For SI: 1 pound = 0.454 kg, 1 cubic foot = 0.0283 m^3.

a. Degrees of hazard are for health, fire, and reactivity, respectively, in accordance with NFPA 704.

b. Reduction to 1-0-0 is allowed if analysis satisfactory to the code official shows that the maximum concentration for a rupture or full loss of refrigerant charge would not exceed the IDLH, considering both the refrigerant quantity and room volume.

c. Class I ozone depleting substance; prohibited for new installations.

d. Occupational Exposure Limit based on the OSHA PEL, ACGIH TLV-TWA, the TERA WEEL or consistent value on a time-weighed average (TWA) basis (unless noted C for ceiling) for an 8 hr/d and 40 hr/wk.

e. LFL is based on WCF @ 73.4°F (23°C) unless otherwise noted.

f. WCFF LFL @ 140°F (60°C).

g. WCFF LFL @ 73.4°F (23°C).

h. WCF LFL @ 212°F (100°C).

FLOOR MODIFICATION # 3958

Committee Reason:
The committee approved the proposal with modifications by a vote of 14-0. The refrigerant classifications are established by ASHRAE SSPC 34 and published in ASHRAE Standard 34. With the addition of additional refrigerants to Standard 34 during the last code cycle, this proposal aims to update the refrigerant table. See https://www.ashrae.org/standards-research-technology/standards-addenda for the rationale behind the incorporation of new refrigerants. The published addenda to ASHRAE Standard 34-2022, accessed via the URL above, incorporates revisions.

M64-24

Individual Consideration Agenda

Comment 1:

IMC®: TABLE 1103.1

Proponents: Emily Toto, ASHRAE, ASHRAE (etoto@ashrae.org) requests As Modified by Committee (AMC2)

Further modify as follows:

2024 International Mechanical Code

Revise as follows:

CHEMICAL REFRIGERANT	FORMULA	CHEMICAL NAME OF BLEND	REFRIGERANT SAFETY GROUP CLASSIFICATION	AMOUNT OF REFRIGERANT PER OCCUPIED SPACE								(F) DEGREES OF HAZARD
				RCL				LFL			OEL	
				lb/1000 ft	ppm	g/m		lb/1000 ft	ppm	g/m	ppm	
R-1336mzz(Z)	$CF_3CHCHCF_3$	cis-1,1,1,4,4,4-hexaflouro-2-butene	A1	5.2	13,000	84		—	—	—	500	—

For SI: 1 pound = 0.454 kg, 1 cubic foot = 0.0283 m^3.

a. Degrees of hazard are for health, fire, and reactivity, respectively, in accordance with NFPA 704.

b. Reduction to 1-0-0 is allowed if analysis satisfactory to the code official shows that the maximum concentration for a rupture or full loss of refrigerant charge would not exceed the IDLH, considering both the refrigerant quantity and room volume.

c. Class I ozone depleting substance; prohibited for new installations.

d. Occupational Exposure Limit based on the OSHA PEL, ACGIH TLV-TWA, the TERA WEEL or consistent value on a time-weighed average (TWA) basis (unless noted C for ceiling) for an 8 hr/d and 40 hr/wk.

e. LFL is based on the Worst Case of Formulation for Flammability (WCF) @ 73.4°F (23°C) unless otherwise noted.

f. Worst Case of Fractionation for Flammability (WCFF) LFL @ 140°F (60°C).

g. WCFF LFL @ 73.4°F (23°C).

h. WCF LFL @ 212°F (100°C).

Reason: The additional 11 refrigerants in this update have been approved by ASHRAE's Standard 34 committee and published via addenda, which can be read here: https://www.ashrae.org/technical-resources/standards-and-guidelines/standards-addenda
This modification also provides a clarification to a footnote based on feedback from CAH #1. We have now stated the meaning of the acronyms WCF and WCFF.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Making the list of approved refrigerants from ASHRAE 34 available to users of the IMC does not impact cost.

