosure, the shutoff valve in the gas cabinet or exhausted enclosure for the specific gas detected shall automatically close.

2. Where the gas-detection sampling point initiating the *gas detection system* alarm is within a room and *compressed gas* containers are not in gas cabinets or exhausted enclosure, the shutoff valves on all gas lines for the specific gas detected shall automatically close.
3. Where the gas-detection sampling point initiating the *gas detection system* alarm is within a piping distribution manifold enclosure, the shutoff valve supplying the manifold for the *compressed gas* container of the specific gas detected shall automatically close.

Exception: Where the gas-detection sampling point initiating the *gas detection system* alarm is at the use location or within a gas valve enclosure of a branch line downstream of a piping distribution manifold, the shutoff valve for the branch line located in the piping distribution manifold enclosure shall automatically close.

2703.14 Exhaust ventilation systems for HPM. Exhaust ventilation systems and materials for exhaust ducts utilized for the exhaust of HPM shall comply with Sections 2703.14.1 through 2703.14.3, other applicable provisions of this code, the *International Building Code* and the *International Mechanical Code*.

2703.14.1 Where required. Exhaust ventilation systems shall be provided in the following locations in accordance with the requirements of this section and the *International Building Code*:

1. *Fabrication areas*: Exhaust ventilation for *fabrication areas* shall comply with the *International Building Code*. The *fire code official* is authorized to require additional manual control switches.
2. Workstations: A ventilation system shall be provided to capture and exhaust gases, fumes and vapors at workstations.
3. Liquid storage rooms: Exhaust ventilation for liquid storage rooms shall comply with Section 5004.3.1 and the *International Building Code*.
4. HPM rooms: Exhaust ventilation for HPM rooms shall comply with Section 5004.3.1 and the *International Building Code*.
5. Gas cabinets: Exhaust ventilation for gas cabinets shall comply with Section 5003.8.6.2. The gas cabinet ventilation system is allowed to connect to a workstation ventilation system. Exhaust ventilation for gas cabinets containing highly toxic or toxic gases shall also comply with Chapter 60.
6. Exhausted enclosures: Exhaust ventilation for exhausted enclosures shall comply with Section 5003.8.5.2. Exhaust ventilation for exhausted enclosures containing highly toxic or toxic gases shall also comply with Chapter 60.
7. Gas rooms: Exhaust ventilation for gas rooms shall comply with Section 5003.8.4.2. Exhaust ventilation for gas rooms containing highly toxic or toxic gases shall also comply with Chapter 60.
8. Cabinets containing *pyrophoric* liquids or Class 3 water-reactive liquids: Exhaust ventilation for cabinets in *fabrication areas* containing *pyrophoric* liquids or Class 3 water-reactive liquids shall be as required in Section 2705.2.3.4.

2703.14.2 Penetrations. Exhaust ducts penetrating *fire barriers* constructed in accordance with Section 707 of the International Building Code or *horizontal assemblies* constructed in accordance with Section 711 of the International Building Code shall be contained in a shaft of equivalent *fire-resistance-rated* construction. Exhaust ducts shall not penetrate *fire walls*. *Fire dampers* shall not be installed in exhaust ducts.

2703.14.3 Treatment systems. Treatment systems for highly toxic and toxic gases shall comply with Chapter 60.

Delete without substitution:

~~**2703.15 Emergency power system.** An emergency power system shall be provided in Group H-5 occupancies in accordance with Section 1203. The emergency power system shall supply power automatically to the electrical systems specified in Section 2703.15.1 when the normal supply system is interrupted.~~

~~**2703.15.1 Required electrical systems.** Emergency power shall be provided for electrically operated equipment and connected control circuits for the following systems:~~

1. HPM exhaust ventilation systems.
2. HPM gas cabinet ventilation systems.
3. HPM exhausted enclosure ventilation systems.
4. HPM gas room ventilation systems.
5. HPM *gas detection systems*.
6. *Emergency alarm systems*.
7. Manual fire alarm systems.
8. *Automatic sprinkler system* monitoring and alarm systems.
9. Automatic alarm and detection systems for *pyrophoric* liquids and Class 3 water-reactive liquids required in Section 2705.2.3.4.
10. Flow alarm switches for *pyrophoric* liquids and Class 3 water-reactive liquids cabinet exhaust ventilation systems required in Section 2705.2.3.4.
11. Electrically operated systems required elsewhere in this code or in the *International Building Code* applicable to the use, storage or handling of HPM.

2703.15.2 Exhaust ventilation systems. Exhaust ventilation systems are allowed to be designed to operate at not less than one-half the normal fan speed on the emergency power system where it is demonstrated that the level of exhaust will maintain a safe atmosphere.

2703.16 Sub-atmospheric pressure gas systems. Sub-atmospheric pressure gas systems (SAGS) shall be in accordance with NFPA 318.

SECTION 2704
STORAGE

2704.1 General. Storage of hazardous materials shall comply with Section 2703 and this section and other applicable provisions of this code.

2704.2 Fabrication areas. Hazardous materials storage and the maximum quantities of hazardous materials in use and storage allowed in *fabrication areas* shall be in accordance with Sections 2704.2.1 through 2704.2.2.1.

2704.2.1 Location of HPM storage in fabrication areas. Storage of HPM in *fabrication areas* shall be within *approved* or *listed* storage cabinets, gas cabinets, exhausted enclosures or within a workstation as follows:

1. *Flammable* and *combustible liquid* storage cabinets shall comply with Section 5704.3.2.
2. Hazardous materials storage cabinets shall comply with Section 5003.8.7.
3. Gas cabinets shall comply with Section 5003.8.6. Gas cabinets for highly toxic or toxic gases shall also comply with Section 6004.1.2.
4. Exhausted enclosures shall comply with Section 5003.8.5. Exhausted enclosures for highly toxic or toxic gases shall also comply with Section 6004.1.3.
5. Workstations shall comply with Section 2705.2.3.

2704.2.2 Maximum aggregate quantities in fabrication areas. The aggregate quantities of hazardous materials stored or used in a single *fabrication area* shall be limited as specified in this section. **Exception:** *Fabrication areas* containing quantities of hazardous materials not exceeding the maximum allowable quantities per control area established by Sections 5003.1.1, 5704.3.4 and 5704.3.5.

Revise as follows:

2704.2.2.1 Storage and use in fabrication areas. The maximum quantities of hazardous materials stored or used in a single *fabrication area* shall not exceed the quantities set forth in NFPA 318.~~Table 2704.2.2.1.~~

~~For SI: 1 pound = 0.454 kg, 1 pound per square foot = 4.882 kg/m^2, 1 gallon per square foot = 40.7 L/m^2, 1 cubic foot @ NTP/square foot = 0.305 m^3 @ NTP/m^2, 1 cubic foot = 0.02832 m^3.~~

~~a. Hazardous materials within piping shall not be included in the calculated quantities.~~

~~b. Quantity of hazardous materials in a single fabrication area shall not exceed the maximum allowable quantities per control area in Tables 5003.1.1(1) and 5003.1.1(2).~~

~~c. Densely packed baled cotton that complies with the packing requirements of ISO 8115 shall not be included in this material class.~~

~~d. The aggregate quantity of flammable, pyrophoric, toxic and highly toxic gases shall not exceed the greater of 0.2 cubic feet at NTP/square foot or 9,000 cubic feet at NTP.~~

~~e. The aggregate quantity of pyrophoric gases in the building shall not exceed the amounts set forth in Table 5003.8.2.~~

~~f. Quantity of Class 3 water-reactive solids in a single tool shall not exceed 1 pound.~~

2704.3 Indoor storage outside of fabrication areas. The indoor storage of hazardous materials outside of *fabrication areas* shall be in accordance with Sections 2704.3.1 through 2704.3.3.

2704.3.1 HPM storage. The indoor storage of HPM in quantities greater than those listed in Sections 5003.1.1 and 5704.3.4 shall be in a room complying with the requirements of the *International Building Code* and this code for a liquid storage room, HPM room or gas room as appropriate for the materials stored.

2704.3.2 Other hazardous materials storage. The indoor storage of other hazardous materials shall comply with Sections 5001, 5003 and 5004 and other applicable provisions of this code.

2704.3.3 Separation of incompatible hazardous materials. Incompatible hazardous materials in storage shall be separated from each other in accordance with Section 5003.9.8.

SECTION 2705
USE AND HANDLING

2705.1 General. The use and handling of hazardous materials shall comply with this section, Section 2703 and other applicable provisions of this code.

2705.2 Fabrication areas. The use of hazardous materials in *fabrication areas* shall be in accordance with Sections 2705.2.1 through 2705.2.3.4.

2705.2.1 Location of HPM in use in fabrication areas. Hazardous production materials in use in *fabrication areas* shall be within *approved* or *listed* gas cabinets, exhausted enclosures or a workstation.

Revise as follows:

2705.2.2 Maximum aggregate quantities in fabrication areas. The aggregate quantities of hazardous materials in a single *fabrication area* and the quantity of HPM in use at a workstation shall comply with NFPA 318. ~~Section 2704.2.2 and Table 2704.2.2.1. The quantity of HPM in use at a workstation shall not exceed the quantities listed in Table 2705.2.2.~~

Delete without substitution:

TABLE 2705.2.2 MAXIMUM QUANTITIES OF HPM AT A WORKSTATION[d]

HPM CLASSIFICATION	STATE	MAXIMUM QUANTITY
Flammable, highly toxic, pyrophoric and toxic combined	Gas	Combined aggregate volume of all cylinders at a workstation shall not exceed an internal cylinder volume of 39.6 gallons or 5.29 cubic feet
Flammable	Liquid	15 gallons[a, b]
	Solid	5 pounds[a, b]
Corrosive	Gas	Combined aggregate volume of all cylinders at a workstation shall not exceed an internal cylinder volume of 39.6 gallons or 5.29 cubic feet
	Liquid	Use-open system: 25 gallons[b] Use-closed system: 150 gallons[b, c]
	Solid	20 pounds[a, b]
Highly toxic	Liquid	15 gallons[a, b]
	Solid	5 pounds[a, b]
Oxidizer	Gas	Combined aggregate volume of all cylinders at a workstation shall not exceed an internal cylinder volume of 39.6 gallons or 5.29 cubic feet
	Liquid	Use-open system: 12 gallons[b] Use-closed system: 60 gallons[b]
	Solid	20 pounds[a, b]
Pyrophoric	Liquid	0.5 gallon[e, f]
	Solid	4.4 pounds[e, f]
Toxic	Liquid	Use-open system: 15 gallons[b] Use-closed system: 60 gallons[b]
	Solid	5 pounds[a, b]
Unstable reactive Class 3	Liquid	0.5 gallon[a, b]
	Solid	5 pounds[a, b]
Water-reactive Class 3	Liquid	0.5 gallon[e, f]
	Solid	See Table 2704.2.2.1

For SI: 1 pound = 0.454 kg, 1 gallon = 3.785 L.

a. Maximum allowable quantities shall be increased 100 percent for closed system operations. Where Note b applies, the increase for both notes shall be allowed.

b. Quantities shall be allowed to be increased 100 percent where workstations are internally protected with an *approved* automatic fire-extinguishing or suppression system complying with Chapter 9. Where Note a applies, the increase for both notes shall be allowed. Where Note c applies, the maximum increase allowed for both Notes b and c shall not exceed 100 percent.

c. Allowed only in workstations that are internally protected with an *approved* automatic fire-extinguishing or fire protection system complying with Chapter 9 and compatible with the reactivity of materials in use at the workstation.

d. The quantity limits apply only to materials classified as HPM.

e. Quantities shall be allowed to be increased 100 percent for nonflammable, noncombustible corrosive liquids where the materials of construction for workstations are listed or *approved* for use without internal fire-extinguishing or suppression system protection. Where Note b applies, the maximum increase allowed for both Notes b and e shall not exceed 100 percent.

f. A maximum quantity of 5.3 gallons of liquids and 44 pounds of total liquids and solids shall be allowed at a workstation where conditions are in accordance with Section 2705.2.3.4.

2705.2.3 Workstations. Workstations in *fabrication areas* shall be in accordance with Sections 2705.2.3.1 through 2705.2.3.4.

2705.2.3.1 Construction. Workstations in *fabrication areas* shall be constructed of materials compatible with the materials used and stored at the workstation. The portion of the workstation that serves as a cabinet for HPM gases, Class I *flammable liquids* or Class II or Class IIIA *combustible liquids* shall be noncombustible and, if of metal, shall be not less than 0.0478-inch (18 gage) (1.2 mm) steel.

2705.2.3.2 Protection of vessels. Vessels containing hazardous materials located in or connected to a workstation shall be protected as follows:

1. HPM: Vessels containing HPM shall be protected from physical damage and shall not project from the workstation.

2. Hazardous *cryogenic fluids*, gases and liquids: Hazardous *cryogenic fluid*, gas and liquid vessels located within a workstation shall be protected from seismic forces in an *approved* manner in accordance with the *International Building Code*.
3. *Compressed gases*: Protection for *compressed gas* vessels shall also comply with Section 5303.5.
4. *Cryogenic fluids*: Protection for *cryogenic fluid* vessels shall also comply with Section 5503.5.

2705.2.3.3 Drainage and containment for HPM liquids. Each workstation utilizing HPM liquids shall have all of the following:

1. Drainage piping systems connected to a compatible system for disposition of such liquids.
2. The work surface provided with a slope or other means for directing spilled materials to the containment or drainage system.
3. An *approved* means of containing or directing spilled or leaked liquids to the drainage system.

2705.2.3.4 Pyrophoric solids, liquids and Class 3 water-reactive liquids. *Pyrophoric* liquids and Class 3 water-reactive liquids in containers greater than 0.5-gallon (2 L) but not exceeding 5.3-gallon (20 L) capacity and *pyrophoric* solids in containers greater than 4.4 pounds (2 kg) but not exceeding 44 pounds (20 kg) shall be allowed at workstations where located inside cabinets and the following conditions are met:

1. Maximum amount per cabinet: The maximum amount per cabinet shall be limited to 5.3 gallons (20 L) of liquids and 44 pounds (20 kg) of total liquids and solids.
2. Cabinet construction: Cabinets shall be constructed in accordance with the following:
   2.1. Cabinets shall be constructed of not less than 0.097-inch (2.5 mm) (12 gage) steel.
   2.2. Cabinets shall be permitted to have self-closing limited access ports or noncombustible windows that provide access to equipment controls.
   2.3. Cabinets shall be provided with self- or manual-closing doors. Manual-closing doors shall be equipped with a door switch that will initiate local audible and visual alarms when the door is in the open position.
3. Cabinet exhaust ventilation system: An exhaust ventilation system shall be provided for cabinets and shall comply with the following:
   3.1. The system shall be designed to operate at a negative pressure in relation to the surrounding area.
   3.2. The system shall be equipped with monitoring equipment to ensure that required exhaust flow or static pressure is provided.
   3.3. Low-flow or static pressure conditions shall send an alarm to the on-site *emergency control station*. The alarm shall be both visual and audible.
4. Cabinet spill containment: Spill containment shall be provided in each cabinet, with the spill containment capable of holding the contents of the aggregate amount of liquids in containers in each cabinet.
5. Valves: Valves in supply piping between the product containers in the cabinet and the workstation served by the containers shall fail in the closed position upon power failure, loss of exhaust ventilation and upon actuation of the fire control system.

6. Fire detection system: Each cabinet shall be equipped with an automatic fire detection system complying with the following conditions:
    6.1. Automatic detection system: UV/IR, high-sensitivity smoke detection (HSSD) or other *approved* detection systems shall be provided inside each cabinet.
    6.2. Automatic shutoff: Activation of the detection system shall automatically close the shutoff valves at the source on the liquid supply.
    6.3. Alarms and signals: Activation of the detection system shall initiate a local alarm within the *fabrication area* and transmit a signal to the *emergency control station*. The alarms and signals shall be both visual and audible.

2705.3 Transportation and handling. The transportation and handling of hazardous materials shall comply with Sections 2705.3.1 through 2705.3.4.1 and other applicable provisions of this code.

2705.3.1 Corridors and enclosures for stairways and ramps. *Corridors* and enclosures for *exit stairways* and *ramps* in new buildings or serving new *fabrication areas* shall not contain HPM, except as permitted in *corridors* by Section 415.11.7.4 of the International Building Code and Section 2705.3.2 of this code.

2705.3.2 Transport in corridors and enclosures for stairways and ramps. Transport in *corridors* and enclosures for *stairways* and *ramps* shall be in accordance with Sections 2705.3.2.1 through 2705.3.3.

2705.3.2.1 Fabrication area alterations. Where existing *fabrication areas* are altered or modified in existing buildings, HPM is allowed to be transported in existing *corridors* where such *corridors* comply with Section 5003.10 of this code and Section 415.11.2 of the International Building Code.

2705.3.2.2 HPM transport in corridors and enclosures for stairways and ramps. Nonproduction HPM is allowed to be transported in *corridors* and enclosures for *stairways* and *ramps* where utilized for maintenance, lab work and testing when the transportation is in accordance with Section 5003.10.

2705.3.3 Service corridors. Where a new *fabrication area* is constructed, a service corridor shall be provided where it is necessary to transport HPM from a liquid storage room, HPM room, gas room or from the outside of a building to the perimeter wall of a *fabrication area*. Service corridors shall be designed and constructed in accordance with the *International Building Code*.

2705.3.4 Carts and trucks. Carts and trucks used to transport HPM in *corridors* and enclosures for *stairways* and *ramps* shall comply with Section 5003.10.3.

2705.3.4.1 Identification. Carts and trucks shall be marked to indicate the contents.

Reason: The overall intent of this proposal is to be more reliant on the nationally recognized standard, NFPA 318. For the most part, provisions in this chapter that are design and construction related are proposed for deletion unless the provisions refer to additional requirements in another I-code or another section of the IFC, that may not be in NFPA 318. With the exception of the MAQ tables, storage, use, and handling requirements have been retained for several reasons, one of which is that the requirements of NFPA 318 do not apply to existing facilities. The MAQ tables are being proposed for deletion since proposals are submitted almost every cycle to correlate the tables in the IFC with the tables in NFPA 318. Due to the different revision cycles, the tables in a particular edition of the IFC will not necessarily correlate with the tables in the edition of NFPA 318 that is referenced. Lastly, the deletion of text will reduce the likelihood of potential claims regarding copyright infringement issues.

For the most part, the proposal is not intended to be a technical change. The text that is proposed for deletion is covered in NFPA 318 or other sections of the IFC or IBC. For example, sprinkler protection will still be required for semiconductor facilities based upon the requirements of NFPA 318. The installation requirements that currently are contained in the IFC are also contained in either NFPA 318 or NFPA 13, which also references NFPA 318. NFPA 318 requires electrical systems to comply with NFPA 70 in addition to a requirement in the IFC for electrical systems to comply with NFPA 70.

In addition to better correlation with NFPA 318, the proposal should result in a Chapter that is easier to enforce by focusing on use and operational requirements, while relying on the IBC and NFPA 318 for design and construction requirements.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

While not editorial or a clarification, the proposal does result in better correlation between the IFC and NFPA 318. The proposal may decrease the cost of construction in instances where NFPA 318 contains a provision that is not currently specifically permitted by the IFC.

F190-24

Public Hearing Results (CAH1)

Committee Action: **As Submitted**

Committee Reason: This proposal was approved as it does good job of keeping the certain portion of requirements in Chapter 27 while referencing NFPA 318. There were some reservations that the revisions may need to be reviewed in more detail such as for flammable and combustible liquid storage. (Vote 11-3)

F190-24

Individual Consideration Agenda

Comment 1:

IFC: 2705.2.2, TABLE 2705.2.2 (New)

Proponents: William Koffel, Koffel Associates, Inc., Semiconductor Industry Association (wkoffel@koffel.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Fire Code

2705.2.2 Maximum aggregate quantities in fabrication areas. The aggregate quantities of hazardous materials in a single *fabrication area and the quantity of HPM in use at a workstation* shall comply with NFPA 318. The quantity of HPM in use at a workstation shall not exceed the quantities listed in Table 2705.2.2.

Add new text as follows:

TABLE 2705.2.2 MAXIMUM QUANTITIES OF HPM AT A WORKSTATION[d]

HPM CLASSIFICATION	STATE	MAXIMUM QUANTITY
Flammable, highly toxic, pyrophoric and toxic combined	Gas	Combined aggregate volume of all cylinders at a workstation shall not exceed an internal cylinder volume of 39.6 gallons or 5.29 cubic feet
Flammable	Liquid	15 gallons[a, b]
	Solid	5 pounds[a, b]
Corrosive	Gas	Combined aggregate volume of all cylinders at a workstation shall not exceed an internal cylinder volume of 39.6 gallons or 5.29 cubic feet
	Liquid	Use-open system: 25 gallons[b] Use-closed system: 150 gallons[b, e]
	Solid	20 pounds[a, b]

HPM CLASSIFICATION	STATE	MAXIMUM QUANTITY
Highly toxic	Liquid	15 gallons[a, b]
	Solid	5 pounds[a, b]
Oxidizer	Gas	Combined aggregate volume of all cylinders at a workstation shall not exceed an internal cylinder volume of 39.6 gallons or 5.29 cubic feet
	Liquid	Use-open system: 12 gallons[b] Use-closed system: 60 gallons[b]
	Solid	20 pounds[a, b]
Pyrophoric	Liquid	0.5 gallon[c, f]
	Solid	4.4 pounds[c, f]
Toxic	Liquid	Use-open system: 15 gallons[b] Use-closed system: 60 gallons[b]
	Solid	5 pounds[a, b]
Unstable reactive Class 3	Liquid	0.5 gallon[a, b]
	Solid	5 pounds[a, b]
Water-reactive Class 3	Liquid	0.5 gallon[c, f]
	Solid	See Table 2704.2.2.1

For SI: 1 pound = 0.454 kg, 1 gallon = 3.785 L.

a. Maximum allowable quantities shall be increased 100 percent for closed system operations. Where Note b applies, the increase for both notes shall be allowed.

b. Quantities shall be allowed to be increased 100 percent where workstations are internally protected with an *approved* automatic fire-extinguishing or suppression system complying with Chapter 9. Where Note a applies, the increase for both notes shall be allowed. Where Note e applies, the maximum increase allowed for both Notes b and e shall not exceed 100 percent.

c. Allowed only in workstations that are internally protected with an *approved* automatic fire-extinguishing or fire protection system complying with Chapter 9 and compatible with the reactivity of materials in use at the workstation.

d. The quantity limits apply only to materials classified as HPM.

e. Quantities shall be allowed to be increased 100 percent for nonflammable, noncombustible corrosive liquids where the materials of construction for workstations are listed or *approved* for use without internal fire-extinguishing or suppression system protection. Where Note b applies, the maximum increase allowed for both Notes b and e shall not exceed 100 percent.

f. A maximum quantity of 5.3 gallons of liquids and 44 pounds of total liquids and solids shall be allowed at a workstation where conditions are in accordance with Section 2705.2.3.4.

Reason: The quantities of HPM at a workstation could vary from the original design and therefore should be retained in the IFC.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Retaining the table in the IFC does not impact the cost of construction.

Comment (CAH2)# 664

F193-24

IFC: TABLE 2705.2.2

Proposed Change as Submitted

Proponents: William Koffel, Koffel Associates, Inc., Semiconductor Industry Association (wkoffel@koffel.com)

2024 International Fire Code

Revise as follows:

TABLE 2705.2.2 MAXIMUM QUANTITIES OF HPM AT A WORKSTATION[d]

HPM CLASSIFICATION	STATE	MAXIMUM QUANTITY
Flammable, highly toxic, pyrophoric and toxic combined	Gas	Combined aggregate volume of all cylinders at a workstation shall not exceed an internal cylinder volume of 39.6 gallons or 5.29 cubic feet
Flammable	Liquid	15 gallons[a, b]
	Solid	5 pounds[a, b]
Corrosive	Gas	Combined aggregate volume of all cylinders at a workstation shall not exceed an internal cylinder volume of 39.6 gallons or 5.29 cubic feet
	Liquid	Use-open system: 25 gallons[b] Use-closed system: 150 gallons[b, e]
	Solid	~~20~~ 400 pounds[~~c,~~ b, e]
Highly toxic	Liquid	15 gallons[a, b]
	Solid	5 pounds[a, b]
Oxidizer	Gas	Combined aggregate volume of all cylinders at a workstation shall not exceed an internal cylinder volume of 39.6 gallons or 5.29 cubic feet
	Liquid	Use-open system: 12 gallons[b] Use-closed system: 60 gallons[b]
	Solid	20 pounds[a, b]
Pyrophoric	Liquid	0.5 gallon[c, f]
	Solid	4.4 pounds[c, f]
Toxic	Liquid	Use-open system: 15 gallons[b] Use-closed system: 60 gallons[b]
	Solid	5 pounds[a, b]
Unstable reactive Class 3	Liquid	0.5 gallon[a, b]
	Solid	5 pounds[a, b]
Water-reactive Class 3	Liquid	0.5 gallon[c, f]
	Solid	See Table 2704.2.2.1

For SI: 1 pound = 0.454 kg, 1 gallon = 3.785 L.

a. Maximum allowable quantities shall be increased 100 percent for closed system operations. Where Note b applies, the increase for both notes shall be allowed.

b. Quantities shall be allowed to be increased 100 percent where workstations are internally protected with an *approved* automatic fire-extinguishing or suppression system complying with Chapter 9. Where Note a applies, the increase for both notes shall be allowed. Where Note e applies, the maximum increase allowed for both Notes b and e shall not exceed 100 percent.

c. Allowed only in workstations that are internally protected with an *approved* automatic fire-extinguishing or fire protection system complying with Chapter 9 and compatible with the reactivity of materials in use at the workstation.

d. The quantity limits apply only to materials classified as HPM.

e. Quantities shall be allowed to be increased 100 percent for nonflammable, noncombustible corrosive liquids where the materials of construction for workstations are listed or *approved* for use without internal fire-extinguishing or suppression system protection. Where Note b applies, the maximum increase allowed for both Notes b and e shall not exceed 100 percent.

f. A maximum quantity of 5.3 gallons of liquids and 44 pounds of total liquids and solids shall be allowed at a workstation where conditions are in accordance with Section 2705.2.3.4.

Reason: The proposal does two things:

- The MAQ for solid corrosives is increased from 20 to 400 pounds
- For solid corrosives, footnote a is proposed to be deleted but footnote e is proposed to be added

The net effect of the change is to more closely align the MAQs for solid corrosives at a workstation and liquid corrosives at a workstation. If all increases are applied, the current code would restrict the quantity of solid corrosives at a workstation to 80 pounds while the quantity of liquid corrosives at a workstation would be permitted to be 300 gallons (approximately 2500 pounds).

Solid corrosives have a low vapor pressure that required a vacuum to sublime the material in order to produce enough vapor for use in manufacturing. Therefore, the solid corrosive needs to be located close to the point of use. The current MAQ for solid corrosives at a workstation is not realistic for consistent operation of a manufacturing process. Furthermore, the highest risk is associated with changing out a solid corrosive vessel.When comparing the risk of liquid corrosives versus solid corrosives, liquid corrosives generally present a higher risk than solid corrosives for the following reasons:

- Liquids can disseminate across the floor and to lower levels in the event of a leak.
- Solids are of a low vapor pressure resulting in a lower risk of vapor exposure as compared to liquids.
- In the event of a container breach or leak, a liquid can escape to the surrounding area with the potential for a liquid exposure as well as a vapor exposure.
- Vapors are controlled by the exhausted enclosure as well as the area exhaust. Solids are less likely to escape the exhausted enclosure as compared to liquids.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

$0.00. The cost of construction and operation should decrease

Estimated Immediate Cost Impact Justification (methodology and variables):

Increasing the MAQ permitted at the workstation reduces the need to change out solid corrosive vessels. This is also not related to construction.

F193-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: This was disapproved based upon the action on F190-24 which more broadly references NFPA 318. (Vote 14-0)

F193-24

Individual Consideration Agenda

Comment 1:

Proponents: William Koffel, Koffel Associates, Inc., Semiconductor Industry Association (wkoffel@koffel.com) requests As Submitted

Reason: F193-24 was Disapproved at my request based upon the action on F190-24 which removed the table from the IFC. We have submitted a Public Comment to retain this table in the IFC which makes this proposal relevant. In addition to what was submitted with the original proposal, Micron, a member of SIA, commissioned a study by Jensen Hughes to address this issue. The Conclusion of the report

recommends an increase greater than what is proposed herein (750 pounds). The report also notes:

"Higher workstation limits for solid corrosive materials should not increase the exposure hazard to personnel. In fact, they will result in less frequent material change outs and reduced risks (exposure) associated with material handling, which is consistent with the intent of the code."

Bibliography: Kyle Lazzaro and Michelle Peatross, "*Final Report: Solid Corrosive Materials For HPM Workstation Use, Hazardous Materials Assessment* ", Jensen Hughes, January 28, 2024

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Comment (CAH2)# 671

F194-24

IFC: TABLE 2705.2.2

Proposed Change as Submitted

Proponents: William Koffel, Koffel Associates, Inc., Semiconductor Industry Association (wkoffel@koffel.com)

2024 International Fire Code

Revise as follows:

TABLE 2705.2.2 MAXIMUM QUANTITIES OF HPM AT A WORKSTATION[d]

HPM CLASSIFICATION	STATE	MAXIMUM QUANTITY
Flammable, highly toxic, pyrophoric and toxic combined	Gas	Combined aggregate volume of all cylinders at a workstation shall not exceed an internal cylinder volume of 39.6 gallons or 5.29 cubic feet
Flammable	Liquid	15 gallons[a, b]
	Solid	5 pounds[a, b]
Corrosive	Gas	Combined aggregate volume of all cylinders at a workstation shall not exceed an internal cylinder volume of 39.6 gallons or 5.29 cubic feet
	Liquid	Use-open system: 25 gallons[b] Use-closed system: 150 gallons[b, e]
	Solid	20 pounds[a, b]
Highly toxic	Liquid	15 gallons[a, b]
	Solid	5 pounds[a, b]
Oxidizing	Gas	Combined aggregate volume of all cylinders at a workstation shall not exceed an internal cylinder volume of 39.6 gallons or 5.29 cubic feet
Oxidizer Class 3 and Class 4 (aggregate)	~~Gas~~	~~Combined aggregate volume of all cylinders at a workstation shall not exceed an internal cylinder volume of 39.6 gallons or 5.29 cubic feet~~
	Liquid	Use-open system: 12 gallons[b] Use-closed system: 60 gallons[b]
	Solid	20 pounds[a, b]
Oxidizer Class 4	Liquid	Maximum Allowable Quantity
	Solid	Maximum Allowable Quantity
Pyrophoric	Liquid	0.5 gallon[c, f]
	Solid	4.4 pounds[c, f]
Toxic	Liquid	Use-open system: 15 gallons[b] Use-closed system: 60 gallons[b]
	Solid	5 pounds[a, b]
Unstable reactive Class 3	Liquid	0.5 gallon[a, b]
	Solid	5 pounds[a, b]
Unstable reactive Class 4	Liquid	Maximum allowable quantity
	Solid	Maximum allowable quantity
Water-reactive Class 3	Liquid	0.5 gallon[c, f]
	Solid	See Table 2704.2.2.1

For SI: 1 pound = 0.454 kg, 1 gallon = 3.785 L.

a. Maximum allowable quantities shall be increased 100 percent for closed system operations. Where Note b applies, the increase for both notes shall be allowed.

b. Quantities shall be allowed to be increased 100 percent where workstations are internally protected with an *approved* automatic fire-extinguishing or suppression system complying with Chapter 9. Where Note a applies, the increase for both notes shall be allowed. Where Note e applies, the maximum increase allowed for both Notes b and e shall not exceed 100 percent.

c. Allowed only in workstations that are internally protected with an *approved* automatic fire-extinguishing or fire protection system complying with Chapter 9 and compatible with the reactivity of materials in use at the workstation.

d. The quantity limits apply only to materials classified as HPM.

e. Quantities shall be allowed to be increased 100 percent for nonflammable, noncombustible corrosive liquids where the materials of construction for workstations are listed or *approved* for use without internal fire-extinguishing or suppression system protection. Where Note b applies, the maximum increase allowed for both Notes b and e shall not exceed 100 percent.

f. A maximum quantity of 5.3 gallons of liquids and 44 pounds of total liquids and solids shall be allowed at a workstation where conditions are in accordance with Section 2705.2.3.4.

Reason: The Table is reconfigured to isolate Oxidizing Gas, which is not further classified, from Class 3 and Class 4 liquid and solid oxidizers which are defined as HPM. This reconfiguration also clarifies for the reader that Class 1 and Class 2 liquid and solid oxidizers are not considered, which is consistent with the treatment of Unstable (reactives) and Water Reactives in this Table.

It is presumed that the current quantities allowed for Liquid and Solid Oxidizers in Table 2705.2.2 is the aggregate of both Class 3 and 4 Oxidizers at a workstation. Class 4 Oxidizers are defined as materials that have the potential to undergo an explosive reaction and they are limited by Table 2704.2.2.1 in a single fabrication area to the Maximum Allowable Quantity provided for in Table 5003.1.1(1), which is 0.25 pounds and 0.25 pounds (0.025 gallons), respectively. Without clarification, the reader can misinterpret IFC Table 2705.2.2 to allow for 12 gallons of Class 4 Oxidizer liquids in open use and 60 gallons of Class 4 Oxidizer liquids in closed use in a single workstation in Group H-5. And similarly, 20 pounds of Class 4 Oxidizer solids.

This proposal does not intend to make any changes to the quantities currently allowed, but it does:

1)Align the hazard categories for oxidizing materials with IFC Table 5003.1.1(1),2)Clarify that the quantities listed apply to the aggregate of Class 3 and Class 4 Oxidizer liquids and solids, and3)Adds a new row for Class 4 Oxidizer liquids and solids with maximum quantity limits aligned with the maximum quantities allowed in a single fabrication area in Group H-5 by IFC Table 2704.2.2.1.

The quantity of Class 4 Unstable reactive liquids and solids allowed at a workstation in Group H-5 is also clarified. Both Class 3 and Class 4 Unstable (reactive) liquids and solids are defined as HPM, but only Class 3 Unstable reactive is listed in Table 2705.2.2. IFC Table 2704.2.2.1 currently allows up to the Maximum Allowable Quantity (MAQ) of Class 4 Unstable liquids and solids listed in IFC Table 5003.1.1(1) in a single fabrication area in Group H-5. But, because the Class 4 Unstable (reactive) hazard classification does not appear in Table 2705.2.2, the reader is led to question whether Class 4 Unstable (reactive) materials are allowed at workstations in Group H-5.

The proposal clarifies the code by adding the Class 4 Unstable (reactive) hazard category to Table 2705.2.2 and aligns the maximum quantities for Class 4 Unstable (reactive) liquids and solids with the maximum quantities currently allowed by IFC Table 2704.2.2.1 for these materials in a single fabrication area.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

As noted in the Reason Statement, the proposal clarifies the intent of the current code requirements.

F194-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: This was disapproved based upon the action on F190-24 which more broadly references NFPA 318. (Vote 14-0)

F194-24

Individual Consideration Agenda

Comment 1:

Proponents: William Koffel, Koffel Associates, Inc., Semiconductor Industry Association (wkoffel@koffel.com) requests As Submitted

Reason: F194-24 was Disapproved at my request because F190-24 deleted the table from the IFC. However, we have submitted a Public Comment to retain the table in the IFC. As such, the original proposal now has relevance.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Comment (CAH2)# 675

F197-24

IFC: 3006.1, 3006.2 (New)

Proposed Change as Submitted

Proponents: Robert Marshall, FCAC, FCAC (fcac@iccsafe.org)

2024 International Fire Code

Revise as follows:

3006.1 Protection study~~Required protection.~~ The *owner* shall conduct a study of the oven in accordance with Section 9.1 of NFPA 86 to determine the need for a fire protection system in Class A ~~and B~~ ovens ~~that contain, or are utilized for the processing of, combustible materials shall be protected by an *approved automatic fire-extinguishing system* complying with Chapter 9~~where any of the following conditions exist.

1. Oven is constructed of combustible materials.
2. Workpieces are constructed of combustible materials.
3. Devices for moving or supporting the workpiece are constructed of combustible materials.
4. Ancillary materials applied to or within the workpiece are combustible.

Exceptions:

1. Small tabletop ovens used in laboratory facilities.
2. Nonwalk-in ovens that are less than 4 feet (1219 mm) in length and width.

Add new text as follows:

3006.2 Required protection. Where the study in Section 3006.1 indicated that fire protection is required, the fire protection system shall be in accordance with Chapter 9.

Reason: Changes are based upon FM guidance (FM Datasheet 6-9), current requirements in NFPA 86 and response from ICC Staff (see attached). The requirement for fire protection is based upon the combustibility of the contents of the oven, or the oven itself. A study would determine if there is sufficient combustibles on, or in, the workpiece to require fire protection. Some liquid and powder coated workpieces do not contain enough ignitible material to require fire protection. Class B oven was removed as, by definition, there are no combustibles. The proposed language also identifies who is responsible for the study and points to the appropriate section in NFPA 86 which includes requirements and supporting information in the annex.

FCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and early 2024 the FCAC has held several virtual meetings and one in-person meeting open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the **FCAC Website**

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal is a clarification where fire protection is required. With the revised language it may be possible that this would reduce the cost as the hazard is more specifically addressed.

Public Hearing Results (CAH1)

Committee Action: **As Submitted**

Committee Reason: This seemed to be a reasonable way to determine if sprinklers were required versus simply requiring protection. However it was suggested that this could be reversed to simply state that sprinklers are require but alternatively a study could be undertaken. (Vote 13-1)

F197-24

Individual Consideration Agenda

Comment 1:

Proponents: Elley Klausbruckner, Klausbruckner & Associates, Self (jm@klausbruckner.com) requests Disapproved

Reason: We are asking for disapproval of Code Change F197-24. The proposed code change forces EVERY owner of an industrial Class A oven to conduct a study in accordance with NFPA 86, Section 9.1 if one of the four conditions in Section 3006.1. The following is Section 9.1 of NFPA 86 **in its entirety**:

"***9.1 * General.*** *A study shall be conducted to determine the need for fixed or portable fire protection systems for ovens, furnaces, or related equipment.*
9.1.1 *The determination of the need for fire protection systems shall be based on a review of the fire hazards associated with the equipment.*

9.1.2 *Unless otherwise agreed to by the manufacturer, installer, or maintainer, the user shall be responsible for conducting the fire protection study required by Section 9.1. (See Annex F.)*

9.1.3 *Where determined to be necessary, fixed or portable fire protection systems shall be provided.*

***9.1.4 ** Written procedures shall be established outlining actions to be taken in response to an unintended fire involving an oven system*."

Do we really need a reference to NFPA 86 for this? Does this improve the codes in any way when the fire code official is allowed to require a technical opinion and report in accordance with IFC Section 104.2.2? Referencing NFPA 86 in this case does not add anything of substance to the codes. It would be far better to incorporate regulations directly into Chapter 30.

Bibliography: NFPA 86 [2023 Ed.], Standard for Ovens and Furnaces, National Fire Protection Association.

Cost Impact: No change to code.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Comment (CAH2)# 753

F198-24

IFC: SECTION 105, 105.5.51, [A] 105.6.25, SECTION 3103, 3103.4

Proposed Change as Submitted

Proponents: Jonathan Siu, Jon Siu Consulting, LLC, Self

2024 International Fire Code

SECTION 105
PERMITS

Revise as follows:

105.5.51 Temporary membrane structures, special event structures and tents. An operational permit is required to operate ~~an air-supported~~ a temporary membrane structure, a temporary *special event structure* or a tent having an area in excess of 400 square feet (37 m^2).

Exceptions:

1. Tents used exclusively for recreational camping purposes.
2. Tents, curtains and extensions attached thereto, when used for funeral services.
3. Tents open on all sides, which comply with all of the following:
   3.1. Individual tents having a maximum size of 700 square feet (65 m^2).
   3.2. The aggregate area of multiple tents placed side by side without a fire break clearance of not less than 12 feet (3658 mm) shall not exceed 700 square feet (65 m^2) total.
   3.3. A minimum clearance of 12 feet (3658 mm) to structures and other tents shall be provided.

[A] 105.6.25 Temporary membrane structures and tents. A construction permit is required to erect ~~an air-supported~~ a temporary membrane structure, a temporary special event structure or a tent in accordance with Section 105.5.51.

SECTION 3103
TEMPORARY TENTS AND MEMBRANE STRUCTURES

Revise as follows:

3103.4 Use period. Temporary *tents*, air-supported, air-inflated or ~~tensioned~~ tensile *membrane structures* shall not be erected for a period of more than 180 days within a 12-month period on a single premises.

Reason: This proposal is intended to make the IFC internally consistent, with respect to its application to temporary structures.

In the process of investigating the application of the building code and the fire code to temporary structures for a separate proposal, it became apparent that there were some discrepancies in the provisions in the 2024 IFC:

- Sections 105.5.51 and 105.6.25 require construction and operational permits for air supported temporary membrane structures. However, Section 3101.1 appears to scope in all membrane structures:

  3101.1 Scope. *Tents*, temporary special event structures and *membrane structures* shall comply with this chapter. The provisions of Section 3103 are applicable only to temporary *tents* and *membrane structures*. The provisions of Sections 3104 and 3108 are applicable to temporary and permanent *tents* and *membrane structures*. The provisions of Section 3105 are

applicable to temporary special event structures. The provisions of Section 3106 are applicable to inflatable amusement devices. The provisions of Section 3107are applicable to outdoor assembly events. Other temporary structures shall comply with the *International Building Code*.

- In addition, Section 3103.4 prohibits "tensioned" membrane structures from being permitted for more than 180 days within 12 months. However, since neither Section 105.5.51 nor 105.6.25 require permits for these, they aren't really regulated by the IFC--there is no "code path" (i.e., legal authority) that gets someone to 3101 or 3103.4.

This proposal revises Sections 105.5.51 and 105.6.25 to encompass all membrane structures, consistent with Section 3101.1. This takes the "lowest common denominator" approach, i.e., takes the broadest interpretation as to what is regulated by the IFC. The changes to Sections 105.5.51 and 105.6.25 will also resolve the code path issue in Section 3103.4. A more strict approach (not taken in this proposal) would have been to revise Sections 3101.1 and 3103.4 to only apply to air-supported temporary membrane structures, consistent with the current provisions in Sections 105.5.51 and 105.6.25.

Finally, Section 3103.4 refers to "tensioned" membrane structures, but the defined term is "tensile" membrane structures. This proposal revises Section 3103.4 to refer to the defined term.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal just makes the IFC internally consistent as far as its scoping of temporary structures is concerned. There are sections in the 2024 IFC that appear to regulate temporary structures more broadly than a tight technical reading of the code would indicate, and jurisdictions who have been enforcing the code with that broad view will see no change in how they approach permits for these structures.

F198-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee did not agree with removing the specific term "air supported" as it will make enforcement more difficult for larger inflated play structures. (Vote 11-2)

F198-24

Individual Consideration Agenda

Comment 1:

IFC: 105.5.51, [A] 105.6.25

Proponents: Jonathan Siu, Jon Siu Consulting, LLC, Washington Association of Building Officials Technical Code Development Committee; Micah Chappell, Seattle Department of Construction and Inspections, Washington Association of Building Officials Technical Code Development Committee (micah.chappell@seattle.gov); Quyen Thai, City of Tacoma, Washington Association of Building Officials Technical Code Development Committee (qthai@cityoftacoma.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Fire Code

Revise as follows:

105.5.51 Temporary membrane structures, special event structures and tents. An operational permit is required to operate a temporary membrane structure, including an air-supported structure, a temporary *special event structure* or a tent having an area in excess of 400 square feet (37 m^2).

Exceptions:

1. Tents used exclusively for recreational camping purposes.
2. Tents, curtains and extensions attached thereto, when used for funeral services.
3. Tents open on all sides, which comply with all of the following:
   3.1. Individual tents having a maximum size of 700 square feet (65 m^2).
   3.2. The aggregate area of multiple tents placed side by side without a fire break clearance of not less than 12 feet (3658 mm) shall not exceed 700 square feet (65 m^2) total.
   3.3. A minimum clearance of 12 feet (3658 mm) to structures and other tents shall be provided.

[A] 105.6.25 Temporary membrane structures and tents. A construction permit is required to erect a temporary membrane structure, including an air-supported structure, a temporary special event structure or a tent in accordance with Section 105.5.51.

Reason: This comment responds to comments received from the Committee and from testimony in opposition from the floor:

- The intent of the code is to regulate all temporary membrane structures (see 2024 IFC Section 3101.1 and the reason statement for the original proposal). This intent was verified with the opposition testifier after the item was heard at the CAH. In that way, the change made in the last cycle to add the words "air-supported" narrowed the scope to just air-supported temporary membrane structures, which conflicts with Section 3101.1. The original proposal undoes what appears to be an unintentional change in scope and removes the conflict between Sections 105 and 3101.
- The Committee and opposition testifier want the code to be clear that bouncy-houses (a type of air-supported structure) are regulated by this section. This revision maintains the originally-proposed language that requires all temporary membrane structures to obtain operational and construction permits but emphasizes temporary air-supported structures (which would include bouncy-houses) are included as a type of temporary membrane structure. Note that this comment uses the defined term, "air-supported structure" instead of "air-supported membrane structure."
- One member of the Committee suggested that the exceptions for operational permits should be extended to construction permits as well. There are several reasons why this comment does not address the suggestion:
  - There are no exceptions in 2024 IFC Section 105.6.25 regarding construction permits for temporary membrane structures and tents. Instead, the current text points back to the operational permits section ("...in accordance with Section 105.5.51.") With that pointer, the current code is clear that if an exception in Section 105.5.51 applies for operational permits, then a construction permit would also be exempted.
  - If, however, one accepts the statement that the code is "broken," as suggested by the Committee member, that is a problem with the existing code language--the original proposal did not change that language, and therefore, did not break it.
  - The proposal only affects temporary membrane structures. The existing exceptions for operational permits in Section 105.5.51 (and per the reasoning above, to construction permits) only apply to tents, which would not fall under the definitions for membrane structures.

Note that this comment revises but does not replace the original proposal, in order to maintain the change made to Section 3103.4 that corrects the terminology from "tensioned membrane structure" to the defined term, "tensile membrane structure." There was no testimony from the floor or comments from the dais in opposition to this part of the change.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

No change from cost impact statement for original proposal.

IFC: 3103.1, 3103.6.1, 3103.8, 3103.8.2, 3103.8.3, 3103.8.4, 3104.1, 3105.1, 3105.4

Proposed Change as Submitted

Proponents: Jennifer Goupil, Structural Engineering Institute of ASCE, American Society of Civil Engineers (jgoupil@asce.org); Don Scott, Don Scott Consulting, PLLC, ASCE/SEI Ad Hoc Committee for Loads on Temporary Structures (don@donscottconsulting.com)

2024 International Fire Code

Revise as follows:

3103.1 General. *Tents* and *membrane structures* used for temporary periods shall comply with this section, ~~and~~Section 3107, and with the *International Building Code* as applicable. Other temporary structures erected for a period of 180 days or less shall comply with the *International Building Code*.

3103.6.1 Inspection report. Where required by the *fire code official* or *building official*, an inspection report shall be provided and shall consist of maintenance, anchors and fabric inspections.

3103.8 Structural stability and anchorage required. *Tents* or *membrane structures* and their appurtenances shall be designed and installed ~~to withstand the elements of weather and prevent collapsing~~ in accordance with Sections 3103.8.1 through 3103.8.4. Documentation of structural stability shall be furnished to the *fire code official*.

3103.8.2 Tents and membrane structures greater than one story. *Tents* and *membrane structures* exceeding one story shall be designed and constructed to comply with ~~Sections 1606 through 1609 of~~ the International Building Code.

3103.8.3 Tents and membrane structures greater than 7,500 square feet. *Tents* and *membrane structures* greater than 7,500 square feet (697 m^2) shall be designed and constructed to comply ~~with Sections 1606 through 1609 of~~ the International Building Code.

3103.8.4 Tents and membrane structures with an occupant load greater than 1,000. *Tents* and *membrane structures* with an occupant capacity greater than 1,000 persons shall be designed and constructed to comply with ~~Sections 1606 through 1609 of~~ the International Building Code.

3104.1 General. *Tents* and *membrane structures*, both temporary and permanent, shall be in accordance with this section and Sections 3107 and 3108, and~~. Permanent *tents* and *membrane structures*~~ shall also comply with the *International Building Code*.

3105.1 General. Temporary special event structures shall comply with Section 3104, Sections 3105.2 through 3105.8 and ~~ANSI E1.21~~the *International Building Code*.

3105.4 Required documents. The following documents shall be submitted to the *fire code official* and the building official for review before a permit is *approved*:

1. Construction documents: *Construction documents* shall be prepared by a *registered design professional* in accordance with Section 3103 of the *International Building Code* ~~and ANSI E1.21~~ where applicable. *Construction documents* shall include:

   1.1. A summary sheet showing the building code used, design criteria, loads and support reactions.

   1.2. Detailed construction and installation drawings.

   1.3. Design calculations.

   1.4. Operating limits of the structure explicitly outlined by the *registered design professional* including environmental conditions and physical forces.

   1.5. Effects of additive elements such as video walls, supported scenery, audio equipment, vertical and horizontal coverings.

   1.6. Means for adequate stability including specific requirements for guying and cross-bracing, ground anchors or ballast for different ground conditions.

2. Designation of responsible party: The *owner* of the temporary special event structure shall designate in writing a person to have responsibility for the temporary special event structure on the site. The designated person shall have sufficient knowledge of the *construction documents*, manufacturer's recommendations and operations plan to make judgments regarding the structure's safety and to coordinate with the *fire code official*.
3. Operations plan: The operations plan shall reflect manufacturer's operational guidelines, procedures for environmental monitoring and actions to be taken under specified conditions consistent with the *construction documents*.

Reason: This code change proposal is being submitted to align the IFC with the current provisions in the IBC regarding temporary structures.

In Group B of the last cycle, a committee organized by ASCE/SEI submitted code change proposal S116-22, which was approved as modified by public comments by the membership. S116-22 added provisions for modified loads on public-occupancy temporary structures into 2024 IBC 3103. The provisions also included requirements for installation and maintenance inspections, controlled occupancy procedures, and durability. The industry standards for these types of structures (ANSI E1.21 and ANSI ES1.7) were adopted by reference in IBC Chapter 35.

This proposal will align the next edition of the IFC with the new IBC provisions by:

- Pointing to the IBC or the building official as needed (Sections 3103.1 and 3103.6.1);
- Clarifying that larger tents and membrane structures must comply with more than just the listed sections in the IBC (Sections 3103.8.2 through 3103.8.4);
- Clarifying that compliance with the IBC is required for both temporary and permanent tents and membrane structures (Section 3104.1); and
- Deleting a now-unnecessary reference to ANSI E1.21 and pointing to the IBC (Sections 3105.1 and 3105.5 Item 1);

The ad hoc group that worked on the IBC last cycle, continuted this effort with this coordinating code change for this cycle. This code change will align the IFC with what is currently in the 2024 IBC for temporary structures.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Since this is just aligning the 2027 IFC with the requirements already in the 2024 IBC, there will be no impact on the cost of construction. (A cost impact statement for the IBC changes was included in S116-22.)

F199-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: This proposal was disapproved as there was concern that the revisions will create a loop between the IBC and IFC for temporary structures with the references to the IBC. Also the references to the IBC will be more general versus referencing specific sections of Chapter 16 which may cause confusion. (Vote 13-0)

F199-24

Individual Consideration Agenda

Comment 1:

IFC: 3103.1, 3103.6.1, 3103.8, 3103.8.2, 3103.8.3, 3103.8.4, 3104.1, 3105.1, 3105.4

Proponents: Jennifer Goupil, Structural Engineering Institute of ASCE, American Society of Civil Engineers (jgoupil@asce.org); Don Scott, Don Scott Consulting, PLLC, ASCE/SEI Ad Hoc Committee for Loads on Temporary Structures (don@donscottconsulting.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Fire Code

3103.1 General. *Tents* and *membrane structures* used for temporary periods shall comply with this section, Section 3107~~, and with the *International Building Code* as applicable~~. Membrane structures erected on a building, balcony, deck, or any other structure shall comply with Section 3101 of the *International Building Code.* Other temporary structures erected for a period of 180 days or less shall comply with the *International Building Code*.

3103.6.1 Inspection report. Where required by the *fire code official* or *building official*, an inspection report shall be provided and shall consist of maintenance, anchors and fabric inspections.

3103.8 Structural stability and anchorage required. *Tents* or *membrane structures* and their appurtenances shall be designed and installed in accordance with Sections 3103.8.1 through 3103.8.4. Documentation of structural stability shall be furnished to the *fire code official*.

3103.8.2 Tents and membrane structures greater than one story. *Tents* and *membrane structures* exceeding one story shall be designed and constructed to comply with Sections 3103.6 through 3103.8 of the *International Building Code*.

3103.8.3 Tents and membrane structures greater than 7,500 square feet. *Tents* and *membrane structures* greater than 7,500 square feet (697 m^2) shall be designed and constructed to comply Sections 3103.6 through 3103.8 of the *International Building Code*.

3103.8.4 Tents and membrane structures with an occupant load greater than 1,000. *Tents* and *membrane structures* with an occupant capacity greater than 1,000 persons shall be designed and constructed to comply with Sections 3103.6 through 3103.8 of the *International Building Code*.

3104.1 General. *Tents* and *membrane structures*, both temporary and permanent, shall be in accordance with this section and Sections 3107 and 3108, and shall also comply with the *International Building Code*.

3105.1 General. Temporary special event structures shall comply with Section 3104, Sections 3105.2 through 3105.8 and Sections

3103.6 through 3103.8 of the *International Building Code*.

3105.4 Required documents. The following documents shall be submitted to the *fire code official* and the building official for review before a permit is *approved*:

1. Construction documents: *Construction documents* shall be prepared by a *registered design professional* in accordance with Section 3103 of the *International Building Code* where applicable. *Construction documents* shall include:
   1.1. A summary sheet showing the building code used, design criteria, loads and support reactions.
   1.2. Detailed construction and installation drawings.
   1.3. Design calculations.
   1.4. Operating limits of the structure explicitly outlined by the *registered design professional* including environmental conditions and physical forces.
   1.5. Effects of additive elements such as video walls, supported scenery, audio equipment, vertical and horizontal coverings.
   1.6. Means for adequate stability including specific requirements for guying and cross-bracing, ground anchors or ballast for different ground conditions.
2. Designation of responsible party: The *owner* of the temporary special event structure shall designate in writing a person to have responsibility for the temporary special event structure on the site. The designated person shall have sufficient knowledge of the *construction documents*, manufacturer's recommendations and operations plan to make judgments regarding the structure's safety and to coordinate with the *fire code official*.
3. Operations plan: The operations plan shall reflect manufacturer's operational guidelines, procedures for environmental monitoring and actions to be taken under specified conditions consistent with the *construction documents*.

Reason: This Comment is being submitted to modify the original code change proposal in response to the committee feedback. This code change is still needed to align the IFC Section 3103, 3104, 3105 with the current provisions in the IBC Section 3103 regarding temporary structures. ****NOTE that this is very confusing that Chapter 31 is discussion for both IFC and IBC – and the sections 3103 used for each code also!**

This proposal for the IFC points to 2024 IBC Section 3103 provisions for reduced structural loading on temporary structures. Without this coordination and pointers to IBC 3103, the IFC would require full structural loading for temporary structures as pointers to IBC Section 1606 through 1609 – which are higher loads than the IBC requires.

Summary of 2024 Code Cycle Actions: In Group B of the last 2024 I-Code cycle, a committee organized by ASCE/SEI submitted code change proposal S116-22, which was approved as modified by public comments by the membership. S116-22 added provisions for modified loads on public-occupancy temporary structures into 2024 IBC 3103. The provisions also included requirements for installation and maintenance inspections, controlled occupancy procedures, and durability. The industry standards for these types of structures (ANSI E1.21 and ANSI ES1.7) were adopted by reference in IBC Chapter 35.

Summary of this proposal: The code change will align the next edition of the IFC with 2024 IBC Section 3103 provisions by:

- Pointing to the IBC Section 3101 or the building official to align with the IBC (in IFC Sections 3103.1 and 3103.6.1);
- Removing vague language "withstand elements of weather and prevent collapse" (in IFC 3103.8) and adding specific pointers in lower IFC Sections 3103.8.2 through 3103.8.4;
- Removing pointers to IBC Section 16 (in IFC 3103.8.2 through 3103.8.4), which is for full structural loading provisions and replacing with IBC Section 3103.6 through 3103.8;
- Clarifying that larger tents and membrane structures must comply with more than just the listed sections in the IBC (in IFC Sections 3103.8.2 through 3103.8.4); and
- Clarifying that compliance with the IBC is required for both temporary and permanent tents and membrane structures (in IFC Section 3104.1).

The following is in the scope of the existing provisions within the 2024 IBC:

2024 IBC 3103.1 General.

The provisions of Sections 3103.1 through 3103.8 shall apply to *structures* erected for a period of less than 180 days. Temporary *special event structures*, *tents*, umbrella *structures* and other membrane *structures* erected for a period of less than 180 days shall also comply with the *International Fire Code* . *Temporary structures* erected for a longer period of time and *public-occupancy temporary structures* shall comply with applicable sections of this code.

The ASCE 7 ad hoc group that worked on the 2024 IBC Section 3103 provisions last cycle, continued this effort with this coordinating code change for the Fire Code in this cycle. Due to the nature of the ICC Code Cycles, 2024 Group B changes could not be coordinated with 2024 Group A. This code change will align the IFC with what is currently in the 2024 IBC for temporary structures and therefore reduce the loads required for design of temporary structures.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Since this is just aligning the 2027 IFC with the requirements already in the 2024 IBC, there will be no impact on the cost of construction. (A cost impact statement for the IBC changes was included in S116-22.)

Comment (CAH2)# 114

F201-24

IFC: 3104.1, 3104.2, 3104.3, 3104.4

Proposed Change as Submitted

Proponents: Marcelo Hirschler, GBH International, GBH International (mmh@gbhint.com); Kevin Scott, KH Scott & Associates LLC, self (khscottassoc@gmail.com)

2024 International Fire Code

3104.1 General. *Tents* and *membrane structures*, both temporary and permanent, shall be in accordance with this section and Sections 3107 and 3108. Permanent *tents* and *membrane structures* shall also comply with the *International Building Code*.

Revise as follows:

3104.2 Flame propagation performance testing and certification. Before a permit is granted, the *owner* or agent shall file with the *fire code official* ~~a certificate~~ an affidavit provided by the product manufacturer to verify that the materials have been tested and certified by an *approved* testing laboratory. The affidavit ~~certificate~~ shall indicate that the floor coverings, *tents*, *membrane structures* and their appurtenances, which include sidewalls, drops and tarpaulins, are composed of materials meeting the flame propagation performance of Test Method 2 of NFPA 701. Additionally, it shall indicate that the bunting and combustible decorative materials and effects are composed of material meeting the flame propagation performance criteria of Test Method 1 or Test Method 2 of NFPA 701, as applicable. Alternatively, the materials shall be treated with a flame retardant in an *approved* manner and meet the flame propagation performance criteria of the applicable test method of NFPA 701. The affidavit ~~certificate~~ shall indicate compliance with the testing requirements of NFPA 701, Chapter 16. The flame propagation performance criteria shall be effective for the period specified by the permit.

3104.3 Label. *Membrane structures* or *tents* shall have a permanently affixed label bearing the following information:

1. The identification of size and fabric or material.
2. The names and addresses of the manufacturers of the *tent* or air-supported structure.
3. A statement that the fabric or material meets the requirements of Section 3104.2.
4. If treated, the date when a flame-retardant treatment was last applied to the fabric or material, the trade name or kind of chemical used in treatment, name of person or firm treating the fabric or material, and name of testing agency and test standard by which the fabric or material was tested.
5. If untreated, a statement that no treatment was applied when the fabric or material met the requirements of Section 3104.2.

3104.4 Affidavit. The affidavit required by Section 3104.2 shall contain all of the information specified in Section 3104.3.

Reason: Section 3104.4 states that the "affidavit" required in section 3104.2 shall contain certain information. In actual fact, section 3104.2 does not contain the word "affidavit" but the word "certificate" and requires that a certificate provide all the relevant information. Clearly the two words are intended to have the same meaning. Since the requirement for an "affidavit" associated with this testing is also called for in the section on inflatables (in 3106), this proposal simply changes the word "certificate" for the word "affidavit" in section 3104.2. The use of the word "affidavit" in section 3104.4 was originally proposed by the industry using these types of tents for events.

Grammatically, the use of the word "certificate" in the same sentence as the word "certified" is relatively poor use of language: "Before a permit is granted, the owner or agent shall file with the fire code official a **certificate** provided by the product manufacturer to verify that the materials have been tested and **certified** by an approved testing laboratory."

This is not the sole location where the term "affidavit" is used in ICC codes. It is actually also used in the IBC and in the IRC.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Simply changes words meaning the same.

F201-24

Public Hearing Results (CAH1)

Committee Action: **As Modified by Committee**

Committee Modification:

3104.2 Flame propagation performance testing and certification. Before a permit is granted, the *owner* or agent shall file with the *fire code official* a certificate ~~an affidavit~~ provided by the product manufacturer to verify that the materials have been tested and certified by an *approved* testing laboratory. The certificate ~~affidavit~~ shall indicate that the floor coverings, *tents*, *membrane structures* and their appurtenances, which include sidewalls, drops and tarpaulins, are composed of materials meeting the flame propagation performance of Test Method 2 of NFPA 701. Additionally, it shall indicate that the bunting and combustible decorative materials and effects are composed of material meeting the flame propagation performance criteria of Test Method 1 or Test Method 2 of NFPA 701, as applicable. Alternatively, the materials shall be treated with a flame retardant in an *approved* manner and meet the flame propagation performance criteria of the applicable test method of NFPA 701. The certificate ~~affidavit~~ shall indicate compliance with the testing requirements of NFPA 701, Chapter 16. The flame propagation performance criteria shall be effective for the period specified by the permit.
3104.4 ~~Affidavit~~ Certificate. The certificate ~~affidavit~~ required by Section 3104.2 shall contain all of the information specified in Section 3104.3.

3106.3 Combustible materials. The materials used in the construction of the inflatable amusement device shall meet the flame propagation criteria of Test Method 2 of NFPA 701. Additionally, a label and a certificate ~~affidavit~~ containing the information required in Sections 3104.3 and 3104.4 of this code shall be permanently affixed to the device.

Committee Reason: This proposal was approved based upon the proponents reason statement. The modification simply revises the term "affidavit" to "certificate." An affidavit is a much more complex legal process that is not considered necessary in this application. (Vote 14-0)

F201-24

Individual Consideration Agenda

Comment 1:

IFC: 3104.3

Proponents: Kevin Scott, KH Scott & Associates LLC, self (khscottassoc@gmail.com) requests As Modified by Committee (AMC2)

Further modify as follows:

2024 International Fire Code

Revise as follows:

3104.3 Label. *Membrane structures* ~~or~~ and *tents* shall have a permanently affixed label bearing the following information:
Exception: A certificate or documentation from the manufacturer is acceptable for existing membrane structures and tents not provided with a label at the time of manufacturing.

1. The identification of size and fabric or material.
2. The names and addresses of the manufacturers of the *tent* or air-supported structure.
3. A statement that the fabric or material meets the requirements of Section 3104.2.
4. If treated, the date when a flame-retardant treatment was last applied to the fabric or material, the trade name or kind of chemical used in treatment, name of person or firm treating the fabric or material, and name of testing agency and test standard by which the fabric or material was tested.
5. If untreated, a statement that no treatment was applied when the fabric or material met the requirements of Section 3104.2.

Reason: The original proposal was Approved as Modified at the CAH 1. This comment merely adds the option for the use of a certificate document in lieu of the label attached to the membrane structure for those older devices which were not provided with a label when manufactured. hundreds of membrane structures have been manufactured with only a certificate indicating they are flame resistant. in those cases, it is appropriate to accept the certificate in lieu of mandated a label attached to the membrane structure.

These existing membrane structures do not bear a label, however they do have a certificate stating acceptable their fire-resistant characteristics. This exception will allow the use of these older membrane structures when they can produce a certificate, but don't have an attached label.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The is an editorial change that affects the inspection process. It does not affect the construction process.

Comment (CAH2)# 561

IFC: SECTION 202, 3105.3, 3105.4, 3107.4.1, ANSI Chapter 80 (New)

Proposed Change as Submitted

Proponents: Robert Marshall, FCAC, FCAC (fcac@iccsafe.org); Richard Nix, Entertainment Services and Technology Association (ESTA), ESTA, and the Event Safety Alliance (ESA) (rnix@zoomtown.com)

2024 International Fire Code

Revise as follows:

TEMPORARY SPECIAL EVENT STRUCTURE. Any temporary ground-supported structure, platform, stage, stage scaffolding or rigging, canopy, tower, ~~supporting audio or visual effects equipment~~ or similar structures supporting entertainment-related equipment or signage for a special event. ~~not regulated within the scope of the *International Building Code*.~~

3105.3 Use period. Temporary special event structures erected in accordance with ANSI E1.21 shall not be erected for a period of more than 180 days. ~~six consecutive weeks.~~

3105.4 Required documents. The following documents shall be submitted to the *fire code official* and the building official for review before a permit is *approved*:

1. Construction documents: *Construction documents* shall be prepared by a *registered design professional* in accordance with the *International Building Code* and ANSI E1.21 where applicable. *Construction documents* shall include:
   1.1. A summary sheet showing the building code used, design criteria, loads and support reactions.
   1.2. Detailed construction and installation drawings.
   1.3. Design calculations.
   1.4. Operating limits of the structure explicitly outlined by the *registered design professional* including environmental conditions and physical forces.
   1.5. Effects of additive elements such as video walls, supported scenery, audio equipment, vertical and horizontal coverings.
   1.6. Means for adequate stability including specific requirements for guying and cross-bracing, ground anchors or ballast for different ground conditions.
2. Designation of responsible party: The *owner* of the temporary special event structure shall designate in writing a person to have responsibility for the temporary special event structure on the site. The designated person shall have sufficient knowledge of the *construction documents*, manufacturer's recommendations and operations plan to make judgments regarding the structure's safety and to coordinate with the *fire code official*.
3. Operations management plan: The operations management plan shall comply with the requirements of ANSI E1.21, and shall reflect manufacturer's operational guidelines, procedures for environmental monitoring and actions to be taken under specified conditions consistent with the *construction documents*.

3107.4.1 Public safety plan for gatherings. A public safety plan shall be prepared where required by Section 403.11.2. The public safety plan shall include the operations management plan required by Section 3105.4 item 3, and a weather preparedness plan in accordance with ANSI ES1.7. The public safety plan shall be submitted to the *fire code official* with the application for an operational permit as required by Section 3107.2.2.

Add new standard(s) as follows:

ANSI

American National Standards Institute
25 West 43rd Street, 4th Floor
New York, NY 10036

ES1.7-2021 Event Safety Requirements - Weather Preparedness
3107.4.1

Reason:

FCAC:

1. The revised definition harmonizes with the IBC definition.
   [BG]SPECIAL EVENT STRUCTURE. Any ground-supported *structure*, *platform, stage, stage* scaffolding or rigging, *canopy*, tower or similar *structure* supporting entertainment-related equipment or signage.

   [BS]TEMPORARY EVENT.A single use during the *service life* of a *public-occupancy temporary structure* at a given location that includes its installation, inspection, use and occupancy, and dismantling.

   [BS]TEMPORARY STRUCTURE.Any *building* or *structure* erected for a period of 180 days or less to support *temporary events*. *Temporary structures* include a range of *structure* types (*public-occupancy temporary structures*, temporary *special event structures*, *tents*, umbrellas and other membrane *structures*, *relocatable buildings*, temporary *bleachers*, etc.) for a range of purposes (storage, equipment protection, dining, workspace, assembly, etc.).
2. The change in use period is now consistent with both IBC and ANSI E1.21. ANSI E1.21 has been revised to incorporate the new IBC design load requirements, thereby eliminating the 6-week limitation.

FCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and early 2024 the FCAC has held several virtual meetings and one in-person meeting open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the FCAC Website.

Richard Nix:

1. The revised definition harmonizes with the IBC definition.
2. The change in use period is now consistent with both IBC and ANSI E1.21. ANSI E1.21 has been revised to incorporate the new IBC design load requirements, thereby eliminating the 6-week limitation.
3. The change in operational requirements enhances the public safety plan, if required, by including the Operations Management Plan information, and the weather preparedness plan information, providing an approved ANSI standard as a reference for the weather preparedness details.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The definition change is in coordination with the IBC 2024 requirements. The change from '6weeks' to '180 days' will reduce costs. The adoption of ANSI ES1.7 Event Safety - Weather Preparedness may increase costs of compliance but is considered industry practice and is not related to construction costs.

F203-24

Public Hearing Results (CAH1)

Committee Action: **As Submitted**

Committee Reason: This was approved as it provides consistency with the 2024 IBC. There was some concern with the jump from 42 days to 180 days. (Vote 10-4)

F203-24

Individual Consideration Agenda

Comment 1:

IFC: 3105.3

Proponents: Jonathan Siu, Jon Siu Consulting, LLC, Washington Association of Building Officials Technical Code Development Committee; Micah Chappell, Seattle Department of Construction and Inspections, Washington Association of Building Officials Technical Code Development Committee (micah.chappell@seattle.gov); Quyen Thai, City of Tacoma, Washington Association of Building Officials Technical Code Development Committee (qthai@cityoftacoma.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Fire Code

3105.3 Use period. Temporary special event structures erected in accordance with ANSI E1.21 shall not be erected for a period of more than ~~180 days~~ six consecutive weeks.

Reason: This proposal changed the time period of a "special event" from six consecutive weeks to 180 days. We do not agree that the use period for special events structures should be aligned with the period for other temporary structures.

- While "special event" is not defined anywhere in the I-Codes, our understanding is it is intended to be applied to events that occur over a very short period of time, such as a weekend or a few weekends. Travelling circuses, revival tent meetings, political rallies, concerts by very popular artists, travelling fairs and carnivals, and some sports-related events (e.g., Wrestlemania, or the NFL-sponsored carnival-like event before the opening game of the season after the Seattle Seahawks won the Super Bowl) come to mind when we think of "special events."
- The lack of definition for "special event" means that in the current IFC, the only distinction between special event structures and all other temporary structures is the six consecutive week limitation. By making the requirements for special events structures the same as all other temporary structures, they are no longer "special." If that is the case, by extension, is there is no need for the special requirements in IFC Section 3105, which means the whole of Section 3105 could be deleted. We do not agree that Section 3105 should be deleted, and therefore, the distinction between special event structures and other temporary structures should be maintained, at least until a definition for "special event" is adopted into the I-codes.
- The documentation and inspections required in IFC 3105 for temporary special events structures are not the same as is currently required for temporary structures in the IBC, particularly in the area of controlled occupancy procedures for Public Occupancy Temporary Structures. While IFC 3105.2 says a permit must be obtained from both the fire official and the building official, the difference in the requirements will cause confusion and conflict for designers and regulators.

We support the change to the definition and have no objection to the other proposed changes, although the reference to ES1.7 will likely cause confusion with the different requirements in the IBC. However, we do not support the change to the use period.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Approving this comment would return the code to its current state. There would be no change in costs as compared to the current code.

Comment (CAH2)# 97

F205-24

IFC: 3203.9, 3203.9.1, 3203.9.2, FIGURE 3203.9(1), SECTION 202 (New)

Proposed Change as Submitted

Proponents: Kevin Scott, KH Scott & Associates LLC, self (khscottassoc@gmail.com)

2024 International Fire Code

Revise as follows:

3203.9 ~~Limited quantities of~~ Commodities containing Group A plastics ~~in mixed commodities~~. ~~Figures 3203.9(1) and 3203.9(2) shall be used to determine the commodity classification based on the quantity of Group A plastics in the following situations:~~

1. ~~The product is not listed in Table 3203.8 and contains Group A plastics.~~
2. ~~The commodity contains Group A plastics and is not classified as high hazard in Table 3203.8.~~
3. ~~The product listing in Table 3203.8 does not specifically include packaging, and the packaging material includes Group A plastics.~~

Commodities containing any amount of Group A plastics shall be classified as a Group A plastic commodity, unless either of the following apply:

1. The product is listed in Table 3203.8 and the listing specifically includes Group A plastics or packaging material of Group A plastics.
2. The commodity is evaluated in accordance with Section 3203.9.1 based on the amount of Group A plastics contained in the commodity and the result is other than Group A plastics.

3203.9.1 Classifying mixed commodities with limited Group A plastics. The percentage of Group A plastics determined in accordance with Section 3203.9.2 shall be used in Figures 3203.9(1) and 3203.9(2). ~~Results from Figure 3203.9(1) must be compared to results from Figure 3203.9(2) and the commodity will be classified with the highest commodity classification.~~ Commodities with products in cartons, boxes or crates shall use Figure 3203.9(1). Commodities with exposed Group A plastics shall use Figure 3203.9(1).
Figures 3203.9(1) and 3203.9(2) shall not be used to reduce the commodity classification shown in Table 3203.8.

3203.9.2 Percentage of Group A plastics. The pallet, if any, shall not be included when measuring the weight of the commodity (W_{PU} ~~or W_{PE}~~) or the volume of the commodity (V_{PE}). The pallet, if any, shall be included when measuring the weight of the entire load (W_L) or the volume of the entire load (V_L). **Exception:** Where noncombustible pallets are used, the pallets shall not be included in the volume and weight calculations.
The percentage by weight of Group A unexpanded plastics in the load shall be calculated in accordance with Equation 32-1.
The percentage by volume of Group A expanded plastics in the load shall be calculated in accordance with Equation 32-2.
~~The percentage by weight of Group A expanded plastics in the load shall be calculated in accordance with Equation 32-3.~~

$$P_{WU} = W_{PU} / W_L \quad \textbf{(Equation-32-1)}$$

where:

P_{WU} = Percentage by weight of Group A unexpanded plastic.

W_{PU} = Weight of Group A unexpanded plastic in the commodity, not including the weight of the pallet, if any.

W_L = Weight of the entire load, including the weight of the pallet, if any.

$$P_{VE} = V_{PE} / V_L \quad \textbf{(Equation-32-1)}$$

where:

P_{VE} = Percentage by volume of Group A expanded plastic.

V_{PE} = Volume of Group A expanded plastic in the commodity, not including the volume of the pallet, if any.

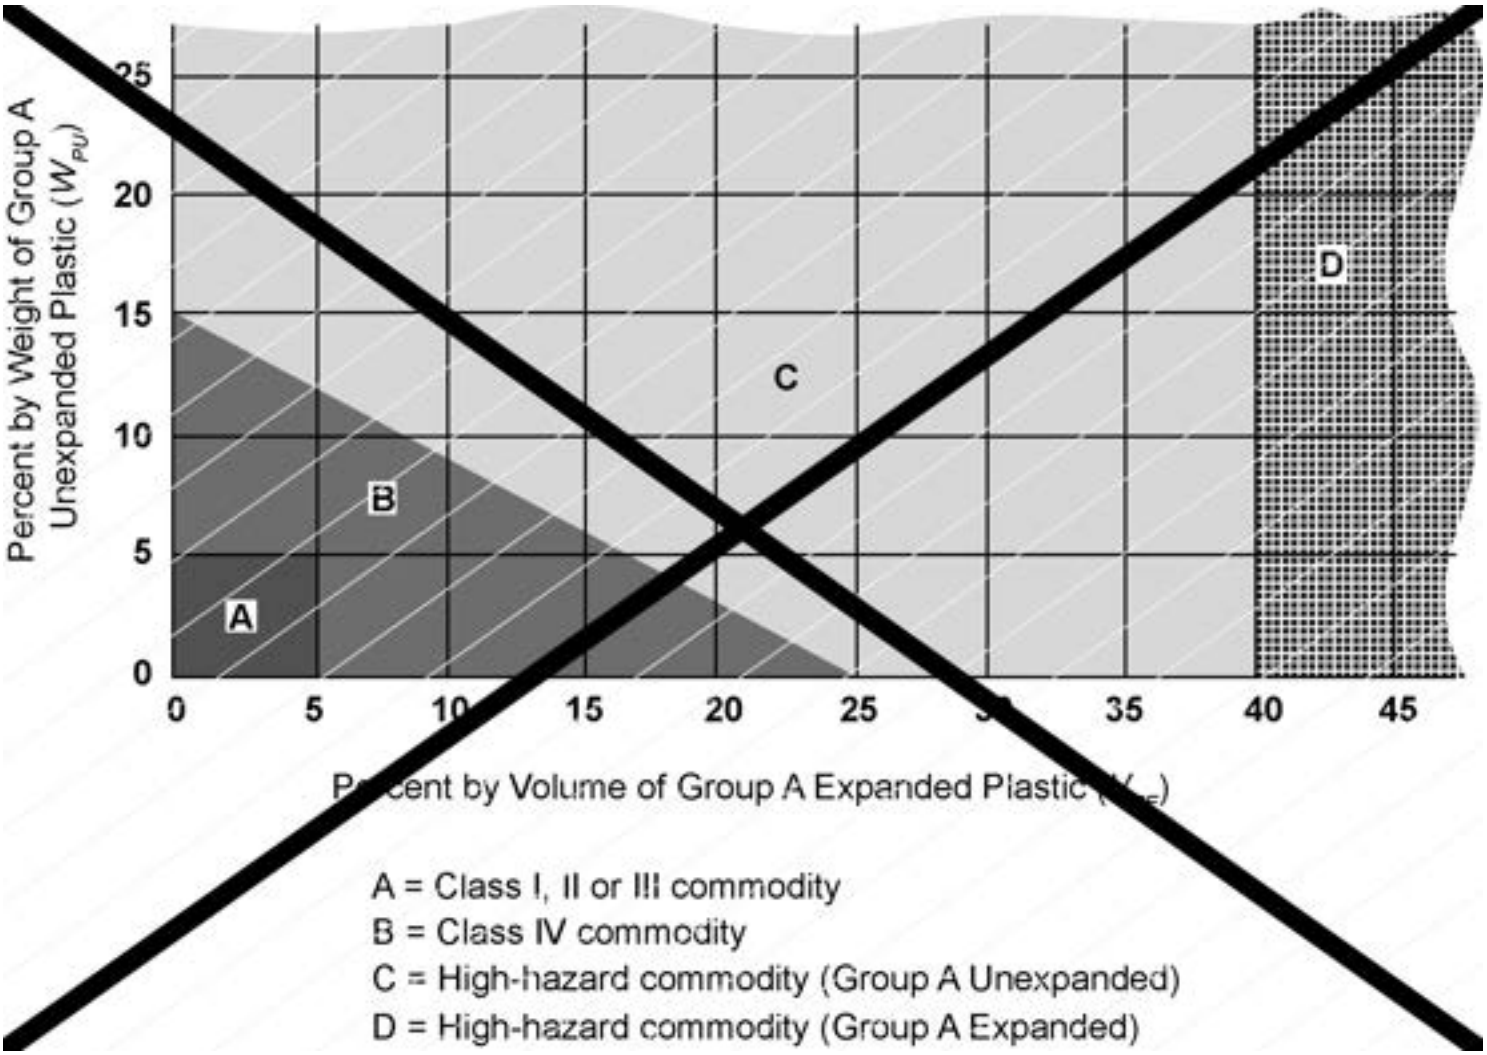
V_L = Volume of the entire load, including the volume of the pallet, if any.

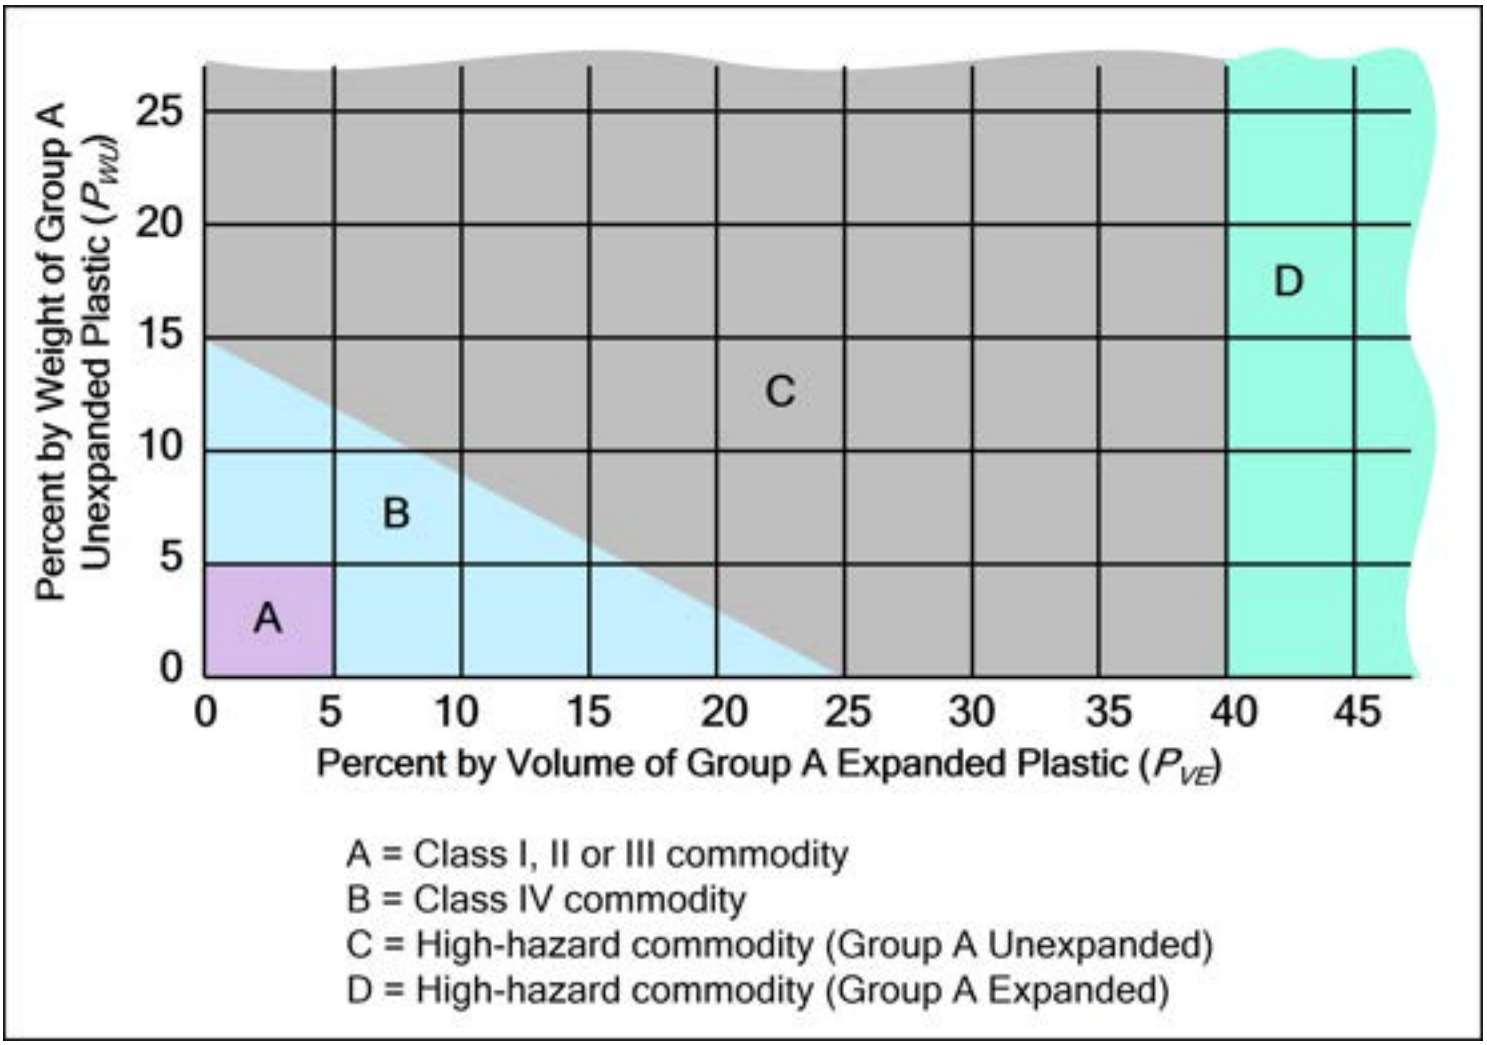
~~$P_{WE} = W_{PE} / W_L$~~ ~~**(Equation 32-3)**~~where:

~~P_{WE} = Percentage by weight of Group A expanded plastic.~~

~~W_{PE} = Weight of Group A expanded plastic in the commodity, not including the weight of the pallet, if any.~~

~~W_L = Weight of the entire load, including the weight of the pallet, if any.~~





a. This figure is used to determine the commodity classification of a mixed commodity with Group A plastics in a package or crate.

b. The following is an example of how to apply Figure 3203.9(1): A pallet load consists of a Class III commodity in cardboard boxes with components of unexpanded Group A plastic and packing material of expanded Group A plastic. Using Equation 32-1, the weight of unexpanded Group A plastic is 5 percent. Using Equation 32-2, the volume of expanded Group A plastic is 15 percent. This commodity is classified as a Class IV commodity. If the volume of the expanded Group A plastic is increased to 20 percent, the classification changes to a high-hazard (Group A unexpanded) commodity. Where the load is stored on a plastic pallet, the requirements in Section 3203.10 also apply.

FIGURE 3203.9(1) EVALUATION OF CARTONED COMMODITIES CONTAINING GROUP A PLASTICS[a, b]

Add new definition as follows:

EXPOSED GROUP A PLASTIC. Commodities containing any amount of Group A plastics that are not within packaging, cartons or coverings that can absorb water to affect the burning hazard of the commodity. Encapsulated loads containing Group A plastic shall be considered exposed Group A plastic. Products containing Group A plastic with a single-thickness paper wrapping shall be considered exposed Group A plastic.

Reason: This proposal clarifies the method for determining whether limited quantities of Group A plastics affect the classification of the commodity.

Section 2303.9 is revised with no technical change. The section is revised to say that commodities containing Group A plastics shall be classified as Group A plastics. This provision has two options: 1) the listing in Table 3203.8 includes a description of the commodity and includes the Group A plastics, and 2) the subsequent figures are used to evaluate the quantity of Group A plastics and determine the

impact provided by those limited quantities.

Figures 3203.9(1) and (2) were revised in the 2021 IFC to alter their use. However, some of the code text needing revision to correlate was missed. This proposal correlates the text with the figures.

Figure 3203.9(1) is revised. The only changes are the parenthetic acronyms for Percentage by Weight of Expanded plastic (PWE) and Percentage by Volume of Unexpanded plastic (PVU). This is done to correlate with the terms in Equations 32-1 and 32-2.

Only one figure is required to complete the calculation of the impact of Group A plastic. Figure 3203.9(1) is used for classifying commodities which are cartoned, boxed, or crated. Figure 3203.9(2) is used for classifying commodities which are exposed. To facilitate this difference, a new definition is added for exposed Group A plastics. This definition is consistent with the definition in NFPA 13.

Both figures compare the weight of unexpanded plastic (Y axis) to the volume of expanded plastic (X axis). The weight of expanded plastics is no longer used in the figures. Equation 32-3 was used to determine the weight of expanded plastics and is no longer needed, so Equation 32-3 is deleted.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposal correlates the requirements and terms in these sections and adds a definition to assist in their application. It also corrects an editorial error in the 2024 IFC.

F205-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: Proposal needs more review as the section is being reversed. I was suggested that the items in Section 3203.9 become exceptions (Vote 8-6)

F205-24

Individual Consideration Agenda

Comment 1:

IFC: 3203.9, 3203.9.1, SECTION 202

Proponents: Kevin Scott, KH Scott & Associates LLC, self (khscottassoc@gmail.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Fire Code

Revise as follows:

3203.9 Commodities containing Group A plastics. Commodities containing any amount of Group A plastics shall be classified as a high-hazard Group A plastic commodity~~, unless either of the following apply:~~.

Exceptions:

1. The product is listed in Table 3203.8 and the listing specifically includes Group A plastics or packaging material of Group A plastics.
2. The commodity is evaluated in accordance with Section 3203.9.1 based on the amount of Group A plastics contained in the commodity and the result is other than ~~Group A plastics~~ a high-hazard commodity.

3203.9.1 Classifying mixed commodities with limited Group A plastics. The percentage of Group A plastics determined in accordance with Section 3203.9.2 shall be used in Figures 3203.9(1) and 3203.9(2). Commodities with products in cartons, boxes or crates shall use Figure 3203.9(1). Commodities with exposed Group A plastics shall use Figure ~~3203.9(1)~~3203.9(2).
Figures 3203.9(1) and 3203.9(2) shall not be used to reduce the commodity classification shown in Table 3203.8.

Delete without substitution:

~~**EXPOSED GROUP A PLASTIC.** Commodities containing any amount of Group A plastics that are not within packaging, cartons or coverings that can absorb water to affect the burning hazard of the commodity. Encapsulated loads containing Group A plastic shall be considered exposed Group A plastic. Products containing Group A plastic with a single-thickness paper wrapping shall be considered exposed Group A plastic.~~

Reason: This code change was modified twice by the committee, but then Disapproved at the final vote during CAH 1. The two modifications are included in this comment and include: 1) deletion of the definition of "exposed Group A plastic" since the term is defined in NFPA 13; and 2) the revision in Section 3203.9 to change the Items 1 and 2 to Exceptions 1 and 2. Both of the modifications were discussed and approved and are included here.

An correction is made in Section 3203.9, Exception 2 to reference "high-hazard commodity" rather than Group A plastics. The material already contains Group A plastics and the result from the evaluation under Section 3203.9.1 would be high-hazard commodity if it is to protected as a Group A plastic.

An addition editorial correction is included in Section 3203.9.1. The incorrect figure is referenced, and is corrected to Figure 3203.9(2) for commodities with exposed Group A plastic.

Additionally, there was some confusion as to why the formatting of Section 3203.9 has changed. The reason for the change is because previous to the 2021 IFC both figures were used to determine the commodity classification. Since the 2021, one figure applies to cartoned commodities and one figure applies to exposed commodities, but only figure is used to determine the commodity classification. Even though the figures were changed in the 2021 IFC, the text was not revised to correlate with that change. The only goal of this code change is to correlate the text with the revised figures.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposal correlates the requirements and terms in these sections and adds a definition to assist in their application. It also corrects an editorial error in the 2024 IFC.

Comment (CAH2)# 791

IFC: 3303.1.1, 3303.5, 3303.5.1, 3303.5.2, 3303.5.2.1, 3303.5.2.2, 3303.5.2.3, 3303.5.3, 3303.5.4; IBC: 3302.1.1; IEBC: [F] 1502.1.1

Proposed Change as Submitted

Proponents: Steven Orlowski, Sundowne Building Code Consultants, LLC, Self (sorlowski@sbcc.codes)

2024 International Fire Code

Revise as follows:

3303.1.1 Components of site safety plans. *Site safety plans* shall include the following as applicable:

1. Name and contact information of site safety director.
2. Documentation of the training of the site safety director and fire watch personnel.
3. Procedures for reporting emergencies.
4. Fire department vehicle access routes.
5. Location of fire protection equipment, including portable fire extinguishers, standpipes, fire department connections and fire hydrants.
6. Smoking and cooking policies, designated areas to be used where *approved*, and signage locations in accordance with Section 3305.7.
7. Location and safety considerations for temporary heating equipment.
8. Hot work permit plan.
9. Plans for control of combustible waste material.
10. Locations and methods for storage and use of *flammable* and *combustible liquids* and other hazardous materials.
11. Provisions for site security ~~and where required, for a fire watch~~.
12. Changes that affect this plan.
13. Other site-specific information required by the *fire code official*.
14. Provision for a fire watch, where required.

3303.5 Fire watch. Where required by the *fire code official* or the *site safety plan* established in accordance withSection 3303.1, a fire watch shall be provided for building construction, alteration, or demolition and in accordance with Section 3303.6 ~~for building construction~~.

3303.5.1 Fire watch during construction. A fire watch shall be provided during nonworking hours for ~~new construction~~ that exceeds 40 feet (12 192 mm) in height above the lowest adjacent grade at any point along the building perimeter, for new multistory construction with an aggregate area exceeding 50,000 square feet (4645 m^2) per story or as required by the *fire code official.*

~~**3303.5.2**~~ **3303.6 Fire watch personnel.** Fire watch personnel shall be ~~provided~~ in accordance with this section.

~~**3303.5.2.1**~~**3303.6.1 Duties.** ~~The primary duty~~ Duties of the fire watch personnel shall be to perform constant patrols, ~~and~~ watch for the occurrence of fire, attempt to control an an incipient stage fire and report the fire in accordance with the site safety plan. The combination of fire watch duties and site security duties shall be permissible. ~~is acceptable.~~

~~**3303.5.2.2**~~ **3303.6.2 Training.** Personnel shall be trained to serve as a~~n on-site~~ fire watch. Training shall include the appropriate type and use of portable fire extinguishers. ~~Fire extinguishers and fire reporting shall be in accordance with Section 3303.6.~~

~~3303.5.2.3~~3303.6.3 **Means of notification.** Fire watch personnel shall be provided with not fewer than one *approved* means for notifying the fire department.

~~3303.5.3~~ 3303.6.4 **Fire watch location ~~and records~~.** The fire watch shall include areas specified by the *site safety plan* established in accordance with Section 3303.

~~3303.5.4~~3303.6.5 **Fire watch records.** Fire watch personnel shall keep a record of all time periods of duty, including the log entry for each time the site was patrolled and each time a structure was entered and inspected. Records shall be made available for review by the *fire code official* upon request.

2024 International Building Code

Revise as follows:

3302.1.1 Components of site safety plans. Site safety plans shall include the following, as applicable:

1. Name and contact information of site safety director.
2. Documentation of the training of the site safety director and fire watch personnel.
3. Procedures for reporting emergencies.
4. Fire department vehicle access routes.
5. Location of fire protection equipment, including portable fire extinguishers, *standpipes*, fire department connections and fire hydrants.
6. Smoking and cooking policies, designated areas to be used where *approved*, and signage locations in accordance with the *International Fire Code*.
7. Location and safety considerations for temporary heating equipment.
8. Hot-work permit plan.
9. Plans for control of combustible waste material.
10. Locations and methods for storage and use of *flammable* and *combustible liquids* and other *hazardous materials*.
11. Provisions for site security ~~and, where required, for a fire watch.~~
12. Changes that affect this plan.
13. Other site-specific information required by the *International Fire Code* .
14. Provision for a fire watch, where required.

2024 International Existing Building Code

Revise as follows:

[F] 1502.1.1 Components of site safety plans. Site safety plans shall include the following as applicable:

1. Name and contact information of site safety director.
2. Documentation of the training of the site safety director and fire watch personnel.
3. Procedures for reporting emergencies.
4. Fire department vehicle access routes.
5. Location of fire protection equipment, including portable fire extinguishers, standpipes, fire department connections and fire hydrants.

6. Smoking and cooking policies, designated areas to be used where approved and signage locations in accordance with the International Fire Code.
7. Location and safety considerations for temporary heating equipment.
8. Hot work permit plan.
9. Plans for control of combustible waste material.
10. Locations and methods for storage and use of flammable and combustible liquids and other hazardous materials.
11. Provisions for site security ~~and, where required, for a fire watch~~.
12. Changes that affect this plan.
13. Other site-specific information required by the International Fire Code.
14. Provision for a fire watch, where required.

Reason: The intent of this proposal is to provide additional information and clarification for the duties of the fire watch, when it is required by the AHJ or the site safety plan. Currently, the fire watch is listed as a subset of the site security under the site safety plan list of components, which to some didn't seem like an appropriate place for it to be listed. It is important to note, that while the term alterations is being added to section 3303.5, the entire chapter already applies to alterations so there is no substantive changes being made in this proposal. The remaining editorial changes to section 3303.5 through 3303.6.5 are to coordinate with other changes that are being proposed to Chapter 33 of both the International Building Code and the International Fire Code and to clarify the duties and responsibilities of the fire watch personnel.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

As stated in the reason statement, the changes in this proposal are editorial in nature.

F210-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The overall intent of the proposal was supported however several concerns were raised such as the use of the phrase "incipient stage fire." Additionally, the language in 3303.6.2 may cause legal issues if the occupant is required to respond and they do not. The order in which fire watch personal are taking action appear reversed. It was unclear how this section would apply to alterations when the terms "new construction" are deleted from Section 3303.5.1. (Vote 9-5)

F210-24

Individual Consideration Agenda

Comment 1:

IFC: 3303.5, 3303.5.1, 3303.6, 3303.6.1

Proponents: Steven Orlowski, Sundowne Building Code Consultants, LLC, Self (sorlowski@sbcc.codes); Robert Marshall, FCAC, FCAC

(fcac@iccsafe.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Fire Code

3303.5 Fire watch. Where required by the *fire code official* or the *site safety plan* established in accordance withSection 3303.1, a fire watch shall be provided for building construction, alteration, or demolition and in accordance with Section 3303.6 .

3303.5.1 Fire watch during construction. A fire watch shall be provided during nonworking hours for new construction that exceeds 40 feet (12 192 mm) in height above the lowest adjacent grade at any point along the building perimeter, for new multistory construction with an aggregate area exceeding 50,000 square feet (4645 m^2) per story or as required by the *fire code official.*

3303.6 Fire watch personnel. Fire watch personnel shall be in accordance with this section.

3303.6.1 Duties. Duties of the fire watch personnel shall be to perform constant patrols, watch for the occurrence of fire, ~~attempt to control an an incipient stage fire~~ and report the fire in accordance with the site safety plan. The combination of fire watch duties and site security duties shall be permissible.

Reason: Based on the feedback received from the committee in Orlando, this committee comment deletes the added language regarding the fire watch is responsibly for controlling fires in the incipient stage which raised legal concern if the fire watch fails to comply. The committee comment reinstates the phrase new construction into section 3303.5.1 to alleviate the concerns raised by the committee when the fire watch would apply during construction activity such as an alteration.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

No changes have been made that would increase the cost of construction.

Comment (CAH2)# 93

F213-24

IFC: 3304.1.3

Proposed Change as Submitted

Proponents: Robert Marshall, FCAC, FCAC (fcac@iccsafe.org)

2024 International Fire Code

Revise as follows:

~~3304.1.3~~3304.1.2.1 ~~Rubbish~~Combustible waste material containers. Where provided rubbish containers with a capacity exceeding 5.33 cubic feet (40 gallons) (0.15 m^3) ~~are~~ used during work shift for temporary storage of combustible debris, rubbish and waste material, ~~they~~ shall have tight-fitting or self-closing lids. Such rubbish containers shall be constructed entirely of materials that comply with either of the following:

1. Noncombustible materials.
2. Materials that meet a peak rate of heat release not exceeding 300 kW/m^2 when tested in accordance with ASTM E1354 at an incident heat flux of 50 kW/m^2 in the horizontal orientation.

Reason: The proposal was developed to clarify that the containers referenced in this section are those containers that are used by construction workers that are emptied throughout the day and at the end of every shift. The requirement in this section are not intended to apply to the combustible waster container outside of the building and this added language clarifies that the section applies to the temporary containers used inside the building during work hours. The other editorial change made was to renumber section and revise the title, to continue to use the terms combustible waster material as mentioned in the preceding sections.

FCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and early 2024 the FCAC has held several virtual meetings and one in-person meeting open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the **FCAC Website**

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

There are no anticipated additional costs associated with this change as it is editorial only. This simply clarifies which containers are to be used and is only applicable for combustible debris, rubbish and waste materials that are required to be removed after each work shift.

F213-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: Overall the term provided some clarification of intent of rubbish removal during a work shift there were several concerns raised on language that appeared inconsistent. One example pointed out was "combustible waste material containers" versus "rubbish containers." The word "a" was missing between "during" and "work." Generally, it was felt that more clean up is needed. (Vote 9-5)

Individual Consideration Agenda

Comment 1:

IFC: 3304.1.2.1

Proponents: Steven Orlowski, Sundowne Building Code Consultants, LLC, Self (sorlowski@sbcc.codes); Robert Marshall, FCAC, FCAC (fcac@iccsafe.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Fire Code

3304.1.2.1 Combustible waste material containers. Where provided, ~~rubbish~~ combustible waste material containers with a capacity exceeding 5.33 cubic feet (40 gallons) (0.15 m^3) used during a work shift for temporary storage of combustible debris, rubbish and waste material, shall have tight-fitting or self-closing lids. Such ~~rubbish~~ combustible waste material containers shall be constructed entirely of materials that comply with either of the following:

1. Noncombustible materials.
2. Materials that meet a peak rate of heat release not exceeding 300 kW/m^2 when tested in accordance with ASTM E1354 at an incident heat flux of 50 kW/m^2 in the horizontal orientation.

Reason: Based on the feedback received from the committee in Orlando, this committee comment addresses the concern of using consistent terminology throughout the section and fixes the grammatical mistake pointed out in the proposed language.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The committee comment is editorial and will not increase the cost of construction.

Comment (CAH2)# 94

NOTE: F217-24 PART I DID NOT RECEIVE A COMMENT (CAH2) AND IS REPRODUCED FOR INFORMATIONAL PURPOSES ONLY

Proposed Change as Submitted

Proponents: Steven Orlowski, Sundowne Building Code Consultants, LLC, Self (sorlowski@sbcc.codes)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE INTERNATIONAL FIRE CODE COMMITTEE AND PART II WILL BE HEARD BY THE INTERNATIONAL BUILDING CODE MEANS OF EGRESS COMMITTEE.

2024 International Fire Code

Revise as follows:

3307.1 Required access. *Approved* vehicle access for firefighting shall be provided to all construction or demolition sites. Vehicle access shall be provided to within 100 feet (30 480 mm) of temporary or permanent fire department connections. Vehicle access shall be provided and maintained by either temporary or permanent roads, capable of supporting vehicle loading under all weather conditions. ~~Vehicle access shall be maintained until permanent fire apparatus access roads are available.~~

3307.1.3 Maintenance. Required *means of egress* and required *accessible means of egress* shall be maintained during construction and demolition, ~~remodeling or~~ *alterations*, and additions to any building. **Exception:** *Approved* temporary *means of egress* and *accessible means of egress systems* and facilities.

3307.5 Standpipes. In buildings required to have standpipes by Section 905.3.1, not less than one functional standpipe for use by the fire service shall be provided for use during construction. ~~Such~~ Each functional *standpipe* ~~standpipes~~ shall be installed with the building as it progresses and prior to construction exceeding 40 feet (12 192 mm) in height above or below the lowest level of fire department vehicle access. Such standpipes shall be provided with fire department hose connections at approved locations in or adjacent to *stairways* complying with Section 3307.1.2. As construction continues to progress ~~progresses~~, ~~such~~ the standpipes shall be extended to within one floor of the highest point ~~of construction~~ having secured decking or flooring.

3307.5.1 Buildings being demolished. Where a building is being demolished and a standpipe is existing within such a building, such standpipe shall be maintained in an operable condition ~~so as~~ to be available for use by the fire department. Such standpipe shall be demolished with the building ~~but~~ and shall not be demolished more than one floor below the floor being demolished. Where more than one standpipe exists in the building, the contractor shall coordinate with the fire code official which standpipe shall remain functional.

Exception: Where the existing standpipe is found to be inoperable, damaged, or required to be removed as part of the site safety plan, a temporary standpipe shall be installed in accordance with Section 905.

Delete without substitution:

~~**3307.5.2 Detailed requirements.** Standpipes shall be installed in accordance with the provisions of Section 905. **Exception:** Standpipes shall be either temporary or permanent in nature, and with or without a water supply, provided that such standpipes comply with the requirements of Section 905 as to capacity, outlets and materials.~~

2024 International Building Code

SECTION 3310
MEANS OF EGRESS

Revise as follows:

[F] 3310.2 Maintenance of means of egress. *Means of egress* and required *accessible means of egress* shall be maintained at all times during construction, demolition, ~~remodeling or~~ *alterations* and *additions* to any *building*.

Exception: Existing *means of egress* need not be maintained where *approved* temporary *means of egress* systems and *facilities* are provided.

SECTION 3311
STANDPIPES

Revise as follows:

[F] 3311.1 Where required. In *buildings* required to have *standpipes* by Section 905.3.1, not fewer than one functional standpipe for use by the fire service shall be provided for use during construction. ~~Such~~ Each functional *standpipe* ~~*standpipes*~~ shall be installed with the building as it progresses and prior to construction exceeding 40 feet (12 192 mm) in height above or below the lowest level of fire department vehicle access. Such *standpipes* shall be provided with fire department hose connections at approved locations in or adjacent to *stairways* complying with Section 3310.1. As construction continues to progress ~~progresses~~, ~~such~~ the *standpipes* shall be extended to within one floor of the highest point ~~of construction~~ having secured decking or flooring.

[F] 3311.2 Buildings being demolished. Where a *building* is being demolished and a standpipe exists within such a *building*, such standpipe shall be maintained in an operable condition ~~so as~~ to be available for use by the fire department. Such standpipe shall be demolished with the *building* ~~but~~ and shall not be demolished more than one floor below the floor being demolished. Where more than one standpipe exists in the building, the contractor shall coordinate with the fire code official which standpipe shall remain functional. **Exception:** Where the existing standpipe is found to be inoperable, damaged, or required to be removed as part of the site safety plan, a temporary standpipe shall be installed in accordance with Section 905.

Delete without substitution:

~~**[F] 3311.3 Detailed requirements.** *Standpipes* shall be installed in accordance with the provisions of Chapter 9. **Exception:** *Standpipes* shall be either temporary or permanent in nature, and with or without a water supply, provided that such *standpipes* conform to the requirements of Section 905 as to capacity, outlets and materials.~~

2024 International Existing Building Code

SECTION 1508
MEANS OF EGRESS

Revise as follows:

[F] 1508.2 Maintenance of means of egress. Means of egress and required accessible means of egress shall be maintained at all times during construction, demolition, ~~remodeling or~~ *alterations* and *additions* to any building. **Exception:** Existing means of egress need not be maintained where *approved* temporary means of egress and accessible means of egress systems and facilities are provided.

SECTION 1509

STANDPIPES

Revise as follows:

[F] 1509.1 Where required. In buildings required to have standpipes by Section 905.3.1 of the *International Building Code*, not less than one functional standpipe for use by the fire service shall be provided for use during construction. ~~Such~~ Each functional standpipe ~~standpipes~~ shall be installed with the building as it progresses and prior to construction exceeding 40 feet (12 192 mm) in height above or below the lowest level of fire department vehicle access. Such standpipes shall be provided with fire department hose connections at approved locations in or adjacent to *stairways*, complying with Section 1508.1. As construction ~~progresses~~ continues to progress, ~~such~~ the standpipes shall be extended to within one floor of the highest point ~~of construction~~ having secured decking or flooring.

[F] 1509.2 Buildings being demolished. Where a building or portion of a building is being demolished and a standpipe is existing within such a building, such standpipe shall be maintained in an operable condition ~~so as~~ to be available for use by the fire department. Such standpipe shall be demolished with the building and ~~but~~ shall not be demolished more than one floor below the floor being demolished. Where more than one standpipe exists in the building, the contractor shall coordinate with the fire code official which standpipe shall remain functional. **Exception:** Where the existing standpipe is found to be inoperable, damaged, or required to be removed as part of the site safety plan, a temporary standpipe shall be installed in accordance with Section 905 of the *International Building Code*.

Delete without substitution:

~~**[F] 1509.3 Detailed requirements.** Standpipes shall be installed in accordance with the provisions of Chapter 9 of the International Building Code. **Exception:** Standpipes shall be either temporary or permanent in nature, and with or without a water supply, provided that such standpipes conform to the requirements of Section 905 of the International Building Code as to capacity, outlets and materials.~~

Reason: Most of the changes in this proposal are editorial clean up, for example:

- Adding the word maintenance to vehicle access in the second sentence of section 3307.1 allows for the complete deletion of the last sentence.

- Both temporary and permanent stairways need to be approved, in section 3307.1.3.

- Section 3307.1.4 removing remodeling as it is a form of an alteration to a building.

- Section 3307.5 needed some additional clarification that as the building progresses in its vertical construction, that a minimum of one functioning standpipe needs to be available to the fire service, once the building reaches 40 feet in height above or below fire department vehicle access.

-Section 3307.5.1 added clarification that in buildings being demolished with mutliple standpipes, at least one standpipe must remain functional as demolition progresses and the contractor shall coordinate with the fire code official. The new exception was also added to this section to signify where the existing standpipe is found to be damaged , inoperable or needs to be removed, than a temporary standpipe shall be installed. Adding the exception allows for the deletion of section 3307.5.2 as it states the temporary or permanent standpipes must comply with section 905 which is in the new exception.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

As stated in the reason statement, the proposed changes to this section is purely editorial in nature and does not add any new requirements which would have an impact on the cost of construction.

F217-24 Part I

Public Hearing Results (CAH1)

Committee Action: **As Submitted**

Committee Reason: This proposal was approved based upon the proponents reason statement. (Vote 14-0)

F217-24 Part I

F217-24 Part II

PART II - IFC: [BE] 3307.1.2; IBC: 3310.1; IEBC: [BE] 1508.1

Proposed Change as Submitted

Proponents: Steven Orlowski, Sundowne Building Code Consultants, LLC, Self (sorlowski@sbcc.codes)

2024 International Fire Code

Revise as follows:

[BE] 3307.1.2 Stairways required. Where building construction exceeds 40 feet (12 192 mm) in height above or below the lowest level of fire department vehicle access, a permanent *stairway* or an approved temporary ~~or permanent~~ *stairway* shall be provided. As construction progresses, such *stairway* shall be extended to within one floor of the highest point of construction having secured decking or flooring.

2024 International Building Code

Revise as follows:

3310.1 Stairways required. Where *building* construction exceeds 40 feet (12 192 mm) in height above or below the lowest level of fire department vehicle access, a permanent *stairway* or an approved temporary ~~or permanent~~ *stairway* shall be provided. As construction progresses, such *stairway* shall be extended to within one floor of the highest point of construction having secured decking or flooring.

2024 International Existing Building Code

Revise as follows:

[BE] 1508.1 Stairways required. Where building construction exceeds 40 feet (12 192 mm) in height above or below the lowest level of fire department vehicle access, a permanent stairway or an *approved* temporary ~~or permanent~~ stairway shall be provided. As construction progresses, such stairway shall be extended to within one floor of the highest point of construction having secured decking or flooring.

Reason: Most of the changes in this proposal are editorial clean up, for example:

- Adding the word maintenance to vehicle access in the second sentence of section 3307.1 allows for the complete deletion of the last sentence.

- Both temporary and permanent stairways need to be approved, in section 3307.1.3.

- Section 3307.1.4 removing remodeling as it is a form of an alteration to a building.

- Section 3307.5 needed some additional clarification that as the building progresses in its vertical construction, that a minimum of one functioning standpipe needs to be available to the fire service, once the building reaches 40 feet in height above or below fire department vehicle access.

-Section 3307.5.1 added clarification that in buildings being demolished with mutliple standpipes, at least one standpipe must remain functional as demolition progresses and the contractor shall coordinate with the fire code official. The new exception was also added to this section to signify where the existing standpipe is found to be damaged , inoperable or needs to be removed, than a temporary standpipe shall be installed. Adding the exception allows for the deletion of section 3307.5.2 as it states the temporary or permanent standpipes must comply with section 905 which is in the new exception.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

As stated in the reason statement, the proposed changes to this section is purely editorial in nature and does not add any new requirements which would have an impact on the cost of construction.

F217-24 Part II

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: This change is not editorial as indicated in the reason statement. At this point in construction, typically only temporary stairs are provided, so permanent stairways should not be in this section. It is not clear on what an 'approved' temporary stairway is - who would be inspecting and certifying that. If the intent is to allow for some flexibility for temporary stairways, that should be clarified further. (Vote: 9-5)

F217-24 Part II

Individual Consideration Agenda

Comment 1:

IFC: [BE] 3307.1.2; IBC: 3310.1; IEBC: [BE] 1508.1

Proponents: Steven Orlowski, Sundowne Building Code Consultants, LLC, National Association of Home Builders (NAHB) (sorlowski@sbcc.codes) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Fire Code

[BE] 3307.1.2 Stairways required. Where building construction exceeds 40 feet (12 192 mm) in height above or exceeds one story below the lowest level of fire department vehicle access, a ~~permanent *stairway* or an approved~~ temporary or permanent *stairway* shall be provided. As construction progresses, such *stairway* shall be extended to within one floor of the highest point of construction having secured decking or flooring.

2024 International Building Code

3310.1 Stairways required. Where *building* construction exceeds 40 feet (12 192 mm) in height above or exceeds one story below the lowest level of fire department vehicle access, a ~~permanent *stairway* or an approved~~ temporary or permanent *stairway* shall be provided. As construction progresses, such *stairway* shall be extended to within one floor of the highest point of construction having secured decking or flooring.

2024 International Existing Building Code

[BE] 1508.1 Stairways required. Where building construction exceeds 40 feet (12 192 mm) in height above or exceeds one story below the lowest level of fire department vehicle access, a ~~permanent stairwayor an *approved*~~ temporary or permanent stairway shall be provided. As construction progresses, such stairway shall be extended to within one floor of the highest point of construction having secured decking or flooring.

Reason: Based on the feedback received from the committee in Orlando, this committee comment reverts back to the original language regarding permanent and temporary stairways, which the committee was unclear as to who would inspect and approve the temporary stairs. The other revision included in this committee comment, is decreasing the threshold from forty feet below fire department vehicle access to more than one story. During the course of creating the committee comment, a concern was raised that from a fire operations standpoint, accessing and fighting fires below grade are much more hazardous to firefighters. FCAC decided that the threshold at which a temporary or permanent stairway should be provided for work below fire department vehicle access should be more than one story below the point of vehicle access.

Cost Impact: Increase

Estimated Immediate Cost Impact:

During the course of construction, temporary or permanent stairways are required to provide a means of egress for construction workers and access to floors for first responders. Any increase in the cost of providing a temporary stairway, will be dependent on the size of the building being constructed and the number of floors. If no temporary stairways are constructed during the course of construction, there will be no increase cost to construction, as the permanent stairways would have already been baked into the overall costs.

Estimated Immediate Cost Impact Justification (methodology and variables):

During the course of construction, temporary or permanent stairways are required to provide a means of egress for construction workers and access to floors for first responders. Any increase in the cost of providing a temporary stairway, will be dependent on the size of the building being constructed and the number of floors. If no temporary stairways are constructed during the course of construction, there will be no increase cost to construction, as the permanent stairways would have already been baked into the overall costs.

Comment (CAH2)# 95

F218-24

IFC: 3307.1.1 (New)

Proposed Change as Submitted

Proponents: James Carver, Self, Southern California Fire Prevention Officer's Association (james90245@pacbell.net)

2024 International Fire Code

Add new text as follows:

3307.1.1 Address Identification. Construction sites shall be provided with approved address identification. The address identification shall be legible and placed in a position that is visible from the street or road fronting the property. Address identification characters shall contrast with their background. The address identification and location shall be in a form approved by the Fire Chief. Where access is by means of a private road and the building cannot be viewed from the public way, a monument, pole or other sign or means shall be used to identify the structure. Address identification shall be maintained.

Reason: Chapter 33 does not have a prescriptive requirement for the address to be posted at the construction site. The requirement is identified only in the site safety plan. Although some construction sites are large and easily distinguishable, it is necessary for all construction sites to have the address posted for emergency responders.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The address posting requirement is not include in Chapter 33. This proposal brings the requirement to the Chapter, in the section reserved for fire department site access. There is no anticipated increase cost to construction, the posting would be included with the other site sign costs.

F218-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: Proposal F212-24 which was approved as submitted already addresses this issue. (Vote 11-3)

F218-24

Individual Consideration Agenda

Comment 1:

IFC: 3307.1.1; IBC: SECTION 502, [F] 502.1

Proponents: Steven Orlowski, Sundowne Building Code Consultants, LLC, Self (sorlowski@sbcc.codes) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Fire Code

3307.1.1 Address Identification. ~~Construction sites~~New and *existing building* shall be provided with *approved* address identification. The address identification shall be legible and placed in a position that is visible from the street or road fronting the property. Address identification characters shall contrast with their background. Address numbers shall be Arabic numbers or alphabetical letters. Numbers shall not be spelled out. Each character shall be a minimum of 4 inches (102 ,,) high with a minimum stroke width of 1/2 inch (12.7mm). ~~The address identification and location shall be in a form approved by the Fire Chief.~~ Where required by the fire code official, address identification shall be provided in additional approved locations to facilitate emergency response. Where access is by means of a private road and the building cannot be viewed from the public way, a monument, pole or other *approved* sign or means shall be used to identify the structure. Address identification shall be maintained.

2024 International Building Code

SECTION ~~502~~3303
BUILDING ADDRESS

Revise as follows:

[F] ~~502.1~~3303.1 Address identification. New and *existing buildings* shall be provided with *approved* address identification. The address identification shall be legible and placed in a position that is visible from the street or road fronting the property. Address identification characters shall contrast with their background. Address numbers shall be Arabic numbers or alphabetical letters. Numbers shall not be spelled out. Each character shall be a minimum of 4 inches (102 mm) high with a minimum stroke width of $^{1}/_{2}$ inch (12.7 mm). Where required by the fire code official, address identification shall be provided in additional *approved* locations to facilitate emergency response. Where access is by means of a private road and the *building* address cannot be viewed from the *public way*, a monument, pole or other *approved* sign or means shall be used to identify the *structure*. Address identification shall be maintained.

Reason: During the CAH #1 meetings there was a point of confusion when F218-24 was brought before the committee for discussion. The committee had just heard a proposal F212 which required the construction site address to be posted at the main entrance to the site and disapproved this proposal. After the hearings, it was realized that the proposal submitted by the proponent was attempting to align the prescriptive requirements for posting of the construction site with the requirements contained in the IBC in Section 502.1.

This modification takes the original proposal and adds language that is missing from the Section 502.1 of the IBC, so that both the IBC and the IFC will match. In addition, this committee comment relocates section 502.1 from the IBC and moves it to a new section in Chapter 33, so that the safety during construction provisions are located in the same chapters of both the IBC and the IFC. The provision seems misplaced in its current location under the height and area chapter in the IBC.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Posting of the address was already required in both the IFC and the IBC. This editorial change correlates the two codes by utilizing the existing text from the IBC and replacing the IFC language with the same provision.

Comment (CAH2)# 445

Comment 2:

IFC: SECTION 3307, 3307.1.1, 505.1

Proponents: Robert Marshall, FCAC, FCAC (fcac@iccsafe.org); Mark Wassom, Olathe Fire Department, FCAC - IAFC-FLSS (mswassom@olatheks.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Fire Code

Revise as follows:

SECTION 3307
FIRE DEPARTMENT SITE ACCESS, ADDRESS IDENTIFICATION, AND WATER SUPPLY

3307.1.4 Address Identification. Temporary or permanent address identification and street signs shall be provided as required by Section 505. ~~Construction sites shall be provided with approved address identification. The address identification shall be legible and placed in a position that is visible from the street or road fronting the property. Address identification characters shall contrast with their background. The address identification and location shall be in a form approved by the Fire Chief. Where access is by means of a private road and the building cannot be viewed from the public way, a monument, pole or other sign or means shall be used to identify the structure. Address identification shall be maintained.~~

505.1 Address identification. New and existing buildings and construction sites shall be provided with *approved* address identification. The address identification shall be legible and placed in a position that is visible from the street or road fronting the property. Address identification characters shall contrast with their background. Address numbers shall be Arabic numbers or alphabetical letters. Numbers shall not be spelled out. Each character shall be not less than 4 inches (102 mm) high with a minimum stroke width of $^{1}/_{2}$ inch (12.7 mm). Where required by the *fire code official*, address identification shall be provided in additional *approved* locations to facilitate emergency response. Where access is by means of a private road and the building cannot be viewed from the *public way*, a monument, pole or other sign or means shall be used to identify the structure. Address identification shall be maintained.