Comment (CAH2)# 300

M65-24

IMC®: 1103.1

Proposed Change as Submitted

Proponents: Emily Toto, ASHRAE, ASHRAE (etoto@ashrae.org)

2024 International Mechanical Code

Revise as follows:

1103.1 Refrigerant classification. Refrigerants shall be classified in accordance with ASHRAE 34 as listed in Table 1103.1. Refrigerants without a refrigerant number designation or without a safety group classification in the referenced edition of ASHRAE Standard 34 shall be classified in accordance with the criteria in ASHRAE Standard 34 as a single-compound refrigerant blend of two or more compounds. Such safety classifications not assigned by ASHRAE Standard 34 shall be submitted for approval to the code official. Compliance with the requirements of this code is contingent upon use of approved safey classifications where not assigned by the referenced edition of ASHRAE Standard 34.

Reason: This change accounts for the fact that new refrigerants will be approved during continuous maintenance of ASHRAE 34 that cannot all be reflected in the latest edition of the IMC due to timing. It offers flexibility to use approved refrigerants even though they are not yet specified in the IMC.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal will provide more choice to the user and, thus, direct costs could ultimately be lower. In general, this change is not expected to have a bearing on cost.

M65-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee voted 14-0 to disapprove of this proposal. The committee's justification is based on the proposed code language's dependence on an authorized safety classification.

M65-24

Individual Consideration Agenda

Comment 1:

IMC®: 1103.1

Proponents: Emily Toto, ASHRAE, ASHRAE (etoto@ashrae.org) requests As Modified by Committee (AMC2)

Modify as follows:

1103.1 Refrigerant classification. Refrigerants shall be classified in accordance with ASHRAE 34 as listed in Table 1103.1. Refrigerants without a ~~refrigerant number designation~~*refrigerant designation* or without a refrigerant safety group classification in the referenced edition of ASHRAE Standard 34 shall be classified in accordance with the criteria in ASHRAE Standard 34 as a single-compound refrigerant or a refrigerant blend of two or more compounds. ~~Such safety classifications not assigned by ASHRAE Standard 34 shall be submitted for approval to the code official. Compliance with the requirements of this code is contingent upon use of approved safey classifications where not assigned by the referenced edition of ASHRAE Standard 34.~~ Documentation supporting the proposed classification shall be submitted to the *code official.*

Reason: This language provides the AHJ with instructions on how to use alternative means to approve refrigerants not listed in Table 1103.1 or the referenced edition of ASHRAE Standard 34. Many refrigerants are approved as addenda to the referenced edition of ASHRAE Standard 34 that are not captured in Table 1103.1. Additionally, refrigerants assigned a provisional safety group by ASHRAE Standard 34 might also be considered for field trials.This proposal would also make Section 11 better aligned with ASHRAE Standard 15-2022.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal does not alter the cost associated with refrigeration systems. It merely provides additional flexibility for refrigerant classification as new options become available between code cycles.

Comment (CAH2)# 207

M69-24

IMC®: TABLE 1107.4, ASTM Chapter 15 (New)

Proposed Change as Submitted

Proponents: Lance MacNevin, Director of Engineering, The Plastics Pipe Institute, The Plastics Pipe Institute (lmacnevin@plasticpipe.org)

2024 International Mechanical Code

Revise as follows:

TABLE 1107.4 REFRIGERANT PIPE

PIPING MATERIAL	STANDARD
Aluminum tube	ASTM B210 , ASTM B491/B491M
Brass (copper alloy) pipe	ASTM B43
Copper linesets	ASTM B280, ASTM B1003
Copper pipe	ASTM B42, ASTM B302
Copper tube[a]	ASTM B68 , ASTM B75, ASTM B88, ASTM B280, ASTM B819
Polyethylene of Raised Temperature/ Aluminum/Polyethylene of Raised Temperature (PE-RT/AL/PE-RT)pipe	ASTM F3506
Steel pipe[b]	ASTM A53, ASTM A106 , ASTM A333
Steel tube	ASTM A254, ASTM A334

a. Soft annealed copper tubing larger than $1\frac{3}{8}$ inch (35 mm) O.D. shall not be used for field-assembled refrigerant piping unless it is protected from mechanical damage.

b. ASTM A53, Type F steel pipe shall only be permitted for discharge lines in pressure relief systems.