Reason: The committee expressed in hearing #1 that this proposal was not necessary because they felt that approval of F212 addressed the need. F212 and F218 cover two different subjects, and approval of F212 does not resolve the issue that this proposal is attempting to address. F212 requires the posting of a construction site address on the emergency information sign so that workers or others on the site can provide the address in the event they need to call emergency services.

F218 would require the address of a construction site to be posted so that it is visible to the fire department and other emergency responders so they can properly identify the location during an emergency response. This is an important feature that is commonly not provided and this proposal will help to resolve that issue.

This proposal was reviewed by the Enforcement and ITM Working Group of the Fire Code Action Committee. We identified that the proposed change has similar text pertaining to address identification that is already in Section 505, however it would be important to provide a clarification that this also must apply to construction sites. We have revised the proposed new section to identify that construction sites are required to have temporary or permanent address identification, and then refer to Section 505 for the criteria. Section 505.1 has a small modification to include construction sites.

We feel that these proposed modifications uphold the original intent of this code change proposal but provide some improvements for clarity. We respectfully request that the committee reconsider this proposal and approve as modified to help to address a common challenge and improve emergency response to construction sites.

FCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and early 2024 the FCAC has held several virtual meetings and one in-person meeting open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the FCAC Website

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This change proposal is merely a clarification that address identification is required on construction sites for efficient emergency

response. There would not be a cost impact.

Comment (CAH2)# 183

Comment 3:

Proponents: James Carver, Self, Southern California Fire Prevention Officer's Association (james90245@pacbell.net) requests As Submitted

Reason: During the 1st Committee Hearing in Orlando, Committee members expressed this code proposal was included in another proposal from Chapter 31. The address posting requirement is included in proposal F212-24. Proposal 212-24 identifies only the address needs to be posted, this proposal includes the prescriptive address identification requirements from Section 505.1. The proposal makes the address posting requirements for buildings and construction sites consistent, assisting the inspector when requiring the code provision.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Comment (CAH2)# 180

F225-24

IFC: SECTION 3313 (New), 3313.1 (New)

Proposed Change as Submitted

Proponents: James Carver, Self, Southern California Fire Prevention Officer's Association (james90245@pacbell.net); Joseph Cervantes, Space Age Electronics, Space Age Electronics (joseph.cervantes@1sae.com)

2024 International Fire Code

Add new text as follows:

SECTION 3313
TEMPORARY DETECTION AND NOTIFICATION

3313.1 General. Buildings under construction greater than 3 stories in height, where the square footage of construction is greater than 100,000 square feet, shall be provided with an approved temporary notification and detection system during construction. The system shall report to a constantly attended location and be installed in accordance with the manufacturer's instructions.

Reason: The recent tragic incident in Charlotte, North Carolina, where two construction workers lost their lives in a significant fire, underscores the urgent need to revise the International Building Code to include mandatory advanced notification and detection systems on construction sites. This proposal is driven by several critical factors:

1. Immediate Notification for Enhanced Worker Safety: In environments like construction sites, where hazards are ever-present, the danger is magnified by the risk of fire. The Charlotte incident painfully illustrates this, as workers, hindered by mandatory hearing protection and ambient noise, were unable to hear verbal fire warnings. A formalized fire detection and notification system ensures that all workers are alerted promptly, significantly decreasing the likelihood of injury or loss of life.

2. Community Safety and Rapid Emergency Response: Fires on construction sites pose a significant threat not just to workers but also to nearby communities. An effective detection system allows for quicker mobilization of emergency services, thereby preventing the spread of fire and protecting local residents.

3. Minimizing Property Damage and Economic Loss: Early fire detection plays a crucial role in limiting property damage. By reducing the extent of the damage, these systems not only save costs but also prevent delays in construction projects.

4. Adherence to Evolving Safety Standards: The integration of fire detection and notification systems aligns construction practices with global safety trends, demonstrating a commitment to the highest safety standards for workers and the community.

5. Valuable Data for Ongoing Safety Enhancements: Such systems also serve as a vital source of data on fire incidents, contributing to the continuous improvement of fire safety standards and practices in the construction industry.

In conclusion, the implementation of temporary notification and detection systems on construction sites is a necessary measure. This proposal aims to provide early fire detection and efficient notification to construction workers, addressing a critical safety gap highlighted by recent catastrophic events. This change is not merely reactive but a proactive step toward enhancing overall safety and aligning with progressive construction management standards.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

This cost impact statement is hypothetical and serves as a template. Actual figures should be derived using detailed cost analysis specific to the region, type of construction sites, and the specific technology used in the notification and detection systems.

Total Immediate Cost per construction site:

- Wireless notification and detection systems - $20,000 - $100,000
- Wired notification and detection systems - $35,000- $150,000

If through alternative means and methods, these systems are approved to replaces fire watch, the cost impact will be negative.

Estimated Immediate Cost Impact Justification (methodology and variables):

Equipment Costs: Includes the purchase of smoke sensors, heat sensors, and notification devices.

Installation Costs: Professional fees for installing and integrating the system into existing construction site infrastructure.

Training Costs: Expenses related to training site personnel in system operation and emergency response protocols.

Maintenance Costs: Initial maintenance and testing costs for the first year.

Administrative and Compliance Costs: Expenses associated with ensuring compliance with the new code, including any required certifications and inspections.

Variables include the size of the construction site, the complexity of the installation (which may vary based on site layout), and the level of technology chosen for the system.

Estimated Life Cycle Cost Impact:

Given the provided baseline cost ranges for wireless and wired notification and detection systems in the per project impact, this would be an estimated life cycle cost impact for each. Using a midpoint value within each range for the calculation to provide a balanced estimate.

Wireless Notification and Detection Systems

Initial Costs

Average Cost: $60,000 (midpoint of $20,000 - $100,000 range)

Installation Costs: Assumed at 10% of system cost = $6,000

Training Costs: $2,000

Total Initial Cost: $68,000

Operational Costs (Annually)

Maintenance: $1,500 (annual)

Energy Consumption: $300 (annual)

Total Annual Operational Cost: $1,800

Long-Term Costs (Over 10 Years)

System Upgrades (every 5 years): $10,000

Decommissioning Costs: $5,000

Total Long-Term Cost: $15,000

Indirect Costs and Savings

Insurance Premium Reductions: $1,000 (annual)

Reduced Accident Costs: $20,000 (over 10 years)

Total Indirect Savings (10 years): $30,000

Total Estimated Life Cycle Cost for Wireless System (10 years):

Initial Costs: $68,000

Operational Costs (10 years): $18,000

Long-Term Costs: $15,000

Indirect Savings: -$30,000

Net Cost: $71,000

Wired Notification and Detection Systems

Initial Costs

Average Cost: $92,500 (midpoint of $35,000 - $150,000 range)

Installation Costs: Assumed at 15% of system cost = $13,875

Training Costs: $2,000

Total Initial Cost: $108,375

Operational Costs (Annually)

Maintenance: $2,000 (annual)

Energy Consumption: $400 (annual)

Total Annual Operational Cost: $2,400

Long-Term Costs (Over 10 Years)

System Upgrades (every 5 years): $15,000

Decommissioning Costs: $7,000

Total Long-Term Cost: $22,000

Indirect Costs and Savings

Insurance Premium Reductions: $1,200 (annual)

Reduced Accident Costs: $25,000 (over 10 years)

Total Indirect Savings (10 years): $37,000

Total Estimated Life Cycle Cost for Wired System (10 years):

Initial Costs: $108,375

Operational Costs (10 years): $24,000

Long-Term Costs: $22,000

Indirect Savings: -$37,000

Net Cost: $117,375

These estimates are based on the provided cost ranges and average industry figures. Actual costs may vary based on specific site requirements, regional cost differences, and technology choices. Detailed, site-specific analysis is recommended for accurate budgeting.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

Long-term Maintenance and Servicing: Regular checks and repairs over the system's lifespan.

Technology Upgrades: Potential costs for upgrading the system to keep up with technological advancements.

Energy Usage: Operational costs including electricity usage of the system.

Potential Insurance Premium Reductions: Reduction in insurance premiums due to improved fire safety measures, contributing to cost savings over the life cycle.

Depreciation: The decrease in the value of the equipment over time.

Variables include the anticipated lifespan of the equipment, estimated frequency of maintenance and upgrades, and expected trends in energy costs and insurance premiums.

F225-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: Disapproval was based on general concerns with the technology and how it works. Additionally there was concern as to how it would work after hours. It as suggested that perhaps an appendix may be a better place to start. Also it was suggested that the devices obtain some sort of listings and for more details regarding these systems be mapped out and provided. (Vote 14-0)

F225-24

Individual Consideration Agenda

Comment 1:

IFC: SECTION 3313, 3313.1, APPENDIX Q (New), SECTION Q101 (New), Q101.1 (New), SECTION Q102 (New), Q102.1 (New), Q102.1.1 (New), Q102.1.2 (New), SECTION Q103 (New), Q103.1 (New), Q103.2 (New), Q103.3 (New), Q103.3.1 (New), Q103.3.2 (New), Q103.3.3 (New), Q103.3.4 (New), SECTION Q104 (New), Q104.1 (New), Q104.1.1 (New), Q104.1.2 (New), Q104.2 (New), Q104.3 (New), Q104.4 (New), Q104.5 (New), Q104.6 (New)

Proponents: Joseph Cervantes, Space Age Electronics, Space Age Electronics requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Fire Code

SECTION 3313
TEMPORARY DETECTION AND NOTIFICATION

Delete and substitute as follows:

~~**3313.1 General.** Buildings under construction greater than 3 stories in height, where the square footage of construction is greater than~~

~~100,000 square feet, shall be provided with an approved temporary notification and detection system during construction. The system shall report to a constantly attended location and be installed in accordance with the manufacturer's instructions.~~

3313.1 General. Where Appendix Q has not been adopted, buildings under construction greater than 3 stories in height, or the square footage of construction is greater than 100,000 square feet, shall be provided with an approved temporary notification and detection system during construction. The system shall report to a constantly attended location and be installed in accordance with the manufacturer's instructions.

Add new text as follows:

APPENDIX Q
TEMPORARY NOTIFICATION AND DETECTION SYSTEM FOR CONSTRUCTION FIRE PROTECTION

SECTION Q101
GENERAL

Q101.1 General. This section addresses the application, installation, performance, and maintenance of temporary notification and detection systems designed specifically for fire protection during all construction phases, including all related components and spans the entire period from the initiation of construction activities through to their completion, when required by the fire code official as a means for emergencies reporting.

SECTION Q102
CONSTRUCTION DOCUMENTS

Q102.1 General. Construction documents for temporary notification and detection systems for construction Fire Protection shall be of sufficient clarity to indicate the location, nature and extent of the work proposed and show in detail that it will conform to the provisions of this code and relevant laws, ordinances, rules, and regulations, as determined by the *fire code official*.

Q102.1.1 Construction Documents. Construction documents and supporting data shall be submitted with each application for a permit and in such form and detail as required by the fire code official. The construction document submittal shall comply with all of the following:

1. Prepared by a registered design professional where required by the statutes of the jurisdiction in which the project is to be constructed.
2. Submitted for review and approval prior to installation.
3. Be clear, legible, and to scale
4. Each drawing shall include a title block with the project name, project number, location, preparer's name, and date.

Q102.1.2 Fire protection system shop drawings. Shop drawings for the fire protection systems shall be submitted to indicate compliance with Appendix Q, this code and the construction documents, and shall be approved prior to the start of installation. Shop drawings shall contain all the following information and as required by the referenced installation standards:

1. System Layout. Detailed layout of the system, including the locations of all components such as sensors, alarms and control units. Indicate the type and model of each device.
2. Pathway Diagram. Detailed pathway (wired or wireless) between all system components.
3. Zones and Circuits. Clear indication of zones and circuits, with identification of devices within each zone.

4. Mounting Details. Mounting height and locations for all components, and details for mounting supports and brackets.
5. Power Supply. Information on the power supply, including source, voltage, and backup power provisions.
6. Calculations and Supporting Documentation. Battery and voltage drop calculations to ensure proper operation of the system under normal and emergency conditions, as applicable. Documentation of device compatibility and manufacturer's specifications.
7. Testing and Commissioning. Outline the testing procedures to be used to verify the system's functionality, including the forms for recording test results and commissioning documentation, acceptable to the fire code official.
8. Maintenance and Operation Manuals. Provide maintenance and operation manuals for the temporary notification and detection system, including information on routine inspections, testing, and maintenance requirements, as required by the fire code official.
9. Compliance and Standards. Ensure that the design complies with relevant local and international standards, as applicable.
10. Equipment. Systems and components should be installed in accordance with the manufacturer's instructions.
11. System Use. The temporary notification and detection system should be removed upon acceptance of the permitted building fire alarm system or as required by the fire code official.

SECTION Q103
TRAINING DOCUMENTATION

Q103.1 General. This section establishes the training documentation requirements to ensure the competence and readiness of site safety directors and fire watch personnel in handling temporary detection and notification systems and applies to all construction sites, and other locations where these temporary systems are deployed.

Q103.2 Where Required. Where required by the fire code official, temporary notification and detection systems shall meet the requirements of this section.

Q103.3 Training requirements. Training shall be followed when temporary detection and notification systems are installed in accordance with Sections Q103.3.1 through Q103.3.4.

Q103.3.1 Site safety director.. The site safety director, as required in Section 3303.2 of this code, shall complete a comprehensive training program specific to temporary detection and notification systems, including, but not limited to, system installation, system operation, system troubleshooting, emergency response procedures related to these systems, and use of notification and detection equipment. Training shall be conducted by a qualified person. Initial training and routine training shall be provided.

Q103.3.2 Fire Watch Personnel.. Fire watch personnel as required in Section 3305.5.2 of this code, shall complete a specialized training program specific to temporary detection and notification systems, covering fire watch duties and responsibilities related to these systems, identification and reporting of system faults and emergency communication procedures. Training shall be conducted by a qualified person. Initial training and routine training shall be provided.

Q103.3.3 Documentation Requirements. Training for both the site safety directors and fire watch personnel shall be documented in detail. The documentation shall include all of the following information:

1. Date and time of the training.
2. Full names and roles of all attendees.
3. Type of training conducted.
4. Name and qualifications of the trainer.
5. List of training materials used.

Q103.3.4 Record keeping.. Records shall be stored in a secure, accessible location and be available to the fire code official upon request. Both physical and digital formats of records are acceptable, provided they are well-organized and protected from loss or damage.

Add new text as follows:

SECTION Q104
TEMPORARY DETECTION AND NOTIFICATION SYSTEMS

Q104.1 Where required. Where required by the fire code official, temporary notification and detection systems shall meet the requirements of this section.

Q104.1.1 New buildings and structures. All new buildings and structures undergoing construction that exceed 3 stories in height and/or encompass more than 100,000 square feet shall be equipped with an approved temporary notification and detection system. This system shall remain operational throughout the construction phase.

Q104.1.2 Renovation, retrofit, and demolition of buildings. All buildings undergoing substantial renovation, retrofit, or demolition shall have temporary detection and notification systems installed to ensure the safety of occupants and construction personnel.These temporary systems shall be designed to provide effective and reliable fire detection and notification throughout the affected construction areas.

Q104.2 Documentation and compliance. Detailed construction documents in accordance with Q102 shall be provided.

Q104.3 System design and installation. The design of temporary detection and notification systems shall include the following

1. The design of temporary detection and notification systems shall comply with this code and referenced standards, as applicable.
2. The systems shall include sensors, alarms, control units, and all necessary components to ensure proper functionality.
3. The systems shall be capable of integrating with existing fire alarm systems, where applicable.

Q104.4 Demolition safety. During the demolition of buildings, temporary detection and notification systems shall remain operational.

Q104.5 Testing and maintenance. Temporary detection and notification systems shall be initially and routinely tested, in accordance with the manufactures instructions. Training Documentation shall be provided in accordance with Section Q103.

Q104.6 System components. Temporary detection and notification systems components shall comply with all the following:

1. Control Units. Temporary notification and detection control units shall be installed in accordance with the manufacturers listed instructions.
    1.1. Alarm Activation and Annunciation. Upon activation, the temporary notification and detection system shall initiate occupant notification and shall annunciate at the control unit. After working hours, the system shall remain in operation.

2. Manual Alarms. The temporary notification and detection system shall include manual alarms. These alarms shall be accessible to construction personnel to allow for immediate activation in case of a fire or other emergency.

   2.1. Location. Not less than one manual alarm shall be provided at each required exit access of the structure.

   2.2. Protective Covers. Where provided, the installation of manual alarm protective covers to prevent malicious alarms or protection from physical damage shall be provided. The protective cover shall be transparent in color with a transparent face to permit visibility of the manual alarm.

   2.3. Unobstructed and unobscured. Manual alarms shall be provided with ready access, unobstructed, unobscured, and visible always.

3. Notification Appliances The system shall provide both audible and visual notification signals that can alert all personnel on the construction site during an emergency.

   3.1. These notifications appliances shall provide distinct audible and visual alarms.

   3.2. These appliances shall be placed throughout the construction area on the interior, a minimum of one exterior appliance in an approved location.

4. Smoke and Heat Sensors. Appropriate smoke and heat sensors shall be installed at locations to ensure prompt detection of fires. Sensor types and placements shall consider the specific hazards and layout of the construction site.

   4.1. Heat Sensors. Heat sensors shall be installed in areas prone to activities that could inadvertently activate smoke sensors. These sensors shall be appropriately rated to withstand the environmental conditions and fire risks present at the construction site.

   4.2. Smoke Sensors. Smoke sensors shall be installed in designated areas of the construction site to ensure early detection of fire incidents. These sensors shall be specifically designed and rated to endure the environmental conditions and potential fire hazards present on the construction site. Additionally, smoke sensors shall be strategically placed to avoid false activations caused by construction activities.

5. Monitoring. The temporary notification and detection system shall be monitored continuously to ensure it always remains operational. Monitoring shall be conducted by designated onsite constantly attended personnel or through a remote, approved monitoring service.

6. Interconnection. All components of the temporary notification and detection system shall be interconnected, either through wired or wireless pathways. Activation of any temporary notification and detection system alarm causing components shall activate the notification system throughout the site.

7. Power Source. The system shall be powered by a reliable, independent source, with provisions for additional backup power to maintain functionality in the event of a power failure. Both the primary and secondary power sources can be battery power.

Reason: We are resubmitting our code proposal to address the concerns raised during the previous review in CAH1, which led to the disapproval based on general concerns with the technology, its functionality, and its operation after hours. Additionally, it was suggested that an appendix might be a more appropriate starting point, and that the devices should obtain relevant listings and include more detailed system mappings.

Addressing General Concerns with the Technology and Functionality

We acknowledge the need for clarity regarding the technology and its operational mechanisms. In response, we have provided comprehensive requirements for documentation that elaborates on the technology's principles, functionalities, and benefits. This will includes detailed schematics, operational protocols, and user scenarios to illustrate its efficacy and safety.

After-Hours Operation

To address concerns about after-hours functionality, we have included additional for the system's reliability and robustness during non-operational hours. This includes backup power system requirements, automated monitoring protocols, and fail-safes to ensure continuous operation and immediate response in emergency situations.

Proposal for an Appendix

In light of the suggestion to start with an appendix, we have developed a detailed appendix outlining the technology's specifications, use cases, and integration procedures. This appendix serves as a comprehensive reference for stakeholders to understand the technology's application and benefits within the code framework.

Obtaining Listings

Companies are actively pursuing relevant listings and certifications to validate the technology's compliance with industry standards. This process includes rigorous testing and evaluation by recognized certification bodies. We anticipate these listings will be obtained shortly and will provide updates as they become available to jurisdictions who require them.

Detailed System Shop Drawings

To provide a clearer understanding of the technology, we have mapped out the system's components, interactions, and integration points. These shop drawings include diagrams, architectural layouts, and operational sequences to ensure a transparent and thorough presentation of how the system functions within various scenarios.

Conclusion

We believe that with these enhancements and additional information, our proposal now addresses the previously raised concerns and provides a clearer understanding of the technology and its benefits. We respectfully request the committee to reconsider our proposal, taking into account the supplementary modification and improvements made.

Thank you for your consideration.

Cost Impact: Increase

Estimated Immediate Cost Impact:

This cost impact statement is hypothetical and serves as a template. Actual figures should be derived using detailed cost analysis specific to the region, type of construction sites, and the specific technology used in the notification and detection systems.

Total Immediate Cost per construction site:

- Wireless notification and detection systems - $20,000 - $100,000
- Wired notification and detection systems - $35,000- $150,000

If through alternative means and methods, these systems are approved to replaces fire watch, the cost impact will be negative.

Estimated Immediate Cost Impact Justification (methodology and variables):

Equipment Costs: Includes the purchase of smoke sensors, heat sensors, and notification devices.

Installation Costs: Professional fees for installing and integrating the system into existing construction site infrastructure.

Training Costs: Expenses related to training site personnel in system operation and emergency response protocols.

Maintenance Costs: Initial maintenance and testing costs for the first year.

Administrative and Compliance Costs: Expenses associated with ensuring compliance with the new code, including any required certifications and inspections.

Variables include the size of the construction site, the complexity of the installation (which may vary based on site layout), and the level of technology chosen for the system.

Estimated Life Cycle Cost Impact:

Given the provided baseline cost ranges for wireless and wired notification and detection systems in the per project impact, this would be an estimated life cycle cost impact for each. Using a midpoint value within each range for the calculation to provide a balanced estimate.

Wireless Notification and Detection Systems

Initial Costs

Average Cost: $60,000 (midpoint of $20,000 - $100,000 range)

Installation Costs: Assumed at 10% of system cost = $6,000

Training Costs: $2,000

Total Initial Cost: $68,000

Operational Costs (Annually)

Maintenance: $1,500 (annual)

Energy Consumption: $300 (annual)

Total Annual Operational Cost: $1,800

Long-Term Costs (Over 10 Years)

System Upgrades (every 5 years): $10,000

Decommissioning Costs: $5,000

Total Long-Term Cost: $15,000

Indirect Costs and Savings

Insurance Premium Reductions: $1,000 (annual)

Reduced Accident Costs: $20,000 (over 10 years)

Total Indirect Savings (10 years): $30,000

Total Estimated Life Cycle Cost for Wireless System (10 years):

Initial Costs: $68,000

Operational Costs (10 years): $18,000

Long-Term Costs: $15,000

Indirect Savings: -$30,000

Net Cost: $71,000

Wired Notification and Detection Systems

Initial Costs

Average Cost: $92,500 (midpoint of $35,000 - $150,000 range)

Installation Costs: Assumed at 15% of system cost = $13,875

Training Costs: $2,000

Total Initial Cost: $108,375

Operational Costs (Annually)

Maintenance: $2,000 (annual)

Energy Consumption: $400 (annual)

Total Annual Operational Cost: $2,400

Long-Term Costs (Over 10 Years)

System Upgrades (every 5 years): $15,000

Decommissioning Costs: $7,000

Total Long-Term Cost: $22,000

Indirect Costs and Savings

Insurance Premium Reductions: $1,200 (annual)

Reduced Accident Costs: $25,000 (over 10 years)

Total Indirect Savings (10 years): $37,000

Total Estimated Life Cycle Cost for Wired System (10 years):

Initial Costs: $108,375

Operational Costs (10 years): $24,000

Long-Term Costs: $22,000

Indirect Savings: -$37,000

Net Cost: $117,375

These estimates are based on the provided cost ranges and average industry figures. Actual costs may vary based on specific site requirements, regional cost differences, and technology choices. Detailed, site-specific analysis is recommended for accurate budgeting.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

Long-term Maintenance and Servicing: Regular checks and repairs over the system's lifespan.

Technology Upgrades: Potential costs for upgrading the system to keep up with technological advancements.

Energy Usage: Operational costs including electricity usage of the system.

Potential Insurance Premium Reductions: Reduction in insurance premiums due to improved fire safety measures, contributing to cost savings over the life cycle.

Depreciation: The decrease in the value of the equipment over time.

Variables include the anticipated lifespan of the equipment, estimated frequency of maintenance and upgrades, and expected trends in energy costs and insurance premiums.

CHAPTER 42
BATTERIES

SECTION 4201
GENERAL

4201.1 Scope. The provisions of this chapter shall apply to research, testing, manufacturing, recycling, use or storage of the battery types defined in Chapter 2. **Exception:** Installed energy storage systems regulated by Section 1207.

4201.1.1 Hazardous Materials Applicability.. Battery types other than those types defined in Chapter 2 shall also be in compliance with Chapters 50 through 67 as applicable.

4201.2 Electrical wiring and equipment.. Electrical wiring and equipment used in connection with batteries shall be installed and maintained in accordance with this chapter, Section 603 and NFPA 70, as applicable.

4201.3 Permits.. Permits shall be required, as applicable, in accordance with Section 105.5 and 105.6.

SECTION 4202
DEFINITIONS

4202.1 Definitions.. The following terms are defined in Chapter 2.**BATTERY**
BATTERY TYPES.

Revise as follows:

SECTION ~~320~~ 4203
LITHIUM-ION AND LITHIUM METAL BATTERY STORAGE

~~**320.1**~~ **4203.1 General.** The storage of lithium-ion and lithium metal batteries shall comply with Section ~~320~~4203.

Exceptions:

1. New or refurbished batteries installed in the equipment, devices or vehicles they are designed to power.
2. New or refurbished batteries packed for use with the equipment, devices or vehicles they are designed to power.

3. Batteries in original retail packaging that are rated at not more than 300 watt-hours for lithium-ion batteries or contain not more than 25 grams of lithium metal for lithium metal batteries.
4. Temporary storage of batteries or battery components during the battery manufacturing process prior to completion of final quality control checks.
5. Temporary storage of batteries during the vehicle manufacturing or repair process.

~~320.2~~ **4203.2 Permits.** Permits shall be required for an accumulation of more than 15 cubic feet (0.42 m^3) of lithium-ion and lithium metal batteries, other than batteries listed in the exceptions to Section ~~321.1~~ 4203.1, as set forth in Section 105.5.29.

~~320.3~~ **4203.3 Fire safety plan.** A fire safety plan shall be provided in accordance with Section 404. In addition, the fire safety plan shall include emergency response actions to be taken upon detection of a fire or possible fire involving lithium-ion or lithium metal battery storage.

~~320.4~~ **4203.4 Storage requirements.** Lithium-ion and lithium metal batteries shall be stored in accordance with Section ~~320.4.1~~4203.4.1, ~~320.4.2~~4203.4.2 or ~~320.4.3~~4203.4.3, as applicable.

~~320.4.1~~ **4203.4.1 Limited indoor storage in containers.** Not more than 15 cubic feet (0.42 m^3) of lithium-ion or lithium metal batteries shall be permitted to be stored in containers in accordance with all of the following:

1. Containers shall be open top and constructed of noncombustible materials or shall be *approved* for battery collection.
2. Individual containers and groups of containers shall not exceed a capacity of 7.5 cubic feet (0.21 m^3).
3. A second container or group of containers shall be separated by not less than 3 feet (914 mm) of open space or 10 feet (3048 mm) of space that contains combustible materials.
4. Containers shall be located not less than 5 feet (1524 mm) from *exits* or *exit access* doors.

~~320.4.2~~ **4203.4.2 Indoor storage areas.** Indoor storage areas for lithium-ion and lithium metal batteries, other than those complying with Section ~~320.4.1~~4203.4.1, shall comply with Sections ~~320.4.2.1~~4203.4.2.1 through ~~320.4.2.6~~4203.2.6.

~~320.4.2.1~~ **4203.4.2.1 Technical opinion and report.** A technical opinion and report complying with Section 104.2.2 shall be prepared to evaluate the fire and explosion risks associated with the indoor storage area and to make recommendations for fire and explosion protection. The report shall be submitted to the *fire code official* and shall require the *fire code official 's* approval prior to issuance of a permit. In addition to the requirements of Section 104.2.2, the technical opinion and report shall specifically evaluate the following:

1. The potential for *deflagration* of flammable gases released during a thermal runaway event.
2. The basis of design for an *automatic sprinkler system* or other *approved* fire suppression system. Such design basis shall reference relevant full-scale fire testing or another *approved* method of demonstrating sufficiency of the recommended design.

~~320.4.2.2~~ **4203.4.2.2 Construction requirements.** Where indoor storage areas for lithium-ion and lithium metal batteries are located in a building with other uses, battery storage areas shall be separated from the remainder of the building by 2-hour rated *fire barriers* or *horizontal assemblies. Fire barriers* shall be constructed in accordance with Section 707 of the *International Building Code*, and *horizontal assemblies* shall be constructed in accordance with Section 711 of the *International Building Code*.

Exceptions:

1. Where battery storage is contained in one or more *approved* prefabricated portable structures providing a complete 2-hour fire-resistance-rated enclosure, *fire barriers* and *horizontal assemblies* are not required.
2. Where battery storage is limited to new batteries in packaging that has been demonstrated to and *approved* by the *fire code official* as sufficient to isolate a fire in packaging to the package interior, *fire barriers* and *horizontal assemblies* are not required.

~~320.4.2.3~~ **4203.4.2.3 Fire protection systems.** Indoor storage areas for lithium-ion and lithium metal batteries shall be protected by an *automatic sprinkler system* complying with Section 903.3.1.1 or an *approved* alternative fire suppression system. The system design shall be based on recommendations in the *approved* technical opinion and report required by Section ~~320.4.2.1~~4203.4.2.1.

~~320.4.2.4~~ **4203.4.2.4 Fire alarm systems.** Indoor storage areas for lithium-ion and lithium metal batteries shall be provided with an *approved* automatic fire detection and alarm system complying with Section 907. The fire detection system shall use air-aspirating smoke detection, radiant energy-sensing fire detection or both.

~~320.4.2.5~~ **4203.4.2.5 Explosion control.** Where the *approved* technical opinion and report required by Section ~~320.4.2.1~~4203.4.2.1 recommends explosion control, explosion control complying with Section 911 shall be provided.

~~320.4.2.6~~ **4203.4.2.6 Reduced requirements for storage of partially charged batteries.** Indoor storage areas for lithium-ion and lithium metal batteries with a demonstrated state of charge not exceeding 30 percent shall not be required to comply with Sections ~~320.4.2.1~~ 4203.4.2.1, ~~320.4.2.2~~4203.4.2.2 and ~~320.4.2.5~~4203.4.2.5, provided that procedures for limiting and verifying that the state of charge will not exceed 30 percent have been *approved*.

~~320.4.3~~ **4203.4.3 Outdoor storage.** Outdoor storage of lithium-ion or lithium metal batteries shall comply with Sections ~~320.4.3.1~~ 4203.4.3.1 through ~~320.4.3.3~~4203.4.3.3.

~~320.4.3.1~~**4203.4.3.1 Distance from storage to exposures.** Outdoor storage of lithium-ion or lithium metal batteries, including storage beneath weather protection in accordance with Section 414.6.1 of the *International Building Code*, shall comply with one of the following:

1. Battery storage shall be located not less than 20 feet (6096 mm) from any building, *lot line*, public street, public alley, public way or *means of egress*.
2. Battery storage shall be located not less than 3 feet (914 mm) from any building, *lot line*, public street, public alley, public way or *means of egress*, where the battery storage is separated by a 2-hour fire-resistance-rated assembly without openings or penetrations and extending 5 feet (1524 mm) above and to the sides of the battery storage area.
3. Battery storage shall be located not less than 3 feet (914 mm) from any building, *lot line*, public street, public alley, public way or *means of egress*, where batteries are contained in *approved,* prefabricated portable structures providing a complete 2-hour fire-resistance-rated enclosure.

~~320.4.3.2~~**4203.4.3.2 Storage area size limits and separation.** Outdoor storage areas for lithium-ion or lithium metal batteries, including storage beneath weather protection in accordance with Section 414.6.1 of the *International Building Code*, shall not exceed 900 square feet (83.6 m^2). The height of battery storage in such areas shall not exceed 10 feet (3048 mm). Multiple battery storage areas shall be separated from each other by not less than 10 feet (3048 mm) of open space.

~~320.4.3.3~~**4203.4.3.3 Fire detection.** Outdoor storage areas for lithium-ion or lithium metal batteries, regardless of whether such areas are open, under weather protection or in a prefabricated portable structure, shall be provided with an *approved* automatic fire detection and alarm system complying with Section 907. The fire detection system shall use radiant energy-sensing fire detection.

SECTION ~~322~~ 4204
POWERED MICROMOBILITY DEVICES

~~322.1~~**4204.1 General.** Lithium-ion and lithium metal battery *powered micromobility devices* shall be operated and maintained in accordance with this section. **Exceptions:**

1. Storage, repair and charging in residential occupancies of *powered mobility devices*, provided that such devices are for personal use by its owner.
2. Charging of a single *powered mobility device* in any occupancy by its owner.

~~322.1.1~~4204.1.1 **Prohibited locations.** The use of a residential occupancy as a business for the charging of commercially owned *powered micromobility devices* as part of a rental or sales service shall not be permitted.

~~322.2~~4204.2 **Battery chargers and equipment.** *Powered micromobility devices* shall be charged in accordance with their listing and the manufacturer's instructions using only the original equipment manufacturer-supplied charging equipment or charging equipment in accordance with the listing and manufacturer's instructions.

~~322.3~~4204.3 **Listing.** *Powered micromobility devices* shall be *listed* and *labeled* in accordance with UL 2272 or UL 2849, as applicable.

~~322.4~~4204.4 **Battery charging areas.** Where *approved*, *powered micromobility devices* shall permitted to be charged in a room or area that complies with all of the following:

1. Only *listed* devices utilizing *listed* charging equipment shall be permitted to be charged.
2. Is provided with sufficient electrical receptacles to allow the charging equipment for each device to be directly connected to a receptacle. Extension cords and relocatable power taps shall not be used.
3. Storage of combustible materials, combustible waste or hazardous materials shall not be permitted.
4. The charging operation shall not be conducted in or obstruct any required means of egress.
5. Removable storage batteries shall not be stacked or charged in an enclosed cabinet unless the cabinet is specially designed and *approved* for such purpose.
6. A minimum distance of 18 inches (457.2 mm) shall be maintained between each removable storage battery during charging operations unless each battery is isolated from neighboring batteries by an *approved* fire-resistant material.
7. A minimum of 18 inches (457.2 mm) shall be maintained between the location of the battery on each *powered micromobility device* during charging operations.
8. The indoor room or area shall be protected by a *fire alarm system* utilizing air-aspirating smoke detectors or radiant energy-sensing fire detection.

~~322.5~~4204.5 **Fire safety plan.** A fire safety plan shall be provided in accordance with Section 403.10.6. In addition, the fire safety plan shall include emergency response actions to be taken upon detection of a fire or possible fire involving lithium-ion or lithium metal battery storage.

Reason: FCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and early 2024 the FCAC has held several virtual meetings and one in-person meeting open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the **FCAC Website**

With the growing number of sections and language addressing batteries from manufacture, R&D, storage and use in devices in the IFC it appears the time is appropriate to create a new chapter to gather the battery related language other than Section 1207 ESS. This proposal provides the initial structure of this chapter moving current Sections 320 and 322 to this chapter. The intent is that revisions made in Sections 320 and 322 would be made in this chapter as well. In addition there are other proposals adding to the requirements in the IFC on batteries. It is intended that all those new topics would be placed in this chapter as outlined below

- **Section 4201 General**
- **Section 4202 Definitions**
- **Section 4203 Lithium-Ion and Lithium Metal Research, Testing, Manufacturing and Recycling**
- **Section 4204 Lithium-Ion and Lithium Metal Battery Storage**
- **Section 4205 Battery-Powered Devices, Industrial Trucks, Equipment and Appliances (Note: Current Section 322 is proposal to expand scope to include the additional items)**
- **Section 4206 Other Battery Types**

Having a Chapter for batteries eases finding the technical language for designers, building owners/operators and code officials.

It is expected that some items from the other sections could be merged into a general requirement such as requirements for fire safety plans with the language specific to the subtopics remaining in the designated subsections.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal is to establish a structure for moving other existing and proposed sections of the IFC related to batteries that are being heard separately into one chapter.

F230-24

Public Hearing Results (CAH1)

Committee Action: **As Submitted**

Committee Reason: This proposal was approved as it appropriately brings all the battery requirements into a single chapter. (Vote 14-0)

F230-24

Individual Consideration Agenda

Comment 1:

IFC: 4201.1

Proponents: Robert J Davidson, Davidson Code Concepts LLC, Self (rjd@davidsoncodeconcepts.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Fire Code

4201.1 Scope. The provisions of this chapter shall apply to research, testing, manufacturing, recycling, use or storage of the battery types defined in Chapter 2.

Exception: ~~Installed~~ Stationary, mobile or portable energy storage systems regulated by Section 1207.

Reason: This proposal corrects a correlation issue. Section 1207 of the fire code applies to "Stationary, mobile and portable" ESS as does NFPA 855. The modified language mirror that.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The change simply correlates this new chapter and its exception with the applicability of the referenced section.

Comment 2:

IFC: CHAPTER 42, 4201.1, SECTION 4204, SECTION 4205 (New), 4205.1 (New)

Proponents: Jonathan Roberts, UL Solutions, UL Solutions (jonathan.roberts@ul.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Fire Code

Revise as follows:

CHAPTER 42
BATTERIES AND BATTERY POWERED EQUIPMENT AND DEVICES

4201.1 Scope. The provisions of this chapter shall apply to the following: ~~research, testing, manufacturing, recycling, use or storage of the battery types defined in Chapter 2.~~

1. The storage of lithium-ion and lithium metal batteries at research, testing, manufacturing, recycling, and other facilities.
2. The charging, use, maintenance, and repair of battery operated equipment and devices.
3. The use, operation and maintenance of portable power packs with an energy capacity of 1 kWh or greater.

Exception: ~~Installed e~~Energy storage systems regulated by Section 1207.

SECTION 4204
BATTERY POWERED EQUIPMENT AND DEVICES ~~POWERED MICROMOBILITY DEVICES~~

Add new text as follows:

SECTION 4205
PORTABLE POWER PACKS

4205.1 General. The use, operation and maintenance of portable power packs with an energy capacity of 1 kWh or greater shall comply with Section 1208.

Reason: The 4201.1 scope was revised to more closely reflect the content in this chapter.
The 4201 exception was revised to take into consideration mobile and portable ESS regulated by 1207.

The title of 4204 was revised to more closely align with the title of section 322 that is being revised by F58-24. It is assumed that the correlating committee will also move the content of that section into this chapter and delete section 322 if a new chapter 42 is adopted.

If proposal F176-24 is adopted the requirements for portable battery packs in 1208 should be moved into section 4205.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Primarily moves requirements into this new chapter.

Comment (CAH2)# 735

F231-24

IFC: CHAPTER 42 (New), SECTION 4201 (New), 4201.1 (New), 4201.2 (New), SECTION 4202 (New), 4202.1 (New), SECTION 202 (New), SECTION 4203 (New), 4203.1 (New), 4203.1.1 (New), 4203.1.2 (New), 4203.2 (New), 4203.3 (New), 4203.3.1 (New), 4203.3.2 (New), 4203.4 (New), 4203.5 (New), 4203.5.1 (New), 4203.5.2 (New), 4203.5.3 (New), SECTION 4204 (New), 4204.1 (New), 4204.2 (New), 4204.3 (New), 4204.4 (New), 903.2.2, 903.2.2.3 (New), 903.2.7, 903.2.7.4 (New), TABLE 906.1, 1103.7, 1103.7.1 (New), 1103.7.1, 1103.7.2, 1103.7.3, 1103.7.4, 1103.7.6 (New), 1103.9, 105.5.41 (New); IBC: [F] 903.2.2, 903.2.2.3 (New), [F] 903.2.7, 903.2.7.4 (New), [F] TABLE 906.1

Proposed Change as Submitted

Proponents: Jeffrey Shapiro, International Code Consultants, Lake Travis Fire Rescue (jshapiro@LTFR.org)

2024 International Fire Code

Add new text as follows:

CHAPTER 42
PET BOARDING

SECTION 4201
GENERAL

4201.1 Scope. Occupancies containing *pet boarding* shall comply with this chapter.

4201.2 Permit. A permit shall be required for *pet boarding* as set forth in Section 105.5.

SECTION 4202
DEFINITIONS

4202.1 Definitions. The following terms are defined in Chapter 2:
PET BOARDING.

Add new definition as follows:

PET BOARDING. Use of a Group B or Group M Occupancy to house a cumulative total of 10 or more dogs or cats for more than 12 hours per day that are available for sale or housed inside of a building as a service to the dog or cat owner.

Add new text as follows:

SECTION 4203
FIRE SAFETY PRECAUTIONS

4203.1 Fire safety plan. An *approved* fire safety and evacuation plan in accordance with Section 404 shall be prepared and maintained for *pet boarding*.

4203.1.1 Fire safety plan additions. In addition to the requirements of Section 404.2.2, fire safety plans for pet boarding shall include all of the following:

1. Sequence of procedures to be followed in the event of a fire.
2. Procedures for evacuating pets, including the location of any special keys or tools required to evacuate pets.
3. Items to be inspected when conducting daily safety inspections.
4. Procedures for training employees to know the locations of portable fire extinguishers and how to properly use them.
5. Procedures for maintaining proper clearances between combustibles and ignition sources in a *pet boarding* area in accordance with Section 305.
6. Procedures to ensure that there are no open flames in a *pet boarding* area.
7. Procedures to ensure that cooking and heating in a *pet boarding* area are conducted in accordance with Chapter 41.
8. Procedures to ensure that use of current taps, relocatable power taps and extension cords in a *pet boarding* area is done in a safe manner and complies with Sections 603.5 and 603.6.
9. Procedures for ensuring that trash and other combustible waste are removed from *pet boarding* areas not less than once per day.
10. Procedures for ensuring that clothes dryer vents are kept clear of lint accumulation in accordance with Section 610.1.2.
11. Procedures for maintaining a staffing plan that specifies hours of operation, minimum staffing, staff names, and staff contact information.

4203.1.2 Posting of fire safety plan. The sequence of procedures to be followed in the event of a fire shall be prominently posted next to each egress door or opening leading out of the *pet boarding* area.

4203.2 Removal of combustible waste. Trash and other combustible waste shall be removed from pet boarding areas not less than once per day.

4203.3 Staffing. Staffing for *pet boarding* shall comply with Sections 4203.3.1 and 4203.3.2.

4203.3.1 Staffing plan. A staffing plan shall be prepared and maintained that includes current hours of operation, minimum staffing, staff names, and staff contact information.

4203.3.2 Minimum staffing. At least one staff member shall be responsible for boarded pets, remaining in or immediately adjacent to pet boarding areas and awake at all times when a cumulative total of 10 or more dogs and cats are present, including overnight, for *pet boarding* in a *fire area* that is not equipped with an *automatic sprinkler system* in accordance with Section 4204.4

4203.4 Safety inspections. Safety inspections specified in the approved fire safety plan shall be conducted at least once per day. A record of such safety inspection shall be maintained on the premises to document the date and time of each inspection and shall include the name of the individual who conducted the inspection.

4203.5 Sources of ignition. Sources of ignition in *pet boarding* areas shall comply with Sections 4203.5.1 through 4203.5.3.

4203.5.1 Cooking and heating. Cooking and heating in *pet boarding* areas shall comply with Chapter 41. Heating pads used for warming animals shall be listed and labeled by a nationally recognized testing laboratory.

4203.5.2 Open flames. Open flames shall be prohibited in *pet boarding* areas.

4203.5.3 Smoking. Smoking shall be prohibited in occupancies containing a *pet boarding* area. “No Smoking” signs shall be provided in accordance with Section 310.

SECTION 4204

FIRE PROTECTION AND LIFE SAFETY SYSTEMS

4204.1 Portable fire extinguishers. Portable fire extinguishers rated 2-A:10-B:C and mounted in accordance with Section 906.9 shall be placed adjacent to each egress door or opening leading out of a *pet boarding* area, with additional extinguishers provided as necessary so that the travel distance to an extinguisher from anywhere in a *fire area* containing a *pet boarding* area does not exceed 50 feet (15240 mm).

4204.2 Smoke detection system. An automatic smoke detection system that activates occupant notification in accordance with Section 907.5 and is monitored in accordance with Section 907.6.6 shall be installed in new and existing *fire areas* containing *pet boarding*. In locations where ambient conditions are incompatible with *smoke detectors*, *heat detectors* with a response time index of 50 $(m \times s)^{1/2}$ shall be permitted. **Exception:** An automatic smoke detection system is not required in *fire areas* equipped with an *automatic sprinkler system* complying with Section 4204.4.

4204.3 Carbon monoxide detection. In addition to the requirements in Section 915, carbon monoxide detection shall be provided in new and existing *pet boarding* areas where a *carbon monoxide source* is present.

4204.4 Automatic sprinkler system. An *automatic sprinkler system* with quick-response sprinklers complying with Section 903.3.1 or a limited area *automatic sprinkler system* complying with Section 903.3.8 with quick-response sprinklers shall be installed in *fire areas* containing *pet boarding*.

Revise as follows:

903.2.2 Group B. An *automatic sprinkler system* shall be provided for Group B occupancies as required in Sections 903.2.2.1 through 903.2.2.3 ~~and 903.2.2.2~~.

Add new text as follows:

903.2.2.3 Pet boarding. An *automatic sprinkler system* shall be installed in *fire areas* containing *pet boarding*.

Revise as follows:

903.2.7 Group M. An *automatic sprinkler system* shall be provided throughout buildings containing a Group M occupancy where required by Sections 903.2.7.1 through 903.2.7.4 or where any~~one~~ of the following conditions exist~~s~~:

1. A Group M *fire area* exceeds 12,000 square feet (1115 m^2).
2. A Group M *fire area* is located more than three stories above *grade plane*.
3. The combined area of all Group M *fire areas* on all floors, including any mezzanines, exceeds 24,000 square feet (2230 m^2).

Add new text as follows:

903.2.7.4 Pet boarding. An *automatic sprinkler system* shall be installed in *fire areas* containing *pet boarding*.

Revise as follows:

TABLE 906.1 ADDITIONAL REQUIRED PORTABLE FIRE EXTINGUISHERS

Portions of table not shown remain unchanged.

SECTION	SUBJECT
4204.1	Pet boarding

1103.7 Fire alarm systems. An *approved fire alarm system* shall be installed in existing buildings and structures in accordance with Sections 1103.7.1 through 1103.7.8~~1103.7.6~~ and provide occupant notification in accordance with Section 907.5 unless other

requirements are provided by other sections of this code. **Exception:** Occupancies with an existing, previously *approved fire alarm system*.

Add new text as follows:

1103.7.1 Group B pet boarding. An *automatic smoke detection system* shall be installed in *fire areas* containing *pet boarding* in accordance with Section 4204.2.

Revise as follows:

1103.7.2~~1103.7.1~~ Group E. A *fire alarm system* shall be installed in existing Group E occupancies in accordance with Section 907.2.3. **Exceptions:**

1. A manual *fire alarm system* is not required in a building with a maximum area of 1,000 square feet (93 m^2) that contains a single classroom and is located not closer than 50 feet (15 240 mm) from another building.
2. A manual *fire alarm system* is not required in Group E occupancies with an *occupant load* less than 50.

1103.7.3~~1103.7.2~~ Group I-1. An automatic *fire alarm system* shall be installed in existing Group I-1 facilities in accordance with Section 907.2.6.1. **Exception:** Where each sleeping room has a *means of egress* door opening directly to an exterior egress balcony that leads directly to the *exits* in accordance with Section 1021, and the building is not more than three stories in height.

1103.7.4~~1103.7.3~~ Group I-2. In Group I-2, an automatic *fire alarm system* shall be installed in accordance with Section 1105.10.

1103.7.5~~1103.7.4~~ Group I-3. An automatic and manual *fire alarm system* shall be installed in existing Group I-3 occupancies in accordance with Section 907.2.6.3.

Add new text as follows:

1103.7.6 Group M pet boarding. An *automatic smoke detection system* shall be installed in *fire areas* containing *pet boarding* in accordance with Section 4204.2.

Revise as follows:

1103.9 Carbon monoxide detection. Carbon monoxide detection shall be installed in existing buildings where any of the conditions identified in Section 915.1.1 exist and in *pet boarding* areas as specified in Section 4204.3. Carbon monoxide alarms shall be installed in the locations specified in Section 915.2 and the installation shall be in accordance with Section 915.4. **Exceptions:**

1. Carbon monoxide alarms are permitted to be solely battery operated where the code that was in effect at the time of construction did not require carbon monoxide detectors to be provided.
2. Carbon monoxide alarms are permitted to be solely battery operated in *dwelling units* that are not served from a commercial power source.
3. A carbon monoxide detection system in accordance with Section 915.5 shall be an acceptable alternative to carbon monoxide alarms.

Add new text as follows:

105.5.41 Pet boarding. An operational permit is required to for *pet boarding*.

2024 International Building Code

[F] 903.2.2 Group B. An *automatic sprinkler system* shall be provided for Group B occupancies as required in Sections 903.2.2.1

and 903.2.2.2.

Add new text as follows:

903.2.2.3 Pet boarding. An *automatic sprinkler system* shall be installed in *fire areas* containing *pet boarding.*

Revise as follows:

[F] 903.2.7 Group M. An *automatic sprinkler system* shall be provided throughout buildings containing a Group M occupancy where required by Sections 903.2.7.1 through 903.2.7.4 or where any~~one~~ of the following conditions exist~~s~~:

1. A Group M *fire area* exceeds 12,000 square feet (1115 m^2).
2. A Group M *fire area* is located more than three stories above *grade plane*.
3. The combined area of all Group M *fire areas* on all floors, including any *mezzanines*, exceeds 24,000 square feet (2230 m^2).

Add new text as follows:

903.2.7.4 Pet boarding. An *automatic sprinkler system* shall be installed in *fire areas* containing *pet boarding.*

Revise as follows:

[F] TABLE 906.1 ADDITIONAL REQUIRED PORTABLE FIRE EXTINGUISHERS IN THE INTERNATIONAL FIRE CODE
Portions of table not shown remain unchanged.

IFC SECTION	SUBJECT
4204.1	Pet boarding

Reason: Unlike past proposals related to animal housing that broadly prescribed a minimum level of safety for all animal housing facilities based on NFPA 150 (Proposals G216-07/08, F277-18, and F69-21), this proposal takes a more targeted approach that focuses exclusively on pet safety in commercial occupancies where 10 or more dogs and cats are kept overnight. The focus on dogs and cats is not meant to diminish the value of other pets. Instead, it promotes incremental progress in the code to directly respond to numerous catastrophic fire losses in facilities that boarded dogs and cats. Most notable to me is the recent loss of 75 dogs in the Ponderosa Pet Resort fire in Georgetown, Texas on September 18, 2021. This incident led several jurisdictions in central Texas to enact ordinances that improve fire protection in new and existing pet boarding facilities. The love and care that dog and cat owners offer their pets is said by many to be on a par with children or family members. In fact, it's long been known that pet owners may delay evacuation or go back into a burning building after safely evacuating to rescue a pet. Likewise, there are recorded instances of employees of pet boarding facilities and firefighters entering burning buildings for the sole purpose of rescuing pets, putting their own lives at risk in the process. With proper safety plans and built-in protection features, these acts of desperation can be avoided.

A pet owner who entrusts a dog or cat to a business offering overnight care should have a reasonable expectation of safety for the pet based on due diligence of the business and building safety laws that govern the business. Likewise, dogs and cats in pet stores awaiting a forever home should be reasonably protected from the risk of dying unattended in an after-hours fire. Accordingly, this proposal adds new administrative requirements for a fire safety plan to be developed and maintained by dog and cat boarding occupancies, expanding the base requirements in Section 404 to address unique safety considerations related to pet boarding. The recommended safety plan additions and fire protection requirements were developed after consideration of relevant content in NFPA 150 (fire extinguisher provisions are correlated with those in NFPA 150), Illinois' 225 ILCS 605 Animal Welfare Act, California Health and Safety Code 122385, and several Texas jurisdiction ordinances.

The "10 or more" threshold is believed to be a reasonable basis for achieving consensus in the 2027 edition code development process. It seems fair that a facility with a smaller number of dogs and cats would occupy a small floor area in a personal environment with closer supervision. The larger number of 10 or more cumulative dogs and cats better reflects a commercial business that should be expected to comply with minimum safety considerations. I expect that there will be recommendations to expand the scope of this proposal, perhaps to include fire protection requirements for buildings where breeders keep dogs or cats or to include other types of animals or uses. Notably, in early January, a fire in a small breeder building killed 25 puppies in Milton, WI. Nevertheless, pet breeding facilities have not been

included in this proposal, recognizing that dogs and cats in such facilities are owned by the breeder on private property, essentially no different than private party pet owners having multiple pets on their own property, who are likewise not included. I am sympathetic to additional discussion as part of the code development process, but my objective is to not let "the perfect become the enemy of the good." It is important that consensus be reached to approve some baseline for animal housing facilities as part of the 2027 code, and more controversial topics can be revisited in a later cycle if necessary to achieve that objective.

Although the value of fire sprinklers in pet boarding occupancies cannot be overstated (demonstrated as recently as December 2023, when a fire at Animal & Medical Hospital of Frisco, Texas was controlled by a single sprinkler, saving 20 pets and resulting in no human injuries), this proposal does not recommend retrofitting existing occupancies with sprinklers. A number of individuals testified in opposition to the code requiring a higher level of protection for animals than people in past code cycles, and in deference to that viewpoint, this proposal suggests a level of protection that parallels Group R-1. Although new Group R-1 Occupancies require sprinkler protection, existing Group R-1 Occupancies need only have fire alarm systems. Recognizing that boarded dogs and cats may be restrained or, even if unrestrained with a path of egress cannot be relied upon to have an evacuation response in the event of a fire, the baseline for existing occupancies should be early warning with onsite staff and rapid notification of emergency responders.

Although I serve as a consultant to the National Fire Sprinkler Association, this proposal has not been reviewed or endorsed by NFSA, and I am not representing NFSA on this issue.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

Administrative requirements, such as fire safety plans, are de minimis, and are mostly providing a means to ensure that existing code requirements are complied with. There will be a cost increase associated with adding a monitored smoke alarm system to existing occupancies, perhaps in the range of $1 to $5 per square foot, and sprinkler systems to new occupancies, perhaps in the range of $1 to $2 per square foot.

Estimated Immediate Cost Impact Justification (methodology and variables):

Various Web sites suggested the quoted price ranges, which will obviously vary greatly depending on conditions associated with any specific installation. ChatGPT generally agreed with these estimates, and given that it is entirely unreasonable to ask someone to better quantify the cost impact of a proposal of this breadth, that's as good a basis as any.

F231-24

Public Hearing Results (CAH1)

Committee Action: **As Modified by Committee**

Committee Modification: 1103.9 Carbon monoxide detection. Carbon monoxide detection shall be installed in existing buildings where any of the conditions identified in Section 915.1.1 exist and in *pet boarding* areas as specified in Section 4204.3. Carbon monoxide alarms shall be installed in the locations specified in Section 915.2 and the installation shall be in accordance with Section 915.4.
Exceptions:

1. Carbon monoxide alarms are permitted to be solely battery operated where the code that was in effect at the time of construction did not require carbon monoxide detectors to be provided.

2. Carbon monoxide alarms are permitted to be solely battery operated in buildings ~~*dwelling units*~~ that are not served from a commercial power source.

3. A carbon monoxide detection system in accordance with Section 915.5 shall be an acceptable alternative to carbon monoxide alarms.

4201.2 Operational Permit. ~~A~~ An operational permit shall be required for *pet boarding* as set forth in Section 105.5.

Committee Reason: Approval was based upon the need for these requirements. The provisions are reasonable and focus on risk. Providing these provisions will provide consistency that can be used more broadly then leaving such requirements up to local regulators and legislature. The committee felt that it is better placed within the code than within an appendix. There were two minor modifications. The first modification corrects the term from "dwelling unit" to "buildings." Dwelling unit would be too limiting for the types of occupancies this would be allowed to be applied. The second provides correlation with the permit related proposal F2-24 stating "operational permit" more specifically. (Vote 14-0)

F231-24

Individual Consideration Agenda

Comment 1:

IFC: SECTION 202, 4201.1, 4201.1.1 (New)

Proponents: Jeffrey Shapiro, P.E., FSFPE, Lake Travis Fire Rescue, Lake Travis Fire Rescue (jshapiro@ltfr.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Fire Code

Revise as follows:

PET BOARDING.
Use of an ~~Group B or Group M Occupancy~~ occupancy to house a cumulative total of 10 or more dogs or cats for more than 12 hours per day that are available for sale or housed inside of a building as a service to the dog or cat owner.

4201.1 Scope. *Pet boarding* shall be conducted in Group B or Group M Occupancies that ~~containing *pet boarding* shall~~ comply with this chapter unless otherwise allowed by Section 4201.1.1.

Add new text as follows:

4201.1.1 Pet breeding. Pet breeding on property associated with a one- or two-family dwelling or agricultural use shall not be required to comply with this chapter.

Reason: During development of this chapter, concerns were raised regarding the ability of a permit applicant to justify classification of a pet boarding facility as Group S or Group F. While I didn't initially consider this to be a significant concern, I have since learned that it is more common than expected that some people view pet boarding as a "pet storage" operation, with pets being considered "property." Accordingly, with the intent of this proposal to not allow such a loophole, it is proposed to apply the provisions regardless of occupancy classification, with the exception of pet breeding operations, which were never intended to be covered by the chapter. I consider this change to simply be a clarification of intent.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The intent is simply to clarify the original intent for applicability of the chapter.

Comment (CAH2)# 774

Comment 2:

IFC: 4203.3.2

Proponents: Jeffrey Shapiro, Lake Travis Fire Rescue, Lake Travis Fire Rescue (jshapiro@ltfr.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Fire Code

Revise as follows:

4203.3.2 Minimum staffing. At least one staff member shall be responsible for boarded pets, remaining in or immediately adjacent to pet boarding areas and awake at all times when a cumulative total of 20~~10~~ or more dogs and cats are present, including overnight, for *pet boarding* in a *fire area* that is not equipped with an *automatic sprinkler system* in accordance with Section 4204.4

Reason: Although I believe that most of the requirements in the proposed chapter should be triggered at 10 or more pets being boarded, I do understand the burden on existing facilities having to provide overnight staffing in non-sprinklered facilities. This ultimately comes down to a decision of reasonable and appropriate thresholds determined by the consensus process, and in an effort to be fair and allow further discussion on this issue, I am submitting this comment to allow others to make a case for a number greater than 10 to be used in this section.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This relates to an operational cost and has no impact on the cost of construction.

Comment (CAH2)# 777

F245-24

IFC: 5307.1, 5307.2 (New), 5307.2, 5307.2.1

Proposed Change as Submitted

Proponents: Kevin Scott, KH Scott & Associates LLC, self (khscottassoc@gmail.com)

2024 International Fire Code

5307.1 General. *Compressed gases* in storage or use not regulated by the material-specific provisions of Chapters 6, 54, 55, and 60 through 67, including asphyxiant, irritant and radioactive gases, shall comply with this section in addition to other requirements of this chapter.

Add new text as follows:

5307.2 Asphyxiants, irritants and radioactive gases. Asphyxiant, irritant or radioactive gases used or stored in quantities exceeding 1,000 cubic feet (28 m^3) shall comply with Sections 5307.2.1 or 5307.2.2. **Exception:** Carbon dioxide systems regulated by Sections 5307.3 or 5307.4.

Revise as follows:

~~**5307.2**~~ **5307.2.1 Ventilation.** Indoor storage and use areas and storage buildings shall be provided with ventilation in accordance with Section 5004.3. Where mechanical ventilation is provided, the systems shall be operational during such time as the building or space is occupied. ~~**Exceptions:**~~

1. ~~A *gas detection system* complying with Section 5307.2.1 shall be permitted in lieu of mechanical ventilation.~~
2. ~~Areas containing insulated liquid carbon dioxide systems used in beverage dispensing applications shall comply with Section 5307.3.~~

~~**5307.2.1**~~ **5307.2.2 Gas detection system.** In rooms or areas not provided with ventilation in accordance with Section ~~5307.2~~ 5307.2.1, a *gas detection system* complying with Section 916 or, where *approved*, an oxygen depletion alarm system, either of which initiates audible and visible alarm signals in the room or area where sensors are installed, shall be provided.