Add new standard(s) as follows:

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box C700
West Conshohocken, PA 19428

F3506-21e1 Standard Specification for Polyethylene of Raised Temperature/Aluminum/Polyethylene of Raised Temperature (PE-RT/AL/PE-RT) Composite Pressure Pipe based on Inner Diameter (ID) for use in Air Conditioning and Refrigeration Line Set Systems

Reason: Piping produced according to ASTM F3506 “Standard Specification for Polyethylene of Raised Temperature/Aluminum/Polyethylene of Raised Temperature (PE-RT/AL/PE-RT) Composite Pressure Pipe based on Inner Diameter (ID) for use in Air Conditioning and Refrigeration Line Set Systems” is intended specifically for the applications referred to in Section 1107.4 of the code and in Table 1107.4. It is proposed to add this piping material to Table 1107.4 to provide installers with a high-performance corrosion-resistant option for this application.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

Including PE-RT/AL/PE-RT piping produced according to ASTM F3506 in Table 1107.4 provides an alternative piping option for refrigerant applications. PE-RT/AL/PE-RT piping is less expensive than some of the existing materials (e.g., copper, brass, or steel), but may be more expensive than certain other piping materials. This code change proposal may decrease the cost of construction by 0% to 10% if PE-RT/AL/PE-RT piping is selected by users, or it may increase the cost of construction by 0% to 10% if selected, or it may have no impact on the cost of construction if PERT/ AL/PE-RT piping is not selected. It depends on which of the seven existing approved materials is used for this comparison.

To assign dollar values to this proposal, the use of PE-RT/AL/PE-RT piping could decrease construction costs over a range from $1

to $10,000, depending on the size of the project, size of piping, etc. or it could increase construction costs over a range from $1 to $10,000, depending on the size of the project, size of piping, etc., or it could have no effect on construction costs if users do not select to use PERT/AL/PE-RT piping. This proposal simply provides another material option.

Estimated Immediate Cost Impact Justification (methodology and variables):

Seven (7) piping materials produced according to seventeen (17) listed standards are already approved in Table 1107.4.. This proposal simply provides another material option. The amount of the cost decrease or increase is highly dependent on exact comparisons for specific piping materials and sizes plus assembly and construction costs which vary for each individual project. Therefore, only a range of cost decreases or increases can be provided in this format.

Estimated Life Cycle Cost Impact:

Seven (7) piping materials produced according to seventeen (17) listed standards are already approved in Table 1107.4. This proposal simply provides another material option. The impact to Life Cycle Cost is highly dependent on exact comparisons for specific piping materials and sizes plus assembly and construction costs which vary for each individual project. PE-RT/AL/PE-RT piping has a corrosion-resistant plastic inner and outer liner for long life.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

Seven (7) piping materials produced according to seventeen (17) listed standards are already approved in Table 1107.4. This proposal simply provides another material option. The impact to Life Cycle Cost is highly dependent on exact comparisons for specific piping materials and sizes plus assembly and construction costs which vary for each individual project. PE-RT/AL/PE-RT piping has a corrosion-resistant plastic inner and outer liner for long life.

M69-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee voted 13-1 to disapprove of this proposal. The committee argues that more testing is required for composite pressure pipe items contained in the proposed code language. Additional testing is necessary expressly for the uses mentioned in Table 1107.4 and Section 1107.4 of the code.

M69-24

Individual Consideration Agenda

Comment 1:

Proponents: Brad Campbell, Titeflex Corp Gastite, Titeflex Corp Gastite (brad.campbell@gastite.com) requests As Submitted

Reason: Reconsider M69-24 to add ASTM F3506 to Table 1107.4 because feedback from the IMC TC was heard. At the time of this submission, ASTM F3506 is being revised to include new requirements for UV resistance, flame and smoke resistance, and additional refrigerant exposure testing. A second ASTM F17 project to add crush and impact testing is being developed and is expected to be submitted for ASTM ballot and approval by the end of 2024.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

M85-24

IMC®: TABLE 1210.4, TABLE 1210.5, 1210.6.9

Proposed Change as Submitted

Proponents: Greg Kurtz Technical Director, The International Ground Source Heat Pump Association (IGSHPA), The International Ground Source Heat Pump Association (IGSHPA) (gkurtz@igshpa.org)

2024 International Mechanical Code

Revise as follows:

Delete without substitution:

~~**1210.6.9 PVC plastic pipe.** Joints between PVC plastic pipe and fittings shall be solvent cemented or threaded joints complying with Section 1203.3.~~

Reason: PVC is a rigid piping material supplied only in short lengths of 10-20 feet and joined via solvent cement or various types of mechanical fittings (e.g., flanges). This pipe is not suitable for ground loop piping because of its lack of flexibility and requirement for many joints over a typical pipe length of 400 or more feet in a ground loop piping system. In addition, the time required for solvent cement joints to cure is not suitable for installation of pipes in a vertical borehole, which often requires more than 400 feet of two vertical pipes to be installed as quickly as possible to prevent the drilled hole from collapsing. The International Ground Source Heat Pump Association (IGSHPA), founded in 1987, has never recommended PVC for ground source loop piping. Failures have occurred in the field when installers attempted to use PVC piping for these applications many years ago. The *ANSI / CSA / IGSHPA C448 Series 16 Bi-National Standard for the design and installation of ground source heat pump systems for commercial and residential buildings* does not list PVC rigid piping as an acceptable material for Geothermal ground loop installations. Additionally, the piping Task Force for the New Edition (2024) of the *ANSI / CSA / IGSHPA C448 Bi- National Standard* have reviewed all suitable piping materials for Geothermal ground loop installations and continue to NOT list PVC material as suitable piping material for Geothermal installations.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

PVC is one of seven (7) piping materials listed in Table 1210.4 for ground loop piping and the user has several choices of better materials for this application, which are approved by IGSHPA or listed in the ANSI / CSA / IGSHPA Bi – National C448 Standard, and commonly used for this purpose. Because PVC is known in the industry to be not suitable for these applications and is not recommended for this purpose by IGSHPA, or the ANSI / CSA /

IGSHPA Bi – National C448 Standard it is rarely, if ever, used for this purpose. Therefore, the removal of PVC piping from Table 1210.4 will neither decrease nor increase the cost of construction.

M85-24

Public Hearing Results (CAH1)

Committee Action: **As Submitted**

Committee Reason: The committee voted 9-5 to approve this proposal as submitted. The committee's reasoning is that of the proponent's reason statement. Only 10 to 20-foot short lengths are available for PVC, a rigid piping material that can be linked using flanges or other mechanical connections. This pipe's lack of flexibility and the need for several joints over a typical pipe length of 400 feet or more make it unsuitable for ground-loop piping systems. Furthermore, placing pipes in a vertical borehole necessitates the faster installation of more than 400 feet of two vertical pipes to prevent the drilled hole from collapsing. Solvent cement joints take too long to cure. The International Ground Source Heat Pump Association (IGSHPA), established in 1987, has never advised PVC for ground source loop piping. Many years ago, there were field failures when installers tried to use PVC plumbing for similar applications. According to the ANSI, CSA, and IGSHPA C448 Series 16 Bi-National Standard for designing and installing ground source and heat pump systems for commercial and residential buildings, PVC rigid piping is inappropriate for geothermal ground loop installations [12]. Furthermore, after reviewing all acceptable pipe materials for geothermal ground loop installations, the piping task force for the New Edition (2024) of the ANSI, CSA, and IGSHPA C448 Bi-National Standard has decided to keep PVC off the list of acceptable piping materials for geothermal installations.