Reason: This proposal intends to resolve an unintended loophole in the code.

Currently, Section 5307 regulates asphyxiant, irritant and radioactive gases in any quantity. These gases require require either ventilation or gas detection.

Section 5307.3 regulates liquid carbon dioxide systems for beverage dispensing, but does not make any requirements until the quantity exceeds 100 pounds.

Section 5307.4 regulates carbon dioxide enrichment systems, and again does not make any requirements until the quantity exceeds 100 pounds. This provision does not limit its application to liquid or gaseous CO2; it applies to both.

Carbon dioxide is an asphyxiant gas, and in fact that characteristic was the impetus for the regulations of beverage dispensing and CO2 enrichment. The inconsistency is that when CO2 is used for something other than beverage dispensing or CO2 enrichment the threshold of regulation drops to 0. There is no justification to regulate the other gases in any quantity, when the liquid asphyxiants (CO2) are not regulated until they exceed 100 pounds. This proposal provides a similar threshold for all other gases that fall under Section 5307, the asphyxiant, irritant and radioactive gases.

A new section 5307.2 is inserted to require that when asphyxiant, irritant and radioactive gases exceed 1,000 cubic feet, they must be provided with either ventilation or gas detection. This is the same approach used for beverage dispensing. The exceptions are relocated to Section 5307.2 in both the text and the new exception.

The 1,000 cubic feet is simply an approximation of an equivalent volume. 100 pounds of CO2 is equivalent to 875 cubic feet. Nitrogen is another common asphyxiant and 100 pounds of nitrogen is approximately 1380 cubic feet. Nitrogen is available in cylinders containing about 230 cubic feet, so 4 cylinders would be below the threshold of 1,000 cubic feet.

This proposal will provide some consistency between the requirements for CO2 in beverage dispensing or CO2 enrichment and other uses of CO2 or other asphyxiants.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

This proposal will decrease the cost of construction because mechanical ventilation or gas detection will not be required for rooms or areas not exceeding 1,000 cubic feet of gas. For a typical small storage room, an estimated $5,000 will be saved by not providing additional ventilation or a gas detection system.

Estimated Immediate Cost Impact Justification (methodology and variables):

The estimated cost is difficult to pinpoint because it would be based on the size of room and other variables. The estimate is based on a reasonable assumption of construction costs.

F245-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: Radioactive gases are currently not defined in the IFC. More detail radioactive gases is needed. Additionally, it was requested that the threshold be lowered before there is an exemption. (Vote 12-1)

F245-24

Individual Consideration Agenda

Comment 1:

IFC: 5307.1, 5307.2, 5307.2.1, 5307.2.2

Proponents: Kevin Scott, KH Scott & Associates LLC, self (khscottassoc@gmail.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Fire Code

5307.1 General. *Compressed gases* in storage or use not regulated by the material-specific provisions of Chapters 6, 54, 55, and 60 through 67, including asphyxiant, irritant and radioactive gases, shall comply with this section in addition to other requirements of this chapter.

Delete without substitution:

~~**5307.2 Asphyxiants, irritants and radioactive gases.** Asphyxiant, irritant or radioactive gases used or stored in quantities exceeding~~

~~1,000 cubic feet (28 m³) shall comply with Sections 5307.2.1 or 5307.2.2.~~ **~~Exception:~~** ~~Carbon dioxide systems regulated by Sections 5307.3 or 5307.4.~~

Revise as follows:

5307.2.~~1~~ Ventilation. Indoor storage and use areas and storage buildings shall be provided with ventilation in accordance with Section 5004.3. Where mechanical ventilation is provided, the systems shall be operational during such time as the building or space is occupied.

Exceptions:

1. A gas detection system complying with Section 5307.2.1 shall be permitted in lieu of mechanical ventilation.
2. Areas containing insulated liquid carbon dioxide systems used in beverage dispensing applications shall comply with Section 5307.3.
3. Ventilation is not required for asphyxiant and irritant gases in quantities not exceeding 800 cubic feet.

~~5307.2.2~~5307.2.1 Gas detection system. In rooms or areas not provided with ventilation in accordance with Section ~~5307.2.1~~5307.2, a *gas detection system* complying with Section 916 or, where *approved*, an oxygen depletion alarm system, either of which initiates audible and visible alarm signals in the room or area where sensors are installed, shall be provided.

Reason: This item was Disapproved at CAH 1. This comment revises the proposal based on comments received at CAH 1.

The current, Section 5307 regulates asphyxiant, irritant and radioactive gases in any quantity, and these gases require either ventilation or gas detection. Then Section 5307.3 specifically regulates liquid carbon dioxide systems for beverage dispensing, but those requirements do not apply until the quantity exceeds 100 pounds. Section 5307.4 also regulates carbon dioxide, but only for enrichment systems—it again has no requirements until the quantity exceeds 100 pounds. The requirements for CO2 enrichment systems apply to both liquid and gaseous CO2.

The intent of this proposal is to provide a similar threshold for asphyxiant and irritant gases that fall under Section 5307 as is applied to the CO2 systems.

The comments received at CAH 1 indicated that there were concerns regarding the inclusion of radioactive gas. Radioactive materials, including radioactive gas, are regulated by the Nuclear Regulatory Commission at a federal level. Therefore, the radioactive gases continue to require ventilation or detection at any quantity.

Exception 3 is added to Section 5307.2 indicating that asphyxiant and irritant gases exceeding 800 cubic feet must be provided with either ventilation or gas detection. This is a similar approach used for beverage dispensing and CO2 enrichment although those thresholds are 100 pounds. The original submittal contained a threshold of 1,000 cubic feet, and at CAH 1 it was stated that this threshold seemed to be too large. The threshold has been reduced to 800 cubic feet. 100 pounds of CO2 is equivalent to 875 cubic feet. Nitrogen is another common asphyxiant and 100 pounds of nitrogen is approximately 1380 cubic feet. Nitrogen is available in cylinders containing about 230 cubic feet, so 3 cylinders (690 cubic feet) would be below the threshold of 800 cubic feet.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

This proposal will decrease the cost of construction because mechanical ventilation or gas detection will not be required for rooms or areas not exceeding 800 cubic feet of gas. For a typical small storage room, an estimated $5,000 will be saved by not providing additional ventilation or a gas detection system.

Estimated Immediate Cost Impact Justification (methodology and variables):

The estimated cost is difficult to pinpoint because it would be based on the size of room and other variables. The estimate is based on a reasonable assumption of construction costs.

IFC: 5505.2, 5504.2.3 (New), 5504.2.3.1 (New), 5504.2.3.2 (New), 5504.2.3.3 (New)

Proposed Change as Submitted

Proponents: Robert Marshall, FCAC, FCAC (fcac@iccsafe.org)

2024 International Fire Code

Revise as follows:

5505.2 Indoor use. Indoor use of *cryogenic fluids* shall comply with the material-specific provisions of Section 5501.1 and Sections 5504.2.3 through 5504.2.3.3.

Add new text as follows:

5504.2.3 Oxygen Gas Detection. An oxygen gas detection system, complying with Section 916, shall be provided in rooms or indoor areas in which cryogenic fluids are stored. The system shall be designed as follows:

1. Activates a low-level alarm upon detection of an oxygen deficient atmosphere of 19.5% oxygen.
2. Activated a high-level alarm upon detection of an oxygen deficient atmosphere of 18% oxygen.

5504.2.3.1 Low level alarm activation. Activation of the low-level gas detection system alarm shall automatically do all of the following:

1. Stop the flow of cryogenic fluid to the piping system.
2. Activate the mechanical exhaust ventilation system.
3. Activate an audible and visible supervisory alarm signal at an approved location within the building.
4. Transmit a supervisory signal to an approved location in accordance with NFPA 72.

5504.2.3.2 High level alarm activation. Activation of the high-level gas detection system alarm shall automatically do all of the following:

1. Stop the flow of cryogenic fluid to the piping system.
2. Activate the mechanical exhaust ventilation system.
3. Activate an audible and visible evacuation alarm both inside and outside of the oxygen deficient area, and the area in which the cryogenic containers are located.
4. Transmit an alarm signal to an approved location in accordance with NFPA 72.

5504.2.3.3 Fire alarm system connections. The oxygen gas detection system shall be connected to a fire alarm system in accordance with fire alarm equipment manufacturer's instructions and NFPA 72.

Reason: Due the high expansion ratio of cryogenic fluids, a small leak of a cryogenic fluid can easily fill up a room or space and create an oxygen deficient or enriched atmosphere. An oxygen deficient atmosphere means that there will not be a sufficient amount of oxygen for someone to survive. An oxygen enriched atmosphere creates an environment that can easily catch fire for explode due to the fact that there is too much oxygen. These new code sections provide a oxygen detection so that the occupants are made aware of the dangerous situation and can safely evacuate. This new code language is in line with existing language for liquified compressed CO2.

FCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and early 2024 the FCAC has held several virtual meetings and one in-person meeting open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the **FCAC Website**

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

Many sensors cost between $20 and $100. Typically, labor costs for a sensor installation and tying into the fire alarm system are around $150.

Estimated Immediate Cost Impact Justification (methodology and variables):

The overall cost increase in minimal but that cost is really outweighed by the fact that we are providing life safety to those that are in areas that are in and around cryogenic fluids. Individuals in these areas would not know that there is a dangerous situation without this detection and notification system. Through our research, many sensors cost between $20 and $100 and labor costs for a sensor installation and tying into the fire alarm system are around $150.

F247-24

Public Hearing Results (CAH1)

Committee Action: **As Submitted**

Committee Reason: The provisions were seen as appropriate but would be better addressed as use and stored. The committee would like to see the proposal revised to reflect the need to address use as well. (Vote 11-2)

F247-24

Individual Consideration Agenda

Comment 1:

IFC: 5505.2, 5504.2.3, 5504.2.3.1, 5504.2.3.2, 5504.2.3.3

Proponents: Robert J Davidson, Davidson Code Concepts LLC, Self (rjd@davidsoncodeconcepts.com); Robert Marshall, FCAC, FCAC (fcac@iccsafe.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Fire Code

Revise as follows:

5505.2 Indoor use. Indoor use of *cryogenic fluids* shall comply with the material-specific provisions of Section 5501.1 ~~and Sections 5504.2.3 through 5504.2.3.3~~.

~~**5504.2.3**~~ **5503.11 Oxygen Gas Detection.** An oxygen gas detection system complying with Section 916,or an oxygen depletion alarm where approved, shall be provided in rooms or indoor areas in which inert cryogenic fluids are stored or used in quantities exceeding 100 pounds (45.5 kg). The system shall be designed as follows:

~~1.~~ Activates a low-level alarm upon detection of an oxygen deficient atmosphere of 19.5% oxygen.

~~2. Activated a high-level alarm upon detection of an oxygen deficient atmosphere of 18% oxygen.~~

~~**5504.2.3.1**~~ **5503.11.1** ~~**Low level alarm**~~ **Alarm activation.** Activation of the ~~low-level~~ oxygen gas detection system alarm shall automatically do all of the following:

~~1. Stop the flow of cryogenic fluid to the piping system.~~

~~2. Activate the mechanical exhaust ventilation system.~~

~~3.~~ 1. Activate an audible and visible supervisory alarm signal at an approved location within the building.

~~4.~~ 2. Transmit a supervisory signal to an approved location in accordance with NFPA 72.

Delete without substitution:

~~**5504.2.3.2 High level alarm activation.** Activation of the high-level gas detection system alarm shall automatically do all of the following:~~

~~1. Stop the flow of cryogenic fluid to the piping system.~~

~~2. Activate the mechanical exhaust ventilation system.~~

~~3. Activate an audible and visible evacuation alarm both inside and outside of the oxygen deficient area, and the area in which the cryogenic containers are located.~~

~~4. Transmit an alarm signal to an approved location in accordance with NFPA 72.~~

~~**5504.2.3.3 Fire alarm system connections.** The oxygen gas detection system shall be connected to a fire alarm system in accordance with fire alarm equipment manufacturer's instructions and NFPA 72.~~

Reason: In response to committee comments and follow up meetings with impacted users of cryogenic fluids the following changes are suggested.

1. The language is renumbered to move the requirement up to the General section of the chapter.
2. The ability to use an oxygen depletion alarm is added.
3. The applicability is clarified to apply to "inert" cryogenic fluids.
4. The language is modified to apply to "stored or used".
5. An exceeding 100 pounds threshold was added to match the trigger currently in the fire code for CO2 applications.
6. The reference to piping systems has been removed as not all applications include piping systems and where they do exist the stopping of the flow may present practical difficulties.
7. The activation of the mechanical exhaust has been eliminated because there is no language requiring the installation of mechanical exhaust.

With the above changes the reference to a high-level alarm is no longer needed and that language has been deleted. Since the charging language points to IFC Section 916 the section relating to tying into the fire alarm system is unnecessary and has been deleted.

Cost Impact: Increase

Estimated Immediate Cost Impact:

The installation of a gas detection system, with notification appliances will vary depending on a number of variables, including number and size of area(s) to be monitored and number of notification appliances required.

Gas Detection System: An approximate estimate for a typical installation of an oxygen gas detection system complying with these provisions is approximately $6,500.

Oxygen Depletion Alarm (Self-Contained): An approximate estimate for a typical installation of self-contained oxygen depletion alarm system is approximately $4,500.

Maintenance is required annually on gas detection systems, and typical oxygen sensors have a life-expectancy of 2-3 years. Estimated annual maintenance, including sensor replacements as needed is $300-500 per year.

Installations without existing FACP and dialer will require additional installation, operating, and maintenance expenses. Installation range from $2000 – $5,0000. Operation and maintenance $500-$1500 per year.

Estimated Immediate Cost Impact Justification (methodology and variables):

Gas Detection System: Cost estimate for a gas detection system is based on a typical installation of a single cryogenic tank supplying a single remote use. This requires a controller, (2) sensors, (2) notification appliances, battery back-up, hardwired electrical connection, and tie-in to existing FACP.

Single Channel Controller: $1,500

Direct Connect 02 sensor x 2: $1,000

Battery Backup: $300

Horn Strobe x 2: $700

Design, installation, wiring, FACP connections: $3,000

Total Install: $6500

If FACP / Communication is needed, add $2,000 - $5,000.

Oxygen Depletion Alarm: Cost estimate for a gas detection system is based on a typical installation of a single cryogenic tank supplying a single remote use. This requires a controller, (2) sensors, (2) notification appliances, battery back-up, hardwired electrical connection, and tie-in to existing FACP.

Self-Contained Oxygen Depletion Alarm:

Fixed O2 Alarms x 2: $3,000 (Range 1,600 - $4,000)

Remote Relay, FACP connection, installation: $1500

Total Install: $4,500

Comment (CAH2)# 642

F248-24

IFC: 5505.2, 5505.2 (New), 5505.2.2.1 (New), 5505.2.2.2 (New)

Proposed Change as Submitted

Proponents: Adam Henson, U.S. Chemical Safety and Hazard Investigation Board (adam.henson@csb.gov)

2024 International Fire Code

Revise as follows:

5505.2 Indoor use. Indoor use of cryogenic fluids shall comply with the material-specific provisions of Section 5501.1.

Add new text as follows:

5505.2 Oxygen deficiency hazards. Oxygen deficiency monitoring, alarms and controls shall be in accordance with Sections 5502.2.1 and 5502.2.2.

5505.2.2.1 Atmospheric monitoring. Areas where cryogenic liquids are used and vaporization takes place shall be monitored for oxygen deficiency. When the concentration of oxygen measures 19.5% or below an audible alarm shall sound and a visual indication shall be given inside the area and immediately outside of all entrances to the area. The alarm shall be distinct from other facility alarms. Area monitors shall be permitted to be supplemented with personal monitors where necessary.

5505.2.2.2 Emergency Stop Devices. Manually operated control devices shall be provided to shut off the cryogenic fluid supply in case of emergency. These devices shall be located at each operator control station, at entrances and exits, at all locations where a human and machine interaction is expected by design, and other locations as determined by risk assessment.

Reason: On January 28, 2021, liquid nitrogen overflowed from an immersion-spiral freezer located inside the Plant 4 building at the Foundation Food Group (FFG) facility in Gainesville, GA. The release asphyxiated two employees working on the freezer immediately and continued undetected and uncontrolled for 30 to 60 minutes. Eventually, another employee noticed the freezer room had filled with a four- to five-foot-high vapor cloud and initiated an emergency response by notifying a supervisor.

During the response to this release as many as 14 other FFG employees, including members of management, traveled to the freezer room either to investigate the release or rescue the workers. Four additional FFG employees were killed by asphyxiation, and four additional people including one firefighter were seriously injured presenting asphyxiation symptoms as the result of the response. Six additional FFG employees and three additional firefighters were also treated in the emergency room for symptoms of asphyxiation but were released that day. In addition to the staggering human toll of this incident damages of roughly $1.7 million were reported by the facility.

The freezer involved in the incident was a liquid nitrogen immersion-spiral freezer operated in conjunction with “Line 4”. Liquid nitrogen was supplied to this freezer from a 13,000-gallon bulk liquid tank installed outside of the building. The freezer was subdivided from the adjacent area by four new walls. The freezer had an exhaust system which directed vaporized nitrogen gas from inside the equipment outside of the building, but the room where the freezer was located was not served by mechanical exhaust or an HVAC system.

Despite warnings from FFG’s nitrogen/equipment supplier, no atmospheric monitoring was installed or used in the area or room where the freezer was located. Manul shutoffs for the nitrogen supply were located at the bulk tanks on the opposite end of the building from the freezer. In addition, there were ten E-stop buttons designed to shut down the freezer and isolate the nitrogen supply upon activation. All ten E-stop buttons were located within the freezer room.

During its investigation the CSB concluded that had FFG installed atmospheric monitoring and an alarm system in and around the freezer room, workers would have been warned against entering the oxygen deficient atmosphere. The CSB also concluded that the placement of the E-stop buttons solely within the room containing the hazard is not a sensible design and delayed the response to this incident. The successful implementation of these devices in conjunction with effective emergency planning and response could have prevented or mitigated the fatalities and injuries that occurred during the response to this incident.

As part of its investigation into this incident, the CSB reviewed the requirements of the International Fire Code (IFC) and determined that the IFC Chapter 55 *Cryogenic Fluids* requires inert cryogenic fluids, including nitrogen, shall comply with ANSI/CGA P-18 along with requirements for storage and use and handling. Nothing in the code would have required FFG to use atmospheric monitoring for oxygen deficiency and an associated alarm. Additionally, no guidance is given in the code regarding the appropriate location of E-stop buttons.

As the result of the investigation, the CSB issued the following recommendation to the International Code Council:

CSB Recommendation No. 2021-03-I-GA-R12:

Update the International Fire Code to:

a) require the use of atmospheric monitoring with cryogenic asphyxiants in accordance with industry guidance such as is contained in CGA P-76 Hazards of Oxygen-Deficient Atmospheres and CGA P-12 Safe Handling of Cryogenic Liquids in addition to CGA P-18 Standard for Bulk Inert Gas Systems; and,

b) include guidance on the adequate safe location of manual shutoff valves and devices such as emergency push buttons used to activate remotely operated emergency isolation valves (ROEIVs) in cryogenic fluid service. At a minimum this guidance should be harmonized with the requirements of ISO 13850 Safety of machinery – Emergency stop function – Principles for design.

The language proposed is intended to satisfactorily implement this recommendation.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

$20,000

Estimated Immediate Cost Impact Justification (methodology and variables):

The cost of equipment is estimated at $12,000 on average and labor is estimated at $8,000 on average. The cost of the freezer unit involved in the incident at FFG was nearly $900,000. Installing the equipment described in this code change proposal would represent a ~2% increase in the total cost of that project.

$12,000 (Materials) + $8,000 (Labor) = $20,000

Cost Source:

This is an analogous estimate based on information from representatives from plant management and an engineering firm.

Estimated Life Cycle Cost Impact:

N/A

Estimated Life Cycle Cost Impact Justification (methodology and variables):

N/A

F248-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: Generally the committee liked the intent but preferred F247-24 with revisions made during CAH#2. Additionally this proposal would need to be coordinated with healthcare occupancies needs. (Vote 11-1)

F248-24

Individual Consideration Agenda

Comment 1:

IFC: 5505.2, 5505.2.2.1, 5505.2.2.2

Proponents: Adam Henson, U.S. Chemical Safety and Hazard Investigation Board (adam.henson@csb.gov) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Fire Code

Delete and substitute as follows:

~~**5505.2 Indoor use.** Indoor use of cryogenic fluids shall comply with the material-specific provisions of Section 5501.1.~~

5503.11 Liquid Nitrogen. The use and storage of liquid nitrogen shall comply with Sections 5503.11.1 and 5503.1.11.2. **Exception:** Where the maximum quantity that could be released is less than 20,000 pounds (9,072 kg).

~~**5505.2 Oxygen deficiency hazards.** Oxygen deficiency monitoring, alarms and controls shall be in accordance with Sections 5502.2.1 and 5502.2.2.~~

5503.11.1 Oxygen Gas Detection. A gas detection system complying with Section 916 shall be provided in rooms or indoor areas in which liquid nitrogen is supplied for use via remote connection, in rooms or indoor areas in which container systems storing liquid nitrogen are located, and other areas where nitrogen vapors are expected to accumulate. The system shall be designed as follows:

1. Activates a low-level alarm upon detection of an oxygen deficient atmosphere of 19.5% oxygen.
2. Activates a high-level alarm upon detection of an oxygen deficient atmosphere of 18% oxygen.

~~**5505.2.2.1 Atmospheric monitoring.** Areas where cryogenic liquids are used and vaporization takes place shall be monitored for oxygen deficiency. When the concentration of oxygen measures 19.5% or below an audible alarm shall sound and a visual indication shall be given inside the area and immediately outside of all entrances to the area. The alarm shall be distinct from other facility alarms. Area monitors shall be permitted to be supplemented with personal monitors where necessary.~~

5503.11.2 System Activation. Activation of the low-level gas detection system alarm shall automatically:

1. Stop the flow of liquid nitrogen to the piping system.
2. Activate the mechanical exhaust ventilation system.
3. Activate an audible and visible supervisory alarm signal at an approved location within the building.

Activation of the high-level gas detection system alarm shall automatically:

1. Stop the flow of liquid nitrogen to the piping system.

2. Activate the mechanical exhaust ventilation system.
3. Activate an audible and visible evacuation alarm both inside and outside of the oxygen deficient area, and the area in which the liquid nitrogen containers are located.

Delete without substitution:

~~**5505.2.2.2 Emergency Stop Devices.** Manually operated control devices shall be provided to shut off the cryogenic fluid supply in case of emergency. These devices shall be located at each operator control station, at entrances and exits, at all locations where a human and machine interaction is expected by design, and other locations as determined by risk assessment.~~

Reason: This comment is being offered to attempt to address the concerns of the committee for F247-24 and F248-24.

The CSB worked with FCAC including Workgroup 6 and several smaller task groups following CAH #1 to draft a proposal that would satisfy the guidance provided by the committee. Unfortunately, that effort resulted in a proposal that has been modified beyond the scope of the guidance provided by the committee and is now less protective than the language approved as submitted at CAH #1. The new proposed language also does not satisfy the requirements of the CSB's recommendation to the ICC because it does nothing to improve access to emergency shutdown systems. To demonstrate the ineffective nature of equipping these systems, or the areas they are within, with air monitoring and alarms alone I refer you to the Xytex incident.

During the winter of 2017 there was a nitrogen release from a liquid nitrogen tissue preservation process at the Xytex Cryo International, Ltd. facility in Augusta, GA. The tank supplying the nitrogen to this process was 3,000 gallons (20,235 lbs.) in size. The incident resulted in the death of Richmond County Sgt. Greg Meagher, injury to an employee of Xytex, and caused symptoms of asphyxiation in three other sheriff's deputies who responded.

According to investigators, the alarm at Xytex went off a total of three times the day of the incident, once at 1:43 PM, again at 3:26 PM, and finally at 3:44 PM. This alarm did not stop the Xytex employee from entering the space to attempt to try to shutdown the equipment. This employee was incapacitated by the oxygen deficient atmosphere in the space and was rescued by Sgt. Meagher. As previously stated, the employee was seriously injured, and Sgt. Meagher died as a result of their exposure.

At the final meeting on the subject attended by the CSB, it was decided that representatives of FCAC Workgroup 6 would enter 1 of 2 comments into CDP Access both of which are geared towards smaller systems and the CSB would enter a comment on F248-24 geared towards industrial scale freezing processes.

The updated proposal for F248-24 is based on the original F247-24 and existing code language for carbon dioxide enrichment systems (5307.4).

Changes of note include:

1. Specifically referencing liquid nitrogen instead of cryogenic fluids (Every example people have referenced this code cycle, e.g. flash freezing ice cream, industrial food processing, and tissue banks, involves liquid nitrogen specifically, also the proposed requirements don't make sense for other cryogenic fluids like oxygen, hydrogen, etc.),
2. Replacing the language about the alarms with the language from 5307.4 (The original language caused problems for many involved in the task group meetings), and
3. Setting a threshold quantity of 20,000 pounds (The tissue freezing process at Xytex was slightly larger than this, and is the smallest system involved in a catastrophic release of nitrogen I am aware of.)

The facet of the original proposal requiring coordination with healthcare occupancies (Emergency Stop Devices) has been removed from the proposal and replaced with the original language of F247-24.

Had the requirements proposed been in effect and complied with, the consequences of both the Xytex and FFG incidents would have been prevented or at least mitigated.

Proposed Change as Submitted

Proponents: Robert Marshall, FCAC, FCAC (fcac@iccsafe.org)

2024 International Fire Code

Add new definition as follows:

FIREWORKS RETAIL SALES (FRS) STRUCTURE. A tent, membrane structure, or temporary structure that is used only for the retail display and sale or storage of consumer fireworks to the public.

Revise as follows:

5601.1.3 Fireworks. The possession, manufacture, storage, sale, handling and use of fireworks are prohibited. **Exceptions:**

1. Storage and handling of fireworks as allowed in Section 5604.
2. Manufacture, assembly and testing of fireworks as allowed in Section 5605.
3. The use of fireworks for fireworks displays as allowed in Section 5608.
4. ~~The possession, storage, sale, handling and use of specific types of Division 1.4G fireworks where allowed by applicable laws, ordinances and regulations, provided that such fireworks and facilities comply with the 2006 edition of NFPA 1124, CPSC 16 CFR Parts 1500 and 1507, and DOTn 49 CFR Parts 100–185, as applicable for consumer fireworks.~~ Retail sale of fireworks shall be permitted where approved and shall comply with the rules and limitations established by the jurisdiction.

Delete without substitution:

~~SECTION 5609~~
~~TEMPORARY STORAGE OF CONSUMER FIREWORKS~~

~~**5609.1 General.** Where the display or temporary storage of fireworks 1.4G (consumer fireworks) is allowed by Section 5601.1.3, Exception 4, such display or storage shall comply with the applicable requirements of NFPA 1124.~~

Add new text as follows:

APPENDIX P
RETAIL SALE OF CONSUMER FIREWORKS

SECTION P101
GENERAL

P101.1 Requirements. Retail display and sales of 1.4G fireworks, including related temporary storage of 1.4G fireworks, shall comply with the requirements of this section unless otherwise indicated.

P101.2 FRS sales of fireworks.. FRS sales of fireworks where allowed by applicable laws, ordinances and regulations shall comply with regulations of the U.S. Consumer Product Safety Commission as set forth in 16 CFR 1500 and 1507 and the regulations of the U.S. Department of Transportation as set forth in 49 CFR 100 to 178, including related storage and display for sale.

P101.2.1 FRS structures. . FRS Structures that are used for the retail display, and sales or temporary storage of 1.4G fireworks shall not exceed a floor area of 1000 ft2 (92.9 m2) individually, or in aggregate where the separation distance between individual FRS structures is less than the distances specified in Table P101.2.6, and shall be one of the following types of structures:

P101.2.2 Temporary use.. Temporary Tents, membrane structures and other temporary structures used as FRS structures shall be erected for a period not to exceed 30 days and shall comply with this section, Chapter 31 of this code, and the International Building Code.

P101.2.3 Construction Permit and approval.. A construction permit is required for the construction of an FRS structure as required by Section 105.6.24, or in accordance with the *International Building Code*, as applicable.

P101.2.4 Operational permits.. Operational permits are required in accordance with Sections 105.5.16 and 105.5.49.

P101.2.5 Construction documents. . Detailed plans for FRS structures and the site they are to be erected on shall be submitted to the code official for review and approval. The construction plans shall comply with this code and the International Building code as applicable and additionally include the following details:

1. Separation distances from the following site features:
   - 1.1 Public ways
   - 1.2 Buildings
   - 1.3 Other FRS structures
   - 1.4 Vehicle fuel dispensing
   - 1.5 Propane-cylinder exchange stations
   - 1.6 Flammable and combustible liquid or gas aboveground tank storage
   - 1.7 Flammable gas and flammable liquefied gas bulk aboveground storage and dispensing areas within 300 ft (91.5 m) of the FRS structure
   - 1.8 Combustible storage
   - 1.9 Permanent or temporary generators
   - 1.10 Additional fireworks storage location
2. Vehicle access and parking areas
3. Location and type of portable fire extinguishers
4. Means of egress exit discharge paths of buildings on the same site.

P101.2.6 Separation Distances. FRS structures shall be located with the minimum separation distances required by Table P101.2.6.

P101.2.6 MINIMUM SEPARATION DISTANCES

EXPOSURE	SEPARATION DISTANCE
Public Ways	20ft (6.1m)
Buildings	20ft (6.1m)
Other FRS structures	100ft (30.4 m)
Vehicle Fuel Dispensing	100ft (30.4 m)

Propane cylinder exchange stations	100ft (30.4 m)
Flammable gas and flammable liquefied gas bulk aboveground storage or dispensing areas	300ft (91.4 m)
Flammable and combustible liquid or gas aboveground tank storage	300ft (91.4 m)
Vehicle access and parking areas	20ft (6.1m)
Combustible storage	20ft (6.1m)
Generators	20ft (6.1m)
Fireworks Storage location	20ft (6.1m)

P101.2.7 Source of Ignition. Sources of ignition shall be controlled and comply with Sections P101.2.7.1 through P101.2.7.5.

P101.2.7.1 Electrical equipment and wiring. FRS structure electrical equipment and wiring shall be in accordance with NFPA 70.

P101.2.7.2 Portable Generators. Portable generators and generator fuel supplies shall be located not less than 20 ft (6.1 m) from a FRS structure or the location of additional fireworks storage.

P101.2.7.3 Cooking Equipment . Cooking equipment of any type shall not be permitted within 25 ft (7.6 m) of FRS structures or the location of additional fireworks storage.

P101.2.7.4 Covered Fuses. Consumer fireworks within reach access of the public shall be required to have covered fuses. The device shall be considered as having a covered fuse if the fireworks device is contained within a packaged arrangement, container, or wrapper that is arranged and configured such that the fuse of the fireworks device cannot be touched directly by a person handling the fireworks without the person having to puncture or tear the packaging or wrapper, unseal or break open a package or container, or otherwise damage or destroy the packaging material, wrapping, or container within which the fireworks are contained.

P101.2.7.5 No Smoking Signs. "FIREWORKS — NO SMOKING" signs complying with Section 310 shall be conspicuously posted on all four sides where required by the fire code official. Smoking shall not be permitted inside or within 25 ft (15.5 m) of the FRS structure or the location of additional fireworks storage.

P101.2.8 Sales Display . The following shall apply to the sale and display of consumer fireworks in FRS structures.:

1. FRS structure retail sales shall not allow access to the interior of the structure by the public:
2. Consumer fireworks shall be displayed in a manner that prevents the fireworks from being handled by persons other than those operating, supervising, or working in the FRS structure.
3. In FRS structures the maximum height of sales displays shall be limited to 8 ft (2.44 m).

P101.2.9 Fireworks Discharge. Fireworks shall not be discharged within three hundred feet of a FRS structure or any fireworks storage structure. Signs reading "NO FIREWORKS DISCHARGE WITHIN 300 FEET" will be in letters at least two inches high, with a principal stroke of not less than one-half inch, on a contrasting background, will be conspicuously posted on all four sides of the FRS structure and any fireworks storage structures.

P101.2.10 Portable Fire Extinguisher. Portable fire extinguishers complying with Section 906 shall be provided and placed in locations approved by the fire code official. FRS structures of less than 200 ft2 (18.6 m2) shall be required to have only one portable fire extinguisher.

P101.2.11 Means of Egress. Retail sales areas within FRS structures shall have a minimum of two egress exit paths for staff with a minimum clear with of 32in. (0.8 m) and otherwise comply with Chapter 10 of this code.

P101.2.11.1 Exit markings. Exit paths and exit doors shall be clearly indicated as approved by the *fire code official*.

P101.2.11.2 Means of egress illumination. . Means of egress shall be illuminated in accordance with Chapter 10.

P101.2.12 Security. FRS structures and storage shall be secured against unauthorized entry and safeguarded in a manner approved by the *fire code official*.

P101.2.12.1 Security management plan. The owner or owner's authorized representative shall prepare a security management plan when the FRS is not open to the public and shall be *approved* by the *fire code official*.

P101.2.13 Storage . Temporary storage associated with FRS structures shall meet the requirements of this section or shall comply with the applicable requirements of Section 5604.

SECTION P102
REFERENCED STANDARDS

P102.1 General. See Table P102.1 for standards that are referenced in various sections of this appendix. Standards are listed by the standard identification with the effective date, standard title, and the section or sections of this appendix that reference the standard.

P102.1 REFERENCED STANDARDS

STANDARD ACRONYM	STANDARD NAME	SECTIONS HEREIN REFERENCED
49 CFR 100-178 - 2015	Department of Transportation Hazardous Materials Regulation	P101.2
16 CFR 1500-2009	CPSC Hazardous Substances and Articles; Administration and Enforcement Regulations	P101.2
16 CFR 1507 - 2002	CPSC - Firework Devices	P101.2

Reason: Forty-nine out of the fifty states permit the sale of some type of consumer fireworks. Currently the 2021 and 2024 codes reference the 2006 NFPA 1124 which contains requirements for indoor sales of consumer fireworks. Later versions of NFPA 1124 no longer include any requirements due to concern that the provisions were not adequate and proper data needs to be developed to support the requirement. Regardless of whether provisions are available within codes or standards jurisdictions are looking for guidance as to how to enforce.

This proposal removes reference to the 2006 edition of NFPA 1124.

The proposal does not address indoor sales and instead is limited to outdoor sales with the use of stands. The focus is on separation, types of outdoor structures, ignition sources, security, signage, how the consumer fireworks are displayed, fire extinguisher availability and basic exit width, markings and illumination.

Due to the sensitivity of this issue it was suggested that this would be better suited for an appendix. This eliminates the need for a jurisdiction to justify removing from the body of the code during adoption.

FCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and early 2024 the FCAC has held several virtual meetings and one in-person meeting open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the **FCAC Website**

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

$0.00

Estimated Immediate Cost Impact Justification (methodology and variables):

This proposal provides a new appendix to provide needed guidance to jurisdictions that must address consumer fireworks that are permitted within their state. It has no affect on construction costs.

Public Hearing Results (CAH1)

Committee Action: **As Submitted**

Committee Reason: There is a gap in regulatory tools for retail firework sales. This proposal was approved as a potential way to address fire works with more updated provisions. However, as currently written the provisions only addresses outdoor retail sales. The committee encouraged comments during CAH#2 to address indoor sales without using the reference to the 2006 edition of NFPA 1124. It was suggested that the comments be broken down by topic for CAH#2. (Vote 7-6)

F249-24

2024 International Fire Code

APPENDIX P
RETAIL SALE OF CONSUMER FIREWORKS

SECTION P101
GENERAL

P101.1 Requirements. Retail display and sales of 1.4G fireworks, including related temporary storage of 1.4G fireworks, shall comply with the requirements of this section unless otherwise indicated.

Revise as follows:

P101.2 ~~FRS s~~ Sales of consumer fireworks.. ~~FRS sales~~ Sales of consumer fireworks where allowed by applicable laws, ordinances and regulations shall comply with regulations of the U.S. Consumer Product Safety Commission as set forth in 16 CFR 1500 and 1507 and the regulations of the U.S. Department of Transportation as set forth in 49 CFR 100 to 178, including related storage and display for sale.

Add new text as follows:

P101.3 Security. Buildings.structures and storage containing consumer fireworks shall be secured against unauthorized entry and safeguarded in a manner *approved* by the *fire code official*.

P101.3.1 Security management plan.. The *owner* or *owner's* authorized representative shall prepare a security managementplan for when the buildings or structures containing consumer fireworks are not open to the public. The plan shall be submitted to the *fire code official* for review and *approval*.

P101.4 Fireworks Discharge.. Fireworks shall not be discharged within three hundred feet of a Mercantile occupancy utilized for fireworks sales, a FRS structure, or any fireworks storage structure. Signs reading "NO FIREWORKS DISCHARGE WITHIN 300 FEET" will be in letters at least two inches high, with a principal stroke of not less than one-half inch, on a contrasting background, will be conspicuously posted on all four sides of the mercantile occupancy, the FRS structure, and any fireworks storage structures.

P101.5 Fireworks storage.. Temporary storage of consumer fireworks shall meet the requirements of this section and the applicable requirements of Section 5604 of this code.

Delete without substitution:

Add new text as follows:

P101.7 Operational permits.. Operational permits are required in accordance with Sections 105.5.16 and 105.5.49 of this code.

SECTION P102
FIREWORKS RETAIL SALES (FRS)

P102.1 General. Consumer fireworks sales utilizing FRS structures shall comply with Sections P102. 2 through P102.10.2.

~~**P101.2.1**~~ **P102.2 FRS structures. .** FRS Structures that are used for the retail display, and sales or temporary storage of 1.4G fireworks shall not exceed a floor area of 1000 ft2 (92.9 m2) individually, or in aggregate where the separation distance between individual FRS structures is less than the distances specified in Table ~~P101.2.6~~ P102.6, and shall be one of the following types of structures:

~~**P101.2.2**~~ **P102.3 Temporary use..** Temporary Tents, membrane structures and other temporary structures used as FRS structures shall be erected for a period not to exceed 30 days and shall comply with this section, Chapter 31 of this code, and the International Building Code.

~~**P101.2.3**~~ **P102.4 Construction Permit and approval..** A construction permit is required for the construction of an FRS structure as required by Section 105.6.24, or in accordance with the *International Building Code*, as applicable.

Delete without substitution:

~~**P101.2.4 Operational permits..** Operational permits are required in accordance with Sections 105.5.16 and 105.5.49.~~

Revise as follows:

~~**P101.2.5**~~ **P102.5 Construction documents. .** Detailed plans for FRS structures and the site they are to be erected on shall be submitted to the code official for review and approval. The construction plans shall comply with this code and the International Building code as applicable and additionally include the following details:

1. Separation distances from the following site features:
   1.1 Public ways
   1.2 Buildings
   1.3 Other FRS structures
   1.4 Vehicle fuel dispensing
   1.5 Propane-cylinder exchange stations
   1.6 Flammable and combustible liquid or gas aboveground tank storage
   1.7 Flammable gas and flammable liquefied gas bulk aboveground storage and dispensing areas within 300 ft (91.5 m) of the FRS structure
   1.8 Combustible storage
   1.9 Permanent or temporary generators
   1.10 Additional fireworks storage location
2. Vehicle access and parking areas
3. Location and type of portable fire extinguishers
4. Means of egress exit discharge paths of buildings on the same site.

~~P101.2.6~~ **P102.6 Separation Distances.** FRS structures shall be located with the minimum separation distances required by Table ~~P101.2.6~~ P102.6.

~~P101.2.6~~ P102.6 MINIMUM SEPARATION DISTANCES

EXPOSURE	SEPARATION DISTANCE
Public Ways	20ft (6.1m)
Buildings	20ft (6.1m)
Other FRS structures	100ft (30.4 m)
Vehicle Fuel Dispensing	100ft (30.4 m)
Propane cylinder exchange stations	100ft (30.4 m)
Flammable gas and flammable liquefied gas bulk aboveground storage or dispensing areas	300ft (91.4 m)
Flammable and combustible liquid or gas aboveground tank storage	300ft (91.4 m)
Vehicle access and parking areas	20ft (6.1m)
Combustible storage	20ft (6.1m)
Generators	20ft (6.1m)
Fireworks Storage location	20ft (6.1m)

~~P101.2.7~~ **P102.7 Source of Ignition.** Sources of ignition shall be controlled and comply with Sections P101.2.7.1 P102.7.1 through ~~P101.2.7.5~~ P102.7.4.

~~P101.2.7.1~~ **P102.7.1 Electrical equipment and wiring.** FRS structure electrical equipment and wiring shall be in accordance with NFPA 70.

~~P101.2.7.2~~ **P102.7.2 Portable Generators.** Portable generators and generator fuel supplies shall be located not less than 20 ft (6.1 m) from a FRS structure or the location of additional fireworks storage.

~~P101.2.7.3~~ **P102.7.3 Cooking Equipment .** Cooking equipment of any type shall not be permitted within 25 ft (7.6 m) of FRS structures or the location of additional fireworks storage.

~~P101.2.7.4~~ **P102.7.4 Covered Fuses.** Consumer fireworks within reach access of the public shall be required to have covered fuses. The device shall be considered as having a covered fuse if the fireworks device is contained within a packaged arrangement, container, or wrapper that is arranged and configured such that the fuse of the fireworks device cannot be touched directly by a person handling the

fireworks without the person having to puncture or tear the packaging or wrapper, unseal or break open a package or container, or otherwise damage or destroy the packaging material, wrapping, or container within which the fireworks are contained.

Revise as follows:

~~**P101.2.7.5**~~ **P102.7.5 No Smoking Signs.** "FIREWORKS — NO SMOKING" signs complying with Section 310 shall be conspicuously posted on all four sides where required by the fire code official. Smoking shall not be permitted inside or within 25 ft (15.5 m) of the FRS structure or the location of additional fireworks storage.

~~**P101.2.8**~~ **P102.8 Sales Display .** The following shall apply to the sale and display of consumer fireworks in FRS structures.:

1. FRS structure retail sales shall not allow access to the interior of the structure by the public:
2. Consumer fireworks shall be displayed in a manner that prevents the fireworks from being handled by persons other than those operating, supervising, or working in the FRS structure.
3. In FRS structures the maximum height of sales displays shall be limited to 8 ft (2.44 m).

Delete without substitution:

~~**P101.2.9 Fireworks Discharge.** Fireworks shall not be discharged within three hundred feet of a FRS structure or any fireworks storage structure. Signs reading "NO FIREWORKS DISCHARGE WITHIN 300 FEET" will be in letters at least two inches high, with a principal stroke of not less than one-half inch, on a contrasting background, will be conspicuously posted on all four sides of the FRS structure and any fireworks storage structures.~~

Revise as follows:

~~**P101.2.10**~~ **P102.9 Portable Fire Extinguisher.** Portable fire extinguishers complying with Section 906 shall be provided and placed in locations approved by the fire code official. FRS structures of less than 200 ft2 (18.6 m2) shall be required to have only one portable fire extinguisher.

~~**P101.2.11**~~ **P102.10 Means of Egress.** Retail sales areas within FRS structures shall have a minimum of two egress exit paths for staff with a minimum clear with of 32in. (0.8 m) and otherwise comply with Chapter 10 of this code.

~~**P101.2.11.1**~~ **P102.10.1 Exit markings.** Exit paths and exit doors shall be clearly indicated as approved by the *fire code official*.

Revise as follows:

~~**P101.2.11.2**~~ **P102.10.2 Means of egress illumination. .** Means of egress shall be illuminated in accordance with Chapter 10.

Delete without substitution:

~~**P101.2.12 Security.** FRS structures and storage shall be secured against unauthorized entry and safeguarded in a manner approved by the *fire code official*.~~

~~**P101.2.12.1 Security management plan.** The owner or owner's authorized representative shall prepare a security management plan when the FRS is not open to the public and shall be *approved* by the *fire code official*.~~

~~**P101.2.13 Storage .** Temporary storage associated with FRS structures shall meet the requirements of this section or shall comply with the applicable requirements of Section 5604.~~

Add new text as follows:

SECTION P103
BUILDINGS CONTAINING CONSUMER FIREWORKS RETAIL SALES

P103.1 General. Occupancies used for the sale of consumer fireworks shall comply with Sections P103.1 through P103.7.3

P103.2 Quantity limitations. The floor area of the retail display and sale of consumer fireworks shall not exceed 40 percent of the available floor area of the total square footage of the building.

P103.3 Construction. Buildings shall not exceed more than one story in height.

P103.4 Multiple-Tenant buildings.. Where consumer fireworks retail sales area is located in a structure containing other tenants, the consumer fireworks retail sales area shall be separated from the other tenants by fire barriers with a minimum fire resistance rating of two hours and no openings.

P103.5 Fire protection.. An automatic sprinkler system complying with Section 903.3.1.1 shall be provided throughout the occupancy in which retail fireworks sales are conducted

P103.5.1 Design density. The required sprinkler system shall have Extra Hazard Group 1 design density or, where *approved*, the automatic sprinkler system design density shall be based upon a hazard classification determined by large-scale fire testing.

P103.6 Fire alarms.. A fire alarm system shall be provided throughout the retail sales occupancy in accordance with Section 907.

P103.7 Means of egress.. Means of egress in the retail sales occupancy shall be in accordance with Sections P103.7.1 through P103.7.3

P103.7.1 Number of exits.. The minimum number of exits provided from the consumer fireworks retail sales area shall be not less than three.

P103.7.2 Exit access travel distance. Exits provided for in consumer fireworks retail sales area shall be located so that the exit access travel distance does not exceed 75 ft. (22.9 m).

P103.7.3 Entrances. No consumer fireworks shall be displayed for sale or stored within 5 ft (1.5 m) of any entrance to the building.

SECTION ~~P102~~ P104
REFERENCED STANDARDS

~~P102.1~~ P104.1 General. See Table ~~P102.1~~ P104.1 for standards that are referenced in various sections of this appendix. Standards are listed by the standard identification with the effective date, standard title, and the section or sections of this appendix that reference the standard.

~~P102.1~~ P104.1 REFERENCED STANDARDS

STANDARD ACRONYM	STANDARD NAME	SECTIONS HEREIN REFERENCED
49 CFR 100-178 - 2015	Department of Transportation Hazardous Materials Regulation	P101.2
16 CFR 1500-2009	CPSC Hazardous Substances and Articles; Administration and Enforcement Regulations	P101.2
16 CFR 1507 - 2002	CPSC - Firework Devices	P101.2

Reason: During the initial hearing on this proposal the committee request that FCAC bring the proposal beck with language addressing fireworks retail sales in permanent buildings. This proposal does that.

General requires that would apply to both the temporary FRS sales and the retail sales in permanent buildings were placed under P101 general requirements. The FRS Sales language is in its own Section P102, and the new language for permanent buildings is in a new Section P103.

In the new section the language addresses Quantity limitations tied to floor area; Construction limiting the building height to a single story; Multiple-tenant buildings by requiring 2-hour fire-resistance-separation from other tenants, Fire protection (suppression) by specifying sprinkler design densit; Fire alarms by requiring the occupancy to have a fire alarm system; and Means of egress addressing the number of exits, travel distance and entrances..

Cost Impact: Increase

Estimated Immediate Cost Impact:

$0.00

Estimated Immediate Cost Impact Justification (methodology and variables):

This proposal provides a new appendix to provide needed guidance to jurisdictions that must address consumer fireworks that are permitted within their state. It has no affect on construction costs.

Comment (CAH2)# 729

F251-24

IFC: 5701.6 (New)

Proposed Change as Submitted

Proponents: Adam Henson, U.S. Chemical Safety and Hazard Investigation Board (adam.henson@csb.gov)

2024 International Fire Code

Add new text as follows:

5701.6 Process Hazard Analysis. Where flammable and combustible liquids are stored or used in excess of the maximum allowable quantity per control area specified in Table 5003.1.1(1) process hazard analyses shall be conducted to ensure reasonable protection of people and property from dangerous conditions involving flammable and combustible liquids. The process hazard analysis shall be conducted utilizing a methodology suitable for the complexity of the process and shall consider factors internal and external to the organization. Recommendations from such analyses shall be addressed in a timely manner.

Reason: On May 1, 2002, there was a fire at the Third Coast Industries petroleum products facility in Friendswood, TX. The fire began as a relatively small one of unknown origin that eventually spread all through the facilities operations for blending and packaging motor oils, hydraulic oils, and engine and other lubricants.

The fire began overnight while the facility was unattended. It was discovered in progress by the facility's security guard who determined it was too severe to fight. Firefighters arrived on scene within minutes, but had insufficient means to fight the fire. The fire burned for more than 24 hours and consumed 1.2 million gallons of combustible and flammable liquids destroying the site. One hundred nearby residents were evacuated, a school was temporarily closed, and significant environmental cleanup was necessary due to fumes and runoff.

Approximately 98 percent of the materials at Third Coast were Class IIIB combustible liquids meaning they had a flash point of 200 Deg F or greater. They also had 4,400 gallons of methanol (Class IB), 3,500 gallons of mineral spirits (Class II), and 9,500 gallons of petroleum distillate (Class IIIA) in storage tanks intermingled with their Class IIIB products and raw materials. Based on the high flash points of most of their raw materials and products, Third Coast may have underestimated the fire hazard present at their facility.

During its investigation the CSB concluded that Third Coast had not analyzed the hazards of their facility. If they had, the deficiencies in onsite water supply, fire detection and alarm equipment, and drainage and containment for combustible liquids could have been identified and addressed prior to the fire preventing the loss of the facility, the evacuation of the community, and the damage done to the environment.

As part of its investigation into this incident, the CSB reviewed the requirements of the International Fire Code chapters on Hazardous Materials – General Provisions and Flammable and Combustible Liquids both then and again now. Nothing in the code requires process hazard analysis unless someone wants to exercise the Performance-Based Design Alternative described at 5001.3 of the IFC.

As the result of the investigation, the CSB issued the following recommendation to the International Code Council:

CSB Recommendation No. 2002-03-I-TX-R3Revise the International Fire Code to address the following issues: For facilities that are not staffed around the clock, specify circumstances where automatic fire detection is needed. Narrow exemptions for Class IIIB liquids. Expand fire protection analysis requirements to include all areas of a facility where there may be flammable or combustible fire risks.

The language proposed is intended to satisfactorily implement the objectives of this recommendation.

Bibliography: U.S. Chemical Safety and Hazard Investigation Board (CSB), "Petroleum Products Facility Incident (Destruction of Facility)," 06 March 2003. [Online]. Available: https://www.csb.gov/file.aspx?DocumentId=5611. [Accessed 30 November 2023].

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

$5,000

Estimated Immediate Cost Impact Justification (methodology and variables):

There are no material costs associated with this code change. The labor cost is based on 8 hours of work by an outside consultant at $500 an hour, 8 hours of work by plant management at $56 an hour, 8 hours of work by plant engineering at $48 an hour, and 4 hours of work by a plant employee at $20 an hour.

The cost can be reduced if plant personnel can conduct a PHA without the help of a consultant. The cost of conducting a PHA is directly proportional to the complexity of the process being analyzed. The process in this example represents a storage process or a simple manufacturing process.

Consultant (8 Hours x $500) + Plant Management (8 Hours x $56) + Plant Engineering (8 Hours x $48) + Plant Employee (4 Hours x $20) = $4,912 (Rounded to $5,000)

Labor Cost Source:

Estimated Life Cycle Cost Impact Justification (methodology and variables):

N/A

F251-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: This was seen as too complex for smaller projects. Such a concept would be better located within Chapter 50. It should also be correlated with NFPA 30. (Vote 12-0)

F251-24

Individual Consideration Agenda

Comment 1:

IFC: 5701.6

Proponents: Adam Henson, U.S. Chemical Safety and Hazard Investigation Board (adam.henson@csb.gov) requests As Modified by Committee (AMC2)

Modify as follows:

Delete and substitute as follows:

~~**5701.6 Process Hazard Analysis.** Where flammable and combustible liquids are stored or used in excess of the maximum allowable quantity per control area specified in Table 5003.1.1(1) process hazard analyses shall be conducted to ensure reasonable protection of people and property from dangerous conditions involving flammable and combustible liquids. The process hazard analysis shall be conducted utilizing a methodology suitable for the complexity of the process and shall consider factors internal and external to the organization. Recommendations from such analyses shall be addressed in a timely manner.~~

5701.6 Hazard Analysis. A hazard analysis shall be conducted by a qualified engineer or specialist for all rooms, buildings, and structures classified in accordance with the International Building Code as Group H-2 or H-3 occupancies. The analysis shall be in accordance with Section 6.4 of NFPA 30 and made available to the fire code official upon request.

Reason:

The proposal was revised in accordance with the committee's guidance regarding correlation with NFPA 30 and the complexity of the ask for smaller projects.

For correlation with NFPA 30, the new proposed requirement requires all facilities designated as high hazard occupancies based on their use of flammable and combustible liquids to conduct a hazard analysis in accordance with NFPA 30 Section 6.4. As, IFC Chapter 57 references NFPA 30 42 times, this suggestion seems very appropriate in hindsight.

To address complexity for smaller projects, the analysis described in Section 6.4 of NFPA 30 is much more straightforward than many common PHA methods. The goals of the analysis described in Section 6.4 of NFPA 30 are also more applicable of the purpose of IFC Chapter 57. Additionally, Section 6.4 of NFPA 30 does not apply to several operations including liquids consumed as fuel and Class II and Class III in atmospheric tanks or transferred at temperatures below their flashpoints. The conditions specified as requiring the analysis to include explosion hazards also reduce the burden on smaller/less hazardous operations.

The new proposal also addresses the committee's concerns regarding the qualifications for individuals performing these analyses. The requirement that the analysis be provided to the fire code official upon request is intended to reduce the burden on fire code officials without placing the information out of their reach.

The committee's suggestion that this requirement be located in Chapter 50 is addressed in another comment to F251-24. Given the loss history, and potential future losses, flammable/combustible liquids need to be analyzed specifically to ensure an acceptable level of risk. Besides the CSB's Third Coast investigation which was referenced in the initial proposal reason statement, the more recent ITC Tank Fire incident investigation demonstrates the potential severity of hazards when facility's fail to detect and suppress fires efficiently.

Comment (CAH2)# 512

Comment 2:

IFC: 5701.6

Proponents: Adam Henson, U.S. Chemical Safety and Hazard Investigation Board (adam.henson@csb.gov) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Fire Code

Delete and substitute as follows:

~~**5701.6 Process Hazard Analysis.** Where flammable and combustible liquids are stored or used in excess of the maximum allowable quantity per control area specified in Table 5003.1.1(1) process hazard analyses shall be conducted to ensure reasonable protection of people and property from dangerous conditions involving flammable and combustible liquids. The process hazard analysis shall be conducted utilizing a methodology suitable for the complexity of the process and shall consider factors internal and external to the organization. Recommendations from such analyses shall be addressed in a timely manner.~~

5001.5.3 Process Hazard Analysis. Where required by the fire code official, an application for a permit shall include a Process Hazard Analysis (PHA). The PHA shall be conducted by a qualified engineer or specialist, acceptable to the fire code official, in accordance with Section 104.2.2.2. Results from the PHA shall be addressed prior to permit issuance.

Reason: This comment is being made in response to the committee's input that the requirements for a PHA would be better located in Chapter 50. The application of the requirements to smaller projects and the qualifications of individuals performing the PHA's are also addressed in the new proposal.

The new proposal places the requirements in the Permits Section of Chapter 50 (5001.5). It also leaves the determination of the need for a PHA to the fire code official and establishes the qualifications of the individuals performing the analysis using existing code language from Chapter 1.

The correlation of this proposal with NFPA 30 was addressed in a previous comment. Flammable and combustible liquids have specific industry recognized analysis requirements in other codes which should be followed. Flammable and combustible liquid specific requirements are best located in IFC Chapter 57.

Cost Impact: Increase

Estimated Immediate Cost Impact:

$5,000.

Estimated Immediate Cost Impact Justification (methodology and variables):

There are no material costs associated with this code change. The labor cost is based on 8 hours of work by an outside consultant at $500 an hour, 8 hours of work by plant management at $56 an hour, 8 hours of work by plant engineering at $48 an hour, and 4 hours of work by a plant employee at $20 an hour.
The cost can be reduced if plant personnel can conduct a PHA without the help of a consultant. The cost of conducting a PHA is directly proportional to the complexity of the process being analyzed. The process in this example represents a storage process or a simple manufacturing process.

F253-24

IFC: 5704.2.13.1.4, 5704.2.14, 5704.2.14.1, 5704.2.14.2

Proposed Change as Submitted

Proponents: Daniel Carroll, NYS, NYS DOS (daniel.carroll@dos.ny.gov); Chad Sievers, NYS, NYS DOS (chad.sievers@dos.ny.gov); Kevin Duerr-Clark, NYS DOS, NYS DOS (kevin.duerr-clark@dos.ny.gov); John R Addario - NYS Department of State, NEW YORK STATE CODES DIVISION, New York State Department of State Division of Building Standards and Codes (john.addario@dos.ny.gov); Jeanne Rice, NYS DOS, NYS DOS (jeanne.rice@dos.ny.gov); China Clarke, New York State Dept of State, Manager Technical Support Unit (china.clarke@dos.ny.gov); Brian Tollisen, NYS Department of State, NYS Department of State (brian.tollisen@dos.ny.gov)

2024 International Fire Code

Revise as follows:

5704.2.13.1.4 Tanks abandoned in place. Tanks abandoned in place shall be as follows:

1. ~~*Flammable* and *combustible liquids* shall be removed from the tank and connected piping.~~ The entire contents of the tank and related piping shall be emptied, and the tank purged of all vapor. The contents of the storage tank and related piping shall be removed from the premises or property and disposed of in accordance with applicable local, state, or federal rules and regulations.
2. The suction, inlet, gauge, vapor return and vapor lines shall be disconnected and either be permanently removed, capped, plugged, or filled completely with an *approved* inert solid material.
3. ~~The tank~~ Tanks shall be filled completely with an *approved* inert solid material.
4. Remaining underground piping shall be capped or plugged.
5. A record of tank size, location and date of abandonment shall be retained.
6. All exterior above-grade fill piping shall be permanently removed when tanks are abandoned or removed, or the fill pipe shall be filled completely with an *approved* inert solid material.

5704.2.14 Removal and disposal of tanks. Removal and disposal of tanks shall comply with Sections 5704.2.14.1 and 5704.2.14.2.

Revise as follows:

5704.2.14.1 Removal. Removal of above-ground and underground tanks shall be in accordance with all of the following:

1. ~~*Flammable* and *combustible liquids* shall be removed from the tank and connected piping.~~ The entire contents of the tank and related piping shall be emptied, purged of all vapor, and inerted.
2. Piping at tank openings that is not to be used further shall be disconnected.
3. Piping shall be removed from the ground. ~~**Exception**~~ **Exceptions:**
    1. Piping is allowed to be abandoned in place where the *fire code official* determines that removal is not practical. Abandoned piping shall be capped and safeguarded as required by the *fire code official*.
    2. Piping that is reused for the installation of a new tank and meets the applicable requirements for the new installation shall be allowed to remain where *approved* by the *fire code official*.

4. Tank openings shall be capped or plugged, leaving a $^{1}/_{8}$-inch to $^{1}/_{4}$-inch-diameter (3.2 mm to 6.4 mm) opening for pressure equalization.
5. Tanks shall be purged of vapor and inerted prior to removal.
6. All exterior above-grade fill and vent piping shall either be permanently removed or filled completely with an *approved* inert solid material.

.

Exception: Piping associated with bulk plants, terminal facilities and refineries.

5704.2.14.2 Disposal. ~~Tanks shall be disposed of in accordance with federal, state and local regulations.~~
The tank and related piping, and the contents of the tank and related piping shall be removed from the premises and disposed of in accordance with applicable local, state, or federal rules and regulations

Reason: This change provides some additional clarity on the proper removal and disposal of the materials within tanks that are abandoned in place and those removed and disposed of. It also attempts to clarify scenarios where either reuse of existing piping is necessary for replacement tank installations, or for when removal of all piping would be unnecessarily onerous.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

These changes provide some more flexibility in the abandonment and removal of tanks while clarifying what would already be required by local,

state, and federal laws.

F253-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: There was concern that it is unclear what an "approved inert solid materials" means. It was noted that term is currently used in item 3. It was also suggested that this may be better addressed with reference to environmental regulations. The new exception in Section 5704.2.14.1 was seen as useful as it requires approval of the piping which does not always occur. (Vote 11-2)

F253-24

Individual Consideration Agenda

Comment 1:

IFC: 5704.2.13.1.4, 5704.2.14.1, 5704.2.14.2

Proponents: Jeanne Rice, NYSDOS (jeanne.rice@dos.ny.gov); Chad Sievers, NYS, NYS DOS (chad.sievers@dos.ny.gov); Kevin Duerr-Clark, NYS DOS, NYS DOS (kevin.duerr-clark@dos.ny.gov); Stephen Van Hoose, NYS DOS, NYS DOS (stephen.vanhoose@dos.ny.gov); China Clarke, New York State Dept of State, Manager Technical Support Unit (china.clarke@dos.ny.gov) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Fire Code

Revise as follows:

5704.2.13.1.4 Tanks abandoned in place. Tanks abandoned in place shall be as follows:

1. The entire contents of the tank and related piping shall be emptied~~, and the tank purged of all vapor~~. The contents of the storage tank and related piping shall be removed from the premises or property and disposed of in accordance with applicable local, state, or federal rules and regulations.
2. The suction, inlet, gauge, vapor return and vapor lines shall be disconnected and either be permanently removed, capped, plugged, or filled completely with an *approved* inert solid material.
3. Tanks shall be filled completely with an *approved* inert solid material and purged of all vapor.
4. Remaining underground piping shall be capped or plugged.
5. A record of tank size, location and date of abandonment shall be retained.
6. All exterior above-grade fill piping shall be permanently removed when tanks are abandoned or removed, or the fill pipe shall be filled completely with an *approved* inert solid material.

5704.2.14.1 Removal. Removal of above-ground and underground tanks shall be in accordance with all of the following:

1. The entire contents of the tank and related piping shall be ~~emptied, purged of all vapor, and inerted~~ removed.
2. Piping at tank openings that is not to be used further shall be disconnected.
3. Piping shall be removed from the ground. **Exceptions:**
    1. Piping is allowed to be abandoned in place where the *fire code official* determines that removal is not practical. Abandoned piping shall be capped and safeguarded as required by the *fire code official*.
    2. Piping that is reused for the installation of a new tank and meets the applicable requirements for the new installation shall be allowed to remain where *approved* by the *fire code official*.
4. Tank openings shall be capped or plugged, leaving a $^{1}/_{8}$-inch to $^{1}/_{4}$-inch-diameter (3.2 mm to 6.4 mm) opening for pressure equalization.
5. Tanks and related piping shall be purged of vapor and inerted prior to removal.
6. All exterior above-grade fill and vent piping shall either be permanently removed or filled completely with an *approved* inert solid material. **Exception:** Piping associated with bulk plants, terminal facilities and refineries.

5704.2.14.2 Disposal. The tank and related piping, and the contents of the tank and related piping, shall be removed from the premises and disposed of in accordance with applicable federal ~~local~~, state, or local ~~federal~~ rules and regulations.

Reason: This proposal was modified based on the committee's suggestions and concerns. See below for a discussion of each section and the modifications therein.

Section 5704.2.13.1.4: Since filling the tank with an inert, solid material will naturally purge the tank of vapor once it is full, this provision has been moved from item #1 to item #3. Without this provision, item #1 is similar to the 2024 code, apart from the addition of a reference to disposal in accordance with federal/state/local regulations, in accordance with the suggestion of the committee at CAH1. Use of the term "inert, solid material" as added to item #2 in the original proposal is left unchanged, since this term exists in item #3 in the 2024 code, and has been present in the code since at least the 2000 edition of the IFC.

Section 5704.2.14.1: Since the existing item #5 already requires tanks to be inerted and purged of all vapor, adding this requirement to item #1 was redundant, and is removed in this modification. "Related piping" has been added to item #5 to include piping in the requirements as was done in item #1 in the original proposal.

Section 5704.2.14.2: The original proposal modified this section to include piping in the disposal requirements. This modification to the proposal makes editorial changes to this section to bring it closer to the original language in the ordering of federal, state, and local regulations.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This modification is editorial in nature. Provisions are not removed or added, simply moved around in the section language for clarity, simplicity, and to avoid redundancy.

2024 International Fire Code

Revise as follows:

5705.5 Alcohol-based hand rubs classified as Class I or II liquids. The use of dispensers containing alcohol-based hand rubs classified as Class I or II liquids shall be in accordance with all of the following:

1. The maximum capacity of each dispenser shall be 68 ounces (2 L).
2. The minimum separation between dispensers shall be 48 inches (1219 mm).
3. Dispensers shall not be located above, below or closer than 1 inch (25 mm) to an electrical receptacle, switch, appliance, device or other ignition source. The wall space between the dispenser and the floor or intervening counter top shall be free of electrical receptacles, switches, appliances, devices or other ignition sources.
4. Dispensers shall be located so that the bottom of the dispenser is not less than 42 inches (1067 mm) and not more than 48 inches (1219 mm) above the finished floor.
5. Dispensers shall not obstruct required means of egress or be placed within 3 feet (914 mm) of an open flame, heating device or other ignition source.
6. Dispensers shall not release their contents except when the dispenser is manually activated. Facilities shall be permitted to install and use automatically activated “touch free” alcohol-based hand-rub dispensing devices with the following requirements:
   6.1. The facility or persons responsible for the dispensers shall test the dispensers each time a new refill is installed in accordance with the manufacturer’s care and use instructions.
   6.2. Dispensers shall be designed and must operate in a manner that ensures accidental or malicious activations of the dispensing device are minimized. At a minimum, all devices subject to or used in accordance with this section shall have the following safety features:
      6.2.1. Any activations of the dispenser shall only occur when an object is placed within 4 inches (98 mm) of the sensing device.
      6.2.2. The dispenser shall not dispense more than the amount required for hand hygiene consistent with label instructions as regulated by the United States Food and Drug Administration (USFDA).
      6.2.3. An object placed within the activation zone and left in place will cause only one activation.
7. Storage ~~and use~~ of alcohol-based hand rub ~~rubs~~ solution not in use shall be in accordance with Section 5705.5.2 ~~the applicable provisions of Sections 5704 and 5705~~.
8. Dispensers located in occupancies with carpeted floors shall only be allowed in *smoke compartments* or *fire areas* equipped throughout with an *approved automatic sprinkler system* in accordance with Section 903.3.1.1 or 903.3.1.2.

Add new text as follows:

5705.5.2 Storage of alcohol-based hand rub solutions classified as Class I or II liquids.. The indoor storage of alcohol-based hand rub solution, classified as Class I or II liquids flammable or combustible, shall be in accordance with all of the following: **Exception:** Alcohol-based hand rub dispensers for personal use with an aggregate of not more than 16 oz (474 ml) at a workstation shall not be

included in determining the MAQ.

1. The maximum capacity of individual alcohol-based hand rub solution storage containers shall be 1 gallon (4 L) and the container shall be constructed of a material compatible with the alcohol-based solution.
2. Storage of alcohol-based hand rub solutions in basements or below grade shall be protected throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.

TABLE 5705.5.2 MAXIMUM ALLOWABLE QUANTITY OF ALCOHOL-BASED HAND RUB SOLUTION IN STORAGEe

STORAGE LOCATION	SPRINKLERED	NONSPRINKLERED
Open storage areas[c]	60 Gal	30 Gal
Non-dedicated storage room[a]	120 Gal	60 Gal
Non-dedicated storage room; 1-HR fire separation[a,d]	240 Gal	120 Gal
Non-dedicated storage room; 2-HR fire separation[a,d]	360 Gal	240 Gal
Dedicated storage room[b]	360 Gal	240 Gal
Dedicated storage room; 1-HR fire separation[b,d]	600 Gal	240 Gal
Dedicated storage room; 2-HR fire separation[b,d]	720 Gal	240 Gal

a. Non-dedicated storage room is an enclosed storage room complying with the applicable storage requirements of this code.

b. Dedicated storage room is an enclosed storage room used only for the storage of alcohol-based hand rub solution.

c. The number of open storage areas is limited to 1 per story or fire area with a maximum, of 4 per building.

d. Fire separation shall be fire resistance-rated construction separating the dedicated storage room from the remainder of the building.

e. The maximum allowable quantity is for per control area, or smoke compartment in health care facilities.

Revise as follows:

TABLE 5003.1.1(5) HAZARDOUS MATERIALS EXEMPTIONS[a]

MATERIAL CLASSIFICATION	OCCUPANCY OR APPLICATION	EXEMPTION
Combustible fiber	Baled cotton	Densely packed baled cotton shall not be classified as combustible fiber, provided that the bales comply with the packing requirements of ISO 8115.
Corrosive	Building materials	The quantity of commonly used building materials that are classified as corrosive materials is not limited.
	Personal and household products	The quantity of personal and household products that are classified as corrosive materials is not limited in retail displays, provided that the products are in original packaging.
	Retail and wholesale sales occupancies	The quantity of medicines, foodstuffs or consumer products, and cosmetics containing not more than 50 percent by volume of water-miscible liquids, with the remainder of the solutions not being flammable, is not limited.
		To qualify for this allowance, such materials shall be packaged in individual containers not exceeding 1.3 gallons.
Explosives	Groups B, F, M and S	Storage of special industrial explosive devices is not limited.
	Groups M and R-3	Storage of black powder, smokeless propellant, and small arms primers is not limited.
Flammable and combustible liquids and gases	Aerosols	Buildings and structures occupied for the storage of aerosol products, aerosol cooking spray products, or plastic aerosol 3 products shall be classified as Group S-1.
	Alcoholic beverages	The quantity of alcoholic beverages in liquor stores and distributors without bulk storage is not limited.
		The quantity of alcoholic beverages in distilling or brewing of beverages is not limited.
		The storage quantity of beer, distilled spirits and wines in barrels and casks is not limited.

		The quantity of alcoholic beverages in retail and wholesale sales occupancies is not limited. To qualify for this allowance, beverages shall be packaged in individual containers not exceeding 1.3 gallons.
	Cleaning establishments with combustible liquid solvents	The quantity of combustible liquid solvents used in closed systems and having a flash point at or above 140°F is not limited. To qualify for this allowance, equipment shall be listed by an approved testing agency and the occupancy shall be separated from all other areas of the building by 1-hour fire barriers or 1-hour horizontal assemblies, or both, constructed in accordance with the *International Building Code*.
		The quantity of combustible liquid solvents having a flash point at or above 200°F is not limited.
	Closed piping systems	The quantity of flammable and combustible liquids and gases utilized for the operation of machinery or equipment is not limited.
	Flammable finishing operations using flammable and combustible liquids	Buildings and structures occupied for the application of flammable finishes shall comply with Section 416.
	Fuel	The quantity of liquid or gaseous fuel in fuel tanks on vehicles or motorized equipment is not limited.
		The quantity of gaseous fuels in piping systems and fixed appliances regulated by the *International Fuel Gas Code* is not limited.
		The quantity of liquid fuels in piping systems and fixed appliances regulated by the *International Mechanical Code* is not limited.
	Fuel oil	The quantity of fuel oil storage complying with Section 605.4.2 is not limited.
	Hand sanitizer	The quantity of alcohol-based hand rubs (ABHR) classified as Class I or II liquids in dispensers installed in accordance with Sections 5705.5 and 5705.5.1 is not limited. The location of the ABHR shall be provided in the construction documents.
		The quantity of alcohol-based hand rubs classified as Class I or II liquids in storage in accordance with Section 5705.5.2.
	Retail and wholesale sales occupancies with flammable and combustible liquids	The quantity of medicines, foodstuffs or consumer products, and cosmetics containing not more than 50 percent by volume of water-miscible liquids, with the remainder of the solutions not being flammable, is not limited.
		To qualify for this allowance, such materials shall be packaged in individual containers not exceeding 1.3 gallons.
Highly toxic and toxic materials	Retail and wholesale sales occupancies	The quantity of medicines, foodstuffs or consumer products, and cosmetics containing not more than 50 percent by volume of water-miscible liquids, with the remainder of the solutions not being flammable, is not limited.
		To qualify for this allowance, such materials shall be packaged in individual containers not exceeding 1.3 gallons.
Any	Agricultural materials	The quantity of agricultural materials stored or utilized for agricultural purposes on the premises is not limited.
	Energy storage	The quantity of hazardous materials in stationary storage battery systems is not limited.
		The quantity of hazardous materials in stationary fuel cell power systems is not limited.
		The quantity of hazardous materials in capacitor energy storage systems is not limited.
	Refrigeration systems	The quantity of refrigerants in refrigeration systems is not limited.

For SI: 1 gallon = 3.785 L, °C = (°F – 32)/1.8.

a. Exempted materials and conditions listed in this table are required to comply with provisions of this code that are not based on exceeding maximum allowable quantities in Section 5003.

2024 International Building Code

Revise as follows:

TABLE 307.1.1 HAZARDOUS MATERIALS EXEMPTIONS[a]

MATERIAL CLASSIFICATION	OCCUPANCY OR APPLICATION	EXEMPTION
Combustible fiber	Baled cotton	Densely packed baled cotton shall not be classified as combustible fiber, provided that the bales comply with the packing requirements of ISO 8115.
Corrosive	Building materials	The quantity of commonly used building materials that are classified as corrosive materials is not limited.
	Personal and household products	The quantity of personal and household products that are classified as corrosive materials is not limited in retail displays, provided that the products are in original packaging.

	Retail and wholesale sales occupancies	The quantity of medicines, foodstuffs or consumer products, and cosmetics containing not more than 50 percent by volume of water-miscible liquids, with the remainder of the solutions not being flammable, is not limited. To qualify for this allowance, such materials shall be packaged in individual containers not exceeding 1.3 gallons.
Explosives	Groups B, F, M and S	Storage of special industrial explosive devices is not limited.
	Groups M and R-3	Storage of black powder, smokeless propellant and small arms primers is not limited.
Flammable and combustible liquids and gases	Aerosols	Buildings and structures occupied for the storage of aerosol products, aerosol cooking spray products, or plastic aerosol 3 products shall be classified as Group S-1.
	Alcoholic beverages	The quantity of alcoholic beverages in liquor stores and distributors without bulk storage is not limited.
		The quantity of alcoholic beverages in distilling or brewing of beverages is not limited.
		The storage quantity of beer, distilled spirits and wines in barrels and casks is not limited.
		The quantity of alcoholic beverages in retail and wholesale sales occupancies is not limited. To qualify for this allowance, beverages shall be packaged in individual containers not exceeding 1.3 gallons.
	Cleaning establishments with combustible liquid solvents	The quantity of combustible liquid solvents used in closed systems and having a flash point at or above 140ºF is not limited. To qualify for this allowance, equipment shall be listed by an approved testing agency and the occupancy shall be separated from all other areas of the building by 1-hour fire barriers constructed in accordance with Section 707 or 1-hour horizontal assemblies constructed in accordance with Section 711, or both
		The quantity of combustible liquid solvents having a flash point at or above 200ºF is not limited.
	Closed piping systems	The quantity of flammable and combustible liquids and gases utilized for the operation of machinery or equipment is not limited.
	Fuel	The quantity of liquid or gaseous fuel in fuel tanks on vehicles or motorized equipment is not limited.
		The quantity of gaseous fuels in piping systems and fixed appliances regulated by the International Fuel Gas Code is not limited.
		The quantity of liquid fuels in piping systems and fixed appliances regulated by the International Mechanical Code is not limited.
	Flammable finishing operations using flammable and combustible liquids	Buildings and structures occupied for the application of flammable finishes shall comply with Section 416.
	Fuel oil	The quantity of fuel oil storage complying with Section 605.4.2 of the *International Fire Code* is not limited. .
	Hand sanitizer	The quantity of alcohol-based hand rubs (ABHR) classified as Class I or II liquids in dispensers installed in accordance with Sections 5705.5 and 5705.5.1 of the *International Fire Code* is not limited. The location of the ABHR dispensers shall be provided in the construction documents.
		<u>The quantity of alcohol-based hand rubs classified as Class I or II liquids in storage in accordance with Section 5705.5.2 of the *International Fire Code.*</u>
	Retail and wholesale sales occupancies with flammable and combustible liquids	The quantity of medicines, foodstuffs or consumer products, and cosmetics containing not more than 50 percent by volume of water-miscible liquids, with the remainder of the solutions not being flammable, is not limited. To qualify for this allowance, such materials shall be packaged in individual containers not exceeding 1.3 gallons.
Highly toxic and toxic materials	Retail and wholesale sales occupancies	The quantity of medicines, foodstuffs or consumer products, and cosmetics containing not more than 50 percent by volume of water-miscible liquids, with the remainder of the solutions not being flammable, is not limited. To qualify for this allowance, such materials shall be packaged in individual containers not exceeding 1.3 gallons.
Any	Agricultural materials	The quantity of agricultural materials stored or utilized for agricultural purposes on the premises is not limited.
	Energy storage	The quantity of hazardous materials in stationary storage battery systems is not limited.
		The quantity of hazardous materials in stationary fuel cell power systems is not limited.
		The quantity of hazardous materials in capacitor energy storage systems is not limited.
	Refrigeration Systems	The quantity of refrigerants in refrigeration systems is not limited.

For SI: 1 gallon = 3.785L, °C = (°F - 32)/1.8.

a. Exempted materials and conditions listed in this table are required to comply with applicable provisions of the International Fire Code.

Reason: The main purpose of this proposal is to add a new Section (5705.5.2) for storage requirements and quantity limitations. This new section adds reasonable storage quantity limits and requirements based on experience over the past 4 years of the pandemic.

Two key points to consider.1. Alcohol-based hand-sanitizer solutions at the 60 - 95% level recommended by CDC are classified as Class IB based on flashpoint. However, alcohol type polar solvents have other characteristics that differentiate them from the more volatile petroleum-based flammable (ignitable) liquids: quick evaporation, water-soluble, respond well to water based automatic fire sprinklers. 2. The proposed storage quantity allowances are for ABHR replacement solution stored in their factory containers intended for replacement qualities of one dispenser can be compared to MAQs permitted for Class IB flammable liquids in Group M Occupancies for wholesale and retail sales uses (Table5704.3.4.1) need to explain this comparison; the values don't match. The proposal addresses storage of alcohol-based rub solutions in a maximum individual container size of 1 gallon; provides maximum storage quantities for sprinklered and nonsprinklered buildings and incorporates allowances for higher storage quantities based on whether the storage room is for only alcohol-based sanitizer solutions and whether the storage room has 1 or 2 hour fire resistance rated construction for compartmentation of the hazard. The current MAQs for Class IB flammable liquids (typical classification for an alcohol-based hand rub solutions) is 120 gallons with 100% increase for sprinklers and approved storage cabinets). The quantities in Table 5705.5.2 are modeled after these MAQ allowances recognizing: the storage challenges created during the pandemic and the experience of storage in these amounts without unreasonable fire risk or notable fire incidents; the benefit of fire sprinkler protection and fire separations for hazard mitigation for ABHR solution in storage.

This proposal is submitted by the ICC Fire Code Action Committee (FCAC), ICC Committee for Healthcare (CHC) and the Pandemic Task Force Code Development Work Group (PTF CDWG).

FCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and early 2024 the FCAC has held several virtual meetings and one in-person meeting open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the **FCAC Website**.

The Committee on Healthcare (CHC) was established by the ICC Board of Directors in 2011 to pursue opportunities to study and develop effective and efficient provisions for Hospital, Nursing Homes, Assisted Living and Ambulatory Care Facilities. This committee was formed in cooperation with the American Society for Healthcare Engineering (ASHE). In July of 2017, the ICC Board made CHC a standing committee. In 2023 the CHC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the CHC website at CHC webpage.

The ICC/NEHA Pandemic Task Force (PTF) was organized and tasked with researching the effects of the COVID-19 pandemic on the built environment and developing a roadmap and proposing needed resources – including guidelines, recommended practices, publications and updates to the International Codes® (I-Codes®) – that are necessary to overcome the numerous challenges that may be faced during future pandemics and to construct and manage safe, sustainable and affordable occupancy of the built environment. The ICC Pandemic Task Force Code Development Work Group (PTF CDWG) has conducted a comprehensive review of current code requirements as they relate to the prevention of the transmission of diseases and other serious health concerns and suggested revisions to current code requirements based on this assessment.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

$0.00

Estimated Immediate Cost Impact Justification (methodology and variables):

Storage of ABHR solution is not mandated by this code requirement, but the storage of large quantities of ABHR may necessitate the construction of separated storage room (fire resistance-rated construction) or the installation of an automatic fire sprinkler system. In those instances there could be a cost for construction for new buildings or a cost of construction to renovate an existing building. However, these requirements provide an increase in amounts of hazardous materials thus further avoiding classification as a Group H occupancy.

F260-24

Public Hearing Results (CAH1)

Committee Action: **As Submitted**

Committee Reason: This proposal sets reasonable storage amounts for ABHR with associated necessary protection. (Vote 11-0)

Individual Consideration Agenda

Comment 1:

IFC: 5705.5, 5705.5.2, 5705.5.2.1 (New), 5705.5.2.2 (New), TABLE 5705.5.2, TABLE 5003.1.1(5); IBC: TABLE 307.1.1

Proponents: Quyen Thai, City of Tacoma, Washington Association of Building Officials Technical Code Development Committee; Micah Chappell, Seattle Department of Construction and Inspections, Washington Association of Building Officials Technical Code Development Committee (micah.chappell@seattle.gov); Hoyt Jeter, City of Tacoma, City of Tacoma (hjeter@cityoftacoma.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Fire Code

5705.5 Alcohol-based hand rubs classified as Class I or II liquids. The use of dispensers containing alcohol-based hand rubs classified as Class I or II liquids shall be in accordance with all of the following:

1. The maximum capacity of each dispenser shall be 68 ounces (2 L).
2. The minimum separation between dispensers shall be 48 inches (1219 mm).
3. Dispensers shall not be located above, below or closer than 1 inch (25 mm) to an electrical receptacle, switch, appliance, device or other ignition source. The wall space between the dispenser and the floor or intervening counter top shall be free of electrical receptacles, switches, appliances, devices or other ignition sources.
4. Dispensers shall be located so that the bottom of the dispenser is not less than 42 inches (1067 mm) and not more than 48 inches (1219 mm) above the finished floor.
5. Dispensers shall not obstruct required means of egress or be placed within 3 feet (914 mm) of an open flame, heating device or other ignition source.

6. Dispensers shall not release their contents except when the dispenser is manually activated. Facilities shall be permitted to install and use automatically activated “touch free” alcohol-based hand-rub dispensing devices with the following requirements:

   6.1. The facility or persons responsible for the dispensers shall test the dispensers each time a new refill is installed in accordance with the manufacturer’s care and use instructions.

   6.2. Dispensers shall be designed and must operate in a manner that ensures accidental or malicious activations of the dispensing device are minimized. At a minimum, all devices subject to or used in accordance with this section shall have the following safety features:

      6.2.1. Any activations of the dispenser shall only occur when an object is placed within 4 inches (98 mm) of the sensing device.

      6.2.2. The dispenser shall not dispense more than the amount required for hand hygiene consistent with label instructions as regulated by the United States Food and Drug Administration (USFDA).

      6.2.3. An object placed within the activation zone and left in place will cause only one activation.

7. Storage of alcohol-based hand rub solution not in use shall be in accordance with Section 5705.5.2 .

8. Dispensers located in occupancies with carpeted floors shall only be allowed in *smoke compartments* or *fire areas* equipped throughout with an *approved automatic sprinkler system* in accordance with Section 903.3.1.1 or 903.3.1.2.

5705.5.2 Storage of alcohol-based hand rub solutions classified as Class I or II liquids.. The maximum allowable quantity (MAQ) of alcohol-based hand rub solution stored inside shall be determined in accordance with Table 5705.5.2. ~~The indoor storage of alcohol-based hand rub solution, classified as Class I or II liquids flammable or combustible, shall be in accordance with all of the following:~~

~~**Exception:** Alcohol-based hand rub dispensers for personal use with an aggregate of not more than 16 oz (474 ml) at a workstation shall not be included in determining the MAQ.~~

~~1. The maximum capacity of individual alcohol-based hand rub solution storage containers shall be 1 gallon (4 L) and the container shall be constructed of a material compatible with the alcohol-based solution.~~

~~2. Storage of alcohol-based hand rub solutions in basements or below grade shall be protected throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.~~

Add new text as follows:

5705.5.2.1 Alcohol-based hand rub solutions classified as Class I or II liquids for personal use. Dispensers for personal use with an aggregate of not more than 16 oz at a workstation shall not be included in determining the MAQ. The maximum capacity of individual alcohol-based hand rub solution storage containers shall be 1 gallon and the container shall be constructed of a material compatible with the alcohol-based solution.

5705.5.2.2 Storage in basements or below grade. Storage of alcohol-based hand rub solutions in basements or below grade shall be protected throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.

TABLE 5705.5.2 MAXIMUM ALLOWABLE QUANTITY OF ALCOHOL-BASED HAND RUB SOLUTION IN STORAGEe

STORAGE LOCATION	SPRINKLERED	NONSPRINKLERED
Open storage areas[c]	60 Gal	30 Gal
Non-dedicated storage room[a]	120 Gal	60 Gal
Non-dedicated storage room; 1-HR fire separation[a,d]	240 Gal	120 Gal
Non-dedicated storage room; 2-HR fire separation[a,d]	360 Gal	240 Gal
Dedicated storage room[b]	360 Gal	240 Gal
Dedicated storage room; 1-HR fire separation[b,d]	600 Gal	240 Gal
Dedicated storage room; 2-HR fire separation[b,d]	720 Gal	240 Gal

a. Non-dedicated storage room is an enclosed storage room complying with the applicable storage requirements of this code.

b. Dedicated storage room is an enclosed storage room used only for the storage of alcohol-based hand rub solution.

c. The number of open storage areas is limited to 1 per story or fire area with a maximum, of 4 per building.

d. Fire separation shall be fire resistance-rated construction separating the dedicated storage room from the remainder of the building.

e. The maximum allowable quantity is for per control area, or smoke compartment in health care facilities.

TABLE 5003.1.1(5) HAZARDOUS MATERIALS EXEMPTIONS[a]

MATERIAL CLASSIFICATION	OCCUPANCY OR APPLICATION	EXEMPTION
Combustible fiber	Baled cotton	Densely packed baled cotton shall not be classified as combustible fiber, provided that the bales comply with the packing requirements of ISO 8115.
Corrosive	Building materials	The quantity of commonly used building materials that are classified as corrosive materials is not limited.
	Personal and household products	The quantity of personal and household products that are classified as corrosive materials is not limited in retail displays, provided that the products are in original packaging.
	Retail and wholesale sales occupancies	The quantity of medicines, foodstuffs or consumer products, and cosmetics containing not more than 50 percent by volume of water-miscible liquids, with the remainder of the solutions not being flammable, is not limited. To qualify for this allowance, such materials shall be packaged in individual containers not exceeding 1.3 gallons.
Explosives	Groups B, F, M and S	Storage of special industrial explosive devices is not limited.
	Groups M and R-3	Storage of black powder, smokeless propellant, and small arms primers is not limited.
Flammable and combustible liquids and gases	Aerosols	Buildings and structures occupied for the storage of aerosol products, aerosol cooking spray products, or plastic aerosol 3 products shall be classified as Group S-1.
	Alcoholic beverages	The quantity of alcoholic beverages in liquor stores and distributors without bulk storage is not limited. The quantity of alcoholic beverages in distilling or brewing of beverages is not limited. The storage quantity of beer, distilled spirits and wines in barrels and casks is not limited. The quantity of alcoholic beverages in retail and wholesale sales occupancies is not limited. To qualify for this allowance, beverages shall be packaged in individual containers not exceeding 1.3 gallons.
	Cleaning establishments with combustible liquid solvents	The quantity of combustible liquid solvents used in closed systems and having a flash point at or above 140°F is not limited. To qualify for this allowance, equipment shall be listed by an approved testing agency and the occupancy shall be separated from all other areas of the building by 1-hour fire barriers or 1-hour horizontal assemblies, or both, constructed in accordance with the *International Building Code*. The quantity of combustible liquid solvents having a flash point at or above 200°F is not limited.
	Closed piping systems	The quantity of flammable and combustible liquids and gases utilized for the operation of machinery or equipment is not limited.
	Flammable finishing operations using flammable and combustible liquids	Buildings and structures occupied for the application of flammable finishes shall comply with Section 416.
	Fuel	The quantity of liquid or gaseous fuel in fuel tanks on vehicles or motorized equipment is not limited. The quantity of gaseous fuels in piping systems and fixed appliances regulated by the *International Fuel Gas Code* is not limited. The quantity of liquid fuels in piping systems and fixed appliances regulated by the *International Mechanical Code* is not limited.
	Fuel oil	The quantity of fuel oil storage complying with Section 605.4.2 is not limited.
	Hand sanitizer	The quantity of alcohol-based hand rubs (ABHR) classified as Class I or II liquids in dispensers installed in accordance with Sections 5705.5 and 5705.5.1 is not limited. The location of the ABHR shall be provided in the construction documents. The quantity of alcohol-based hand rubs classified as Class I or II liquids in storage in accordance with Section 5705.5.2.
	Retail and wholesale sales occupancies with flammable and combustible liquids	The quantity of medicines, foodstuffs or consumer products, and cosmetics containing not more than 50 percent by volume of water-miscible liquids, with the remainder of the solutions not being flammable, is not limited. To qualify for this allowance, such materials shall be packaged in individual containers not exceeding 1.3 gallons.

Highly toxic and toxic materials	Retail and wholesale sales occupancies	The quantity of medicines, foodstuffs or consumer products, and cosmetics containing not more than 50 percent by volume of water-miscible liquids, with the remainder of the solutions not being flammable, is not limited.
		To qualify for this allowance, such materials shall be packaged in individual containers not exceeding 1.3 gallons.
Any	Agricultural materials	The quantity of agricultural materials stored or utilized for agricultural purposes on the premises is not limited.
	Energy storage	The quantity of hazardous materials in stationary storage battery systems is not limited.
		The quantity of hazardous materials in stationary fuel cell power systems is not limited.
		The quantity of hazardous materials in capacitor energy storage systems is not limited.
	Refrigeration systems	The quantity of refrigerants in refrigeration systems is not limited.

For SI: 1 gallon = 3.785 L, °C = (°F – 32)/1.8.

a. Exempted materials and conditions listed in this table are required to comply with provisions of this code that are not based on exceeding maximum allowable quantities in Section 5003.

2024 International Building Code

TABLE 307.1.1 HAZARDOUS MATERIALS EXEMPTIONS[a]

MATERIAL CLASSIFICATION	OCCUPANCY OR APPLICATION	EXEMPTION
Combustible fiber	Baled cotton	Densely packed baled cotton shall not be classified as combustible fiber, provided that the bales comply with the packing requirements of ISO 8115.
Corrosive	Building materials	The quantity of commonly used building materials that are classified as corrosive materials is not limited.
	Personal and household products	The quantity of personal and household products that are classified as corrosive materials is not limited in retail displays, provided that the products are in original packaging.
	Retail and wholesale sales occupancies	The quantity of medicines, foodstuffs or consumer products, and cosmetics containing not more than 50 percent by volume of water-miscible liquids, with the remainder of the solutions not being flammable, is not limited. To qualify for this allowance, such materials shall be packaged in individual containers not exceeding 1.3 gallons.
Explosives	Groups B, F, M and S	Storage of special industrial explosive devices is not limited.
	Groups M and R-3	Storage of black powder, smokeless propellant and small arms primers is not limited.
Flammable and combustible liquids and gases	Aerosols	Buildings and structures occupied for the storage of aerosol products, aerosol cooking spray products, or plastic aerosol 3 products shall be classified as Group S-1.
	Alcoholic beverages	The quantity of alcoholic beverages in liquor stores and distributors without bulk storage is not limited.
		The quantity of alcoholic beverages in distilling or brewing of beverages is not limited.
		The storage quantity of beer, distilled spirits and wines in barrels and casks is not limited.
		The quantity of alcoholic beverages in retail and wholesale sales occupancies is not limited. To qualify for this allowance, beverages shall be packaged in individual containers not exceeding 1.3 gallons.
	Cleaning establishments with combustible liquid solvents	The quantity of combustible liquid solvents used in closed systems and having a flash point at or above 140ºF is not limited. To qualify for this allowance, equipment shall be listed by an approved testing agency and the occupancy shall be separated from all other areas of the building by 1-hour fire barriers constructed in accordance with Section 707 or 1-hour horizontal assemblies constructed in accordance with Section 711, or both
		The quantity of combustible liquid solvents having a flash point at or above 200ºF is not limited.
	Closed piping systems	The quantity of flammable and combustible liquids and gases utilized for the operation of machinery or equipment is not limited.
	Fuel	The quantity of liquid or gaseous fuel in fuel tanks on vehicles or motorized equipment is not limited.
		The quantity of gaseous fuels in piping systems and fixed appliances regulated by the International Fuel Gas Code is not limited.
		The quantity of liquid fuels in piping systems and fixed appliances regulated by the International Mechanical Code is not limited.

	Flammable finishing operations using flammable and combustible liquids	Buildings and structures occupied for the application of flammable finishes shall comply with Section 416.
	Fuel oil	The quantity of fuel oil storage complying with Section 605.4.2 of the *International Fire Code* is not limited. .
	Hand sanitizer	The quantity of alcohol-based hand rubs (ABHR) classified as Class I or II liquids in dispensers installed in accordance with Sections 5705.5 and 5705.5.1 of the *International Fire Code* is not limited. The location of the ABHR dispensers shall be provided in the construction documents. The quantity of alcohol-based hand rubs classified as Class I or II liquids in storage in accordance with Section 5705.5.2 of the *International Fire Code.*
	Retail and wholesale sales occupancies with flammable and combustible liquids	The quantity of medicines, foodstuffs or consumer products, and cosmetics containing not more than 50 percent by volume of water-miscible liquids, with the remainder of the solutions not being flammable, is not limited. To qualify for this allowance, such materials shall be packaged in individual containers not exceeding 1.3 gallons.
Highly toxic and toxic materials	Retail and wholesale sales occupancies	The quantity of medicines, foodstuffs or consumer products, and cosmetics containing not more than 50 percent by volume of water-miscible liquids, with the remainder of the solutions not being flammable, is not limited. To qualify for this allowance, such materials shall be packaged in individual containers not exceeding 1.3 gallons.
Any	Agricultural materials	The quantity of agricultural materials stored or utilized for agricultural purposes on the premises is not limited.
	Energy storage	The quantity of hazardous materials in stationary storage battery systems is not limited. The quantity of hazardous materials in stationary fuel cell power systems is not limited. The quantity of hazardous materials in capacitor energy storage systems is not limited.
	Refrigeration Systems	The quantity of refrigerants in refrigeration systems is not limited.

For SI: 1 gallon = 3.785L, °C = (°F - 32)/1.8.

a. Exempted materials and conditions listed in this table are required to comply with applicable provisions of the International Fire Code.

Reason: As it's currently written and approved as submitted, the charging language in new section 5705.5.2 contains exceptions, but does not reference any tables as intended. We feel that this could be rewritten so that it's organized making it more clear.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal is more of a clarification to the original proposal and does not increase or decrease beyond what was stated in the original proposed language.

Comment (CAH2)# 337

F264-24

IFC: 6104.3.2, 6104.3.3 (New)

Proposed Change as Submitted

Proponents: Gregory Wilson, Federal Emergency Management Agency, FEMA (gregory.wilson2@fema.dhs.gov); Rebecca Quinn, RCQuinn Consulting, Inc., FEMA Building Science (rebecca@rcquinnconsulting.com)

2024 International Fire Code

6104.3.2 Special hazards. LP-gas containers shall be located with respect to special hazards including, but not limited to, above-ground *flammable* or *combustible liquid* tanks, oxygen or gaseous hydrogen containers, flooding or electric power lines as specified in Section 6.5.3 of NFPA 58.

Add new text as follows:

6104.3.3 Flood hazard areas. LP-gas containers located in *flood hazard areas* established in Section 1612.3 of the *International Building Code* shall be located and installed in accordance with ASCE 24.

Reason: Section 6104.3.2 requires location of LP-gas containers “with respect to flooding” but does not provide specifics on what that means. This proposal adds a pointer on the minimum I-Code requirements for LP-gas containers located in flood hazard areas. The proposed change is not a new requirement; it is simply adding a reference to existing requirements for utilities and equipment in flood hazard areas.

Bibliography: *Flood Resistant Design and Construction,* ASCE/SEI 24-14

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal does not increase or decrease the initial construction costs or life-cycle costs because it does not change any requirements; it only points to existing requirements for development in flood hazard areas.

F264-24

Public Hearing Results (CAH1)

Committee Action: **As Submitted**

Committee Reason: Provides a specific pointer to existing requirements on flood hazard protection for LP-gas containers. Whether or not NFPA 58 addresses this would still be beneficial. The committee verified ASCE 24 is not referenced in NFPA 58.(Vote 10-3)

F264-24

Individual Consideration Agenda

Comment 1:

Proponents: Bruce Swiecicki, National Propane Gas Association, National Propane Gas Association (bswiecicki@npga.org) requests Disapproved

Reason: F264 is adding a requirement to the fire code that would specify that in certain flood hazard areas, propane containers must either be installed underground or on elevated platforms such that the container is located above the flood elevation. This proposal was submitted without any supporting data indicating that propane containers have caused destruction, injuries or loss of life in flood events that have taken place.

Currently, the Building Code requires that buildings and other structures located in flood hazard areas be designed and constructed to withstand the effects of flooding. That is where the requirement should reside because the fire code official should not be placed in the position of having to approve specially designed structures for propane containers. It is also important to note that the requirements in Section 1612 of the Building Code (which presumably the proponent is referring to) apply only to new buildings or those that have undergone "substantial improvement," which is defined as improvements exceeding 50% of the market value of the structure. Therefore, the proposal in F264 would exceed those limitations and could very well lead to unwarranted retrofits of existing installations at extremely high costs to do so. Note that the proponent indicates that there are no increases to the cost of construction to comply with ASCE 24. This is totally untrue! The information below provides substantial costs to comply with ASCE 24. Keep in mind that there was no data submitted that would compare the benefits received to these costs, which involve either installing a container underground or on a platform above the flood elevation.

Standard above ground installations range in the low hundreds $300-800 depending on the amount of piping installed. Underground tank installation is generally in the range of $8,000-10,000 including the tank. Because the tank is underground most consumers have to shoulder the full cost as a lease option would require the customer pay for the excavation and removal should they change providers or stop using propane. Even containers installed underground may not comply with ASCE 24 if the topsoil can be washed away by hydrodynamic forces, which the standard says must be considered. Therefore, the only option might be to install the container on an elevated platform.

The construction of a platform structure suitable for the installation of both the container and product weight would cost substantially more money, probably in the range of $20,000. Since many tanks in storm prone area are also used for back up power these tanks must be larger capacity (500-1000 gallons). All fittings reside on the top of a container for both filling and shut-down. Elevation of containers creates an unsafe condition related to walking and working surfaces, accessibility, valve closure in an emergency situation, fire department access, and vapor dispersion. Since intentional work will be performed at elevation, a step, railing, platform, and guardrail assembly would be required for compliance with OSHA requirements for elevated structures.

Since adequately anchored containers are resistant to movement in flooding of even storm surge, there is no functional requirement for them to be above water at all times. A propane tank and piping is a closed system no different from a natural gas pipeline. A tank is completely functional below water with no deleterious effects as a pipeline would be. The only impact in high water is that the container can not be refilled when under water. This would be the exact same restriction however if the tank was on an elevated platform. If the water was at such a height that it was impacting the platform a person would not fill, as they would have to walk through water (and what is below the water) to get to the tank.

In an emergency or during general operations access to the top of a propane container is required. Further, propane vapors are heavier than air. This will force emergency responders, propane servicers, or consumers to potentially become exposed to leaking gas while trying to access valves used for container operation. In a fire situation, flame capture will be complicated due to the elevated installation. This capture will impact responders or create confinement while climbing to the top of the platform to control the release, increasing the potential for extinguishment. Extinguishment of a propane fire, prior to elimination of the source can lead to significant emergency responder exposure, conflagration, or vapor cloud explosions.

In conclusion, F264 should be disapproved. It's an effort to impose unwarranted and unjustified requirements on the use of propane energy systems, a recognized clean-burning alternative fuel.

Proposed Change as Submitted

Proponents: Kris Jaggari, Nouryon/OPPSD Representative (kris.jaggari@nouryon.com)

2024 International Fire Code

Revise as follows:

ORGANIC PEROXIDE.
An organic compound that contains the bivalent -O-O- structure and which may be considered to be a structural derivative of hydrogen peroxide where one or both of the hydrogen atoms have been replaced by an organic radical. ~~Organic peroxides can present an explosion hazard (detonation or deflagration) or they can be shock sensitive. They can also decompose into various unstable compounds over an extended period of time.~~ Organic peroxide formulation is a pure or technically pure organic peroxide or a mixture of organic peroxides with an active oxygen (aO) concentration greater than 1 percent alone or in combination with one or more materials. Organic peroxide storage classification is based on the organic peroxide transportation type and burning rate. The transport type for organic peroxide formulations is determined by the UN Manual of Tests and Criteria, Part II. The methods used to determine the burning rate of organic peroxide formulations are spelled out in the Storage of Organic Peroxides in The Netherlands (also known as PGS 8). Terms such as accelerator, catalyst, initiator, and curing agent are sometimes used to describe organic peroxide formulations and are misleading because they can also refer to materials that are not or do not contain organic peroxides, some of which might present increased hazard when mixed with organic peroxides.

Class I. Describes those formulations that are capable of *deflagration* but not *detonation*. This class comprises of organic peroxide formulations with transport classification Type B, those with transport classification Type C and Type D with large-scale burning rate equal to or higher than 300 kg/min, and those with transport classification Type C and Type D with small-scale burning rate equal to or higher than 9.0 kg/min × m^2 unless the large-scale burning rate is lower than 300 kg/min.

Class II<u>A</u>. Describes those formulations that burn very rapidly and that pose a moderate reactivity hazard. This class comprises of organic peroxide formulations with transport classification Type C and Type D with a large-scale burning rate equal to or higher than 140 kg/min but lower than 300 kg/min and those with transport classification Type E with a large-scale burning rate equal to or higher than 140 kg/min, those with Type C and Type D if the small-scale burning rate is equal to or higher than 2.2 kg/min × m^2 but lower than 9.0 kg/min × m^2, and Type E if the small-scale burning rate is equal to or higher than 2.2 kg/min × m^2.

Add new definition as follows:

Class IIB. Describes those formulations that burn rapidly and that pose a moderate reactivity hazard. This class comprises of organic peroxide formulations with transport classification Type C with a large-scale burning rate lower than 140 kg/min, those with transport classification Type D and Type E with a large-scale burning rate equal to or higher than 60 kg/min but lower than 140 kg/min, those with transport classification Type C if the small-scale burning rate is lower than 2.2 kg/min × m^2, and those with transport classification Type D and Type E if the small-scale burning rate is equal to or higher than 0.9 kg/min × m^2 but lower than 2.2 kg/min × m^2.

Revise as follows:

Class III. Describes those formulations that burn rapidly and that pose a moderate reactivity hazard.
This class comprises of organic peroxide formulations with transport classification Type D with a large-scale burning rate lower than 60 kg/min, those with transport classification Type E with a large-scale burning rate equal to or higher than 10 kg/min but lower than 60 kg/min, those with transport classification Type F with a large-scale burning rate equal to or higher than 10 kg/min, and those with

transport classification Type D and Type E if the small-scale burning rate is lower than 0.9 kg/min × m^2, and those with transport classification Type F irrespective of the small scale burning rate.

Class IV. Describes those formulations that burn in the same manner as ordinary combustibles and that pose a minimal reactivity hazard. This class comprises of organic peroxide formulations of transport classification Type E or Type F with a large-scale burning rate lower than 10 kg/min.

Class V. Describes those formulations that burn with less intensity than ordinary combustibles or do not sustain combustion and that pose no reactivity hazard. This class comprises of organic peroxide formulations of transport classification Type G without additional subsidiary risks.

~~**Unclassified detonable**~~ **Detonable.** *Organic peroxides* that are capable of *detonation*. These peroxides pose an extremely high-explosion hazard through rapid explosive decomposition.

6201.1 Scope. The storage and use of *organic peroxides* shall be in accordance with this chapter and Chapter 50. ~~Unclassified detonable~~ Detonable *organic peroxides* that are capable of *detonation* in their normal shipping containers under conditions of fire exposure shall be stored in accordance with Chapter 56.

6202.1 Definition. The following term is defined in Chapter 2:
ORGANIC PEROXIDE.

Class I.
Class II~~A~~.
Class IIB.
Class III.
Class IV.
Class V.
~~**Unclassified detonable**~~ **Detonable.**

6203.1.1 Special limitations for indoor storage and use by occupancy. The indoor storage and use of *organic peroxides* shall be in accordance with Sections 6203.1.1.1 through 6203.1.1.4.

Revise as follows:

6203.1.1.1 Group A, E, I or U occupancies. In Group A, E, I or U occupancies, any amount of ~~unclassified~~ detonable and Class I organic peroxides shall be stored in accordance with the following:

1. ~~Unclassified detonable~~ Detonable and Class I *organic peroxides* shall be stored in hazardous materials storage cabinets complying with Section 5003.8.7.
2. The hazardous materials storage cabinets shall not contain other storage.

6203.1.1.2 Group R occupancies. ~~Unclassified d~~Detonable and Class I *organic peroxides* shall not be stored or used within Group R occupancies.

6203.1.1.3 Group B, F, M or S occupancies. ~~Unclassified detonable~~ Detonable and Class I *organic peroxides* shall not be stored or used in offices, or retail sales areas of Group B, F, M or S occupancies.

6203.1.1.4 Classrooms. In classrooms in Group B, F or M occupancies, any amount of ~~unclassified~~ detonable and Class I *organic peroxides* shall be stored in accordance with the following:

1. ~~Unclassified detonable~~ Detonable and Class I *organic peroxides* shall be stored in hazardous materials storage cabinets complying with Section 5003.8.7.
2. The hazardous materials storage cabinets shall not contain other storage.

6204.1 Indoor storage. Indoor storage of *organic peroxides* in amounts exceeding the *maximum allowable quantity per control area* indicated in Table 5003.1.1(1) shall be in accordance with Sections 5001, 5003, 5004 and this chapter.
Indoor storage of ~~unclassified~~ detonable *organic peroxides* that are capable of *detonation* in their normal shipping containers under conditions of fire exposure shall be stored in accordance with Chapter 56.

6204.1.2 Distance from detached buildings to exposures. In addition to the requirements of the *International Building Code*, detached storage buildings for Class I, IIA, IIB,III, IV and V *organic peroxides* shall be located in accordance with Table 6204.1.2. Detached buildings containing quantities of ~~unclassified~~ detonable *organic peroxides* in excess of those set forth in Table 5003.8.2 shall be located in accordance with Table 5604.5.2(1).

TABLE 6204.1.2 ORGANIC PEROXIDES—DISTANCE TO EXPOSURES FROM DETACHED STORAGE BUILDINGS OR OUTDOOR STORAGE AREAS

ORGANIC PEROXIDE CLASS	MAXIMUM STORAGE QUANTITY (POUNDS) AT MINIMUM SEPARATION DISTANCE					
	Distance to buildings, lot lines, public streets, public alleys, public ways or means of egress			Distance between individual detached storage buildings or individual outdoor storage areas		
	50 feet	100 feet	150 feet	20 feet	75 feet	100 feet
I	2,000	20,000	175,000	2,000	20,000	175,000
IIA	100,000	200,000	No Limit	100,000[a]	No Limit	No Limit
IIB	175,000	No Limit	No Limit	175,000[a]	No Limit	No Limit
III	200,000	No Limit	No Limit	200,000[a]	No Limit	No Limit
IV	No Limit	No Limit	No Limit	No Limit	No Limit	No Limit
V	No Limit	No Limit	No Limit	No Limit	No Limit	No Limit

For SI: 1 foot = 304.8 mm, 1 pound = 0.454 kg.

a. Where the amount of organic peroxide stored exceeds this amount, the minimum separation shall be 50 feet.

6204.1.4 Electrical wiring and equipment. In addition to the requirements of Section 5003.9.4, electrical wiring and equipment in storage areas for Class I, IIA or IIB *organic peroxides* shall comply with the requirements for electrical Class I, Division 2, locations.

6204.1.5 Smoke detection. An *approved* supervised smoke detection system in accordance with Section 907 shall be provided in rooms or areas where Class I, IIA, IIB or III *organic peroxides* are stored. Activation of the smoke detection system shall sound a local alarm.

Exception: A smoke detection system shall not be required in detached storage buildings equipped throughout with an *approved automatic fire-extinguishing system* complying with Chapter 9.

TABLE 6204.1.7 STORAGE OF ORGANIC PEROXIDES

ORGANIC PEROXIDE CLASS	PILE CONFIGURATION				MAXIMUM QUANTITY PER BUILDING
	Maximum width (feet)	Maximum height (feet)	Minimum distance to next pile (feet)	Minimum distance to walls (feet)	
I	6	8	4[a]	4[b]	Note c
IIA	10	8	4[a]	4[b]	Note c
IIB	10	8	4[a]	4[b]	Note c
III	10	8	4[a]	4[b]	Note c
IV	16	10	3[a, d]	4[b]	No Requirement
V	No Requirement	No Requirement	No Requirement	No Requirement	No Requirement

For SI: 1 foot = 304.8 mm.

a. Not less than one main aisle with a minimum width of 8 feet shall divide the storage area.

b. Distance to noncombustible walls is allowed to be reduced to 2 feet.

c. See Table 6204.1.2 for maximum quantities.

d. The distance shall be not less than one-half the pile height.

6204.1.8 Location in building. The storage of Class I, IIA or IIB *organic peroxides* shall be on the ground floor. Class III *organic peroxides* shall not be stored in *basements*.

6204.1.10 Explosion control. Indoor storage rooms, areas and buildings containing ~~unclassified~~ detonable and Class I *organic peroxides* shall be provided with explosion control in accordance with Section 911.

6204.1.11 Standby power. Standby power shall be provided in accordance with Section 1203 for the following systems used to protect Class I and ~~unclassified~~ detonable *organic peroxides*:

1. Exhaust ventilation system.
2. Treatment system.
3. Smoke detection system.
4. Temperature control system.
5. *Fire alarm system*.
6. *Emergency alarm system*.

6204.2.2 Electrical wiring and equipment. In addition to the requirements of Section 5003.9.4, electrical wiring and equipment in outdoor storage areas containing ~~unclassified~~ detonable, Class I, IIA or ~~Class~~ IIB *organic peroxides* shall comply with the requirements for electrical Class I, Division 2, locations.

For SI: 1 gallon = 3.785 L, 1 pound = 0.454 kg.

a. 22 gallons where Table 5003.1.1(1) Note k applies and hazard identification signs in accordance with Section 5003.5 are provided for quantities of 22 gallons or less.

b. 220 pounds where Table 5003.1.1(1) Note k applies and hazard identification signs in accordance with Section 5003.5 are provided for quantities of 220 pounds or less.

203.6.3 High-hazard Group H-1. Buildings and structures containing materials that pose a *detonation* hazard shall be classified as Group H-1. Such materials shall include, but not be limited to, the following:

Detonable *pyrophoric* materials
Explosives:
Division 1.1
Division 1.2
Division 1.3
Division 1.4
Division 1.5
Division 1.6
Organic peroxides, u~~nclassified detonable~~ detonable
Oxidizers, Class 4
Unstable (reactive) materials, Class 3 detonable and Class 4

203.6.5 High-hazard Group H-3. Buildings and structures containing materials that readily support combustion or that pose a *physical hazard* shall be classified as Group H-3. Such materials shall include, but not be limited to, the following:

Class I, II or IIIA flammable or *combustible liquids* that are used or stored in normally closed containers or systems pressurized at 15 pounds per square inch gauge (103.4 kPa) or less
Combustible fibers, other than densely packed baled cotton, where manufactured, generated or used in such a manner that the concentration and conditions create a fire or explosion hazard based on information prepared in accordance with Section 414.1.3 of the *International Building Code*
Consumer fireworks, 1.4G (Class C, Common)
Cryogenic fluids, oxidizing
Category 1B flammable gases having a burning velocity of 3.9 inches per second (99 mm/s) or less
Flammable solids
Organic peroxides, Class II<u>A, IIB</u> and III
Oxidizers, Class 2
Oxidizers, Class 3, that are used or stored in normally closed containers or systems pressurized at 15 pounds per square inch gauge (103 kPa) or less
Oxidizing gases
Unstable (reactive) materials, Class 2
Water-reactive materials, Class 2

TABLE 911.1 EXPLOSION CONTROL REQUIREMENTS[f]

For SI: 1 pound = 0.454 kg, 1 pound per square foot = 4.882 kg/m^2, 1 gallon per square foot = 40.7 L/m^2, 1 cubic foot @ NTP/square foot = 0.305 m^3 @ NTP/m^2, 1 cubic foot = 0.02832 m^3.

a. Hazardous materials within piping shall not be included in the calculated quantities.

b. Quantity of hazardous materials in a single fabrication area shall not exceed the maximum allowable quantities per control area in Tables 5003.1.1(1) and 5003.1.1(2).

c. Densely packed baled cotton that complies with the packing requirements of ISO 8115 shall not be included in this material class.

d. The aggregate quantity of flammable, pyrophoric, toxic and highly toxic gases shall not exceed the greater of 0.2 cubic feet at NTP/square foot or 9,000 cubic feet at NTP.

e. The aggregate quantity of pyrophoric gases in the building shall not exceed the amounts set forth in Table 5003.8.2.

f. Quantity of Class 3 water-reactive solids in a single tool shall not exceed 1 pound.

TABLE 5003.1.1(1) MAXIMUM ALLOWABLE QUANTITY PER CONTROL AREA OF HAZARDOUS MATERIALS POSING A PHYSICAL HAZARD[a, c, i, l, m, o]

Portions of table not shown remain unchanged.

For SI: 1 cubic foot = 0.02832 m^3, 1 pound = 0.454 kg, 1 gallon = 3.785 L.

NA = Not Applicable, NL = Not Limited~~, UD = Unclassified Detonable.~~

a. For use of control areas, see Section 5003.8.3.

b. The aggregate quantity in use and storage shall not exceed the maximum allowance quantity for storage, including applicable increases.

c. For hazardous materials in Group B higher education laboratory occupancies, see Section 428 of the *International Building Code* and Chapter 38.

d. Maximum allowable quantities shall be increased 100 percent in buildings equipped throughout with an approved automatic sprinkler system in accordance with Section 903.3.1.1. Where Note e applies, the increase for both notes shall be applied accumulatively.

e. Maximum allowable quantities shall be increased 100 percent where stored in approved storage cabinets, day boxes, gas cabinets, gas rooms, exhausted enclosures or in listed safety cans in accordance with Section 5003.9.10. Where Note d applies, the increase for both notes shall be applied accumulatively.

f. Quantities shall not be limited in a building equipped throughout with an approved automatic sprinkler system in accordance with Section 903.3.1.1.

g. Allowed only in buildings equipped throughout with an approved automatic sprinkler system.

h. Containing not more than the maximum allowable quantity per control area of Class IA, Class IB or Class IC flammable liquids.

i. Quantities in parentheses indicate quantity units in parentheses at the head of each column.

j. A maximum quantity of 220 pounds of solid or 22 gallons of liquid Class 3 oxidizers is allowed where such materials are necessary for maintenance purposes, operation or sanitation of equipment where the storage containers and the manner of storage are approved.

k. Net weight of pyrotechnic composition of the fireworks. Where the net weight of the pyrotechnic composition of the fireworks is not known, 25 percent of the gross weight of the fireworks including packaging shall be used.

l. For gallons of liquids, divide the amount in pounds by 10 in accordance with Section 5003.1.2.

m. For oxidizers, unstable (reactive) materials and water-reactive materials stored or displayed in Group M occupancies or storedin Group S occupancies, see Section 5003.11..

n. For flammable and combustible liquid storage in Group M occupancy wholesale and retail sales uses, see Section 5704.3.6.

o. Quantities in this table shall be modified in accordance with Table 5003.1.1(5).

p. Where manufactured, generated or used in such a manner that the concentration and conditions create a fire or explosion hazard based on information prepared in accordance with Section 104.2.2.

q. "High BV" Category 1B flammable gas has a burning velocity greater than 3.9 in/s (10 cm/s). "Low BV" Category 1B flammable gas has a burning velocity of 3.9 in/s (10 cm/s) or less.

For SI: 1 pound = 0.454 kg, 1 gallon = 3.785 L, 1 cubic foot = 0.02832 m^3.

a. For gallons of liquids, divide the amount in pounds by 10 in accordance with Section 5003.1.2.

b. The aggregate quantities in storage and use shall not exceed the maximum allowable quantity for storage, including applicable increases.

c. The aggregate quantity of nonflammable solid and nonflammable or noncombustible liquid hazardous materials allowed in outdoor storage per single property under the same ownership or control used for retail or wholesale sales is allowed to exceed the maximum allowable quantity per control area where such storage is in accordance with Section 5003.11.

d. Quantities in parentheses indicate quantity units in parentheses at the head of each column.

e. “High BV” Category 1B flammable gas has a burning velocity greater than 3.9 in/s (10 cm/s). “Low BV” Category 1B flammable gas has a burning velocity of 3.9 in/s (10 cm/s) or less.

TABLE 5003.8.2 DETACHED BUILDING REQUIRED

A DETACHED BUILDING IS REQUIRED WHERE THE QUANTITY OF MATERIAL EXCEEDS THAT LISTED HEREIN

Material	Class	Solids and liquids (tons)[a, b]	Gases (cubic feet)[a, b]
Explosives	Division 1.1	Maximum Allowable Quantity	Not Applicable
	Division 1.2	Maximum Allowable Quantity	
	Division 1.3	Maximum Allowable Quantity	
	Division 1.4[e]	Maximum Allowable Quantity	
	Division 1.4[c, e]	1	
	Division 1.5	Maximum Allowable Quantity	
	Division 1.6	Maximum Allowable Quantity	
Oxidizers	Class 4	Maximum Allowable Quantity	Maximum Allowable Quantity
Unstable (reactives) detonable	Class 3 or 4	Maximum Allowable Quantity	Maximum Allowable Quantity
Oxidizer, liquids and solids	Class 3	1,200	Not Applicable
	Class 2	2,000	
Organic peroxides	Detonable	Maximum Allowable Quantity	Not Applicable
	Class I	Maximum Allowable Quantity	
	Class IIA	25[f]	
	Class IIB	40[f]	
	Class III	50[f]	
Unstable (reactives) nondetonable	Class 3	125	2,000
	Class 2		10,000
Water reactives	Class 3	125	Not Applicable
	Class 2		
Pyrophoric gases[d]	Not Applicable	Not Applicable	2,000

For SI: 1 pound = 0.454 kg, 1 cubic foot = 0.02832 m^3, 1 ton = 2000 lb = 907.2 kg.

a. For materials that are detonable, the distance to other buildings or lot lines shall be in accordance with Section 415.6 of the International Building Code or Chapter 56 based on the trinitrotoluene (TNT) equivalence of the material, whichever is greater.

b. “Maximum Allowable Quantity” means the maximum allowable quantity per control area set forth in Table 5003.1.1(1).

c. Limited to Division 1.4 materials and articles, including articles packaged for shipment, that are not regulated as an explosive under Bureau of Alcohol, Tobacco, Firearms and Explosives regulations, or unpackaged articles used in process operations that do not propagate a detonation or deflagration between articles, providing the net explosive weight of individual articles does not exceed 1 pound.

d. Detached buildings are not required for gases in gas rooms that support H-5 fabrication facilities where the gas room is separated from other areas by a fire barrier with a fire-resistance rating of not less than 2 hours and the gas is located in a gas cabinet that is internally sprinklered, equipped with continuous leak detection, automatic shutdown, and is not manifolded upstream of pressure controls. The gas supply is limited to cylinders that do not exceed 125 pounds water capacity in accordance with DOTn 49 CFR 173.192 for Hazard Zone A toxic gases.

e. Does not apply to consumer fireworks, Division 1.4G.

f. Where different classes of organic peroxides are stored in the same building, the aggregate sum of the ratios of the actual quantity divided by the allowed quantity for each class shall not exceed one.