M85-24

Individual Consideration Agenda

Comment 1:

Proponents: Michael Cudahy, PPFA Plastic Pipe and Fittings Association, PPFA Plastic Pipe and Fittings Association (mikec@cmservices.com) requests Disapproved

Reason: PVC and CPVC should remain as options. While the majority of the piping in these systems would likely be coils of polyethylene, PEX or PE-RT, rigid pipe could have use in manifolds and other above ground piping.

There is also a lack of a definition of what the "GROUND-SOURCE LOOP PIPE" consists of, is it only the below ground loops themselves, or does it include all piping/valves and fittings associated with the working fluid?

Cost Impact: No change to code.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Comment (CAH2)# 329

M87-24

IMC®: TABLE 1302.3

Proposed Change as Submitted

Proponents: Christopher Adam Smith, Viega, LLC, Codes and Standards Manager for Viega, LLC

2024 International Mechanical Code

Revise as follows:

TABLE 1302.3 FUEL OIL PIPING AND FITTINGS

MATERIAL	STANDARD (see Chapter 15)
Copper or copper-alloy pipe and fittings	ASTM B42; ASTM B43; ASTM B302; ASTM F3226
Copper or copper-alloy tubing and fittings (Type K, L or M)	~~ASME B16.51;~~ ASTM B75; ASTM B88; ~~ASTM B280;~~ ASTM F3226
Labeled pipe	(See Section 1302.4)
Nonmetallic pipe	ASTM D2996
Steel and stainless steel pipe and fittings	ASTM A53; ASTM A106; A312/A312M; ASTM F3226; UL 180
Steel and stainless steel tubing and fittings	ASTM A254; A269/A269M; ASTM A539; ASTM F3226; UL 180

Reason: This proposal adds UL 180 "Combustible Liquid Tank Accessories" is a standard for pipe, fittings, and accessories for use with fuel oil. This Standard has been revised since the IMC was last updated, and now includes press-connect fittings. Adding UL 180 to this table will allow press-connect fittings to be used for fuel oil applications, and inspectors will be able to verify that those fittings have been listed and labeled for the application.

This proposal will also remove the standards ASME B16.51 "Copper and Copper-Alloy Press-Connect Pressure Fittings" and ASTM B280 "Seamless Copper Tube for Air Conditioning and Refrigeration Field Service." ASME B16.51 has a scope which covers only "...pressure fittings for use with hard-drawn seamless copper water tube conforming to ASTM B88 for piping systems conveying water." ASTM B280 is a refrigerant tubing standard. It is our understanding that these standards were used in lieu of applicable standards available at the time. The Code will be more accurate and less confusing with these two inappropriate references removed from the Table. Removal of these standards from this table will decrease the likelihood of inappropriate products being used in a fuel oil application.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The addition of this standard does not increase the cost of construction. The addition of this standard allows for a wider selection of materials but does not make their use mandatory. By including this standard in the code, the options for installers will increase while the cost of construction should stay the same or even decrease.

M87-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee voted 10-4 to disapprove of the proposal. The committee felt that the proposed code language included the wrong standard suggested for Table 1302.3 by the proponent.

M87-24

Individual Consideration Agenda

Comment 1:

Proponents: Christopher Adam Smith, Viega, LLC, Codes and Standards Manager for Viega, LLC (adam@hydrotech-h2o.com) requests As Submitted

Reason: This comment is to urge the committee to accept proposal M87-24 as submitted.