E102.1.8.1 Classification of organic peroxides ~~according to hazard~~. ~~Examples include:~~
~~Unclassified: Unclassified *organic peroxides* are capable of *detonation* and are regulated in accordance with Chapter 56.~~

~~Class I: acetyl cyclohexane sulfonyl 60-65 percent concentration by weight, fulfonyl peroxide, benzoyl peroxide over 98 percent concentration, t butyl hydroperoxide 90 percent, t butyl peroxyacetate 75 percent, t butyl peroxyisopropylcarbonate 92 percent, diisopropyl peroxydicarbonate 100 percent, di-n-propyl peroxydicarbonate 98 percent, and di-n-propyl peroxydicarbonate 85 percent.~~

~~Class II: acetyl peroxide 25 percent, t butyl hydroperoxide 70 percent (with DTBP and t BuOH diluents), t butyl peroxybenzoate 98 percent, t butyl peroxy-2-ethylhexanoate 97 percent, t butyl peroxyisobutyrate 75 percent, t butyl peroxyisopropyl carbonate 75 percent, t butyl peroxypivalate 75 percent, dybenzoyl peroxydicarbonate 85 percent, di-sec butyl peroxydicarbonate 98 percent, di-secbutyl peroxydicarbonate 75 percent, 1,1-di-(t butylperoxy) 3,5,5-trimethycyclohexane 95 percent, di-(2-ethythexyl) peroxydicarbonate 97 percent, 2,5-dymethyl-2-5-di (benzoylperoxy) hexane 92 percent, and peroxyacetic acid 43 percent.~~

~~Class III: acetyl cyclohexane sulfonal peroxide 29 percent, benzoyl peroxide 78 percent, benzoyl peroxide paste 55 percent, benzoyl peroxide paste 50 percent peroxide/50 percent butylbenzylphthalate diluent, cumene hydroperoxide 86 percent, di-(4-butylcyclohexyl) peroxydicarbonate 98 percent, t butyl peroxy-2-ethylhexanoate 97 percent, t butyl peroxyneodecanoate 75 percent, decanoyl peroxide 98.5 percent, di-t butyl peroxide 99 percent, 1,1-di-(t butylperoxy)3,5,5-trimethylcyclohexane 75 percent, 2,4-dichlorobenzoyl peroxide 50 percent, di-isopropyl peroxydicarbonate 30 percent, 2,-5-di-methyl-2,5-di-(2-ethylhexanolyperoxy) hexane 90 percent, 2,5-dimethyl-2,5-di-(t butylperoxy) hexane 90 percent and methyl ethyl ketone peroxide 9 percent active oxygen diluted in dimethyl phthalate.~~

~~Class IV: benzoyl peroxide 70 percent, benzoyl peroxide paste 50 percent peroxide/15 percent water/35 percent butylphthalate diluent, benzoyl peroxide slurry 40 percent, benzoyl peroxide powder 35 percent, t butyl hydroperoxide 70 percent, (with water diluent), t butyl peroxy-2-ethylhexanoate 50 percent, decumyl peroxide 98 percent, di-(2-ethylhexal) peroxydicarbonate 40 percent, laurel peroxide 98 percent, p-methane hydroperoxide 52.5 percent, methyl ethyl ketone peroxide 5.5 percent active oxygen and methyl ethyl ketone peroxide 9 percent active oxygen diluted in water and glycols.Class V: benzoyl peroxide 35 percent, 1,1-di-t butyl peroxy 3,5,5-trimethylcyclohexane 40 percent, 2,5-di-(t butyl peroxy) hexane 47 percent and 2,4-pentanedione peroxide 4 percent active oxygen.~~

Organic peroxide requirements in the IFC are based on the hazard classification, burning rate and transport type.

Add new text as follows:

E102.1.8.1.1 Hazard classification. Organic peroxide formulations are classified into seven hazard classifications (Detonable, I, IIA, IIB, III, IV and V). These classifications are used to determine the occupancy classifications and maximum allowable quantities. Detonable organic peroxides are explosive. As such, the storage requirements for detonable organic peroxides are found in Chapter 56, and Chapter 62 contains additional use, handling and transfer provisions.

E102.1.8.1.2 Transport types. Organic peroxides are also categorized based on the explosion hazard rating—referred to as the Transport Type. The transport type for organic peroxide formulations is determined in accordance with the UN RTDG. The explosion hazard levels are divided into "Types" (Type A-G) and a corresponding UN Number is identified based on whether the formulations are liquid or solid, and whether they require temperature control. Table E102.1.8.1.2 lists the transport types, UN Numbers, explosion hazard level and the maximum size container based on the transport type.

TABLE E102.1.8.1.2 TRANSPORT TYPES FOR ORGANIC PEROXIDES

Portions of table not shown remain unchanged.

TRANSPORT TYPE	EXPLOSIVE HAZARD RATING	MAXIMUM CONTAINER SIZE		UN NUMBER			
		Solid	Liquid	Ambient Temperature		Temperature Controlled	
		pounds (kg)	gallons (L)	Liquid	Solid	Liquid	Solid
A	Explosive	NP	NP	NA	NA	NA	NA
B	Very high	55 (25)	8 (30)	3101	3102	3111	3112
C	High	110 (50)	16 (60)	3103	3104	3113	3114
D	Medium	110 (50)	16 (60)	3105	3106	3115	3116
E	Low	882 (400)	60 (225)	3107	3108	3117	3118
F	Very low	IBC or Portable Tank	IBC or Portable Tank	3109	3110	3119	3120
G	None	NL	NL	NA	NA	NA	NA

NA – Not applicable; NL = Not Limited; NP = Not Permitted

E102.1.8.1.3 Burning rate. Organic peroxides are capable of high heat release and large quantities of smoke when they are involved in fire. The burning rate varies for each organic peroxide material and is determined in accordance with PGS 8. The burning rate is calculated from results of large-scale testing or small-scale testing detailed in PGS 8. Where the burning rate is not known, the highest classification for the organic peroxide shall be used.

TABLE E102.1.8.2 STORAGE CLASSIFICATION OF ORGANIC PEROXIDES

TRANSPORT TYPE	BURNING RATE					
	Large Scale Test (kg/minute)	<10	≥10 and <60	≥60 and <140	≥140 and <300	≥300
	OR					
	Small Scale Test[a] (kg/m²/minute)	NA	<0.9	≥0.9 and <2.2	≥2.2 and <9.0	≥9.0
B		I	I	I	I	I

C	IIB	IIB	IIB	IIA	I
D	III	III	IIB	IIA	I
E	IV	III	IIB	IIA	IIA
F	IV	III	III	III	III
G	V	V	V	V	V

a. Solid materials shall be tested using the large-scale test. Liquid materials can be tested using either the large-scale test or the small-scale test.

E102.1.8.2 Classification process. The classification process is based on the definitions of the various classes of organic peroxides. The classification for use in the IFC is based on the transport type and burning rate and is shown in Table E102.1.8.2. For example, a Transport Type C organic peroxide with a burning rate equal to or greater than 300 kilograms (662 pounds) per minute will be treated a Class I organic peroxide; and another Transport Type C organic peroxide with a burning rate less than 140 kilograms (309 pounds) per minute will be treated as a Class IIB organic peroxide.

E102.1.8.3 Organic peroxide classification. Organic peroxides and their corresponding classifications are listed in Table E102.1.8.3.

TABLE E102.1.8.3 ORGANIC PEROXIDE STORAGE CLASSIFICATIONS

Organic Peroxide Storage Class	Organic Peroxide Name	CAS#	Concentration (mass%)	Diluent type A	Diluent type B	Inert solid	Water	UN Number (Generic entry)	Transport Type	Subsidiary risks and remarks
III	Acetyl acetone peroxide	37187-22-7	≤42	≥48			≥8	3105	Type D	2

1. Diluent type B may always be replaced by Diluent type A. The boiling point of Diluent type B should be at least 60°C higher than the SADT of the organic peroxide formulation.

2. Available (or Active) oxygen less than 4.7 percent.

3. “EXPLOSIVE” subsidiary risk label required.

4. Diluent may be replaced by di-tert-butyl peroxide.

5. Available (or Active) oxygen not greater than 4.7 percent.

6. Hydrogen peroxide not greater than 9 percent, and available (or active) oxygen not greater than 10 percent.

7. Only non-metallic packaging allowed.

8. Available (or Active) oxygen greater than 10 percent but not greater than 10.7 percent, with or without water.

9. Available (or Active) oxygen not greater than 10 percent with or without water.

10. Available (or Active) oxygen not greater than 8.2 percent with or without water.

11. See 2.5.3.2.5.1 of UN RTDG.

12. Up to 2000 kg per receptacle assigned to ORGANIC PEROXIDE TYPE F on the basis of large scale trials.

13. "CORROSIVE" subsidiary risk label required.

14. Peroxyacetic acid formulations which fulfill the criteria of 2.5.3.3.2 (d) of UN RTDG.

15. Peroxyacetic acid formulations which fulfill the criteria of 2.5.3.3.2 (e) of UN RTDG.

16. Peroxyacetic acid formulations which fulfill the criteria of 2.5.3.3.2 (f) of UN RTDG.

17. Addition of water to this organic peroxide will decrease its thermal stability.

18. No "CORROSIVE" subsidiary risk label required for concentrations not greater than 80 percent.

19. Mixtures with hydrogen peroxide, water and acid(s).

20. With Diluent type A with or without water.

21. Diluent type A 25 percent or greater by mass, and in addition to ethylbenzene.

22. Diluent type A 19 percent or greater by mass, and in addition to methyl isobutyl ketone.

23. di-tert-butyl peroxide not greater than 6 percent.

24. 1-isopropylhydroperoxy-4-isopropylhydroxybenzene not greater than 8 percent.

25. Diluent type B with a boiling point greater than 230°F (110°C).

26. Hydroperoxides content not greater than 0.5 percent.

27. Concentrations greater than 56 percent require a "CORROSIVE" subsidiary risk label.

28. Available (or Active) oxygen not greater than 7.6 percent and Diluent type A with a 95-percent boil-off point between 392°F and 500°F (200°C and 260°C).

29. Not subject to the requirements of these Model Regulations for Division 5.2 per the UN RTDG.

30. Diluent type B with boiling point greater than 266°F (130°C).

31. Available (or active) oxygen not greater than 6.7 percent.

32. Tert-Butyl hydroperoxide can be transported and stored in bulk provided that polyethylene saddles are used—DOTn 49 CFR Part 173.225(g) and (h).

Water reactive 2	W2
Corrosive	H3, COR
Toxic	H3
Highly toxic	H4

a. F3 = Finely divided solids, typically less than 75 micrometers (µm) (200 mesh), that pose an elevated risk of forming an ignitable dust cloud, such as finely divided sulfur, *National Electric Code* Group E dusts (for example, aluminum, zirconium and titanium) and bisphenol A. F2 = Finely divided solids less than 420 µm (40 mesh) that pose an ordinary risk of forming an ignitable dust cloud.

F—Flammable category.

R—Reactive category.

H—Health category.

W—Special hazard: water reactive.

OX—Special hazard: oxidizing properties.

COR—Corrosive.

~~UD—Unclassified detonable material.~~

4D—Class 4 detonable material.

3D—Class 3 detonable material.

3N—Class 3 nondetonable material.

TABLE H102.1 SECTION II—HAZARDOUS MATERIALS INVENTORY STATEMENT (HMIS) SUMMARY REPORT[a] (Storage[b] Conditions)[c]

8-21 Organic peroxides: Storage -Guidance for the safe storage of organic peroxides.

2024 International Building Code

Revise as follows:

[F] ORGANIC PEROXIDE. An organic compound that contains the bivalent -O-O- structure and which may be considered to be a structural derivative of hydrogen peroxide where one or both of the hydrogen atoms have been replaced by an organic radical. ~~Organic peroxides can pose an *explosion* hazard (*detonation* or *deflagration*) or they can be shock sensitive. They can also decompose into various unstable compounds over an extended period of time.~~Organic peroxide formulation is a pure or technically pure organic peroxide or a mixture of organic peroxides with an active oxygen (aO) concentration greater than 1 percent alone or in combination with one or more materials. Organic peroxide storage classification is based on the organic peroxide transportation type and burning rate. The transport type for organic peroxide formulations is determined by the UN Manual of Tests and Criteria, Part II. The methods used to determine the burning rate of organic peroxide formulations are spelled out in the Storage of Organic Peroxides in The Netherlands (also known as PGS 8). Terms such as accelerator, catalyst, initiator, and curing agent are sometimes used to describe organic peroxide formulations and are misleading because they can also refer to materials that are not or do not contain organic peroxides, some of which might present increased hazard when mixed with organic peroxides.

Class I. Those formulations that are capable of *deflagration* but not *detonation*.This class comprises of organic peroxide formulations with transport classification Type B, those with transport classification Type C and Type D with large-scale burning rate equal to or higher than 300 kg/min, and those with transport classification Type C and Type D with small-scale burning rate equal to or higher than 9.0 kg/min × m^2 unless the large-scale burning rate is lower than 300 kg/min.

Class IIA. Those formulations that burn very rapidly and that pose a moderate reactivity hazard.This class comprises of organic peroxide formulations with transport classification Type C and Type D with a large-scale burning rate equal to or higher than 140 kg/min but lower than 300 kg/min and those with transport classification Type E with a large-scale burning rate equal to or higher than 140 kg/min, those with Type C and Type D if the small-scale burning rate is equal to or higher than 2.2 kg/min × m^2 but lower than 9.0 kg/min × m^2, and Type E if the small-scale burning rate is equal to or higher than 2.2 kg/min × m^2.

Class IIB. Describes those formulations that burn rapidly and that pose a moderate reactivity hazard. This class comprises of organic peroxide formulations with transport classification Type C with a large-scale burning rate lower than 140 kg/min, those with transport classification Type D and Type E with a large-scale burning rate equal to or higher than 60 kg/min but lower than 140 kg/min, those with transport classification Type C if the small-scale burning rate is lower than 2.2 kg/min × m^2, and those with transport classification Type D and Type E if the small-scale burning rate is equal to or higher than 0.9 kg/min × m^2 but lower than 2.2 kg/min × m^2.

Class III. Those formulations that burn rapidly and that pose a moderate reactivity hazard.This class comprises of organic peroxide formulations with transport classification Type D with a large-scale burning rate lower than 60 kg/min, those with transport classification Type E with a large-scale burning rate equal to or higher than 10 kg/min but lower than 60 kg/min, those with transport classification Type F with a large-scale burning rate equal to or higher than 10 kg/min, and those with transport classification Type D and Type E if the small-scale burning rate is lower than 0.9 kg/min × m^2, and those with transport classification Type F irrespective of the small scale burning rate.

Class IV. Those formulations that burn in the same manner as ordinary combustibles and that pose a minimal reactivity hazard.This class comprises of organic peroxide formulations of transport classification Type E or Type F with a large-scale burning rate lower than 10 kg/min.

Class V. Those formulations that burn with less intensity than ordinary combustibles or do not sustain combustion and that pose no reactivity hazard. This class comprises of organic peroxide formulations of transport classification Type G without additional subsidiary risks.

~~**Unclassified detonable**~~ **Detonable.** *Organic peroxides* that are capable of *detonation*. These peroxides pose an extremely high *explosion* hazard through rapid *explosive* decomposition.

[F] TABLE 307.1(1) MAXIMUM ALLOWABLE QUANTITY PER CONTROL AREA OF HAZARDOUS MATERIALS POSING A PHYSICAL

For SI: 1 cubic foot = 0.028 m^3, 1 pound = 0.454 kg, 1 gallon = 3.785 L.

NL = Not Limited; NA = Not Applicable; ~~UD = Unclassified Detonable.~~

a. For use of control areas, see Section 414.2.

b. The aggregate quantity in use and storage shall not exceed the maximum allowable quantity for storage, including applicable increases.

c. For hazardous materials in Group B higher education laboratory occupancies, see Section 428 of this code and Chapter 38 of the *International Fire Code*.

d. Maximum allowable quantities shall be increased 100 percent in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1. Where Note e also applies, the increase for both notes shall be applied accumulatively.

e. Maximum allowable quantities shall be increased 100 percent when stored in approved storage cabinets, day boxes, gas cabinets, gas rooms or exhausted enclosures or in listed safety cans in accordance with Section 5003.9.10 of the International Fire Code. Where Note d also applies, the increase for both notes shall be applied accumulatively.

f. Quantities shall not be limited in a building equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.

g. Allowed only in buildings equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1.

h. Containing not more than the maximum allowable quantity per control area of Class IA, IB or IC flammable liquids.

i . Quantities in parentheses indicate quantity units in parentheses at the head of each column.

j . A maximum quantity of 220 pounds of solid or 22 gallons of liquid Class 3 oxidizers is allowed when such materials are necessary for maintenance purposes, operation or sanitation of equipment when the storage containers and the manner of storage are approved.

k . Net weight of the pyrotechnic composition of the fireworks. Where the net weight of the pyrotechnic composition of the fireworks is not known, 25 percent of the gross weight of the fireworks, including packaging, shall be used.

l . For gallons of liquids, divide the amount in pounds by 10 in accordance with Section 5003.1.2 of the International Fire Code.

m . For oxidizers, unstable (reactive) materials, and water-reactive materials stored or displayed in Group M occupancies or stored in Group S occupancies, see Section 414.2.5.1.

n . For flammable and combustible liquid storage in Group M occupancy wholesale and retail sales uses, see Section 414.2.5.2.

o . Where manufactured, generated or used in such a manner that the concentration and conditions create a fire or explosion hazard based on information prepared in accordance with Section 414.1.3.

p. “High BV” Category 1B flammable gas has a burning velocity greater than 3.9 inches per second (10 cm/s). "Low BV" Category 1B flammable gas has a burning velocity of 3.9 inches per second (10 cm/s) or less.

[F] 307.3 High-hazard Group H-1. *Buildings* and *structures* containing materials that pose a *detonation* hazard shall be classified as Group H-1. Such materials shall include, but not be limited to, the following:

Detonable *pyrophoric* materials
Explosives:

Division 1.1
Division 1.2

Division 1.3
Division 1.4
Division 1.5
Division 1.6

Organic peroxides, ~~unclassified detonable~~ detonable
Oxidizers, Class 4
Unstable (reactive) materials, Class 3 detonable and Class 4

[F] 307.5 High-hazard Group H-3. *Buildings* and *structures* containing materials that readily support combustion or that pose a *physical hazard* shall be classified as Group H-3. Such materials shall include, but not be limited to, the following:

Class I, II or IIIA *flammable or combustible liquids* that are used or stored in normally closed containers or systems pressurized at 15 pounds per square inch gauge (103.4 kPa) or less
Combustible fibers, other than *densely packed baled cotton*, where manufactured, generated or used in such a manner that the concentration and conditions create a fire or *explosion* hazard based on information prepared in accordance with Section 414.1.3
Consumer *fireworks*, 1.4G (Class C, Common)
Cryogenic fluids, oxidizing
Category 1B flammable gases having a burning velocity of 3.9 inches per second (10 cm/s) or less
Flammable solids
Organic peroxides, Class II<u>A, IIB</u> and III
Oxidizers, Class 2
Oxidizers, Class 3, that are used or stored in normally closed containers or systems pressurized at 15 pounds per square inch gauge (103 kPa) or less
Oxidizing gases
Unstable (reactive) materials, Class 2
Water-reactive materials, Class 2

[F] TABLE 414.5.1 EXPLOSION CONTROL REQUIREMENTS[a, h]

MATERIAL	CLASS	EXPLOSION CONTROL METHODS	
		Barricade construction	Explosion (deflagration) venting or explosion (deflagration) prevention systems[b]
HAZARD CATEGORY			
Combustible dusts[c]	—	Not Required	Required
Cryogenic flammables	—	Not Required	Required
Explosives	Division 1.1	Required	Not Required
	Division 1.2	Required	Not Required
	Division 1.3	Not Required	Required
	Division 1.4[j]	Not Required	Required
	Division 1.5	Required	Not Required
	Division 1.6	Required	Not Required
Flammable gas	Gaseous	Not Required	Required[k]
	Liquefied	Not Required	Required[k]
Flammable liquid	IA[d]	Not Required	Required
	IB[e]	Not Required	Required
Organic peroxides	~~U~~Detonable	Required	Not Permitted
	I	Required	Not Permitted
Oxidizer liquids and solids	4	Required	Not Permitted
Pyrophoric gas	—	Not Required	Required
Unstable (reactive)	4	Required	Not Permitted
	3 Detonable	Required	Not Permitted
	3 Nondetonable	Not Required	Required
Water-reactive liquids and solids	3	Not Required	Required
	2[g]	Not Required	Required
SPECIAL USES			
Acetylene generator rooms	—	Not Required	Required
Electrochemical energy storage system[i]	—	Not Required	Required
Energy storage system[i]	—	Not Required	Required
Grain processing	—	Not Required	Required
Liquefied petroleum gas-distribution facilities	—	Not Required	Required
Where explosion hazards exist[f]	Detonation	Required	Not Permitted
	Deflagration	Not Required	Required

a. See Section 414.1.3.

b. See the International Fire Code.

c. Combustible dusts where manufactured, generated or used in such a manner that the concentration and conditions create a fire or explosion hazard based on information prepared in accordance with Section 104.2.2 of the *International Fire Code*. See definition of "Combustible dust" in Chapter 2.

d. Storage or use.

e. In open use or dispensing.

f. Rooms containing dispensing and use of hazardous materials where an explosive environment can occur because of the characteristics or nature of the hazardous materials or as a result of the dispensing or use process.

g. A method of explosion control shall be provided where Class 2 water-reactive materials can form potentially explosive mixtures.

h. Explosion venting is not required for Group H-5 fabrication areas complying with Section 415.11.1 and the International Fire Code.

i. Where explosion control is required in Section 1207 of the *International Fire Code*.

j. Does not apply to consumer fireworks, Division 1.4G.

k. Not required for Category 1B Flammable Gases having a burning velocity not exceeding 3.9 inches per second (10 cm/s).

[F] TABLE 415.6.5 DETACHED BUILDING REQUIRED

A DETACHED BUILDING IS REQUIRED WHERE THE QUANTITY OF MATERIAL EXCEEDS THAT SPECIFIED HEREIN			
Material	**Class**	**Solids and Liquids (tons)[a, b]**	**Gases (cubic feet)[a, b]**
Explosives	Division 1.1	Maximum Allowable Quantity	Not Applicable
	Division 1.2	Maximum Allowable Quantity	
	Division 1.3	Maximum Allowable Quantity	
	Division 1.4[e]	Maximum Allowable Quantity	
	Division 1.4[c, e]	1	
	Division 1.5	Maximum Allowable Quantity	
	Division 1.6	Maximum Allowable Quantity	
Oxidizers	Class 4	Maximum Allowable Quantity	Maximum Allowable Quantity
Unstable (reactives) detonable	Class 3 or 4	Maximum Allowable Quantity	Maximum Allowable Quantity
Oxidizer, liquids and solids	Class 3	1,200	Not Applicable
	Class 2	2,000	Not Applicable
Organic peroxides	Detonable	Maximum Allowable Quantity	Not Applicable
	Class I	Maximum Allowable Quantity	Not Applicable
	Class IIA	25[f]	Not Applicable
	Class IIB	40[f]	
	Class III	50[f]	Not Applicable
Unstable (reactives) nondetonable	Class 3	1	2,000
	Class 2	25	10,000
Water reactives	Class 3	1	Not Applicable
	Class 2	25	Not Applicable
Pyrophoric gases[d]	Not Applicable	Not Applicable	2,000

For SI: 1 ton = 906 kg, 1 cubic foot = 0.02832 m^3, 1 pound = 0.454 kg.

a. For materials that are detonable, the distance to other buildings or lot lines shall be in accordance with Section 415.6 of this code or Chapter 56 of the International Fire Code based on trinitrotoluene (TNT) equivalence of the material, whichever is greater.

b. “Maximum Allowable Quantity” means the maximum allowable quantity per control area set forth in Table 307.1(1).

c. Limited to Division 1.4 materials and articles, including articles packaged for shipment, that are not regulated as an explosive under Bureau of Alcohol, Tobacco, Firearms and Explosives (BATF) regulations or unpackaged articles used in process operations that do not propagate a detonation or deflagration between articles, provided that the net explosive weight of individual articles does not exceed 1 pound.

d. Detached buildings are not required, for gases in gas rooms that support H-5 fabrication facilities where the gas room is separated from other areas by a fire barrier with a fire-resistance rating of not less than 2 hours and the gas is located in a gas cabinet that is internally sprinklered, equipped with continuous leak detection, automatic shutdown and is not manifolded upstream of pressure controls. Additionally, the gas supply is limited to cylinders that do not exceed 125 pounds (57 kg) water capacity in accordance with 49 CFR 173.192 for Hazard Zone A toxic gases.

e. Does not apply to consumer fireworks, Division 1.4G.

f. Where different classes of organic peroxides are stored in the same building, the aggregate sum of the ratios of the actual quantity divided by the allowed quantity for each class shall not exceed one.

[F]TABLE 415.11.1.1 QUANTITY LIMITS FOR HAZARDOUS MATERIALS IN A SINGLE FABRICATION AREA IN GROUP H-5[a]

HAZARD CATEGORY		SOLIDS (pounds per square foot)	LIQUIDS (gallons per square foot)	GAS (cubic feet @ NTP/square foot)
		PHYSICAL-HAZARD MATERIALS

	Class 1	Not Limited	Not Limited	
		HEALTH-HAZARD MATERIALS		
Corrosives		Not Limited	Not Limited	Not Limited
Highly toxic		Not Limited	Not Limited	Note d
Toxics		Not Limited	Not Limited	Note d

For SI: 1 pound = 0.454 kg, 1 pound per square foot = 4.882 kg/m^2, 1 gallon per square foot = 40.7 L/m^2, 1 cubic foot @ *NTP*/square foot = 0.305 m^3 @ *NTP*/m^2, 1 cubic foot = 0.02832 m^3.

a. Hazardous materials within piping shall not be included in the calculated quantities.

b. Quantity of hazardous materials in a single fabrication shall not exceed the maximum allowable quantities per control area in Tables 307.1(1) and 307.1(2).

c. Densely packed baled cotton that complies with the packing requirements of ISO 8115 shall not be included in this material class.

d. The aggregate quantity of flammable, pyrophoric, toxic and highly toxic gases shall not exceed the greater of 0.2 cubic feet at *NTP*/square foot or 9,000 cubic feet at *NTP*.

e. The aggregate quantity of pyrophoric gases in the building shall not exceed the amounts set forth in Table 415.6.5.

f. Quantity of Class 3 water-reactive solids in a single tool shall not exceed 1 pound.

2024 International Fire Code

Add new text as follows:

Reason: Organic peroxides are hazardous materials with key hazard characteristics of thermal instability, explosivity and flammability with high burning rates. Organic peroxides can undergo self-accelerating decomposition and may result in fire and/or explosion when exposed to heat or when they come in contact with incompatible materials. The decomposition process is further accelerated when the containers are confined. The explosion hazard rating for organic peroxides is determined by the transport type testing in accordance with the UN Recommendations on the Transport of Dangerous Goods, Manual of tests and criteria, and is divided into Type A through G. The transport type testing addresses the explosivity hazard of the organic peroxide and the package size but not the flammability or the burning rate. The flammability aspect of organic peroxide is determined by the burning rate test methods listed in PGS8 Storage Code. Organic peroxides burn vigorously once ignited and the burning rates may be significantly high when compared to that of ordinary flammables. Organic peroxide fires may be characterized by large fire heights, high heat release, high flame temperatures and large amounts of smoke. Given the importance of both the explosivity and high flammability characteristics of organic peroxides, it is very important the storage classification takes into consideration both the transport type and burning rate test results, especially as organic peroxides in storage are stored for long term unlike in transport. An organic peroxide fire can significantly impact the inventory in the storage area, the storage building itself, personnel, nearby property, local community and the environment. The proposed storage classification of organic peroxides is based on both the transport type and the burning rate as shown in the below table (included in Appendix E) and the organic peroxide class definitions are defined accordingly. With the proposed changes, the organic peroxides storage class definitions are defined quantitively as against current qualitative definitions. The proposed storage class definitions harmonize with the definitions in NPFA 400 code and the European organic peroxides codes.

Appendix E is revised as part of this code change proposal, which provides the code official and the code user with the details of organic peroxide classification types, basis for classification, test method references, classification details and classification list of all organic peroxides with composition information included. This information provides the code official and code user the storage classification to be used for a given organic peroxide formulation and how this is determined.

STORAGE CLASSIFICATION OF ORGANIC PEROXIDES

TRANSPORT TYPE	BURNING RATE					
	Large Scale Test (kg/minute)	<10	≥10 and <60	≥60 and <140	≥140 and <300	≥300
	OR					
	Small Scale Test [a] (kg/m²/minute)	NA	<0.9	≥0.9 and <2.2	≥2.2 and <9.0	≥9.0
B		I	I	I	I	I
C		IIB	IIB	IIB	IIA	I
D		III	III	IIB	IIA	I
E		IV	III	IIB	IIA	IIA
F		IV	III	III	III	III
G		V	V	V	V	V

a. Solid materials shall be tested using the large-scale test. Liquid materials can be tested using either the large-scale te or the small-scale test.

This code change proposal also revises Unclassified Detonable classification name to Detonable. Organic peroxides are classified by

transport type A to transport type G. There is no such class called Unclassified Detonable. If an organic peroxide is detonable, then it is classified as transport type A per the UN and DOT organic peroxides definitions. As such, Detonable is an appropriate word to denote such class. This change from Unclassified Detonable to Detonable is made throughout Chapter 62, other chapters and appendices.

This code change proposal also proposes organic peroxide classification Class II is split into two classes: Class IIA and Class IIB, since the range of burn rate for Class II is broad - lower limit is 60 kg/min and upper limit is 300 kg/min. By subdividing the range into Class IIA (burn rates of 140 kg/min to 300 kg/min) and Class IIB (60 kg/min to 140 kg/min) we have two classes with materials similarly classed for transportation (Type C, D, or E) by explosion hazard but are distinguished by their burning rate in the storage class definition. This additional distinction of the storage classification system allows better definition of separation distances versus quantity and other features that reflect the burning behavior of the materials, beyond the explosion hazard concerns identified in the transport type designation. This change is made throughout Chapter 62 and other chapters. Maximum quantities are defined for Class IIA and IIB where required. Footnote is added under the maximum quantities table in Chapter 62 which states that when multiple classes of organic peroxides are stored, the sum of the ratios is used to determine the maximum quantity allowed. So even though the proposal is adding Class IIB quantities, the aggregate of all organic peroxide materials must be considered based on the footnote which is more restrictive than the current code.

The IFC Organic Peroxides Task Group is aware of IFC's intention to align storage classification definitions with GHS classifications in this code cycle as the GHS classification is listed on a safety data sheet of each material and a fire code official can then easily determine the storage classification of that material. In the case of organic peroxides, however, the GHS classification aligns with transport type definitions. The transport type testing, as explained above, addresses only the explosivity hazard of the organic peroxide and not the flammability or the burning rate. This proposal requests that the storage classifications for organic peroxides be as proposed in this code change proposal which is based on both the transport type and the burning rate, and an exception be made for organic peroxides to not align with GHS classifications. The storage classification for all organic peroxides is easily available for a code official as this is now listed in the Appendix E.

If the organic peroxide storage classification definitions are aligned with GHS definitions:

1. 20 organic peroxide formulations which are classified as Class I based on transport type and burning rate will be classified in a less severe hazard class of Class II organic peroxides based on GHS definition.
2. 24 organic peroxide formulations which are classified as Class II (IIA or IIB) based on transport type and burning rate will be classified in a less severe hazard class of Class III organic peroxides based on GHS definition.
3. 27 organic peroxide formulations which are classified as Class III based on transport type and burning rate will be classified in a less severe hazard class of Class IV organic peroxides based on GHS definition.
4. a total of 71 organic peroxide formulations will be classified in a less severe hazard class despite the presence of high burning rate hazard. Classifying the organic peroxide formulation into a less severe hazard class means a code user would be allowed to store increased quantities and/or at a shorter separation distance which will put the code user's storage area, personnel, nearby property, local community and the environment at increased risk in case of a fire.
5. 15 organic peroxide formulations which are classified as Class IV based on transport type and burning rate will be classified in a more severe hazard class of Class III organic peroxides based on GHS definition. These Class IV formulations are those that do not burn at all, or their burning rate is significantly low due to the presence of decompositions products like carbon dioxide, and these will be reclassified to a higher hazard storage class despite their lower hazard.

Therefore, it is strongly requested that an exception be made for organic peroxides to not align with GHS classifications and classify as proposed based on both the burning rate and explosivity hazard.

Bibliography: Safety and Handling of Organic Peroxides - American Chemistry Council

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal is to define and update storage classification of organic peroxides based on both the explosivity and flammability hazards. This code change proposal also revises Unclassified Detonable classification name change to Detonable and split Class II into two classes: Class IIA and Class IIB

for the reasons stated in reason statement. These changes are made throughout Chapter 62, other chapters and appendices. Appendix E is revised as part of this code change proposal, which provides the code official and the code user with the details of organic peroxide classification types, basis for classification, test method references, classification details and classification list of all organic peroxides with composition information included. The information provided in this proposal helps both the code official and the code user to effectively implement the code. The proposal does not impact the cost of construction.

F270-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: This proposal was disapproved as it would not be consistent with the previous actions aligning the IFC definitions with GHS. There was some support for the burn rate data but the current format of the definitions does not work. (Vote 13-0)

F270-24

Proponents: Robert Marshall, FCAC, FCAC (fcac@iccsafe.org); Kris Jaggari, Nouryon/OPPSD Representative (kris.jaggari@nouryon.com) requests As Modified by Committee (AMC2)

Replace as follows:

2024 International Fire Code

6201.1 Scope. The storage and use of *organic peroxides* shall be in accordance with this chapter and Chapter 50. ~~Unclassified d~~Detonable *organic peroxides* that are capable of *detonation* in their normal shipping containers under conditions of fire exposure shall be stored in accordance with Chapter 56.

6202.1 Definition. The following term is defined in Chapter 2:
ORGANIC PEROXIDE.

Class I.

Class II~~A~~.

Class IIB.

Class III.

Class IV.

Class V.

~~**Unclassified d**~~ **Detonable.**

6203.1.1.1 Group A, E, I or U occupancies. In Group A, E, I or U occupancies, any amount of ~~unclassified~~ detonable and Class I organic peroxides shall be stored in accordance with the following:

1. 1. ~~Unclassified d~~ Detonable and Class I organic peroxides shall be stored in hazardous materials storage cabinets complying with Section 5003.8.7.
2. The hazardous materials storage cabinets shall not contain other storage.

6203.1.1.2 Group R occupancies. ~~Unclassified d~~Detonable and Class I organic peroxides shall not be stored or used within Group R occupancies.

6203.1.1.3 Group B, F, M or S occupancies. ~~Unclassified d~~Detonable and Class I organic peroxides shall not be stored or used in offices, or retail sales areas of Group B, F, M or S occupancies.

6203.1.1.4 Classrooms. In classrooms in Group B, F or M occupancies, any amount of ~~unclassified~~ detonable and Class I organic peroxides shall be stored in accordance with the following:

1. 1. ~~Unclassified d~~ Detonable and Class I organic peroxides shall be stored in hazardous materials storage cabinets complying with Section 5003.8.7.
2. The hazardous materials storage cabinets shall not contain other storage.

6204.1 Indoor storage. Indoor storage of *organic peroxides* in amounts exceeding the *maximum allowable quantity per control area* indicated in Table 5003.1.1(1) shall be in accordance with Sections 5001, 5003, 5004 and this chapter.
Indoor storage of ~~unclassified~~ detonable organic peroxides that are capable of detonation in their normal shipping containers under conditions of fire exposure shall be stored in accordance with Chapter 56.

6204.1.2 Distance from detached buildings to exposures. In addition to the requirements of the InternationalBuilding Code, detached storage buildings for Class I, IIA, IIB,III, IV and V organic peroxides shall be in accordancewith Table 6204.1.2. Detached buildingscontaining quantities of ~~unclassified~~ detonable organicperoxides in excess of those set forth in Table 5003.8.2shall be located in accordance with Table 5604.5.2(1).

TABLE 6204.1.2 ORGANIC PEROXIDES—DISTANCE TO EXPOSURES FROM DETACHED STORAGE BUILDINGS OR OUTDOOR STORAGE AREAS

ORGANIC PEROXIDE CLASS	MAXIMUM STORAGE QUANTITY (POUNDS) AT MINIMUM SEPARATION DISTANCE					
	Distance to buildings, lot lines, public streets, public alleys, public ways or means of egress			Distance between individual detached storage buildings or individual outdoor storage areas		
	50 feet	100 feet	150 feet	20 feet	75 feet	100 feet
I	2,000	20,000	175,000	2,000	20,000	175,000
IIA	100,000	200,000	No Limit	100,000[a]	No Limit	No Limit
IIB	175, 000	No Limit	No Limit	175,000[a]	No Limit	No Limit
III	200,000	No Limit	No Limit	200,000[a]	No Limit	No Limit
IV	No Limit	No Limit	No Limit	No Limit	No Limit	No Limit
V	No Limit	No Limit	No Limit	No Limit	No Limit	No Limit

For SI: 1 foot = 304.8 mm, 1 pound = 0.454 kg.

a. Where the amount of organic peroxide stored exceeds this amount, the minimum separation shall be 50 feet.

6204.1.4 Electrical wiring and equipment. In addition to the requirements of Section 5003.9.4, electrical wiring and equipment in

storage areas for Class I, IIA or IIB organic peroxides shall comply with the requirements for electrical Class I, Division 2, locations.

6204.1.5 Smoke detection. An approved supervised smoke detection system in accordance with Section 907 shall be provided in rooms or areas where Class I, IIA, IIB or III organic peroxides are stored. Activation of the smoke detection system shall sound a local alarm. **Exception:** A smoke detection system shall not be required in detached storage buildings equipped throughout with an *approved automatic fire-extinguishing system* complying with Chapter 9.

TABLE 6204.1.7 STORAGE OF ORGANIC PEROXIDES

ORGANIC PEROXIDE CLASS	PILE CONFIGURATION				MAXIMUM QUANTITY PER BUILDING
	Maximum width (feet)	Maximum height (feet)	Minimum distance to next pile (feet)	Minimum distance to walls (feet)	
I	6	8	4[a]	4[b]	Note c
IIA	10	8	4[a]	4[b]	Note c
IIB	10	8	4[a]	4[b]	Note c
III	10	8	4[a]	4[b]	Note c
IV	16	10	3[a, d]	4[b]	No Requirement
V	No Requirement	No Requirement	No Requirement	No Requirement	No Requirement

For SI: 1 foot = 304.8 mm.

a. Not less than one main aisle with a minimum width of 8 feet shall divide the storage area.

b. Distance to noncombustible walls is allowed to be reduced to 2 feet.

c. See Table 6204.1.2 for maximum quantities.

d. The distance shall be not less than one-half the pile height.

6204.1.8 Location in building. The storage of Class I, IIA or IIB organic peroxides shall be on the ground floor. Class III organic peroxides shall not be stored in basements.

6204.1.10 Explosion control. Indoor storage rooms, areas and buildings containing ~~unclassified~~ detonable and Class I organic peroxides shall be provided with explosion control in accordance with Section 911.

6204.1.11 Standby power. Standby power shall be provided in accordance with Section 1203 for the following systems used to protect Class I and ~~unclassified~~ detonable organic peroxides:

1. Exhaust ventilation system.
2. Treatment system.
3. Smoke detection system.
4. Temperature control system.
5. *Fire alarm system*.
6. *Emergency alarm system*.

6204.2.2 Electrical wiring and equipment. In addition to the requirements of Section 5003.9.4, electrical wiring and equipment in outdoor storage areas containing ~~unclassified~~ detonable, Class I, IIA or ~~Class~~ IIB organic peroxides shall comply with the requirements for electrical Class I, Division 2, locations.

For SI: 1 gallon = 3.785 L, 1 pound = 0.454 kg.

a. 22 gallons where Table 5003.1.1(1) Note k applies and hazard identification signs in accordance with Section 5003.5 are provided for quantities of 22 gallons or less.

b. 220 pounds where Table 5003.1.1(1) Note k applies and hazard identification signs in accordance with Section 5003.5 are provided for quantities of 220 pounds or less.

203.6.3 High-hazard Group H-1. Buildings and structures containing materials that pose a *detonation* hazard shall be classified as Group H-1. Such materials shall include, but not be limited to, the following:

Detonable *pyrophoric* materials

Explosives:

Division 1.1

Division 1.2

Division 1.3

Division 1.4

Division 1.5

Division 1.6

Organic peroxides, ~~unclassified~~ detonable

Oxidizers, Class 4

Unstable (reactive) materials, Class 3 detonable and Class 4

203.6.5 High-hazard Group H-3. Buildings and structures containing materials that readily support combustion or that pose a*physical hazard* shall be classified as Group H-3. Such materials shall include, but not be limited to, the following:

Class I, II or IIIA flammable or *combustible liquids* that are used or stored in normally closed containers or systems pressurized at 15 pounds per square inch gauge (103.4 kPa) or less

Combustible fibers, other than densely packed baled cotton, where manufactured, generated or used in such a manner that the concentration and conditions create a fire or explosion hazard based on information prepared in accordance with Section 414.1.3 of the *International Building Code*

Consumer fireworks, 1.4G (Class C, Common)

Cryogenic fluids, oxidizing

Category 1B flammable gases having a burning velocity of 3.9 inches per second (99 mm/s) or less

Flammable solids

Organic peroxides, Class II<u>A, IIB</u> and III

Oxidizers, Class 2

Oxidizers, Class 3, that are used or stored in normally closed containers or systems pressurized at 15 pounds per square inch gauge (103 kPa) or less

Oxidizing gases

Unstable (reactive) materials, Class 2

Water-reactive materials, Class 2

2024 International Building Code

[F] 307.3 High-hazard Group H-1. *Buildings* and *structures* containing materials that pose a *detonation* hazard shall be classified as Group H-1. Such materials shall include, but not be limited to, the following:

Detonable *pyrophoric* materials

Explosives:

Division 1.1

Division 1.2

Division 1.3

Division 1.4

Division 1.5

Division 1.6

Organic peroxides, ~~unclassified~~ detonable

Oxidizers, Class 4

Unstable (reactive) materials, Class 3 detonable and Class 4

[F] 307.5 High-hazard Group H-3. *Buildings* and *structures* containing materials that readily support combustion or that pose a *physical hazard* shall be classified as Group H-3. Such materials shall include, but not be limited to, the following:

Class I, II or IIIA *flammable or combustible liquids* that are used or stored in normally closed containers or systems pressurized at 15 pounds per square inch gauge (103.4 kPa) or less

Combustible fibers, other than *densely packed baled cotton*, where manufactured, generated or used in such a manner that the concentration and conditions create a fire or *explosion* hazard based on information prepared in accordance with Section 414.1.3

Consumer *fireworks*, 1.4G (Class C, Common)

Cryogenic fluids, oxidizing

Category 1B flammable gases having a burning velocity of 3.9 inches per second (10 cm/s) or less

Flammable solids

Organic peroxides, Class II<u>A, IIB</u> and III

Oxidizers, Class 2

Oxidizers, Class 3, that are used or stored in normally closed containers or systems pressurized at 15 pounds per square inch gauge (103 kPa) or less

Oxidizing gases

Unstable (reactive) materials, Class 2

Water-reactive materials, Class 2

For SI: 1 cubic foot = 0.02832 m^3, 1 pound = 0.454 kg, 1 gallon = 3.785 L.

NA = Not Applicable, NL = Not Limited~~, UD = Unclassified Detonable~~.

a. For use of control areas, see Section 5003.8.3.

b. The aggregate quantity in use and storage shall not exceed the maximum allowance quantity for storage, including applicable increases.

c. For hazardous materials in Group B higher education laboratory occupancies, see Section 428 of the *International Building Code* and Chapter 38.

d. Maximum allowable quantities shall be increased 100 percent in buildings equipped throughout with an approved automatic sprinkler system in accordance with Section 903.3.1.1. Where Note e applies, the increase for both notes shall be applied accumulatively.

e. Maximum allowable quantities shall be increased 100 percent where stored in approved storage cabinets, day boxes, gas cabinets, gas rooms, exhausted enclosures or in listed safety cans in accordance with Section 5003.9.10. Where Note d applies, the increase for both notes shall be applied accumulatively.

f. Quantities shall not be limited in a building equipped throughout with an approved automatic sprinkler system in accordance with Section 903.3.1.1.

g. Allowed only in buildings equipped throughout with an approved automatic sprinkler system.

h. Containing not more than the maximum allowable quantity per control area of Class IA, Class IB or Class IC flammable liquids.

i. Quantities in parentheses indicate quantity units in parentheses at the head of each column.

j. A maximum quantity of 220 pounds of solid or 22 gallons of liquid Class 3 oxidizers is allowed where such materials are necessary for maintenance purposes, operation or sanitation of equipment where the storage containers and the manner of storage are approved.

k. Net weight of pyrotechnic composition of the fireworks. Where the net weight of the pyrotechnic composition of the fireworks is not known, 25 percent of the gross weight of the fireworks including packaging shall be used.

l. For gallons of liquids, divide the amount in pounds by 10 in accordance with Section 5003.1.2.

m. For oxidizers, unstable (reactive) materials and water-reactive materials stored or displayed in Group M occupancies or storedin Group S occupancies, see Section 5003.11..

n. For flammable and combustible liquid storage in Group M occupancy wholesale and retail sales uses, see Section 5704.3.6.

o. Quantities in this table shall be modified in accordance with Table 5003.1.1(5).

p. Where manufactured, generated or used in such a manner that the concentration and conditions create a fire or explosion hazard based on information prepared in accordance with Section 104.2.2.

q. "High BV" Category 1B flammable gas has a burning velocity greater than 3.9 in/s (10 cm/s). "Low BV" Category 1B flammable gas has a burning velocity of 3.9 in/s (10 cm/s) or less.

For SI: 1 pound = 0.454 kg, 1 gallon = 3.785 L, 1 cubic foot = 0.02832 m^3.

a. For gallons of liquids, divide the amount in pounds by 10 in accordance with Section 5003.1.2.

b. The aggregate quantities in storage and use shall not exceed the maximum allowable quantity for storage, including applicable increases.

c. The aggregate quantity of nonflammable solid and nonflammable or noncombustible liquid hazardous materials allowed in outdoor storage per single property under the same ownership or control used for retail or wholesale sales is allowed to exceed the maximum allowable quantity per control area where such storage is in accordance with Section 5003.11.

d. Quantities in parentheses indicate quantity units in parentheses at the head of each column.

e. "High BV" Category 1B flammable gas has a burning velocity greater than 3.9 in/s (10 cm/s). "Low BV" Category 1B flammable gas has a burning velocity of 3.9 in/s (10 cm/s) or less.

TABLE 5003.8.2 DETACHED BUILDING REQUIRED

Material	Class	A DETACHED BUILDING IS REQUIRED WHERE THE QUANTITY OF MATERIAL EXCEEDS THAT LISTED HEREIN: Solids and liquids (tons)[a, b]	Gases (cubic feet)[a, b]
Explosives	Division 1.1	Maximum Allowable Quantity	Not Applicable
	Division 1.2	Maximum Allowable Quantity	
	Division 1.3	Maximum Allowable Quantity	
	Division 1.4[e]	Maximum Allowable Quantity	
	Division 1.4[c, e]	1	
	Division 1.5	Maximum Allowable Quantity	
	Division 1.6	Maximum Allowable Quantity	

A DETACHED BUILDING IS REQUIRED WHERE THE QUANTITY OF MATERIAL EXCEEDS THAT LISTED HEREIN			
Material	**Class**	**Solids and liquids (tons)**	**Gases (cubic feet)**
Oxidizers	Class 4	Maximum Allowable Quantity	Maximum Allowable Quantity
Unstable (reactives) detonable	Class 3 or 4	Maximum Allowable Quantity	Maximum Allowable Quantity
Oxidizer, liquids and solids	Class 3	1,200	Not Applicable
	Class 2	2,000	
Organic peroxides	Detonable	Maximum Allowable Quantity	Not Applicable
	Class I	Maximum Allowable Quantity	
	Class II<u>A</u>	25[f]	
	<u>Class IIB</u>	<u>40[f]</u>	
	Class III	50[f]	
Unstable (reactives) nondetonable	Class 3	125	2,000
	Class 2		10,000
Water reactives	Class 3	125	Not Applicable
	Class 2		
Pyrophoric gases[d]	Not Applicable	Not Applicable	2,000

For SI: 1 pound = 0.454 kg, 1 cubic foot = 0.02832 m^3, 1 ton = 2000 lb = 907.2 kg.

a. For materials that are detonable, the distance to other buildings or lot lines shall be in accordance with Section 415.6 of the International Building Code or Chapter 56 based on the trinitrotoluene (TNT) equivalence of the material, whichever is greater.

b. “Maximum Allowable Quantity” means the maximum allowable quantity per control area set forth in Table 5003.1.1(1).

c. Limited to Division 1.4 materials and articles, including articles packaged for shipment, that are not regulated as an explosive under Bureau of Alcohol, Tobacco, Firearms and Explosives regulations, or unpackaged articles used in process operations that do not propagate a detonation or deflagration between articles, providing the net explosive weight of individual articles does not exceed 1 pound.

d. Detached buildings are not required for gases in gas rooms that support H-5 fabrication facilities where the gas room is separated from other areas by a fire barrier with a fire-resistance rating of not less than 2 hours and the gas is located in a gas cabinet that is internally sprinklered, equipped with continuous leak detection, automatic shutdown, and is not manifolded upstream of pressure controls. The gas supply is limited to cylinders that do not exceed 125 pounds water capacity in accordance with DOTn 49 CFR 173.192 for Hazard Zone A toxic gases.

e. Does not apply to consumer fireworks, Division 1.4G.

f. <u>Where different classes of organic peroxides are stored in the same building, the aggregate sum of the ratios of the actual quantity divided by the allowed quantity for each class shall not exceed one.</u>

E102.1.8.1 Classification of organic peroxides ~~according to hazard~~. ~~Examples include:~~

~~Unclassified: Unclassified *organic peroxides* are capable of *detonation* and are regulated in accordance with Chapter 56.~~

~~Class I: acetyl cyclohexane sulfonyl 60-65 percent concentration by weight, fulfonyl peroxide, benzoyl peroxide over 98 percent concentration, t butyl hydroperoxide 90 percent, t butyl peroxyacetate 75 percent, t butyl peroxyisopropylcarbonate 92 percent, diisopropyl peroxydicarbonate 100 percent, di-n-propyl peroxydicarbonate 98 percent, and di-n-propyl peroxydicarbonate 85 percent.~~

~~Class II: acetyl peroxide 25 percent, t butyl hydroperoxide 70 percent (with DTBP and t BuOH diluents), t butyl peroxybenzoate 98 percent, t butyl peroxy-2-ethylhexanoate 97 percent, t butyl peroxyisobutyrate 75 percent, t butyl peroxyisopropyl-carbonate 75 percent, t butyl peroxypivalate 75 percent, dybenzoyl peroxydicarbonate 85 percent, di-sec butyl peroxydicarbonate 98 percent, di-secbutyl peroxydicarbonate 75 percent, 1,1-di-(t butylperoxy)-3,5,5-trimethyecyclohexane 95 percent, di-(2-ethythexyl) peroxydicarbonate 97 percent, 2,5-dymethyl-2-5-di-(benzoylperoxy) hexane 92 percent, and peroxyacetic acid 43 percent.~~

~~Class III: acetyl cyclohexane sulfonal peroxide 29 percent, benzoyl peroxide 78 percent, benzoyl peroxide paste 55 percent, benzoyl peroxide paste 50 percent peroxide/50 percent butylbenzylphthalate diluent, cumene hydroperoxide 86 percent, di-(4-butylcyclohexyl) peroxydicarbonate 98 percent, t butyl peroxy-2-ethylhexanoate 97 percent, t butyl peroxyneodecanoate 75 percent, decanoyl peroxide 98.5 percent, di-t butyl peroxide 99 percent, 1,1-di-(t butylperoxy)3,5,5-trimethylcyclohexane 75 percent, 2,4-dichlorobenzoyl peroxide 50 percent, di-isopropyl peroxydicarbonate 30 percent, 2,-5-di-methyl-2,5-di-(2-ethylhexanolyperoxy)-hexane 90 percent, 2,5-dimethyl-2,5-di-(t butylperoxy) hexane 90 percent and methyl ethyl ketone peroxide 9 percent active oxygen diluted in dimethyl phthalate.~~

~~Class IV: benzoyl peroxide 70 percent, benzoyl peroxide paste 50 percent peroxide/15 percent water/35 percent butylphthalate diluent, benzoyl peroxide slurry 40 percent, benzoyl peroxide powder 35 percent, t butyl hydroperoxide 70 percent, (with water diluent), t butyl peroxy-2-ethylhexanoate 50 percent, decumyl peroxide 98 percent, di-(2-ethylhexal) peroxydicarbonate 40 percent, laurel peroxide 98 percent, p-methane hydroperoxide 52.5 percent, methyl ethyl ketone peroxide 5.5 percent active oxygen and methyl ethyl ketone peroxide 9 percent active oxygen diluted in water and glycols.Class V: benzoyl peroxide 35 percent, 1,1-di-t butyl peroxy-3,5,5-trimethylcyclohexane 40 percent, 2,5-di-(t butyl peroxy) hexane 47 percent and 2,4-pentanedione peroxide 4 percent active oxygen.~~

Organic peroxide requirements in the IFC are based on the hazard classification, burning rate and transport type.

Add new text as follows:

E102.1.8.1.1 Hazard classification. Organic peroxide formulations are classified into seven hazard classifications (Detonable, I, IIA, IIB, III, IV and V). These classifications are used to determine the occupancy classifications and maximum allowable quantities. Detonable organic peroxides are explosive. As such, the storage requirements for detonable organic peroxides are found in Chapter 56, and Chapter 62 contains additional use, handling and transfer provisions.

E102.1.8.1.2 Transport types. Organic peroxides are also categorized based on the explosion hazard rating—referred to as the Transport Type. The transport type for organic peroxide formulations is determined in accordance with the Globally Harmonized System of Classification and Labelling of Chemicals (GHS). The explosion hazard levels are divided into “Types” (Type A-G).

E102.1.8.1.3 Burning rate. Organic peroxides are capable of high heat release and large quantities of smoke when they are involved in fire. The burning rate varies for each organic peroxide material and is determined in accordance with PGS 8. The burning rate is calculated from results of large-scale testing or small-scale testing detailed in PGS 8.

E102.1.8.2 Classification process. The classification process for storage and use of organic peroxides is based on the transport type and burning rate as shown in Table E102.1.8.2. For example, a Transport Type C organic peroxide with a burning rate equal to or greater than 300 kilograms (662 pounds) per minute will be treated a Class I organic peroxide; and another Transport Type C organic peroxide with a burning rate less than 140 kilograms (309 pounds) per minute will be treated as a Class IIB organic peroxide.

TABLE E102.1.8.2 STORAGE CLASSIFICATION OF ORGANIC PEROXIDES

TRANSPORT TYPE	BURNING RATE[a]

	Large Scale Test	<10	≥10 and <60	≥60 and <140	≥140 and <300	≥300
	(kg/minute)					
	OR					
	Small Scale Test[b]	NA	<0.9	≥0.9 and <2.2	≥2.2 and <9.0	≥9.0
	(kg/m²/minute)					
B		I	I	I	I	I
C		IIB	IIB	IIB	IIA	I
D		III	III	IIB	IIA	I
E		IV	III	IIB	IIA	IIA
F		IV	III	III	III	III
G		V	V	V	V	V

a. In the absence of burning rate test data, organic peroxides shall be treated as having a burning rate greater than 300 kg/min.

b. Solid materials shall be tested using the large-scale test. Liquid materials can be tested using either the large-scale test or the small-scale test.

E102.1.8.3 Organic peroxide classification.. Examples of organic peroxides and their corresponding classifications are listed in Table E102.1.8.3.

TABLE E102.1.8.3 EXAMPLES OF ORGANIC PEROXIDE STORAGE CLASSIFICATIONS

Organic Peroxide Storage Class	Organic Peroxide Name	CAS#	Formulation Components				
			Concentration (mass%)	Diluent type A	Diluent type B	Inert solid	Water
I	tert-Butyl peroxyacetate	107-71-1	>52-77	≥23			
I	Di-sec-butyl peroxydicarbonate	19910-65-7	>62-100				
I	Di-(4-tert-butylcyclohexyl)peroxydicarbonate	15520-11-3	≤100				
IIA	tert-Amyl peroxy-2-ethylhexyl carbonate	70833-40-8	≤100				
IIA	tert-Butyl peroxyacetate	107-71-1	>32-52	≥48			
IIA	tert-Butyl peroxy-2-ethylhexylcarbonate	34443-12-4	≤100				
IIB	tert-Butyl peroxy-2-ethylhexanoate	3006-82-4	>32-52	≥48			
IIB	tert-Butylperoxy isopropylcarbonate	2372-21-6	≤77	≥23			
IIB	Dilauroyl peroxide	105-74-8	≤100				
III	tert-Butyl hydroperoxide	75-91-2	≤72				≥28
III	Cumyl hydroperoxide	80-15-9	≤80	≥20			
III	Di-tert-butyl peroxide	110-05-4	≤52	≥48			
III	Dicetyl peroxydicarbonate	26322-14-5	≤100				

IV	tert-Butyl peroxyneodecanoate [as a stable dispersion in water]	26748-41-4	≤52	
IV	Di-(4-tert-butylcyclohexyl)peroxydicarbonate [as a stable dispersion in water]	15520-11-3	≤42	
IV	Di-(2-ethylhexyl) peroxydicarbonate [as a stable dispersion in water (frozen)]	16111-62-9	≤52	
V	Dibenzoyl peroxide	94-36-0	≤35	≥65
V	Di-(tert-butylperoxyisopropyl) benzene(s)	25155-25-3	≤42	≥58
V	Dicumyl peroxide	80-43-3	≤52	≥48

TABLE F101.2 FIREFIGHTER WARNING PLACARD DESIGNATIONS BASED ON HAZARD CLASSIFICATION CATEGORIES

HAZARD CATEGORY	DESIGNATION
Combustible liquid II	F2
Combustible liquid IIIA	F2
Combustible liquid IIIB	F1
Combustible dust	F3 or F2[a]
Combustible fiber	F3
Cryogenic flammable	F4, H3
Cryogenic oxidizing	OX, H3
Explosive	R4
Flammable solid	F2
Flammable gas (gaseous)	F4
Flammable gas (liquefied)	F4
Flammable liquid IA	F4
Flammable liquid IB	F3
Flammable liquid IC	F3
Organic peroxide, ~~UD~~Detonable	R4
Organic peroxide I	F4, R3
Organic peroxide IIA	F3, R3
Organic peroxide IIB	F3, R3
Organic peroxide III	F2, R2
Organic peroxide IV	F1, R1
Organic peroxide V	None
Oxidizing gas (gaseous)	OX
Oxidizing gas (liquefied)	OX
Oxidizer 4	OX4
Oxidizer 3	OX3
Oxidizer 2	OX2
Oxidizer 1	OX1
Pyrophoric gases	F4
Pyrophoric solids, liquids	F3

HAZARD CATEGORY	DESIGNATION
Unstable reactive 4D	R4
Unstable reactive 3D	R4
Unstable reactive 3N	R2
Unstable reactive 2	R2
Unstable reactive 1	None
Water reactive 3	W3
Water reactive 2	W2
Corrosive	H3, COR
Toxic	H3
Highly toxic	H4

a. F3 = Finely divided solids, typically less than 75 micrometers (µm) (200 mesh), that pose an elevated risk of forming an ignitable dust cloud, such as finely divided sulfur, *National Electric Code* Group E dusts (for example, aluminum, zirconium and titanium) and bisphenol A. F2 = Finely divided solids less than 420 µm (40 mesh) that pose an ordinary risk of forming an ignitable dust cloud.

F—Flammable category.

R—Reactive category.

H—Health category.

W—Special hazard: water reactive.

OX—Special hazard: oxidizing properties.

COR—Corrosive.

~~UD—Unclassified detonable material.~~

4D—Class 4 detonable material.

3D—Class 3 detonable material.

3N—Class 3 nondetonable material.

TABLE H102.1 SECTION II—HAZARDOUS MATERIALS INVENTORY STATEMENT (HMIS) SUMMARY REPORT[a] (Storage[b] Conditions)[c]

IBC/IFC HAZARD CLASS	HAZARD CLASS	INVENTORY AMOUNT			IBC/IFC MAXIMUM ALLOWABLE QUANTITY[d]		
	(Abbrev)	Solid (lb)	Liquid (gal)	Gas (cu ft, gal, lb)	Solid (lb)	Liquid (gal)	Gas (cu ft, gal, lb)
Combustible Liquid	C2		5			120	
	C3A					330	
	C3B		6			13,200	
Combustible Fiber	Loose/Baled						
Cryogenics, Flammable	Cryo-Flam					45	
Cryogenic, Oxidizing	Cryo-OX					45	
Flammable Gas	FLG						
(Gaseous)				150			1,000
(Liquefied)						30	
Flammable Liquid	F1A					30	
	F1B & F1C		5			120	
Combination (1A, 1B, 1C)			5			120	
Flammable Solid	FLS				125		
Organic Peroxide	~~OPU~~OPD				~~0~~1		
	OP1				~~5~~16		
	OP2A				~~50~~100		
	OP2B				200		
	OP3				~~125~~400		
	OP4				NL		
	OP5				NL		
Oxidizer	OX4				0		
	OX3				10		
	OX2				250		
	OX1				4,000		

a. Complete a summary report for each *control area* and Group H occupancy.

b. Storage = storage + use-closed + use-open systems.

c. Separate reports are required for use-closed and use-open systems.

d. Include increases for sprinklers or storage in cabinets, if applicable.

(This is an example; add additional hazard classes as needed.)

Add new standard(s) as follows:

8-21 Organic peroxides: Storage -Guidance for the safe storage of organic peroxides.

Reason: F26-24 and F270-24 were heard during CAH 1. Both proposals revised the definition of Organic Peroxide and its subclasses. This Comment to F270-24 removes the Organic Peroxide definitions from F270 and instead a separate Comment to F26-24 proposal is submitted with Organic Peroxide definitions based on both transport type and burning rate. This Comment to F270-24 correlates with Comment to F26-24 and makes F26-24 definition associated changes (Class II to Class IIA and Class IIB split and Unclassified Detonable classification name change to Detonable) throughout Chapter 62, other chapters and appendices, and the IBC. Appendix E is revised as part of this code change proposal, which provides the code official and the code user with the details of organic peroxide classification types, basis for classification, test method references and classification details. The list of organic peroxides examples has been updated to reflect the correct classifications for the organic peroxides listed.

Comment to F26-24 revises Organic Peroxide definitions which includes splitting the current Organic Peroxide Class II into Class IIA and IIB; creating an additional subclassification. The range of the burning rate for the current Class II is quite broad—with a lower limit of 60 kg/min and an upper limit of 300 kg/min. By splitting Class II, it creates Class IIA (burning rate of 140 kg/min to 300 kg/min) and Class IIB (burning rate of 60 kg/min to 140 kg/min). This will provide two I-Code classifications for materials similarly classified by GHS (Type C, D and E) which are then separated by their burning rate into either Class IIA or IIB. This additional classification allows better control of separation distances versus quantity and other features that reflect the burning behavior of the materials, beyond just the explosion hazard represented by the GHS designation. In this proposal, this change from Class II to Class IIA and Class IIB is made throughout Chapter 62, other chapters and appendices, and the IBC. Maximum quantities are defined for Class IIA and IIB where required. Footnote is added under the maximum quantities table in Chapter 62 in a corelated proposal F269 which states that when multiple classes of organic peroxides are stored, the sum of the ratios is used to determine the maximum quantity allowed. So even though the proposal is adding Class IIB quantities, the aggregate of all organic peroxide materials must be considered based on the footnote which is more restrictive than the current code.

Comment to F26-24 also includes Unclassified Detonable classification name change to Detonable. Organic peroxides are classified by transport type A to transport type G. There is no such class called Unclassified Detonable. If an organic peroxide is detonable, then it is classified as transport type A per the UN and DOT organic peroxides definitions. As such, Detonable is an appropriate word to denote such class. In this proposal, this change from Unclassified Detonable to Detonable is made throughout Chapter 62, other chapters and appendices, and the IBC.

Proposals F269-24 and Comment to F270-24 correlate with each other with respect to Chapter 62. While proposal F269-24 makes comprehensive changes to Chapter 62, Comment to F270-24 makes Class II to Class IIA and Class IIB split and Unclassified Detonable class name change to Detonable throughout Chapter 62.

FCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and early 2024 the FCAC has held several virtual meetings and one in-person meeting open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the **FCAC Website**.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This Comment to F270-24 code proposal makes Class II to Class IIA and Class IIB split and changes Unclassified Detonable classification name to Detonable throughout Chapter 62, other chapters and appendices, and the IBC. Appendix E is revised as part of this code change proposal, which provides the code official and the code user with the details of organic peroxide classification types, basis for classification, test method references and classification details. The list of organic peroxides examples has been updated to reflect the correct classifications for the organic peroxides listed. The information provided in this proposal helps both the code official and the code user to effectively implement the code. The proposal does not impact the cost of construction.

2024 International Fire Code

Revise as follows:

TABLE E104.2 IFC AND GHS HAZARD DEFINITIONS COMPARISON[a]

IFC MATERIAL	IFC CLASS	IFC DEFINITION	GHS ~~2017 (REV 7)~~ CLASSIFICATION (H-CODE AND CATEGORY); HAZARD STATEMENT; DEFINITION
Aerosol	—	A combination of a container, a propellant and a material that is dispensed. Aerosol products shall be classified by means of the calculation of their chemical heats of combustion and shall be designated Level ~~1, Level 2 or Level~~ 3, Level 2, or Level 1.	Any nonrefillable receptacles made of metal, glass or plastics and containing a gas compressed, liquefied or dissolved under pressure, with or without a liquid, paste or powder, and fitted with a release device allowing the contents to be ejected as solid or liquid particles in suspension in a gas, as a foam, paste or powder or in a liquid state or in a gaseous state.
~~Aerosol~~	~~Level 1~~	~~Those with a total chemical heat of combustion that is less than or equal to 8,600 Btu/lb (20 kJ/g).~~	~~H223, Category 3, Pressurized container: May burst if heated.~~ ~~1. Any aerosol that contains ≤ 1% flammable components (by mass) and that has a heat of combustion < 20 kJ/g.~~ ~~2. Any aerosol that contains > 1% (by mass) flammable components or which has a heat of combustion of ≥ 20 kJ/g but which, based on the results of the ignition distance test, the enclosed space ignition test or the aerosol foam flammability test, does not meet the criteria for Category 1 or Category 2.~~

Aerosol	Level 2	These with a total chemical heat of combustion that is less than or equal to 8,600 Btu/lb (20 kJ/g).	H223, Category 2; Flammable aerosol. Pressurized container: May burst if heated: 1. Any aerosol that dispenses a spray that, based on the results of the ignition distance test, does not meet the criteria for Category 1, and which has: a. A heat of combustion of ≥ 20 kJ/g. b. A heat of combustion of < 20 kJ/g along with an ignition distance of ≥ 15 cm; or c. A heat of combustion of < 20 kJ/g and an ignition distance of < 15 cm along with either, in the enclosed space ignition test a time: i. A time equivalent of ≤ 300 s/m^3; or ii. A deflagration density of ≤ 300 g/m^3; or 2. Any aerosol that dispenses a foam that, based on the results of the aerosol foam flammability test, does not meet the criteria for Category 1, and which has a flame height of ≥ 4 cm and a flame duration of ≥ 2 s.

Aerosol	Level 3	An aerosol product that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as an Aerosol (Category 1). Where the GHS category is not known, the following is acceptable for classification purposes: Those with a total chemical heat of combustion that is greater than 13,000 Btu/lb (30 kJ/g).	H222, Category 1; Extremely flammable aerosol. Pressurized container: May burst if heated: 1. Any aerosol that contains ≥ 85% flammable components (by mass) and has a heat of combustion of ≥ 30 kJ/g. 2. Any aerosol that dispenses a spray that, in the ignition distance test, has an ignition distance of ≥ 75 cm. 3. Any aerosol that dispenses a foam that, in the foam flammability test, has: a. A flame height of ≥ 20 cm and a flame duration of ≥ 2 s. b. A flame height of ≥ 4 cm and a flame duration of ≥ 7 s.
Aerosol	Level 2	An aerosol product that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as an Aerosol (Category 2). Where the GHS category is not known, the following is acceptable for classification purposes: Those with a total chemical heat of combustion that is less than or equal to 8,600 Btu/lb (20 kJ/g).	

			H223, Category 2; Flammable aerosol: 1. Any aerosol that dispenses a spray that, based on the results of the ignition distance test, does not meet the criteria for Category 1, and which has: a. A heat of combustion of ≥ 20 kJ/g. b. A heat of combustion of < 20 kJ/g along with an ignition distance of ≥ 15 cm; or c. A heat of combustion of < 20 kJ/g and an ignition distance of < 15 cm along with either, in the enclosed space ignition test a time: i. A time equivalent of ≤ 300 s/m^3; or ii. A deflagration density of ≤ 300 g/m^3; or
Aerosol	Level 1	An aerosol product that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as an Aerosol (Category 3). Where the GHS category is not known, the following is acceptable for classification purposes: Those with a total chemical heat of combustion that is less than or equal to 8,600 Btu/lb (20 kJ/g).	H223, Category 3: 1. Any aerosol that contains ≤ 1% flammable components (by mass) and that has a heat of combustion ≥ 20 kJ/g; 2. Any aerosol that dispenses a spray that, based on the results of the aerosol foam flammability test, does not meet the criteria for Category 1, and which has a flame height of ≥ 4 cm and a flame duration of ≥ 2 s; 2. Any aerosol that contains > 1% (by mass) flammable components or which has a heat of combustion of ≥ 20 kJ/g but which, based on the results of the ignition distance test, the enclosed space ignition test or the aerosol foam flammability test, does not meet the criteria for Category 1 or Category 2. and H229; Pressurized container: May burst if heated and H229; Pressurized container: May burst if heated
Combustible liquid	—	A liquid having a closed cup flash point at or above 100°F (38°C). Combustible liquids shall be subdivided as follows:	A flammable liquid means a liquid having a flash point of not more than 93°C.
Combustible liquid	II	A liquid that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as a Flammable Liquid (Category 3) and having a flashpoint at or above 100°F (38°C). Where the GHS category is not known, the following is acceptable for classification purposes: Liquids having a closed cup flash point at or above 100°F (38°C) and below 140°F (60°C).	H226, Category 3; Flammable liquid and vapor: Flash point ≥ 23°C and ≤ 60°C
Combustible liquid	IIIA	A liquid that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as a Flammable Liquid (Category 4). Where the GHS category is not known, the following is acceptable for classification purposes: Liquids having a closed cup flash point at or above 140°F (60°C) and below 200°F (93°C).	H227, Category 4; Combustible liquid: Flash point > 60°C and ≤ 93°C
Combustible liquid	IIIB	Liquids having closed cup flash points at or above 200°F (93°C).	N/A

Compressed gas	—	A material or mixture of materials that: 1. Is a gas at 68°F (20°C) or less at 14.7 psia (101 kPa) of pressure, and 2. Has a boiling point of 68°F (20°C) or less at 14.7 psia (101 kPa) which is either liquefied, nonliquefied (gaseous) or in solution (dissolved), except those gases that have no other health- or physical-hazard properties are not considered to be compressed until the pressure in the packaging exceeds 41 psia (282 kPa) at 68°F (20°C). COMPRESSED GAS, DISSOLVED. Dissolved compressed gases, or gases in solution, are non-liquefied gases that are dissolved in a solvent. Under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS), these gases are categorized as Gases Under Pressure – Dissolved Gas. COMPRESSED GAS, GASEOUS. Gaseous compressed gases are non-liquefied gases, other than those in solution (dissolved), which are in a packaging under the charged pressure and are entirely gaseous at a temperature of 68°F (20°C). Under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS), these gases are categorized as Gases Under Pressure – Compressed Gas. COMPRESSED GAS, LIQUEFIED. Liquefied compressed gases are gases that, in a packaging under the charged pressure, are partially liquid at a temperature of 68°F (20°C). Under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS), these gases are categorized as Gases Under Pressure – Liquefied Gas. ~~States of compressed gases:~~ ~~1. Nonliquefied compressed gases are gases, other than those in solution, that are in a packaging under the charged pressure and are entirely gaseous at a temperature of 68°F (20°C).~~ ~~2. Liquefied compressed gases are gases that, in a packaging under the charged pressure, are partially liquid at a temperature of 68°F (20°C).~~ ~~3. Compressed gases in solution are nonliquefied gases that are dissolved in a solvent.~~ ~~4. Compressed gas mixtures consist of a mixture of two or more compressed gases contained in a packaging, the hazard properties of which are represented by the properties of the mixture as a whole.~~	Gases under pressure are gases which are contained in a receptacle at a pressure of 200 kPa (gauge) or more at 20°C, or which are liquefied, or liquefied and refrigerated. H280, Compressed gas; Contains gas under pressure: May explode if heated. A gas which when under pressure is entirely gaseous at -50°C (-58°F), including all gases with a critical temperature ≤ -50°C (-58°F). H280, Liquefied gas; Contains gas under pressure: May explode if heated. A gas which when under pressure is partially liquid at temperatures above -50°C (-58°F). H280, Dissolved gas; Contains gas under pressure: May explode if heated. A gas which when under pressure is dissolved in a liquid phase solvent.
Corrosive	—	A substance or mixture that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as either Skin Corrosion (Category 1A, 1B, or 1C), or Serious Eye Damage (Category 1). Where the GHS category is not known, the following is acceptable for classification purposes: A chemical that causes visible destruction of, or irreversible alterations in, living tissue by chemical action at the point of contact. A chemical shall be considered corrosive if, when tested on the intact skin of albino rabbits by the method described in DOTn 49 CFR 173.137, such chemical destroys or changes irreversibly the structure of the tissue at the point of contact following an exposure period of 4 hours. This term does not refer to action on inanimate surfaces.	H314, Category 1 (1A, 1B, 1C); Causes severe skin burns and eye damage. Skin corrosion refers to the production of irreversible damage to the skin; namely, visible necrosis through the epidermis and into the dermis occurring after exposure to a substance or mixture.
Cryogenic fluid	—	A fluid having a boiling point lower than -130°F (-89.9°C) at 14.7 pounds per square inch atmosphere (psia) (an absolute pressure of 101.3 kPa). Under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS), Cryogenic Fluids are categorized as a Gas Under Pressure – Refrigerated Liquefied Gas. However, not all GHS Refrigerated Liquefied Gases are Cryogenic Fluids.	H281, Refrigerated liquefied gas; Contains refrigerated gas: May cause cryogenic burns or injury. A gas which is made partially liquid because of its low temperature.

Cryogenic fluid, flammable	—	A cryogenic fluid that is a *flammable gas* in its vapor state. These fluids are categorized under the Globally Harmonized System of Classification and Labeling of Chemicals (GHS) as Flammable Gas, Category 1A or Category 1B and Gases Under Pressure - Refrigerated Liquefied Gas. ~~A cryogenic fluid that is flammable in its vapor state.~~	H220, Category 1A; Extremely flammable gas. Gases, which at 20° C and a standard pressure of 101.3 kPa: 1. Are ignitable when in a mixture of 13% or less by volume in air; or 2. Have a flammable range with air of at least 12 percentage points, regardless of the lower flammability limit unless data show they meet the criteria for Category 1B. Category 1A includes pyrophoric gases and chemically unstable gases.~~—~~ H281, refrigerated liquefied gas, would also apply
Cryogenic fluid,~~—~~Inert	—	A cryogenic fluid that is an *inert* gas in its vapor state. These fluids are categorized under the Globally Harmonized System of Classification and Labeling of Chemicals (GHS) as Gases Under Pressure - Refrigerated Liquefied Gas.	H281, Refrigerated liquefied gas. Contains refrigerated gas: May cause cryogenic burns or injury. A gas which is made partially liquid because of its low temperature.
Cryogenic fluid,~~—~~ Oxidizing	—	~~An oxidizing gas in the cryogenic state.~~A cryogenic fluid that is an *oxidizing gas* in its vapor state. These fluids are categorized under the Globally Harmonized System of Classification and Labeling of Chemicals (GHS) as Oxidizing Gas, Category 1 and Gases Under Pressure - Refrigerated Liquefied Gas.	H270, Category 1: May cause or intensify fire; oxidizer. Any gas which may, generally by providing oxygen, cause or contribute to the combustion of other material more than air does. H281, refrigerated liquefied gas, would also apply.
Explosives	—	A chemical compound, mixture or device, the primary or common purpose of which is to function by explosion. The term includes, but is not limited to, dynamite, black powder, pellet powder, initiating explosives, detonators, safety fuses, squibs, detonating cord, igniter cord and igniters. The term "Explosive" includes any material determined to be within the scope of USC Title 18: Ch. 40 and also includes any material classified as an explosive other than consumer fireworks, Division 1.4G Explosives, by the hazardous materials regulations of DOTn 49 CFR Parts 100–185.	An explosive substance (or mixture) is a solid or liquid substance (or mixture of substances) which is in itself capable by chemical reaction of producing gas at such a temperature and pressure and at such a speed as to cause damage to the surroundings. Pyrotechnic substances are included even when they do not evolve gases.
Explosives	Unstable explosives		H200; Unstable explosive. Unstable explosives are those which are thermally unstable and/or too sensitive for normal handling, transport and use. Special precautions are necessary.
Explosives	Division 1.1	A chemical or item that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as Explosive (Division 1.1). Where the GHS category is not known, the following is acceptable for classification purposes: Explosives that have a mass explosion hazard. A mass explosion is one which affects almost the entire load instantaneously.	H201; Explosive; mass explosion hazard. Substances, mixtures and articles which have a mass explosion hazard (a mass explosion is one which affects almost the entire quantity present virtually instantaneously).
Explosives	Division 1.2	A chemical or item that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as Explosive (Division 1.2). Where the GHS category is not known, the following is acceptable for classification purposes: Explosives that have a projection hazard but not a mass explosion hazard.	H202; Explosive; severe projection hazard. Substances, mixtures and articles which have a projection hazard but not a mass explosion hazard.
Explosives	Division 1.3	A chemical or item that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as Explosive (Division 1.3). Where the GHS category is not known, the following is acceptable for classification purposes: Explosives that have a fire hazard and either a minor blast hazard or a minor projection hazard or both, but not a mass explosion hazard.	H203; Explosive; fire, blast or projection hazard. Substances, mixtures and articles which have a fire hazard and either a minor blast hazard or a minor projection hazard or both, but not a mass explosion hazard: 1. Combustion of which gives rise to considerable radiant heat; or 2. Which burn one after another, producing minor blast or projection effects or both.
Explosives	Division 1.4	A chemical or item that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as Explosive (Division 1.4). Where the GHS category is not known, the following is acceptable for classification purposes: Explosives that pose a minor explosion hazard. The explosive effects are largely confined to the package and no projection of fragments of appreciable size or range is to be expected. An external fire must not cause virtually instantaneous explosion of almost the entire contents of the package.	H204; Fire or projection hazard: Substances, mixtures and articles which present no significant hazard; substances, mixtures and articles which present only a small hazard in the event of ignition or initiation. The effects are largely confined to the package and no projection of fragments of appreciable size or range is to be expected. An external fire shall not cause virtually instantaneous explosion of almost the entire contents of the package.
Explosives	Division 1.4G	Small fireworks devices containing restricted amounts of pyrotechnic composition designed primarily to produce visual or audible effects by combustion or deflagration that complies with the construction, chemical composition and labeling regulations of the DOTn for fireworks, UN No. 0336 and the US Consumer Product Safety Commission as set forth in CPSC 16 CFR Parts 1500 and 1507.	N/A

Explosives	Division 1.5	A chemical or item that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as Explosive (Division 1.5). Where the GHS category is not known, the following is acceptable for classification purposes: Very insensitive explosives. This division is comprised of substances that have a mass explosion hazard but which are so insensitive that there is very little probability of initiation or of transition from burning to detonation under normal conditions of transport.	H205; May mass explode in fire. Very insensitive substances or mixtures which have a mass explosion hazard: substances and mixtures which have a mass explosion hazard but are so insensitive that there is very little probability or initiation or of transition from burning to detonation under normal conditions.
Explosives	Division 1.6	A chemical or item that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as Explosive (Division 1.6). Where the GHS category is not known, the following is acceptable for classification purposes: Extremely insensitive articles that do not have a mass explosion hazard. This division is comprised of articles that contain only extremely insensitive detonating substances and that demonstrate a negligible probability of accidental initiation or propagation.	Extremely insensitive articles which do not have a mass explosion hazard: articles which predominantly contain extremely insensitive substances or mixtures and which demonstrate a negligible probability of accidental initiation or propagation.
Flammable gas	Gaseous or Liquefied	A material that is a gas at 68°F (20°C) or less at 14.7 psia (101 kPa) of pressure [a material that has a boiling point of 68°F (20°C) or less at 14.7 psia (101 kPa)] subdivided as follows: ~~which:~~ 1. Category 1A. a gas that meets either of the following: 1.1 ~~A gas that is~~ Ignitable at 14.7 psia (101 kPa) when in a mixture of 13% or less by volume with air; or ~~2.~~ 1.2 ~~Has a~~A flammable range at 14.7 psia (101 kPa) with air of not less than 12%, regardless of the lower limit, unless data shows compliance with Category 1B. 2. Category 1B. A gas that meets the flammability criteria for Category 1A, is not pyrophoric or chemically unstable, and meets one of more of the following: 2.1. A lower flammability limit of more than 6 percent by volume of air. 2.2. A fundamental burning velocity of less than 3.9 inches/second (99 mm/s). The limits specified shall be determined at 14.7 psia (101 kPa) of pressure and a temperature of 68°F (20°C) in accordance with ASTM E681.Where not otherwise specified, the term "flammable gas" includes both Categories 1A and 1B. Under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS), Flammable Gases are categorized as a Flammable Gas (Category 1A or 1B).	A flammable gas is a gas having a flammable range with air at 20°C and a standard pressure of 101.3 kPa. H220, Category 1A; Extremely flammable gas. Gases, which at 20°C and a standard pressure of 101.3 kPa: 1. Are ignitable when in a mixture of 13% or less by volume in air; or 2. Have a flammable range with air of at least 12 percentage points regardless of the lower flammability limit unless data show they meet the criteria for Category 1B. Category 1A includes pyrophoric gases and chemically unstable gases. H220, Category 1B; Flammable gas. Gases which meet the flammability criteria for Category 1A, but which are not pyrophoric nor chemically unstable, and which have at least either: 1. A lower flammability limit of more than 6% by volume in air; or 2. A fundamental burning velocity of less than 10 cm/s. ~~H280, compressed gas, would also apply.~~
Flammable liquid	—	A liquid having a closed cup flash point below 100°F (38°C). Flammable liquids are further categorized into a group known as Class I liquids. The Class I category is subdivided as follows:	A liquid having a flash point of not more than 93°C. A flammable liquid is classified in one of the four categories for this class.
Flammable liquid	IA	A liquid that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as a Flammable Liquid (Category 1). Where the GHS category is not known, the following is acceptable for classification purposes: Liquids having a flash point below 73°F (23°C) and having a boiling point below 100°F (38°C).	H224, Category 1; Extremely flammable liquid and vapor. Flash point < 23°C and initial boiling point ≤ 35°C
Flammable liquid	IB	A liquid that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as a Flammable Liquid (Category 2). Where the GHS category is not known, the following is acceptable for classification purposes: Liquids having a flash point below 73°F (23°C) and having a boiling point at or above 100°F (38°C).	H225, Category 2; Highly flammable liquid and vapor. Flash point < 23°C and initial boiling point > 35°C
Flammable liquid	IC	A liquid that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as a Flammable Liquid (Category 3) and having a flashpoint below 100°F (38°C). Where the GHS category is not known, the following is acceptable for classification purposes: Liquids having a flash point at or above 73°F (23°C) and below 100°F (38°C).	H226, Category 3; Flammable liquid and vapor. Flash point ≥ 23°C and ≤ 60°C

Flammable solid	—	A solid that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as a Flammable Solid (Category 1 or 2). Where the GHS category is not known, the following is acceptable for classification purposes: A solid, other than a blasting agent or explosive, that is capable of causing fire through friction, absorption of moisture, spontaneous chemical change or retaining heat from manufacturing or processing, or which has an ignition temperature below 212°F (100°C) or which burns so vigorously and persistently when ignited as to create a serious hazard. A chemical shall be considered a flammable solid, as determined in accordance with the test method of CPSC 16 CFR Part 1500.44, if it ignites and burns with a self-sustained flame at a rate greater than 0.0866 inch (2.2 mm) per second along its major axis.	A flammable solid is a solid which is readily combustible, or may cause or contribute to fire through friction. A flammable solid is classified in one of the two categories for this class using method N.1 as described in Part III, subsection 33.2.1 of the Manual of Tests and Criteria, according to: H228, Category 1; Flammable solid: Burning rate test: Substances or mixtures other than metal powders: 1. Wetted zone does not stop fire; and 2. Burning time < 45 s or burning rate > 2.2 mm/s. Metal powders: burning time ≤ 5 min H228, Category 2; Flammable solid: Burning rate test: Substances or mixtures other than metal powders: 1. Wetted zone stops the fire for at least 4 min; and 2. Burning time < 45 s or burning rate > 2.2 mm/s. Metal powders: burning time > 5 min and ≤ 10 min
Highly toxic	—	A substance or mixture that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as Acute Toxicity Oral Category 1 or 2, Dermal Category 1 or 2, Inhalation Gases Category 1, Inhalation Vapors Category 1, or Inhalation Dusts and Mists Category 1 or 2. Where the GHS category is not known, one of the following is acceptable for classification purposes: ~~A material that produces a lethal dose or lethal concentration that falls within any of the following categories:~~ 1. A chemical that has a median lethal dose (LD50) of 50 mg or less per kg of body weight when administered orally to albino rats weighing between 200 and 300 g each. 2. A chemical that has a medial lethal dose (LD50) of 200 mg or less per kg of body weight when administered by continuous contact for 24 hr (or less if death occurs within 24 hr) with the bare skin of albino rabbits weighing between 2 and 3 kg each. 3. A chemical that has a median lethal concentration (LC50) in air of 200 ppm by volume or less of gas or vapor, or 2 mg/l or less of mist~~, fume~~ or dust, when administered by continuous inhalation for 1 hr (or less if death occurs within 1 hr) to albino rats weighing between 200 and 300 g.	Acute toxicity refers to serious adverse health effects (i.e., lethality) occurring after a single or short-term oral, dermal or inhalation exposure to a substance or mixture. Oral H300, Category 1; Fatal if swallowed: LD50 ≤ 5 mg/kg bodyweight H300, Category 2; Fatal if swallowed: LD50 > 5 ≤ 50 mg/kg bodyweight Dermal H310, Category 1; Fatal in contact with skin: LD50 ≤ 50 mg/kg bodyweight H310, Category 2; Fatal in contact with skin: LD50 > 50 ≤ 200 mg/kg bodyweight Inhalation H330, Category 1; Fatal if inhaled. Gases: LC50 ≤ 100 ppm (4 hr) ≈ 200 ppm (1 hr) Vapors: LC50 ≤ 0.5 mg/l (4 hr) ≈ ~~2~~1 mg/l (1 hr) Dust/mist: LC50 ≤ 0.05 mg/l (4 hr) ≈ 0.2 mg/l (1 hr)
Inert compressed gas	—	A compressed gas that is capable of reacting with other materials only under abnormal conditions such as high temperatures, pressures and similar extrinsic physical forces. Within the context of the code, inert compressed gases do not exhibit either physical or health hazard properties as defined (other than acting as a simple asphyxiant) or hazard properties other than those of a compressed gas. Some of the more common inert compressed gases include argon, helium, krypton, neon, nitrogen and xenon.	Gases under pressure are gases which are contained in receptacles at a pressure of 200 kPa (gauge) or more at 20°C or which are liquefied or liquefied and refrigerated. They comprise compressed gases, liquefied gases, dissolved gases and refrigerated liquefied gases. See the description of “Compressed gas.”

Organic peroxide	—	Liquid or solid ~~An~~ organic substances ~~compound~~ that contains the bivalent -O-O- structure and which may be considered to be a structural derivative of hydrogen peroxide where one or both of the hydrogen atoms have been replaced by ~~an~~ organic radicals.The term also includes organic peroxide formulations (mixtures).Organic peroxides ~~can present an explosion hazard (detonation or deflagration) or they can be shock sensitive. They can also decompose into various unstable compounds over an extended period of time.~~are thermally unstable substances or mixtures, which may undergo exothermic self-accelerating decomposition. In addition, they may have one or more of the following properties: a. be liable to explosive decomposition; b. burn rapidly; c. be sensitive to impact or friction; d. react dangerously with other substances.	Organic peroxides are liquid or solid organic substances which contain the bivalent -O-O- structure and may be considered derivatives of hydrogen peroxide, where one or both of the hydrogen atoms have been replaced by organic radicals. The term also includes organic peroxide formulations (mixtures). Organic peroxides are thermally unstable substances or mixtures, which may undergo exothermic self-accelerating decomposition. In addition, they may have one or more of the following properties: 1. Be liable to explosive decomposition. 2. Burn rapidly. 3. Be sensitive to impact or friction. 4. React dangerously with other substances.
Organic peroxide	UD	Any organic peroxide which, as packaged, is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as an Organic Peroxide (Type A). Type A Organic Peroxides are forbidden in transportation. Where the GHS Category is not known, the following is acceptable for classification purposes: Organic peroxides that are capable of *detonation*. These peroxides pose an extremely high-explosion hazard through rapid explosive decomposition.	H240, Organic peroxide, Type A; Heating may cause an explosion. Any organic peroxide which, as packaged, can detonate or deflagrate rapidly will be defined as organic peroxide Type A.
Organic peroxide	I	Any organic peroxide which, as packaged, is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as an Organic Peroxide (Type B). Where the GHS Category is not known, the following is acceptable for classification purposes: ~~Describes t~~Those formulations that are capable of *deflagration* but not *detonation*.	H241, Organic peroxide, Type B; Heating may cause a fire or explosion. Any organic peroxide possessing explosive properties and which, as packaged, neither detonates nor deflagrates rapidly but is liable to undergo a thermal explosion in that package will be defined as organic peroxide Type B.
Organic peroxide	II	Any organic peroxide which, as packaged, is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as an Organic Peroxide (Type C) or (Type D). Where the GHS Category is not known, the following is acceptable for classification purposes: ~~Describes t~~Those formulations that burn very rapidly and that pose a moderate reactivity hazard.	H242, Organic peroxide, Type C; Heating may cause a fire. Any organic peroxide possessing explosive properties when the substance or mixture as packaged cannot detonate or deflagrate rapidly or undergo a thermal explosion will be defined as organic peroxide Type C. H242, Organic peroxide, Type D; Heating may cause a fire. Any organic peroxide which in laboratory testing: Detonates partially, does not deflagrate rapidly and shows no violent effect when heated under confinement; or Does not detonate at all, deflagrates slowly and shows no violent effect when heated under confinement; or Does not detonate or deflagrate at all and shows a medium effect when heated under confinement; will be defined as organic peroxide Type D.
Organic peroxide	III	Any organic peroxide which, as packaged, is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as an Organic Peroxide (Type E). Where the GHS Category is not known, the following is acceptable for classification purposes: ~~Describes t~~Those formulations that burn rapidly and that pose a moderate reactivity hazard.	H242, Organic peroxide, Type E; Heating may cause a fire. Any organic peroxide which, in laboratory testing, neither detonates nor deflagrates at all and shows low or no effect when heated under confinement will be defined as organic peroxide Type E.
Organic peroxide	IV	Any organic peroxide which, as packaged, is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as an Organic Peroxide (Type F). Where the GHS Category is not known, the following is acceptable for classification purposes: ~~Describes t~~Those formulations that burn in the same manner as ordinary combustibles and that pose a minimal reactivity hazard.	H242, Organic peroxide, Type F; Heating may cause a fire. Any organic peroxide which, in laboratory testing, neither detonates in the cavitated state nor deflagrates at all and shows only a low or no effect when heated under confinement as well as low or no explosive power will be defined as organic peroxide Type F.
Organic peroxide	V	Any organic peroxide which, as packaged, is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as an Organic Peroxide (Type G). Where the GHS Category is not known, the following is acceptable for classification purposes: ~~Describes t~~Those formulations that burn with less intensity than ordinary combustibles or do not sustain combustion and that pose no reactivity hazard.	Organic peroxide, Type G. Any organic peroxide which, in laboratory testing, neither detonates in the cavitated state nor deflagrates at all and shows no effect when heated under confinement nor any explosive power, provided that it is thermally stable (self-accelerating decomposition temperature is 60°C or higher for a 50 kg package), and for liquid mixtures, a diluent having a boiling point of not less than 150°C and used for desensitization will be defined as organic peroxide Type G. If the organic peroxide is not thermally stable or is a diluent having a boiling point less than 150°C and is used for desensitization, it shall be defined as organic peroxide Type F.

Oxidizer	—	A material that readily yields oxygen or other oxidizing gas, or that readily reacts to promote or initiate combustion of combustible materials and, if heated or contaminated, can result in vigorous self-sustained decomposition.	An oxidizing solid is a solid which, while in itself is not necessarily combustible, may, generally by yielding oxygen, cause, or contribute to, the combustion of other material. An oxidizing liquid is a liquid which, while in itself not necessarily combustible, may, generally by yielding oxygen, cause, or contribute to, the combustion of other material.
Oxidizer	4	A solid or liquid that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as either Oxidizing Solids (Category 1) or Oxidizing Liquids (Category 1) and which have evidence of explosive properties or are packaged for transport in Packing Group I. Where the GHS category is not known, the following is acceptable for classification purposes: An oxidizer that can undergo an explosive reaction due to contamination or exposure to a thermal or physical shock that causes a severe increase in the burning rate of combustible materials with which it comes into contact. Additionally, the oxidizer causes a severe increase in the burning rate and can cause spontaneous ignition of combustibles.	H271, Category 1; May cause fire or explosion; strong oxidizer. Criteria for solids (based on Test O.1 or O.3 in Part III of UN ST/SG/AC.10/11, *Manual of Tests and Criteria*): Test O.1—Any substance or mixture which, in the 4:1 or 1:1 sample-to-cellulose ratio (by mass) tested, exhibits a mean burning time less than the mean burning time of a 3:2 mixture (by mass) of potassium bromate and cellulose. Test O.3—Any substance or mixture which, in the 4:1 or 1:1 sample-to-cellulose ratio (by mass) tested, exhibits a mean burning rate greater than the mean burning rate of a 3:1 mixture (by mass) of calcium peroxide and cellulose. Criteria for liquids (based on Test O.2 in Part III of UN ST/SG/AC.10/11, *Manual of Tests and Criteria*): Any substance or mixture which, in the 1:1 mixture (by mass) of substance (or mixture) and cellulose tested, spontaneously ignites; or the mean pressure rise time of a 1:1 mixture (by mass) of substance and cellulose is less than that of a 1:1 mixture (by mass) of 50% perchloric acid and cellulose.
Oxidizer	3	A solid or liquid that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as either Oxidizing Solids (Category 1) or Oxidizing Liquids (Category 1) and is not otherwise classified as Class 4. Where the GHS category is not known, the following is acceptable for classification purposes: An oxidizer that causes a severe increase in the burning rate of combustible materials with which it comes in contact.	H271, Category 1; May cause fire or explosion; strong oxidizer. Criteria for solids (based on Test O.1 or O.3 in Part III of UN ST/SG/AC.10/11, *Manual of Tests and Criteria*): Test O.1—Any substance or mixture which, in the 4:1 or 1:1 sample-to-cellulose ratio (by mass) tested, exhibits a mean burning time less than the mean burning time of a 3:2 mixture (by mass) of potassium bromate and cellulose. Test O.3—Any substance or mixture which, in the 4:1 or 1:1 sample-to-cellulose ratio (by mass) tested, exhibits a mean burning rate greater than the mean burning rate of a 3:1 mixture (by mass) of calcium peroxide and cellulose. Criteria for liquids (based on Test O.2 in Part III of UN ST/SG/AC.10/11, *Manual of Tests and Criteria*): Any substance or mixture which, in the 1:1 mixture (by mass) of substance (or mixture) and cellulose tested, spontaneously ignites; or the mean pressure rise time of a 1:1 mixture (by mass) of substance and cellulose is less than that of a 1:1 mixture (by mass) of 50% perchloric acid and cellulose.
Oxidizer	2	A solid or liquid that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as either Oxidizing Solids (Category 2) or Oxidizing Liquids (Category 2). Where the GHS category is not known, the following is acceptable for classification purposes: An oxidizer that will cause a moderate increase in the burning rate of combustible materials with which it comes in contact.	H272, Category 2; May intensify fire; oxidizer. Criteria for solids (based on Test O.1 or O.3 in Part III of UN ST/SG/AC.10/11, *Manual of Tests and Criteria*): Test O.1—Any substance or mixture which, in the 4:1 or 1:1 sample-to-cellulose ratio (by mass) tested, exhibits a mean burning time equal to or less than the mean burning time of a 2:3 mixture (by mass) of potassium bromate and cellulose and the criteria for Category 1 are not met. Test O.3—Any substance or mixture which, in the 4:1 or 1:1 sample-to-cellulose ratio (by mass) tested, exhibits a mean burning rate equal to or greater than the mean burning rate of a 1:1 mixture (by mass) of calcium peroxide and cellulose and the criteria for Category 1 are not met. Criteria for liquids (based on Test O.2 in Part III of UN ST/SG/AC.10/11, *Manual of Tests and Criteria*): Any substance or mixture which, in the 1:1 mixture (by mass) of substance (or mixture) and cellulose tested, exhibits a mean pressure rise time less than or equal to the mean pressure rise time of a 1:1 mixture (by mass) of a 40% aqueous sodium chlorate solution and cellulose and the criteria for Category 1 are not met.

Oxidizer	1	A solid or liquid that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as either Oxidizing Solids (Category 3) or Oxidizing Liquids (Category 3). Where the GHS category is not known, the following is acceptable for classification purposes: An oxidizer that does not moderately increase the burning rate of combustible materials.	H272, Category 3; May intensify fire; oxidizer: Criteria for solids (based on Test O.1 or O.3 in Part III of UN ST/SG/AC.10/11, *Manual of Tests and Criteria*): Test O.1—Any substance or mixture which, in the 4:1 or 1:1 sample-to-cellulose ratio (by mass) tested, exhibits a mean burning time equal to or less than the mean burning time of a 3:7 mixture (by mass) of potassium bromate and cellulose and the criteria for Categories 1 and 2 are not met. Test O.3—Any substance or mixture which, in the 4:1 or 1:1 sample-to-cellulose ratio (by mass) tested, exhibits a mean burning rate equal to or greater than the mean burning rate of a 1:2 mixture (by mass) of calcium peroxide and cellulose and the criteria for Categories 1 and 2 are not met. Criteria for liquids (based on Test O.2 in Part III of UN ST/SG/AC.10/11, *Manual of Tests and Criteria*): Any substance or mixture which, in the 1:1 mixture (by mass) of substance (or mixture) and cellulose tested, exhibits a mean pressure rise time less than or equal to the mean pressure rise time of a 1:1 mixture (by mass) of a 65% aqueous nitric acid solution and cellulose and the criteria for Categories 1 and 2 are not met.
Oxidizing gas	Gaseous or Liquefied	A compressed gas that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as an Oxidizing Gas, Category 1. Where the GHS category is not known, the following is acceptable for classification purposes: A gas that can support and accelerate combustion of other materials more than air does.	Any gas which may, generally by providing oxygen, cause or contribute to the combustion of other material more than air does. H270, Category 1; May cause or intensify fire; oxidizer: Any gas which may, generally by providing oxygen, cause or contribute to the combustion of other material more than air does. ~~H280, compressed gas would also apply.~~
Oxidizing gas	Liquified	An oxidizing gas that is liquefied [liquefied gases are gases that, in a packaging under the charged pressure, are partially liquid at 68°F (20°C)].	Any gas which may, generally by providing oxygen, cause or contribute to the combustion of other material more than air does. H270, Category 1; May cause or intensify fire; oxidizer. Any gas which may, generally by providing oxygen, cause or contribute to the combustion of other material more than air does. H280, liquefied gas, would also apply.
Pyrophoric	—	A substance or mixture that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as Pyrophoric Gas, Pyrophoric Solid (Category 1), or Pyrophoric Liquid (Category 1). Where the GHS category is not known, the following is acceptable for classification purposes: A chemical with an autoignition temperature in air, at or below a temperature of 130°F (54°C).	Separate definitions based on physical state; see each category of pyrophoric:
Pyrophoric	Solid	A substance or mixture that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as Pyrophoric Gas, Pyrophoric Solid (Category 1), or Pyrophoric Liquid (Category 1). Where the GHS category is not known, the following is acceptable for classification purposes: A solid with an autoignition temperature in air, at or below a temperature of 130°F (54°C).	H250, Category 1; Pyrophoric solid; Catches fire spontaneously if exposed to air. A pyrophoric solid is a solid which, even in small quantities, is liable to ignite within 5 minutes after coming into contact with air. Classification criteria: The solid ignites within 5 minutes of coming into contact with air.
Pyrophoric	Liquid	A substance or mixture that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as Pyrophoric Gas, Pyrophoric Solid (Category 1), or Pyrophoric Liquid (Category 1). Where the GHS category is not known, the following is acceptable for classification purposes: A liquid with an autoignition temperature in air, at or below a temperature of 130°F (54°C).	H250, Category 1; Pyrophoric liquid; Catches fire spontaneously if exposed to air: A pyrophoric liquid is a liquid which, even in small quantities, is liable to ignite within 5 minutes after coming into contact with air. Classification criteria: The liquid ignites within 5 minutes when added to an inert carrier and exposed to air, or it ignites or chars a filter paper on contact with air within 5 minutes. Testing is performed at 25 ±2°C and 50 ±5% relative humidity.
Pyrophoric	Gas	A substance or mixture that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as Pyrophoric Gas, Pyrophoric Solid (Category 1), or Pyrophoric Liquid (Category 1). Where the GHS category is not known, the following is acceptable for classification purposes: A gas with an autoignition temperature in air, at or below a temperature of 130°F (54°C).	H220, Category 1A~~, Extremely flammable,~~ Pyrophoric gas. ~~May ignite spontaneously if exposed to air.:~~ A pyrophoric gas is a flammable gas that is liable to ignite spontaneously in air at a temperature of 54°C or below. and H232; May ignite spontaneously if exposed to air ~~H280, compressed (or liquefied) gas, would also apply.~~

Toxic	—	A substance or mixture that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as Acute Toxicity Oral Category 3 or 4, Dermal Category 3, Inhalation Gases Category 2 or 3, Inhalation Vapors Category 2 or 3, or Inhalation Dusts and Mists Category 3 or 4. Where the GHS category is not known, one of the following is acceptable for classification purposes: ~~A chemical falling within any of the following categories:~~ 1. A chemical that has a median lethal dose (LD50) of more than 50 mg per kg, but not more than 500 mg per kg of body weight when administered orally to albino rats weighing between 200 and 300 g each. 2. A chemical that has a medial lethal dose (LD50) of more than 200 mg per kg but not more than 1,000 mg per kg of body weight when administered by continuous contact for 24 hr (or less if death occurs within 24 hr) with the bare skin of albino rabbits weighing between 2 and 3 kg each. 3. A chemical that has a median lethal concentration (LC50) in air of more than 200 ppm but not more than 2,000 ppm by volume or less of gas or vapor, or more than 2 mg/l but not more than 20 mg/l of mist~~, fume~~ or dust, when administered by continuous inhalation for 1 hr (or less if death occurs within 1 hr) to albino rats weighing between 200 and 300 g	Acute toxicity refers to serious adverse health effects (i.e., lethality) occurring after a single or short-term oral, dermal or inhalation exposure to a substance or mixture. Oral H301, Category 3; Toxic if swallowed: LD50 > 50 ≤ 300 mg/kg bodyweight H302, Category 4; Harmful if swallowed: LD50 > 300 ≤ 2,000 mg/kg bodyweight Dermal H311, Category 3, Toxic in contact with skin: LD50 > 200 ≤ 1,000 mg/kg bodyweight Inhalation H330, Category 2; Fatal if inhaled: Gases: LC50 > 100 ppm (4 hr) ≈ 200 ppm (1 hr) ≤ 500 ppm (4 hr) ≈ 1,000 ppm (1 hr) Vapours: LC50 > 0.5 mg/l (4 hr) ≈ ~~2~~1 mg/l (1 hr) ≤ 2 mg/l (4 hr) ≈ ~~8~~4 mg/l (1 hr) Dust/mist: LC50 > 0.05 mg/l (4 hr) ≈ 0.2 mg/l (1 hr) ≤ 0.5 mg/l (4 hr) ≈ 2 mg/l (1 hr) H331, Category 3; Toxic if inhaled: Gases: LC50 > 500 ppm (4 hr) ≈ 1,000 ppm (1 hr) ≤ 2,500 ppm (4 hr) ≈ 5,000 ppm (1 hr) Vapours: LC50 > 2 mg/l (4 hr) ≈ ~~8~~4 mg/l (1 hr) ≤ 10 mg/l (4 hr) ≈ ~~4~~20 mg/l (1 hr) Dust/mist: LC50 > 0.5 mg/l (4 hr) ≈ 2 mg/l (1 hr) ≤ 1 mg/l (4 hr) ≈ 4 mg/l (1 hr)
Unstable (reactive)	—	A material, other than an explosive, which in the pure state or as commercially produced, will vigorously polymerize, decompose, condense or become self-reactive and undergo other violent chemical changes, including explosion, when exposed to heat, friction or shock, or in the absence of an inhibitor~~, or in the presence of contaminants, or in contact with incompatible materials.~~ Unstable (reactive) materials are subdivided as follows:	Self-reactive substances or mixtures are thermally unstable liquids or solid substances or mixtures liable to undergo a strongly exothermic decomposition even without participation of oxygen (air). This definition excludes substances and mixtures classified under the GHS as explosives, organic peroxides or as oxidizing. A self-reactive substance or mixture is regarded as possessing explosive properties when in laboratory testing the formulation is liable to detonate, to deflagrate rapidly or to show a violent effect when heated under confinement.
Unstable (reactive)	4	Materials that in themselves are readily capable of detonation or of explosive decomposition or explosive reaction at normal temperatures and pressures. This class includes materials that are sensitive to mechanical or localized thermal shock at normal temperatures and pressures. This Class includes liquid or solid materials that are categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as Self-Reactive (Category A) and can include compressed gases categorized as Chemically Unstable (Type A).	H240, Type A; Heating may cause an explosion. Any self-reactive substance or mixture which can detonate or deflagrate rapidly, as packaged, will be defined as self-reactive substance Type A.
Unstable (reactive)	3	Materials that in themselves are capable of detonation or of explosive decomposition or explosive reaction but which require a strong initiating source or which must be heated under confinement before initiation. This class includes materials that are sensitive to thermal or mechanical shock at the elevated temperatures and pressures. This Class includes liquid or solid materials that are categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as Self-Reactive (Category B) and can include compressed gases categorized as Chemically Unstable (Type B).	H241, Type B; Heating may cause a fire or explosion. Any self-reactive substance or mixture possessing explosive properties and which, as packaged, neither detonates nor deflagrates rapidly, but is liable to undergo a thermal explosion in that package will be defined as self-reactive substance Type B.

Unstable (reactive)	2	Materials that in themselves are normally unstable and readily undergo violent chemical change but do not detonate. This class includes materials that can undergo chemical change with rapid release of energy at normal temperatures and pressures, and that can undergo violent chemical change at elevated temperatures and pressures. This Class includes liquid or solid materials that are categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as Self-Reactive (Category C or D).	H242, Type C; Heating may cause a fire. Any self-reactive substance or mixture possessing explosive properties when the substance or mixture as packaged cannot detonate or deflagrate rapidly or undergo a thermal explosion will be defined as self-reactive substance Type C. H242, Type D; Heating may cause a fire. Any self-reactive substance or mixture which in laboratory testing: Detonates partially, does not deflagrate rapidly and shows no violent effect when heated under confinement; or Does not detonate at all, deflagrates slowly and shows no violent effect when heated under confinement; or Does not detonate or deflagrate at all and shows a medium effect when heated under confinement; will be defined as self-reactive substance Type D; Will be defined as self-reactive substance Type D.
Unstable (reactive)	1	Materials that in themselves are normally stable but which can become unstable at elevated temperatures and pressures. This Class includes liquid or solid materials that are categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as Self-Reactive (Category E or F).	H242, Type E; Heating may cause a fire. Any self-reactive substance or mixture which, in laboratory testing, neither detonates nor deflagrates at all and shows low or no effect when heated under confinement will be defined as self-reactive substance Type E. H242, Type F; Heating may cause a fire. Any self-reactive substance or mixture which, in laboratory testing, neither detonates in the cavitated state nor deflagrates at all and shows only a low or no effect when heated under confinement as well as low or no explosive power will be defined as self-reactive substance Type F. Any self-reactive substance or mixture which, in laboratory testing, neither detonates in the cavitated state nor deflagrates at all and shows no effect when heated under confinement nor any explosive power, provided that it is thermally stable (self-accelerating decomposition temperature is 60°C to 75°C for a 50 kg package), and for liquid mixtures, a diluent having a boiling point greater than or equal to 150°C and used for desensitization will be defined as self-reactive substance Type G. If the mixture is not thermally stable or is a diluent having a boiling point less than 150°C and is used for desensitization, the mixture shall be defined as self-reactive substance Type F.

Unstable (reactive) gas	Gaseous		A chemically unstable gas is a flammable gas that is able to react explosively even in the absence of air or oxygen. H220, Category 1A, Chemically Unstable, Category A; Extremely flammable gas~~; May react explosively even in the absence of air.~~: Flammable gases which are chemically unstable at 20° C and a standard pressure of 101.3 kPa. and H230: May react explosively even in the absence of air or H220, Category 1A, Chemically Unstable, Category B; Extremely flammable gas~~; May react explosively even in the absence of air at elevated pressure and/or temperature.~~: Flammable gases which are chemically unstable at a temperature greater than 20° C and/or a standard pressure greater than 101.3 kPa. and H231: May react explosively even in the absence of air at elevated pressure and/or temperature ~~H280, compressed gas, would also apply.~~
Water reactive	3	Materials that react explosively with water without requiring heat or confinement. Under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS), these are classified as substances or mixtures which, in contact with water, emit flammable gases (Category 1).	H260, Category 1; Contact with water releases flammable gases which may ignite spontaneously. Any substance or mixture which reacts vigorously with water at ambient temperatures and demonstrates generally a tendency for the gas produced to ignite spontaneously, or which reacts readily with water at ambient temperatures such that the rate of evolution of flammable gas is equal to or greater than 10 liters per kilogram of substance over any 1 minute. (UN/DOT test methods: Test N.5, Part III, subsection 33.4.1.4)
Water reactive	2	Materials that react violently with water or have the ability to boil water. Materials that produce flammable, toxic or other hazardous gases, or evolve enough heat to cause autoignition of combustibles upon exposure to water or moisture. Under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS), these are classified as substances or mixtures which, in contact with water, emit flammable gases (Category 2).	H261, Category 2; Contact with water releases flammable gas. Any substance or mixture which reacts readily with water at ambient temperatures such that the maximum rate of evolution of flammable gas is equal to or greater than 20 liters per kilogram of substance per hour, and which does not meet the criteria for Category 1.
Water reactive	1	Materials that react with water with some release of energy, but not violently. Under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS), these are classified as substances or mixtures which, in contact with water, emit flammable gases (Category 3).	H261, Category 3; Contact with water releases flammable gas. Any substance or mixture which reacts slowly with water at ambient temperatures such that the maximum rate of evolution of flammable gas is equal to or greater than 1 liter per kilogram of substance per hour, and which does not meet the criteria for Categories 1 and 2.

—

a. The table illustrates that there is not perfect alignment between the IFC and GHS definitions and provides information on similarities and difference between the two classification systems.

E104.2 GHS hazardous materials definitions comparison table. Table E104.2 provides a tabular presentation of the various definitions published within the *International Fire Code*. In addition, the table presents corresponding definitions, where available, from the ~~2012 edition of~~ DOL 29 CFR 1910.1200 along with applicable hazard statement codes. DOL 29 CFR 1910.1200 aligns with the UN's *Globally Harmonized System of Classification and Labelling of Chemicals (GHS)*. The table is not meant to imply perfect alignment between IFC and GHS definitions.

E104.1 Hazardous materials definitions. The categorization and classification of hazardous materials enables the code user to determine the applicability of requirements based on hazard category and class related to the physical and health hazards of materials. The ~~current~~ definitions found in Chapter 2 have been developed using criteria found in NFPA codes and standards, model fire prevention

codes, NIOSH, and requirements of the US Department of Transportation (DOTn 49 CFR) and US Department of Labor (DOL 49 CFR 1910).
The chemical industry has grown substantially since the inception of the IFC hazard definitions. Large-scale global production and distribution of common and specialty chemicals has become mainstream. In the 1990s, the United Nations (UN) developed the *Globally Harmonized System of Classification and Labelling of Chemicals (GHS)* to create international congruency among chemical suppliers. The GHS is an internationally agreed upon standard of classification and labeling that utilizes prescriptive, standardized testing procedures and criteria to classify hazardous materials.
The DOL ~~published a~~ revised the *Hazard Communication Standard*(DOL 29 CFR 1910.1200) to align with the GHS ~~in March 2012. It became effective in May 2012.~~ All manufacturers selling, producing or transporting chemicals in the United States are ~~now~~ required to comply with the GHS and provide ~~this~~ standardized hazard information on all Safety Data Sheets (SDS).
SDS are a primary source of information for identifying hazards for chemicals and mixtures containing hazardous materials. It can be helpful for fire code officials to become familiar with the GHS definitions and how they relate to IFC hazard definitions.

Reason:
Fire Code officials must enforce the hazardous materials provisions of the International Fire Code (IFC) and the International Building Code (IBC) to ensure that people and property in our communities are safe. While code officials need to verify and validate the hazards of materials, classifying hazardous materials in accordance with definitions and hazard classes in the I-codes is the responsibility of facility owners which continues to be a challenge. Consequences of missing or incorrect classification include increased fire and life safety risk and can lead to misclassification of an occupancy.

Due to the expansion of international chemical trade, the United Nations (UN) developed a Globally Harmonized System (GHS) of classification of hazardous materials. The GHS is an internationally agreed upon standard of classification and labeling that in most cases utilizes prescriptive, standardized testing procedures and criteria to classify hazardous materials. Federal law (29 CFR 1910.1200 (OSHA) and 49 CFR 173.127 (DOT)) mandates that manufacturers selling, producing or transporting chemicals in the United States classify chemicals according to the GHS system and make the information readily available in product Safety Data Sheets (SDSs).

This proposal aims to incorporate the readily available GHS (Revision 7) classifications into the I-code definitions to better align with federal standards for hazardous materials classification. Proper identification of multiple hazards and the degree of hazard are likely outcomes of utilizing the GHS.

FCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and early 2024 the FCAC has held several virtual meetings and one in-person meeting open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the FCAC Website

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal is meant to provide correlation with the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) which is used globally and by OSHA. This comparison will make compliance more straightforward. In some cases, utilizing GHS definitions may more heavily regulate additional materials for new buildings; conversely, in other cases GHS definitions will result in reduced classification of materials. However, any differences are balanced out by the coordination and ease of enforcement that comes with being aligned with GHS and OSHA. US manufacturers and distributors of hazardous materials have been required to use the GHS classification system to communicate the hazards of materials in Safety Data Sheets (SDS) since 2012.

F276-24

Public Hearing Results (CAH1)

Committee Action: **As Submitted**

Committee Reason: The intent of this proposal is appropriate which is to update the Appendix Table dealing with the GHS hazard definition comparisons and was approved based upon the need to keep this proposal available for further revision. However, it was requested that the proponent update these definitions to match the actions taken on the GHS definition proposals. It was also suggested that the definition proposals include this table in each of the associated definitions proposals as a Comment to the committee at CAH#2. (Vote 9-4)

F276-24

Individual Consideration Agenda

Comment 1:

IFC: TABLE E104.2

Proponents: Megan Hall, UC Berkeley Fire Prevention, self (mchall@berkeley.edu); Lynne Kilpatrick, HMEx Assistant LLC, self (lkilpatrick425@gmail.com); Robert Marshall, FCAC, FCAC (fcac@iccsafe.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Fire Code

Revise as follows:

TABLE E104.2 IFC AND GHS HAZARD DEFINITIONS COMPARISON[a]

IFC MATERIAL	IFC CLASS	IFC DEFINITION	GHS ~~CLASSIFICATION (H-CODE AND CATEGORY); HAZARD STATEMENT;~~ HAZARD CLASS, CATEGORY: DEFINITION
Aerosol	—	A combination of a container, a propellant and a material that is dispensed. Aerosol products shall be classified by means of the calculation of their chemical heats of combustion and shall be designated Level ~~3, Level 2, or Level 1.~~1, Level 2, or Level 3	Any nonrefillable receptacles made of metal, glass or plastics and containing a gas compressed, liquefied or dissolved under pressure, with or without a liquid, paste or powder, and fitted with a release device allowing the contents to be ejected as solid or liquid particles in suspension in a gas, as a foam, paste or powder or in a liquid state or in a gaseous state.
Aerosol	Level 1	Those with a total chemical heat of combustion that is less than or equal to 8,600 Btu/lb (20kJ/g). And, where the heat of combustion is unknown, those classified as Aerosols (Category 3) under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS).	**Aerosols, Category 3:** 1) Any aerosol that contains ≤ 1% flammable components (by mass) and that has a heat of combustion < 20 kJ/g; or 2) Any aerosol that contains > 1% (by mass) flammable components or which has a heat of combustion of ≥ 20 kJ/g but which, based on the results of the ignition distance test, the enclosed space ignition test or the aerosol foam flammability test, does not meet the criteria for Category 1 or Category 2.

Aerosol	Level 2	Those with a total chemical heat of combustion that is greater than 8,600 Btu/lb (20kJ/g), but less than or equal to 13,000 Btu/lb (30kJ/g). And, where the heat of combustion is unknown, those classified as Aerosols (Category 2) under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS).	**Aerosols, Category 2:** 1) Any aerosol that dispenses a spray that, based on the results of the ignition distance test, does not meet the criteria for Category 1, and which has: (a) a heat of combustion of ≥ 20 kJ/g; (b) a heat of combustion of < 20 kJ/g along with an ignition distance of ≥ 15 cm; or (c) a heat of combustion of < 20 kJ/g and an ignition distance of < 15 cm along with either, in the enclosed space ignition test a time: (i) - a time equivalent of ≤ 300 s/m^3; or (ii) - a deflagration density of ≤ 300 g/m^3; or 2) Any aerosol that dispenses a foam that, based on the results of the aerosol foam flammability test, does not meet the criteria for Category 1, and which has a flame height of ≥ 4 cm and a flame duration of ≥ 2 s.
Aerosol	Level 3	~~An aerosol product that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as an Aerosol (Category 1). Where the GHS category is not known, the following is acceptable for classification purposes:~~ Those with a total chemical heat of combustion that is greater than 13,000 Btu/lb (30 kJ/g). And, where the heat of combustion is unknown, those classified as Aerosols (Category 1) under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS).	~~H222~~**Aerosols, Category 1**~~; Extremely flammable aerosol. Pressurized container: May burst if heated~~: 1. Any aerosol that contains ≥ 85% flammable components (by mass) and has a heat of combustion of ≥ 30 kJ/g. 2. Any aerosol that dispenses a spray that, in the ignition distance test, has an ignition distance of ≥ 75 cm. 3. Any aerosol that dispenses a foam that, in the foam flammability test, has: a. A flame height of ≥ 20 cm and a flame duration of ≥ 2 s. b. A flame height of ≥ 4 cm and a flame duration of ≥ 7 s.
~~Aerosol~~	~~Level 2~~	~~An aerosol product that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as an Aerosol (Category 2). Where the GHS category is not known, the following is acceptable for classification purposes: Those with a total chemical heat of combustion that is less than or equal to 8,600 Btu/lb (20 kJ/g).~~	

			~~H223, Category 2, Flammable aerosol~~: ~~1. Any aerosol that dispenses a spray that, based on the results of the ignition distance test, does not meet the criteria for Category 1, and which has:~~ ~~a. A heat of combustion of ≥ 20 kJ/g.~~ ~~b. A heat of combustion of < 20 kJ/g along with an ignition distance of ≥ 15 cm; or~~ ~~c. A heat of combustion of < 20 kJ/g and an ignition distance of < 15 cm along with either, in the enclosed space ignition test a time:~~ ~~i. A time equivalent of ≤ 300 s/m^3; or~~ ~~ii. A deflagration density of ≤ 300 g/m^3; or~~ ~~2. Any aerosol that dispenses a foam that, based on the results of the aerosol foam flammability test, does not meet the criteria for Category 1, and which has a flame height of ≥ 4 cm and a flame duration of ≥ 2 s.~~ ~~and~~ ~~H229, Pressurized container: May burst if heated~~
~~Aerosol~~	~~Level 1~~	~~An aerosol product that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as an Aerosol (Category 3). Where the GHS category is not known, the following is acceptable for classification purposes: Those with a total chemical heat of combustion that is less than or equal to 8,600 Btu/lb (20 kJ/g).~~	~~H223, Category 3:~~ ~~1. Any aerosol that contains ≤ 1% flammable components (by mass) and that has a heat of combustion < 20 kJ/g.~~ ~~2. Any aerosol that contains > 1% (by mass) flammable components or which has a heat of combustion of ≥ 20 kJ/g but which, based on the results of the ignition distance test, the enclosed space ignition test or the aerosol foam flammability test, does not meet the criteria for Category 1 or Category 2.~~ ~~and~~ ~~H229, Pressurized container: May burst if heated~~
Combustible liquid	—	A liquid having a closed cup flash point at or above 100° F (38° C). Combustible liquids shall be subdivided as follows:	A flammable liquid means a liquid having a flash point of not more than 93° C.

Combustible liquid	II	A liquid that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as a Flammable Liquid (Category 3) and having a flashpoint at or above 100°F (38°C). Where the GHS category is not known, the following is acceptable for classification purposes: Liquids having a closed cup flash point at or above 100°F (38°C) and below 140°F (60°C).	~~H226~~**Flammable liquids, Category 3**~~, Flammable liquid and vapor~~: Flash point ≥ 23°C and ≤ 60°C
Combustible liquid	IIIA	A liquid that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as a Flammable Liquid (Category 4). Where the GHS category is not known, the following is acceptable for classification purposes: Liquids having a closed cup flash point at or above 140°F (60°C) and below 200°F (93°C).	~~H227~~**Flammable liquids, Category 4**~~, Combustible liquid~~: Flash point > 60°C and ≤ 93°C
Combustible liquid	IIIB	Liquids having closed cup flash points at or above 200°F (93°C).	N/A
Compressed gas	—	A material or mixture of materials that: 1. Is a gas at 68°F (20°C) or less at 14.7 psia (101 kPa) of pressure, and 2. Has a boiling point of 68°F (20°C) or less at 14.7 psia (101 kPa) which is either liquefied, nonliquefied (gaseous) or in solution (dissolved), except those gases that have no other health- or physical-hazard properties are not considered to be compressed until the pressure in the packaging exceeds 41 psia (282 kPa) at 68°F (20°C). COMPRESSED GAS, DISSOLVED. Dissolved compressed gases, or gases in solution, are non-liquefied gases that are dissolved in a solvent. Under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS), these gases are categorized as Gases Under Pressure – Dissolved Gas. COMPRESSED GAS, GASEOUS. Gaseous compressed gases are non-liquefied gases, other than those in solution (dissolved), which are in a packaging under the charged pressure and are entirely gaseous at a temperature of 68°F (20°C). Under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS), these gases are categorized as Gases Under Pressure – Compressed Gas. COMPRESSED GAS, LIQUEFIED. Liquefied compressed gases are gases that, in a packaging under the charged pressure, are partially liquid at a temperature of 68°F (20°C). Under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS), these gases are categorized as Gases Under Pressure – Liquefied Gas. .	**Gases under pressure** are gases which are contained in a receptacle at a pressure of 200 kPa (gauge) or more at 20°C, or which are liquefied, or liquefied and refrigerated. ~~H280~~**Gases under pressure, compressed gas**~~, Contains gas under pressure: May explode if heated.~~: A gas which when under pressure is entirely gaseous at -50°C (-58°F), including all gases with a critical temperature ≤ -50°C (-58°F). ~~H280~~**Gases under pressure**, **liquefied gas**~~, Contains gas under pressure: May explode if heated.~~: A gas which when under pressure is partially liquid at temperatures above -50°C (-58°F). ~~H280~~**Gases under pressure**, **dissolved gas**~~, Contains gas under pressure: May explode if heated.~~: A gas which when under pressure is dissolved in a liquid phase solvent.
Corrosive	—	A substance or mixture that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as either Skin Corrosion (Category 1A, 1B, or 1C), or Serious Eye Damage (Category 1). Where the GHS category is not known, the following is acceptable for classification purposes: A chemical that causes visible destruction of, or irreversible alterations in, living tissue by chemical action at the point of contact. A chemical shall be considered corrosive if, when tested on the intact skin of albino rabbits by the method described in DOTn 49 CFR 173.137, such chemical destroys or changes irreversibly the structure of the tissue at the point of contact following an exposure period of 4 hours. This term does not refer to action on inanimate surfaces.	~~H314~~**Skin corrosion/irritation**, **Category 1 (1A, 1B, 1C)**~~, Causes severe skin burns and eye damage.~~: *Skin corrosion* refers to the production of irreversible damage to the skin; namely, visible necrosis through the epidermis and into the dermis occurring after exposure to a substance or mixture. **Serious eye damage/eye irritation, Category 1**: *Serious eye damage* refers to the production of tissue damage in the eye, or serious physical decay of vision, which is not fully reversible, occurring after exposure of the eye to the substance or mixture.
Cryogenic fluid	—	A fluid having a boiling point lower than -130°F (-89.9°C) at 14.7 pounds per square inch atmosphere (psia) (an absolute pressure of 101.3 kPa). Under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS), Cryogenic Fluids are categorized as a Gas Under Pressure – Refrigerated Liquefied Gas. However, not all GHS Refrigerated Liquefied Gases are Cryogenic Fluids.	~~H281~~**Gases under pressure, refrigerated liquefied gas**~~, Contains refrigerated gas~~: May cause cryogenic burns or injury. A gas which is made partially liquid because of its low temperature.

Cryogenic fluid, flammable	—	A cryogenic fluid that is a *flammable gas* in its vapor state. These fluids are categorized under the Globally Harmonized System of Classification and Labeling of Chemicals (GHS) as Flammable Gas, Category 1A or Category 1B and Gases Under Pressure - Refrigerated Liquefied Gas.	~~H220~~**Flammable gases, Category 1A**~~, Extremely flammable gas.~~: Gases, which at 20°C and a standard pressure of 101.3 kPa: 1. Are ignitable when in a mixture of 13% or less by volume in air; or 2. Have a flammable range with air of at least 12 percentage points, regardless of the lower flammability limit unless data show they meet the criteria for Category 1B. Category 1A includes pyrophoric gases and chemically unstable gases, or **Flammable gas, Category 1B**: Gases which meet the flammability criteria for Category 1A, but which are not pyrophoric, nor chemically unstable, and which have at least either: (a) a lower flammability limit of more than 6% by volume in air; or (b) (b) a fundamental burning velocity of less than 10 cm/s *and* **Gases under pressure, refrigerated liquefied gas** ~~H281, refrigerated liquefied gas, would also apply~~
Cryogenic fluid,Inert	—	A cryogenic fluid that is an *inert* gas in its vapor state. These fluids are categorized under the Globally Harmonized System of Classification and Labeling of Chemicals (GHS) as Gases Under Pressure - Refrigerated Liquefied Gas.	~~H281~~**Gases under pressure, refrigerated liquefied gas**~~ Contains refrigerated gas: May cause cryogenic burns or injury.~~: A gas which is made partially liquid because of its low temperature.
Cryogenic fluid,Oxidizing	—	A cryogenic fluid that is an *oxidizing gas* in its vapor state. These fluids are categorized under the Globally Harmonized System of Classification and Labeling of Chemicals (GHS) as Oxidizing Gas, Category 1 and Gases Under Pressure - Refrigerated Liquefied Gas.	~~H270~~**Oxidizing gases, Category 1**: ~~May cause or intensify fire; oxidizer.~~ Any gas which may, generally by providing oxygen, cause or contribute to the combustion of other material more than air does. *and* **Gases under pressure, refrigerated liquefied gas** ~~H281, refrigerated liquefied gas, would also apply.~~
Explosives	—	A chemical compound, mixture or device, the primary or common purpose of which is to function by explosion. The term includes, but is not limited to, dynamite, black powder, pellet powder, initiating explosives, detonators, safety fuses, squibs, detonating cord, igniter cord and igniters. The term “Explosive” includes any material determined to be within the scope of USC Title 18: Ch. 40 and also includes any material classified as an explosive other than consumer fireworks, Division 1.4G Explosives, by the hazardous materials regulations of DOTn 49 CFR Parts 100–185.	An explosive substance (or mixture) is a solid or liquid substance (or mixture of substances) which is in itself capable by chemical reaction of producing gas at such a temperature and pressure and at such a speed as to cause damage to the surroundings. Pyrotechnic substances are included even when they do not evolve gases.
Explosives	Unstable explosives		~~H200,~~ **Explosives, Unstable explosive**~~.~~: Unstable explosives are those which are thermally unstable and/or too sensitive for normal handling, transport and use. Special precautions are necessary.
Explosives	Division 1.1	A chemical or item that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as Explosive (Division 1.1). Where the GHS category is not known, the following is acceptable for classification purposes: Explosives that have a mass explosion hazard. A mass explosion is one which affects almost the entire load instantaneously.	~~H201, Explosive; mass explosion hazard.~~**Explosives, Division 1.1:** Substances, mixtures and articles which have a mass explosion hazard (a mass explosion is one which affects almost the entire quantity present virtually instantaneously).
Explosives	Division 1.2	A chemical or item that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as Explosive (Division 1.2). Where the GHS category is not known, the following is acceptable for classification purposes: Explosives that have a projection hazard but not a mass explosion hazard.	~~H202, Explosive; severe projection hazard.~~ **Explosives, Division 1.2:** Substances, mixtures and articles which have a projection hazard but not a mass explosion hazard.

Explosives	Division 1.3	A chemical or item that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as Explosive (Division 1.3). Where the GHS category is not known, the following is acceptable for classification purposes: Explosives that have a fire hazard and either a minor blast hazard or a minor projection hazard or both, but not a mass explosion hazard.	~~H203; Explosive; fire, blast or projection hazard.~~**Explosives, Division 1.3:** Substances, mixtures and articles which have a fire hazard and either a minor blast hazard or a minor projection hazard or both, but not a mass explosion hazard: 1. Combustion of which gives rise to considerable radiant heat; or 2. Which burn one after another, producing minor blast or projection effects or both.
Explosives	Division 1.4	A chemical or item that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as Explosive (Division 1.4). Where the GHS category is not known, the following is acceptable for classification purposes: Explosives that pose a minor explosion hazard. The explosive effects are largely confined to the package and no projection of fragments of appreciable size or range is to be expected. An external fire must not cause virtually instantaneous explosion of almost the entire contents of the package.	~~H204; Fire or projection hazard.~~ **Explosives, Division 1.4:** ~~Substances, mixtures and articles which present no significant hazard; s~~Substances, mixtures and articles which present only a small hazard in the event of ignition or initiation. The effects are largely confined to the package and no projection of fragments of appreciable size or range is to be expected. An external fire shall not cause virtually instantaneous explosion of almost the entire contents of the package.
Explosives	Division 1.4G	Small fireworks devices containing restricted amounts of pyrotechnic composition designed primarily to produce visual or audible effects by combustion or deflagration that complies with the construction, chemical composition and labeling regulations of the DOTn for fireworks, UN No. 0336 and the US Consumer Product Safety Commission as set forth in CPSC 16 CFR Parts 1500 and 1507.	N/A
Explosives	Division 1.5	A chemical or item that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as Explosive (Division 1.5). Where the GHS category is not known, the following is acceptable for classification purposes: Very insensitive explosives. This division is comprised of substances that have a mass explosion hazard but which are so insensitive that there is very little probability of initiation or of transition from burning to detonation under normal conditions of transport.	~~H205; May mass explode in fire.~~ **Explosives, Division 1.5:** ~~Very insensitive substances or mixtures which have a mass explosion hazard: s~~Substances and mixtures which have a mass explosion hazard but are so insensitive that there is very little probability or initiation or of transition from burning to detonation under normal conditions.
Explosives	Division 1.6	A chemical or item that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as Explosive (Division 1.6). Where the GHS category is not known, the following is acceptable for classification purposes: Extremely insensitive articles that do not have a mass explosion hazard. This division is comprised of articles that contain only extremely insensitive detonating substances and that demonstrate a negligible probability of accidental initiation or propagation.	**Explosives, Division 1.6:** ~~Extremely insensitive articles which do not have a mass explosion hazard.~~ A~~a~~rticles which predominantly contain extremely insensitive substances or mixtures and which demonstrate a negligible probability of accidental initiation or propagation.
Flammable gas	Gaseous or Liquefied	A material that is a gas at 68°F (20°C) or less at 14.7 psia (101 kPa) of pressure [a material that has a boiling point of 68°F (20°C) or less at 14.7 psia (101 kPa)] subdivided as follows: 1. Category 1A. a gas that meets either of the following: 1.1 Ignitable at 14.7 psia (101 kPa) when in a mixture of 13% or less by volume with air; or 1.2 A flammable range at 14.7 psia (101 kPa) with air of not less than 12%, regardless of the lower limit, unless data shows compliance with Category 1B. 2. Category 1B. A gas that meets the flammability criteria for Category 1A, is not pyrophoric or chemically unstable, and meets one of more of the following: 2.1. A lower flammability limit of more than 6 percent by volume of air. 2.2. A fundamental burning velocity of less than 3.9 inches/second (99 mm/s). The limits specified shall be determined at 14.7 psia (101 kPa) of pressure and a temperature of 68°F (20°C) in accordance with ASTM E681.Where not otherwise specified, the term “flammable gas” includes both Categories 1A and 1B. Under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS), Flammable Gases are categorized as a Flammable Gas (Category 1A or 1B).	A flammable gas is a gas having a flammable range with air at 20°C and a standard pressure of 101.3 kPa. ~~H220~~**Flammable gases, Category 1A**~~; Extremely flammable gas.~~: Gases, which at 20°C and a standard pressure of 101.3 kPa: 1. Are ignitable when in a mixture of 13% or less by volume in air; or 2. Have a flammable range with air of at least 12 percentage points regardless of the lower flammability limit unless data show they meet the criteria for Category 1B. Category 1A includes pyrophoric gases and chemically unstable gases. ~~H220~~**Flammable gases, Category 1B**~~; Flammable gas.~~: Gases which meet the flammability criteria for Category 1A, but which are not pyrophoric nor chemically unstable, and which have at least either: 1. A lower flammability limit of more than 6% by volume in air; or 2. A fundamental burning velocity of less than 10 cm/s.

Flammable liquid	—	A liquid having a closed cup flash point below 100°F (38°C). Flammable liquids are further categorized into a group known as Class I liquids. The Class I category is subdivided as follows:	A liquid having a flash point of not more than 93°C. A flammable liquid is classified in one of the four categories for this class.
Flammable liquid	IA	A liquid that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as a Flammable Liquid (Category 1). Where the GHS category is not known, the following is acceptable for classification purposes: Liquids having a flash point below 73°F (23°C) and having a boiling point below 100°F (38°C).	~~H224~~**Flammable liquids, Category 1**~~, Extremely flammable liquid and vapor.~~; Flash point < 23°C and initial boiling point ≤ 35°C
Flammable liquid	IB	A liquid that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as a Flammable Liquid (Category 2). Where the GHS category is not known, the following is acceptable for classification purposes: Liquids having a flash point below 73°F (23°C) and having a boiling point at or above 100°F (38°C).	~~H225~~**Flammable liquids, Category 2**~~, Highly flammable liquid and vapor.~~; Flash point < 23°C and initial boiling point > 35°C
Flammable liquid	IC	A liquid that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as a Flammable Liquid (Category 3) and having a flashpoint below 100°F (38°C). Where the GHS category is not known, the following is acceptable for classification purposes: Liquids having a flash point at or above 73°F (23°C) and below 100°F (38°C).	~~H226~~**Flammable liquids, Category 3**~~, Flammable liquid and vapor.~~; Flash point ≥ 23°C and ≤ 60°C
Flammable solid	—	A solid that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as a Flammable Solid (Category 1 or 2). Where the GHS category is not known, the following is acceptable for classification purposes: A solid, other than a blasting agent or explosive, that is capable of causing fire through friction, absorption of moisture, spontaneous chemical change or retaining heat from manufacturing or processing, or which has an ignition temperature below 212°F (100°C) or which burns so vigorously and persistently when ignited as to create a serious hazard. A chemical shall be considered a flammable solid, as determined in accordance with the test method of CPSC 16 CFR Part 1500.44, if it ignites and burns with a self-sustained flame at a rate greater than 0.0866 inch (2.2 mm) per second along its major axis.	A flammable solid is a solid which is readily combustible, or may cause or contribute to fire through friction. A flammable solid is classified in one of the two categories for this class using method N.1 as described in Part III, subsection 33.2.1 of the Manual of Tests and Criteria, according to: ~~H228~~**Flammable solids, Category 1**~~, Flammable solid~~: Burning rate test: Substances or mixtures other than metal powders: 1. Wetted zone does not stop fire; and 2. Burning time < 45 s or burning rate > 2.2 mm/s. Metal powders: burning time ≤ 5 min ~~H228~~**Flammable solids, Category 2**~~, Flammable solid~~: Burning rate test: Substances or mixtures other than metal powders: 1. Wetted zone stops the fire for at least 4 min; and 2. Burning time < 45 s or burning rate > 2.2 mm/s. Metal powders: burning time > 5 min and ≤ 10 min

Highly toxic	—	A substance or mixture that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as any one of the following GHS Acute Toxicity categories: · Oral Category 1 or 2 · Dermal Category 1 or 2 · Inhalation Gases Category 1 · Inhalation Vapors Category 1 · Inhalation Dusts and Mists Category 1 or 2. ~~Acute Toxicity Oral Category 1 or 2, Dermal Category 1 or 2, Inhalation Gases Category 1, Inhalation Vapors Category 1, or Inhalation Dusts and Mists Category 1 or 2.~~ Where the GHS category is not known, ~~one of the following is acceptable~~ use the following for classification purposes: 1. A chemical that has a median lethal dose (LD50) of 50 mg or less per kg of body weight when administered orally to albino rats weighing between 200 and 300 g each. 2. A chemical that has a medial lethal dose (LD50) of 200 mg or less per kg of body weight when administered by continuous contact for 24 hr (or less if death occurs within 24 hr) with the bare skin of albino rabbits weighing between 2 and 3 kg each. 3. A chemical that has a median lethal concentration (LC50) in air of 200 ppm by volume or less of gas or vapor, or 2 mg/l or less of mist or dust, when administered by continuous inhalation for 1 hr (or less if death occurs within 1 hr) to albino rats weighing between 200 and 300 g.	Acute toxicity refers to serious adverse health effects (i.e., lethality) occurring after a single or short-term oral, dermal or inhalation exposure to a substance or mixture. Oral ~~H300~~**Acute toxicity, Category 1**~~; Fatal if swallowed~~: LD50 ≤ 5 mg/kg bodyweight ~~H300~~**Acute toxicity, Category 2**~~; Fatal if swallowed~~: LD50 > 5 ≤ 50 mg/kg bodyweight Dermal ~~H310~~**Acute toxicity, Category 1**~~; Fatal in contact with skin~~: LD50 ≤ 50 mg/kg bodyweight ~~H310~~**Acute toxicity, Category 2**~~; Fatal in contact with skin~~: LD50 > 50 ≤ 200 mg/kg bodyweight Inhalation ~~H330~~**Acute toxicity, Category 1**~~; Fatal if inhaled.~~: Gases: LC50 ≤ 100 ppm (4 hr) ≈ 200 ppm (1 hr) Vapors: LC50 ≤ 0.5 mg/l (4 hr) ≈ 1 mg/l (1 hr) Dust/mist: LC50 ≤ 0.05 mg/l (4 hr) ≈ 0.2 mg/l (1 hr) **Acute toxicity, Category 2**: Dust/mist: LC50 > 0.05 mg/l (4 hr) ≈ 0.2 mg/l (1 hr) ≤ 0.5 mg/l (4 hr) ≈ 2 mg/l (1 hr)
Inert ~~compressed~~ gas	—	A ~~compressed~~ gas that is capable of reacting with other materials only under abnormal conditions such as high temperatures, pressures and similar extrinsic physical forces. Within the context of the code, inert ~~compressed~~ gases do not exhibit either physical or health hazard properties as defined (other than acting as a simple asphyxiant) or hazard properties other than those of a compressed gas. ~~Some of the more common inert compressed gases include argon, helium, krypton, neon, nitrogen and xenon.~~	Gases under pressure are gases which are contained in receptacles at a pressure of 200 kPa (gauge) or more at 20° C or which are liquefied or liquefied and refrigerated. They comprise compressed gases, liquefied gases, dissolved gases and refrigerated liquefied gases. See ~~the description of "~~Compressed gases/Gases under pressure.~~"~~
Organic peroxide	—	Liquid or solid organic substances that contains the bivalent -O-O- structure and ~~which~~ may be considered ~~to be~~ a structural derivative of hydrogen peroxide, where one or both of the hydrogen atoms have been replaced by organic radicals.The term also includes organic peroxide formulations (mixtures). Organic peroxides can present an explosion hazard (detonation or deflagration) or they can be shock sensitive. They can also decompose into various unstable compounds over an extended period of time. Organic peroxide classifications used in the International Codes are based on the organic peroxide transport type determined in accordance with the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) and the burning rate of the material. ~~Organic peroxides are thermally unstable substances or mixtures, which may undergo exothermic self-accelerating decomposition. In addition, they may have one or more of the following properties:~~ ~~a. be liable to explosive decomposition;~~ ~~b. burn rapidly;~~ ~~c. be sensitive to impact or friction;~~ ~~d. react dangerously with other substances~~.	Organic peroxides are liquid or solid organic substances which contain the bivalent -O-O- structure and may be considered derivatives of hydrogen peroxide, where one or both of the hydrogen atoms have been replaced by organic radicals. The term also includes organic peroxide formulations (mixtures). Organic peroxides are thermally unstable substances or mixtures, which may undergo exothermic self-accelerating decomposition. In addition, they may have one or more of the following properties: 1. Be liable to explosive decomposition. 2. Burn rapidly. 3. Be sensitive to impact or friction. 4. React dangerously with other substances.
Organic peroxide	~~UD~~ Detonable	Any organic peroxide which, as packaged, is categorized under the Globally Harmonized System of Classification and Labelling of ~~Chemicals (GHS) as an Organic Peroxide (Type A). Type A Organic Peroxides are forbidden in transportation. Where the GHS Category is not known, the following is acceptable for classification purposes: Organic peroxides that are capable of *detonation*. These peroxides pose an extremely high explosion hazard through rapid explosive decomposition.~~ Organic peroxides that are capable of detonation. These peroxides pose an extremely high-explosion hazard through rapid explosive decomposition. This class is comprised of organic peroxide formulations which are organic peroxide Type A under GHS.	~~H240, Organic peroxides, Type A~~; ~~Heating may cause an explosion.~~: (a) Any organic peroxide which, as packaged, can detonate or deflagrate rapidly will be defined as organic peroxide Type A.

Organic peroxide	I	~~Any organic peroxide which, as packaged, is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as an Organic Peroxide (Type B). Where the GHS Category is not known, the following is acceptable for classification purposes: Those~~ Describes those formulations that are capable of *deflagration* but not *detonation*. This class is comprised of organic peroxide formulations which, as packaged, are: 1. Organic peroxide Type B under GHS regardless of the burning rate. 2. Organic peroxide Type C or D under GHS with a large-scale burning rate equal to or greater than 300 kg/min. 3. Organic peroxide Type C or D under GHS with a small-scale burning rate equal to or greater than 9.0 kg/(min × m^2) unless the large-scale burning rate is less than 300 kg/min. 4. Organic peroxides of Type C, D, E, F or G under GHS where the burning rate is not known.	~~H241, Organic peroxides, Type B; Heating may cause a fire or explosion.~~; (b) Any organic peroxide possessing explosive properties and which, as packaged, neither detonates nor deflagrates rapidly but is liable to undergo a thermal explosion in that package will be defined as organic peroxide Type B. **Organic Peroxides, Type C**: (c) Any organic peroxide possessing explosive properties when the substance or mixture as packaged cannot detonate or deflagrate rapidly or undergo a thermal explosion will be defined as organic peroxide TYPE C; **Organic Peroxides, Type D:** (d) Any organic peroxide which in laboratory testing: (i) detonates partially, does not deflagrate rapidly and shows no violent effect when heated under confinement; or (ii) does not detonate at all, deflagrates slowly and shows no violent effect when heated under confinement; or (iii) does not detonate or deflagrate at all and shows a medium effect when heated under confinement; will be defined as organic peroxide TYPE D; **Organic Peroxides, Type E:** (e) Any organic peroxide which, in laboratory testing, neither detonates nor deflagrates at all and shows low or no effect when heated under confinement will be defined as organic peroxide TYPE E; **Organic Peroxides, Type F**: (f) Any organic peroxide which, in laboratory testing, neither detonates in the cavitated state nor deflagrates at all and shows only a low or no effect when heated under confinement as well as low or no explosive power will be defined as organic peroxide TYPE F; **Organic Peroxides, Type G**: (g) Any organic peroxide which, in laboratory testing, neither detonates in the cavitated state nor deflagrates at all and shows no effect when heated under confinement nor any explosive power, provided that it is thermally stable (self-accelerating decomposition temperature is 60°C or higher for a 50 kg package), and, for liquid mixtures, a diluent having a boiling point of not less than 150 °C is used for desensitization, will be defined as organic peroxide TYPE G. If the organic peroxide is not thermally stable or a diluent having a boiling point less than 150 °C is used for desensitization, it is defined as organic peroxide TYPE F.

Organic peroxide	IIA	~~Any organic peroxide which, as packaged, is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as an Organic Peroxide (Type C) or (Type D). Where the GHS Category is not known, the following is acceptable for classification purposes: Those~~ Describes those formulations that burn very rapidly and that pose a moderate reactivity hazard. This class is comprised of organic peroxide formulations which, as packaged, are: 1. Organic peroxide Type C or D under GHS with a large-scale burning rate equal to or greater than 140 kg/min, but less than 300 kg/min. 2. Organic peroxide Type C or D under GHS with a small-scale burning rate equal to or greater than 2.2 kg/(min × m²), but less than 9.0 kg/(min × m²). 3. Organic peroxide Type E under GHS with a large-scale burning rate equal to or greater than 140 kg/min. 4. Organic peroxide Type E under GHS with a small-scale burning rate equal to or greater than 2.2 kg/(min × m²).	~~H242, Organic peroxides, Type C; Heating may cause a fire.;~~ (c) Any organic peroxide possessing explosive properties when the substance or mixture as packaged cannot detonate or deflagrate rapidly or undergo a thermal explosion will be defined as organic peroxide Type C. ~~H242, Organic peroxides, Type D; Heating may cause a fire.;~~ Any organic peroxide which in laboratory testing: (i) Detonates partially, does not deflagrate rapidly and shows no violent effect when heated under confinement; or (ii) Does not detonate at all, deflagrates slowly and shows no violent effect when heated under confinement; or (iii) Does not detonate or deflagrate at all and shows a medium effect when heated under confinement; will be defined as organic peroxide Type D. **Organic Peroxides, Type E:** (e) Any organic peroxide which, in laboratory testing, neither detonates nor deflagrates at all and shows low or no effect when heated under confinement will be defined as organic peroxide TYPE E;
Organic peroxide	IIB	Describes those formulations that burn very rapidly and that pose a moderate reactivity hazard. This class is comprised of organic peroxide formulations which, as packaged, are: 1. Organic peroxide Type C under GHS with a large-scale burning rate less than 140 kg/min. 2. Organic peroxide Type C under GHS with a small-scale burning rate less than 2.2 kg/(min × m²). 3. Organic peroxide Type D or E under GHS with a large-scale burning rate equal to or greater than 60 kg/min, but less than 140 kg/min. 4. Organic peroxide Type D or E under GHS with a small-scale burning rate equal to or greater than 0.9 kg/(min × m²), but lower than 2.2 kg/(min × m²).	**Organic Peroxides, Type C**: (c) Any organic peroxide possessing explosive properties when the substance or mixture as packaged cannot detonate or deflagrate rapidly or undergo a thermal explosion will be defined as organic peroxide TYPE C; **H242, Organic Peroxides, Type D**: (d) Any organic peroxide which in laboratory testing: (i) detonates partially, does not deflagrate rapidly and shows no violent effect when heated under confinement; or (ii) does not detonate at all, deflagrates slowly and shows no violent effect when heated under confinement; or (iii) does not detonate or deflagrate at all and shows a medium effect when heated under confinement; will be defined as organic peroxide TYPE D; **Organic Peroxides, Type E:** (e) Any organic peroxide which, in laboratory testing, neither detonates nor deflagrates at all and shows low or no effect when heated under confinement will be defined as organic peroxide TYPE E;

Organic peroxide	III	~~Any organic peroxide which, as packaged, is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as an Organic Peroxide (Type E). Where the GHS Category is not known, the following is acceptable for classification purposes:~~ ~~Those~~ Describes those formulations that burn rapidly and that pose a moderate reactivity hazard. This class is comprised of organic peroxide formulations which, as packaged, are: 1. Organic peroxide Type D under GHS with a large-scale burning rate less than 60 kg/min. 2. Organic peroxide Type D under GHS with a small-scale burning rate less than 0.9 kg/(min × m²). 3. Organic peroxide Type E under GHS with a large-scale burning rate equal to or greater than 10 kg/min, but less than 60 kg/min. 4. Organic peroxide Type E under GHS with a small-scale burning rate less than 0.9 kg/(min × m²). 5. Organic peroxide Type F under GHS with a large-scale burning rate equal to or greater than 10 kg/min. 6. Organic peroxide Type F under GHS regardless of the small-scale burning rate.	**Organic Peroxides, Type D:** (d) Any organic peroxide which in laboratory testing: (i) detonates partially, does not deflagrate rapidly and shows no violent effect when heated under confinement; or (ii) does not detonate at all, deflagrates slowly and shows no violent effect when heated under confinement; or (iii) does not detonate or deflagrate at all and shows a medium effect when heated under confinement; will be defined as organic peroxide TYPE D; ~~H242, Organic peroxides, Type E; Heating may cause a fire.~~; (e) Any organic peroxide which, in laboratory testing, neither detonates nor deflagrates at all and shows low or no effect when heated under confinement will be defined as organic peroxide Type E. **Organic Peroxides, Type F**: (f) Any organic peroxide which, in laboratory testing, neither detonates in the cavitated state nor deflagrates at all and shows only a low or no effect when heated under confinement as well as low or no explosive power will be defined as organic peroxide TYPE F;
Organic peroxide	IV	~~Any organic peroxide which, as packaged, is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as an Organic Peroxide (Type F). Where the GHS Category is not known, the following is acceptable for classification purposes:~~ ~~Those~~ Describes those formulations that burn in the same manner as ordinary combustibles and that pose a minimal reactivity hazard. This class is comprised of organic peroxide formulations which, as packaged, are organic peroxide Type E or F under GHS with a large-scale burning rate less than 10 kg/min.	**Organic Peroxides, Type E:** (e) Any organic peroxide which, in laboratory testing, neither detonates nor deflagrates at all and shows low or no effect when heated under confinement will be defined as organic peroxide TYPE E; ~~H242, Organic peroxides, Type F; Heating may cause a fire.~~; (f) Any organic peroxide which, in laboratory testing, neither detonates in the cavitated state nor deflagrates at all and shows only a low or no effect when heated under confinement as well as low or no explosive power will be defined as organic peroxide Type F.
Organic peroxide	V	~~Any organic peroxide which, as packaged, is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as an Organic Peroxide (Type G). Where the GHS Category is not known, the following is acceptable for classification purposes:~~ ~~Those~~ Describes those formulations that burn with less intensity than ordinary combustibles or do not sustain combustion and that pose no reactivity hazard. This class is comprised of organic peroxide formulations which, as packaged, are organic peroxide Type G under GHS.	**Organic peroxides, Type G.**: (g) Any organic peroxide which, in laboratory testing, neither detonates in the cavitated state nor deflagrates at all and shows no effect when heated under confinement nor any explosive power, provided that it is thermally stable (self-accelerating decomposition temperature is 60°C or higher for a 50 kg package), and for liquid mixtures, a diluent having a boiling point of not less than 150°C and used for desensitization will be defined as organic peroxide Type G. If the organic peroxide is not thermally stable or is a diluent having a boiling point less than 150°C and is used for desensitization, it shall be defined as organic peroxide Type F.
Oxidizer	—	A material that readily yields oxygen or other oxidizing gas, or that readily reacts to promote or initiate combustion of combustible materials and, if heated or contaminated, can result in vigorous self-sustained decomposition.	An oxidizing solid is a solid which, while in itself is not necessarily combustible, may, generally by yielding oxygen, cause, or contribute to, the combustion of other material. An oxidizing liquid is a liquid which, while in itself not necessarily combustible, may, generally by yielding oxygen, cause, or contribute to, the combustion of other material.

Oxidizer	4	A solid or liquid that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as either Oxidizing Solids (Category 1) or Oxidizing Liquids (Category 1) and which have evidence of explosive properties or are packaged for transport in Packing Group I. Where the GHS category is not known, the following is acceptable for classification purposes: An oxidizer that can undergo an explosive reaction due to contamination or exposure to a thermal or physical shock that causes a severe increase in the burning rate of combustible materials with which it comes into contact. Additionally, the oxidizer causes a severe increase in the burning rate and can cause spontaneous ignition of combustibles.	~~H271~~**Oxidizing solids *or* Oxidizing liquids, Category 1**~~; May cause fire or explosion; strong oxidizer.~~: Criteria for solids (based on Test O.1 or O.3 in Part III of UN ST/SG/AC.10/11, *Manual of Tests and Criteria*): Test O.1—Any substance or mixture which, in the 4:1 or 1:1 sample-to-cellulose ratio (by mass) tested, exhibits a mean burning time less than the mean burning time of a 3:2 mixture (by mass) of potassium bromate and cellulose. Test O.3—Any substance or mixture which, in the 4:1 or 1:1 sample-to-cellulose ratio (by mass) tested, exhibits a mean burning rate greater than the mean burning rate of a 3:1 mixture (by mass) of calcium peroxide and cellulose. Criteria for liquids (based on Test O.2 in Part III of UN ST/SG/AC.10/11, *Manual of Tests and Criteria*): Any substance or mixture which, in the 1:1 mixture (by mass) of substance (or mixture) and cellulose tested, spontaneously ignites; or the mean pressure rise time of a 1:1 mixture (by mass) of substance and cellulose is less than that of a 1:1 mixture (by mass) of 50% perchloric acid and cellulose.
Oxidizer	3	A solid or liquid that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as either Oxidizing Solids (Category 1) or Oxidizing Liquids (Category 1) and is not otherwise classified as Class 4. Where the GHS category is not known, the following is acceptable for classification purposes: An oxidizer that causes a severe increase in the burning rate of combustible materials with which it comes in contact.	~~H271~~**Oxidizing solids *or* Oxidizing liquids, Category 1**~~; May cause fire or explosion; strong oxidizer.~~: Criteria for solids (based on Test O.1 or O.3 in Part III of UN ST/SG/AC.10/11, *Manual of Tests and Criteria*): Test O.1—Any substance or mixture which, in the 4:1 or 1:1 sample-to-cellulose ratio (by mass) tested, exhibits a mean burning time less than the mean burning time of a 3:2 mixture (by mass) of potassium bromate and cellulose. Test O.3—Any substance or mixture which, in the 4:1 or 1:1 sample-to-cellulose ratio (by mass) tested, exhibits a mean burning rate greater than the mean burning rate of a 3:1 mixture (by mass) of calcium peroxide and cellulose. Criteria for liquids (based on Test O.2 in Part III of UN ST/SG/AC.10/11, *Manual of Tests and Criteria*): Any substance or mixture which, in the 1:1 mixture (by mass) of substance (or mixture) and cellulose tested, spontaneously ignites; or the mean pressure rise time of a 1:1 mixture (by mass) of substance and cellulose is less than that of a 1:1 mixture (by mass) of 50% perchloric acid and cellulose.
Oxidizer	2	A solid or liquid that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as either Oxidizing Solids (Category 2) or Oxidizing Liquids (Category 2). Where the GHS category is not known, the following is acceptable for classification purposes: An oxidizer that will cause a moderate increase in the burning rate of combustible materials with which it comes in contact.	~~H272~~**Oxidizing solids *or* Oxidizing liquids, Category 2**~~; May intensify fire; oxidizer.~~: Criteria for solids (based on Test O.1 or O.3 in Part III of UN ST/SG/AC.10/11, *Manual of Tests and Criteria*): Test O.1—Any substance or mixture which, in the 4:1 or 1:1 sample-to-cellulose ratio (by mass) tested, exhibits a mean burning time equal to or less than the mean burning time of a 2:3 mixture (by mass) of potassium bromate and cellulose and the criteria for Category 1 are not met. Test O.3—Any substance or mixture which, in the 4:1 or 1:1 sample-to-cellulose ratio (by mass) tested, exhibits a mean burning rate equal to or greater than the mean burning rate of a 1:1 mixture (by mass) of calcium peroxide and cellulose and the criteria for Category 1 are not met. Criteria for liquids (based on Test O.2 in Part III of UN ST/SG/AC.10/11, *Manual of Tests and Criteria*): Any substance or mixture which, in the 1:1 mixture (by mass) of substance (or mixture) and cellulose tested, exhibits a mean pressure rise time less than or equal to the mean pressure rise time of a 1:1 mixture (by mass) of a 40% aqueous sodium chlorate solution and cellulose and the criteria for Category 1 are not met.

Oxidizer	1	A solid or liquid that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as either Oxidizing Solids (Category 3) or Oxidizing Liquids (Category 3). Where the GHS category is not known, the following is acceptable for classification purposes: An oxidizer that does not moderately increase the burning rate of combustible materials.	~~H272~~**Oxidizing solids *or* Oxidizing liquids, Category 3**~~; May intensify fire; oxidizer.~~: Criteria for solids (based on Test O.1 or O.3 in Part III of UN ST/SG/AC.10/11, *Manual of Tests and Criteria*): Test O.1—Any substance or mixture which, in the 4:1 or 1:1 sample-to-cellulose ratio (by mass) tested, exhibits a mean burning time equal to or less than the mean burning time of a 3:7 mixture (by mass) of potassium bromate and cellulose and the criteria for Categories 1 and 2 are not met. Test O.3—Any substance or mixture which, in the 4:1 or 1:1 sample-to-cellulose ratio (by mass) tested, exhibits a mean burning rate equal to or greater than the mean burning rate of a 1:2 mixture (by mass) of calcium peroxide and cellulose and the criteria for Categories 1 and 2 are not met. Criteria for liquids (based on Test O.2 in Part III of UN ST/SG/AC.10/11, *Manual of Tests and Criteria*): Any substance or mixture which, in the 1:1 mixture (by mass) of substance (or mixture) and cellulose tested, exhibits a mean pressure rise time less than or equal to the mean pressure rise time of a 1:1 mixture (by mass) of a 65% aqueous nitric acid solution and cellulose and the criteria for Categories 1 and 2 are not met.
Oxidizing gas	Gaseous or Liquefied	A compressed gas that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as an Oxidizing Gas, Category 1. Where the GHS category is not known, the following is acceptable for classification purposes: A gas that can support and accelerate combustion of other materials more than air does.	Any gas which may, generally by providing oxygen, cause or contribute to the combustion of other material more than air does. ~~H270~~**Oxidizing gases, Category 1**~~; May cause or intensify fire; oxidizer~~: Any gas which may, generally by providing oxygen, cause or contribute to the combustion of other material more than air does.
~~Oxidizing gas~~	~~Liquified~~	~~An oxidizing gas that is liquefied [liquefied gases are gases that, in a packaging under the charged pressure, are partially liquid at 68°F (20°C)].~~	~~Any gas which may, generally by providing oxygen, cause or contribute to the combustion of other material more than air does.~~ ~~H270, Category 1, May cause or intensify fire; oxidizer. Any gas which may, generally by providing oxygen, cause or contribute to the combustion of other material more than air does.~~ ~~H280, liquefied gas, would also apply.~~
Pyrophoric	—	A substance or mixture that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as Pyrophoric Gas, Pyrophoric Solid (Category 1), or Pyrophoric Liquid (Category 1). Where the GHS category is not known, the following is acceptable for classification purposes: A chemical with an autoignition temperature in air, at or below a temperature of 130°F (54°C).	*Separate definitions based on physical state; see each category of pyrophoric:*
Pyrophoric	Solid	A substance or mixture that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as Pyrophoric Gas, Pyrophoric Solid (Category 1), or Pyrophoric Liquid (Category 1). Where the GHS category is not known, the following is acceptable for classification purposes: A solid with an autoignition temperature in air, at or below a temperature of 130°F (54°C).	~~H250~~**Pyrophoric solids, Category 1**~~; Pyrophoric solid; Catches fire spontaneously if exposed to air.~~: A pyrophoric solid is a solid which, even in small quantities, is liable to ignite within 5 minutes after coming into contact with air. Classification criteria: The solid ignites within 5 minutes of coming into contact with air.
Pyrophoric	Liquid	A substance or mixture that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as Pyrophoric Gas, Pyrophoric Solid (Category 1), or Pyrophoric Liquid (Category 1). Where the GHS category is not known, the following is acceptable for classification purposes: A liquid with an autoignition temperature in air, at or below a temperature of 130°F (54°C).	~~H250~~**Pyrophoric liquids, Category 1**~~; Pyrophoric liquid; Catches fire spontaneously if exposed to air~~: A pyrophoric liquid is a liquid which, even in small quantities, is liable to ignite within 5 minutes after coming into contact with air. Classification criteria: The liquid ignites within 5 minutes when added to an inert carrier and exposed to air, or it ignites or chars a filter paper on contact with air within 5 minutes. Testing is performed at 25 ±2°C and 50 ±5% relative humidity.

Pyrophoric	Gas	A substance or mixture that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as Pyrophoric Gas, Pyrophoric Solid (Category 1), or Pyrophoric Liquid (Category 1). Where the GHS category is not known, the following is acceptable for classification purposes: A gas with an autoignition temperature in air, at or below a temperature of 130° F (54° C).	~~H220~~**Flammable gases, Category 1A, Pyrophoric gas**~~; Extremely flammable gas. May ignite spontaneously if exposed to air~~: A pyrophoric gas is a flammable gas that is liable to ignite spontaneously in air at a temperature of 54° C or below. ~~and~~ ~~H232; May ignite spontaneously if exposed to air~~
Toxic	—	A substance or mixture that is categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as any one of the following GHS Acute Toxicity categories: · Oral Category 3 · Dermal Category 3 · Inhalation Gases Category 2 · Inhalation Gases Category 3 and having an LC50 ≤1,000 ppm (4 hour exposure) · Inhalation Vapors Category 2 · Inhalation Vapors Category 3 and having an LC50 ≤4 mg/l (4 hour exposure) · Inhalation Dusts and Mists Category 3 or 4 ~~Acute Toxicity Oral Category 3 or 4, Dermal Category 3, Inhalation Gases Category 2 or 3, Inhalation Vapors Category 2 or 3, or Inhalation Dusts and Mists Category 3 or 4.~~ Where the GHS category is not known, ~~one of the following is acceptable~~ use the followingfor classification purposes: 1. A chemical that has a median lethal dose (LD50) of more than 50 mg per kg, but not more than ~~500~~ 300 mg per kg of body weight when administered orally to albino rats weighing between 200 and 300 g each. 2. A chemical that has a medial lethal dose (LD50) of more than 200 mg per kg but not more than 1,000 mg per kg of body weight when administered by continuous contact for 24 hr (or less if death occurs within 24 hr) with the bare skin of albino rabbits weighing between 2 and 3 kg each. 3. A chemical that has a median lethal concentration (LC50) in air of more than 200 ppm but not more than 2,000 ppm by volume or less of gas or vapor, or more than 2 mg/l but not more than 20 mg/l of mist or dust, when administered by continuous inhalation for 1 hr (or less if death occurs within 1 hr) to albino rats weighing between 200 and 300 g	*Acute toxicity* refers to serious adverse health effects (i.e., lethality) occurring after a single or short-term oral, dermal or inhalation exposure to a substance or mixture. Oral ~~H301~~**Acute toxicity, Category 3**~~, Toxic if swallowed~~: LD50 > 50 ≤ 300 mg/kg bodyweight ~~H302, Category 4, Harmful if swallowed: LD50 > 300 ≤ 2,000 mg/kg bodyweight~~ Dermal ~~H311~~**Acute toxicity, Category 3**~~, Toxic in contact with skin~~: LD50 > 200 ≤ 1,000 mg/kg bodyweight Inhalation ~~H330~~**Acute toxicity**, **Category 2**~~, Fatal if inhaled~~: Gases: LC50 > 100 ppm (4 hr) ≈ 200 ppm (1 hr) ≤ 500 ppm (4 hr) ≈ 1,000 ppm (1 hr) Vapo~~ur~~rs: LC50 > 0.5 mg/l (4 hr) ≈ 1 mg/l (1 hr) ≤ 2 mg/l (4 hr) ≈ 4 mg/l (1 hr) ~~Dust/mist: LC50 > 0.05 mg/l (4 hr) ≈ 0.2 mg/l (1 hr) ≤ 0.5 mg/l (4 hr) ≈ 2 mg/l (1 hr)~~ ~~H331~~**Acute toxicity, Category 3**~~, Toxic if inhaled~~: Gases: LC50 > 500 ppm (4 hr) ≈ 1,000 ppm (1 hr) ≤ 2,500 ppm (4 hr) ≈ 5,000 ppm (1 hr) Vapo~~ur~~rs: LC50 > 2 mg/l (4 hr) ≈ 4 mg/l (1 hr) ≤ 10 mg/l (4 hr) ≈ 20 mg/l (1 hr) Dust/mist: LC50 > 0.5 mg/l (4 hr) ≈ 2 mg/l (1 hr) ≤ 1 mg/l (4 hr) ≈ 4 mg/l (1 hr) **Acute toxicity, Category 4**: Dust/mist: LC50 > 1 mg/l (4 hr) ≈ 4 mg/l (1 hr) ≤ 5 mg/l (4 hr) ≈ 20 mg/l (1 hr)
Unstable (reactive)	—	A material, other than an explosive, which in the pure state or as commercially produced, will vigorously polymerize, decompose, condense or become self-reactive and undergo other violent chemical changes, including explosion, when exposed to heat, friction or shock, or in the absence of an inhibitor. Unstable (reactive) materials are subdivided as follows:	Self-reactive substances or mixtures are thermally unstable liquids or solid substances or mixtures liable to undergo a strongly exothermic decomposition even without participation of oxygen (air). This definition excludes substances and mixtures classified under the GHS as explosives, organic peroxides or as oxidizing. A self-reactive substance or mixture is regarded as possessing explosive properties when in laboratory testing the formulation is liable to detonate, to deflagrate rapidly or to show a violent effect when heated under confinement.
Unstable (reactive)	4	Materials that in themselves are readily capable of detonation or of explosive decomposition or explosive reaction at normal temperatures and pressures. This class includes materials that are sensitive to mechanical or localized thermal shock at normal temperatures and pressures. This Class includes liquid or solid materials that are categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as Self-Reactive (Category A) and can include compressed gases categorized as Chemically Unstable (Type A).	~~H240~~**Self-reactive substances and mixtures, Type A**~~; Heating may cause an explosion.~~: (a) Any self-reactive substance or mixture which can detonate or deflagrate rapidly, as packaged, will be defined as self-reactive substance Type A.

Unstable (reactive)	3	Materials that in themselves are capable of detonation or of explosive decomposition or explosive reaction but which require a strong initiating source or which must be heated under confinement before initiation. This class includes materials that are sensitive to thermal or mechanical shock at the elevated temperatures and pressures. This Class includes liquid or solid materials that are categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as Self-Reactive (Category B) and can include compressed gases categorized as Chemically Unstable (Type B).	~~H241~~**Self-reactive substances and mixtures, Type B**~~; Heating may cause a fire or explosion.~~: (b) Any self-reactive substance or mixture possessing explosive properties and which, as packaged, neither detonates nor deflagrates rapidly, but is liable to undergo a thermal explosion in that package will be defined as self-reactive substance Type B.
Unstable (reactive)	2	Materials that in themselves are normally unstable and readily undergo violent chemical change but do not detonate. This class includes materials that can undergo chemical change with rapid release of energy at normal temperatures and pressures, and that can undergo violent chemical change at elevated temperatures and pressures. This Class includes liquid or solid materials that are categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as Self-Reactive (Category C or D).	~~H242~~**Self-reactive substances and mixtures, Type C**~~; Heating may cause a fire.~~: (c) Any self-reactive substance or mixture possessing explosive properties when the substance or mixture as packaged cannot detonate or deflagrate rapidly or undergo a thermal explosion will be defined as self-reactive substance Type C. ~~H242~~**Self-reactive substances and mixtures, Type D**~~; Heating may cause a fire.~~: (d) Any self-reactive substance or mixture which in laboratory testing: (i) Detonates partially, does not deflagrate rapidly and shows no violent effect when heated under confinement; or (ii) Does not detonate at all, deflagrates slowly and shows no violent effect when heated under confinement; or (iii) Does not detonate or deflagrate at all and shows a medium effect when heated under confinement; will be defined as self-reactive substance Type D; Will be defined as self-reactive substance Type D.
Unstable (reactive)	1	Materials that in themselves are normally stable but which can become unstable at elevated temperatures and pressures. This Class includes liquid or solid materials that are categorized under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) as Self-Reactive (Category E or F).	~~H242~~**Self-reactive substances and mixtures, Type E**~~; Heating may cause a fire.~~: (e) Any self-reactive substance or mixture which, in laboratory testing, neither detonates nor deflagrates at all and shows low or no effect when heated under confinement will be defined as self-reactive substance Type E. ~~H242~~**Self-reactive substances and mixtures, Type F**~~; Heating may cause a fire.~~: (f) Any self-reactive substance or mixture which, in laboratory testing, neither detonates in the cavitated state nor deflagrates at all and shows only a low or no effect when heated under confinement as well as low or no explosive power will be defined as self-reactive substance Type F. (g) Any self-reactive substance or mixture which, in laboratory testing, neither detonates in the cavitated state nor deflagrates at all and shows no effect when heated under confinement nor any explosive power, provided that it is thermally stable (self-accelerating decomposition temperature is 60°C to 75°C for a 50 kg package), and for liquid mixtures, a diluent having a boiling point greater than or equal to 150°C and used for desensitization will be defined as self-reactive substance Type G. If the mixture is not thermally stable or is a diluent having a boiling point less than 150°C and is used for desensitization, the mixture shall be defined as self-reactive substance Type F.

Unstable (reactive) gas	Gaseous		A chemically unstable gas is a flammable gas that is able to react explosively even in the absence of air or oxygen. ~~H220~~**Flammable gases, Category 1A, Chemically unstable, Category A~~; Extremely flammable gas~~: Flammable gases which are chemically unstable at 20° C and a standard pressure of 101.3 kPa. ~~and~~ ~~H230: May react explosively even in the absence of air~~ or ~~H220~~**Flammable gases, Category 1A, Chemically unstable, Category B~~; Extremely flammable gas~~: Flammable gases which are chemically unstable at a temperature greater than 20° C and/or a standard pressure greater than 101.3 kPa. ~~and~~ ~~H231: May react explosively even in the absence of air at elevated pressure and/or temperature~~
Water reactive	3	Materials that react explosively with water without requiring heat or confinement. Under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS), these are classified as substances or mixtures which, in contact with water, emit flammable gases (Category 1).	~~H260~~**Substances and mixtures, which in contact with water, emit flammable gases, Category 1~~; Contact with water releases flammable gases which may ignite spontaneously.~~:** Any substance or mixture which reacts vigorously with water at ambient temperatures and demonstrates generally a tendency for the gas produced to ignite spontaneously, or which reacts readily with water at ambient temperatures such that the rate of evolution of flammable gas is equal to or greater than 10 liters per kilogram of substance over any 1 minute. (UN/DOT test methods: Test N.5, Part III, subsection 33.4.1.4)
Water reactive	2	Materials that react violently with water or have the ability to boil water. Materials that produce flammable, toxic or other hazardous gases, or evolve enough heat to cause autoignition of combustibles upon exposure to water or moisture. Under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS), these are classified as substances or mixtures which, in contact with water, emit flammable gases (Category 2).	~~H261~~**Substances and mixtures, which in contact with water, emit flammable gases, Category 2~~; Contact with water releases flammable gas.~~:** Any substance or mixture which reacts readily with water at ambient temperatures such that the maximum rate of evolution of flammable gas is equal to or greater than 20 liters per kilogram of substance per hour, and which does not meet the criteria for Category 1.
Water reactive	1	Materials that react with water with some release of energy, but not violently. Under the Globally Harmonized System of Classification and Labelling of Chemicals (GHS), these are classified as substances or mixtures which, in contact with water, emit flammable gases (Category 3).	~~H261~~**Substances and mixtures, which in contact with water, emit flammable gases, Category 3~~; Contact with water releases flammable gas.~~:** Any substance or mixture which reacts slowly with water at ambient temperatures such that the maximum rate of evolution of flammable gas is equal to or greater than 1 liter per kilogram of substance per hour, and which does not meet the criteria for Categories 1 and 2.

—

a. The table illustrates that there is not perfect alignment between the IFC and GHS definitions and provides information on similarities and difference between the two classification systems.

Reason: Proposed changes align with GHS but also are amended to reflect Committee's request for updates to proposals which were disapproved. Changes reflect CAH2 comments/modifications for 3 proposals that were disapproved in CAH1 (Aerosols, Toxic/Highly Toxic, Inert gases) and Organic peroxides after discussions with industry. There is also an update to how GHS Hazard classifications are presented (last column) to better align with what is reflected on Safety Data Sheets.

FCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 and early 2024 the FCAC has held several virtual meetings and one in-person meeting open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the FCAC Website

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal is meant to provide correlation with the Globally Harmonized System of Classification and Labelling of Chemicals (GHS) which is used globally and by OSHA. This comparison will make compliance more straightforward. In some cases, utilizing GHS definitions may more heavily regulate additional materials for new buildings; conversely, in other cases GHS definitions will result in reduced classification of materials. However, any differences are balanced out by the coordination and ease of enforcement that comes with being aligned with GHS and OSHA. US manufacturers and distributors of hazardous materials have been required to use the GHS classification system to communicate the hazards of materials in Safety Data Sheets (SDS) since 2012.

Proposed Change as Submitted

Proponents: Jeffrey Shapiro, International Code Consultants, Lake Travis Fire Rescue (jshapiro@LTFR.org)

2024 International Fire Code

Add new text as follows:

APPENDIX P
SHORT-TERM RESIDENTIAL RENTAL SAFETY PROGRAM

N/A. *The provisions contained in this appendix are not mandatory unless specifically referenced in the adopting ordinance or legislation of the jurisdiction.*

About this appendix: This appendix prescribes minimum safeguards for life-safety to protect *transient* occupants of a s*hort-term rental property*. It is intended for distribution to a *responsible party* to highlight select requirements of the International Fire Code and International Property Maintenance Code plus prescribe additional requirements that are uniquely applicable to *short-term rental properties.*

SECTION P101
GENERAL

P101.1 Scope. *Dwelling units, sleeping units*, and portions thereof classified as a *short-term rental property* shall comply with this appendix.

P101.2 Definitions. For the purpose of this appendix, certain terms are defined as follows:

Add new definition as follows:

RESPONSIBLE PARTY. An *owner* or manager operating a *short-term rental* property.

SHORT-TERM RENTAL PROPERTY. A *dwelling unit*, *sleeping unit*, or portion thereof providing one or more *sleeping spaces*, made available for temporary occupancy, whether rented or swapped, for a period of 30 days or less.

SLEEPING SPACE. A bedroom or other location intended to provide sleeping accommodations.

Add new text as follows:

P101.3 Permit. A permit shall be required for each short-term rental property. Where two or more sleeping rooms are available for separate rental or exchange in a single *dwelling unit* or *sleeping unit*, only one permit for the *dwelling unit* or *sleeping unit* shall be required. A permit application shall be accompanied by a floor plan that identifies every *sleeping space* and a copy of the safety plan required by this appendix.

SECTION P102
GENERAL SAFETY FEATURES AND PRECAUTIONS

P102.1 General. *Short-term rental properties* shall comply with Sections P102.2 through P102.10.

P102.2 Permissible locations. *Short-term rental properties* shall be located in buildings that were constructed with an *approved* building code and are maintained in accordance with the International Property Maintenance Code. **Exception:** The *fire code official* is authorized to accept *short-term rental properties* of a different type where justified in accordance with Section 104.2.3 or 104.2.4.

P102.3 Smoke alarms. *Smoke alarms* shall be installed and maintained in accordance with Section 907.2.11.

P102.3.1 Additional smoke alarms. Where a *sleeping space* would otherwise not require a *smoke alarm* based on the requirements of 907.2.11, a *smoke alarm* shall be installed in such space.

P102.3.2 Replacement. If a smoke alarm stops functioning or is more than 10-years old, based on the date marked on the back of the device, or if there is no marked date, such smoke alarm shall be replaced.

P102.4 Carbon monoxide alarms. Carbon monoxide alarms shall be provided and maintained in accordance with Section 915.

P102.5 Portable Fire extinguishers. A minimum of one portable fire extinguisher with a minimum rating of 2-A:10-B:C shall be provided on each story of a *short-term rental unit*, secured on a mounting bracket in a conspicuous and unobstructed location along a normal path of travel.

P102.6 Fire protection system maintenance. *Fire alarm systems* and *automatic sprinkler systems*, where provided, shall be inspected, tested, and maintained operational in accordance with this code.

P102.7 Electrical safety. Use of current taps, relocatable power taps and extension cords shall be in a safe manner and that complies with Sections 603.5 and 603.6.

P102.8 Portable heater safety. Portable heaters shall be listed and labeled and shall be located not less than 3 feet (914 mm) from any combustible material. Portable electric heaters shall be plugged directly into a permanent receptacle. Portable fuel-fired heaters shall not be placed in a *sleeping space* or within 5 feet (1524 mm) of an exit.

P102.9 Outdoor cooking. Outdoor cooking shall not be conducted on combustible balconies or decks or within 10 feet (3048 mm) of combustible construction.

P102.10 Clothes dryer maintenance. The lint trap, mechanical and heating components, and the exhaust duct system of clothes dryers shall be maintained free of lint accumulation.

SECTION P103
OCCUPANCY AND USE LIMITS