During Committee Action Hearing 1 a concern was raised about the applicability of UL 180 for inclusion in Table 1302.3 due to its title being "Combustible Liquid Tank Accessories." While the title of UL 180 seems to indicate otherwise, UL 180 does in fact include pipe and fittings within the scope of the Standard, as well as construction requirements for piping systems. During its last revision (2023) UL 180 had its scope greatly expanded specifically to cover pipe and fittings used to fill and vent fuel oil storage tanks, as well as pipe and fittings used to connect fuel oil tanks to their oil burning equipment. So while the title says "Tank Accessories" this standard covers significantly more than just accessories.

The scope of UL 180 includes Aboveground Piping Systems as seen in Claus 1.2, c):

1 Scope

1.1 This Standard covers construction and performance requirements for the tank accessories identified in Clause 1.2, for use on atmospheric aboveground tanks not exceeding 19,927 L (5,000 U.S. gal) which are intended for the storage and supply of heating fuels for oil burning equipment, diesel fuels for compression ignition engines, motor oils (new or used) for automotive service stations, and similar combustible liquid applications.

In addition to this Standard's traditional safety requirements for tank accessories that primarily evaluate functional operation, structural integrity, and mitigate fire and environmental hazards from loss of liquid containment under expected normal conditions; optional construction and/or performance requirements, and associated ratings, intended to address more severe conditions associated with the effects of Climate Change are included in Appendix B.

1.2 These requirements cover the following tank accessories intended for installation in, on or connected to the storage tank or supply tank in accordance with the manufacturer's instructions:

a) Liquid Level Gauges – mechanical float, low-voltage electric, or other types with integral or remote indicators;

b) Fill Signal Devices –indicating devices with audible and/or visual signals, including "whistle vent" alarms;

c) Aboveground Piping Systems – aboveground pipe and fittings for tank fill & venting and supply of utilization equipment, including flexible hose; and

d) Fill Pipe Covers & Vent Pipe Caps.

The definition of Aboveground Piping System used by UL 180 includes Fill & Vent Pipe, as well as Supply Pipe as seen in Clause 4.3, a) and 4.3, d):

4.3 ABOVEGROUND PIPING SYSTEMS – Combinations of small diameter pipe, tubing, or hose and their connection or termination fittings for containment and transfer of combustible liquids in applications identified in the scope of this Standard. Aboveground piping system may be of different containment designs for different application types:

a) Fill & Vent Pipe – Intended for transfer of liquids from a delivery truck to a supply tank and venting of displaced vapors in the tank during fill operations. Vent pipe also provides combined normal and emergency venting of the tank. These pipes are typically rigid types in the 25.4 mm to 101.6 mm (1.0 in to 4.0 in) size range;

b) Flexible Hose – Special highly flexible hose connectors of short length/small diameter intended for transfer of liquids typically from a supply pipe end to the utilization equipment, where tight bending and frequent disconnection for installation and maintenance is required. Flexible hose are typically elastomeric hose with metal braid sleeves in a 1/4" to 3/8" size range;

c) Special piping/tubing – Engineered piping or tubing that does not conform to common tubing standards (i.e. Schedule or SDR) for dimension or wall thickness as part of an engineered piping system for filling and venting of above ground combustible liquid tanks; or

d) Supply Pipe – Intended for transfer of liquids from a fuel storage tank or supply tank to utilization equipment, such as an oil burner or diesel generator. These pipes are typically flexible in the 9.5 mm to 25.4 mm (3/8 in to 1.0 in) size range.

There is even an entire Section of UL 180 (*6 Aboveground Piping System Construction*) dedicated to the construction of piping systems, the type of pipe and fittings that are approved, and their respective standards.

Proposal M87-24 also seeks to remove the standards ASME B16.51 "*Copper and Copper-Alloy Press-Connect Pressure Fittings*" and ASTM B280 "*Seamless Copper Tube for Air Conditioning and Refrigeration Field Service*."

ASME B16.51 has a scope which covers only "...pressure fittings for use with hard-drawn seamless copper water tube conforming to ASTM B88 for piping systems conveying water."

ASTM B280 has a scope which covers only "...copper tube intended for use in the connection, repairs, or alterations of air conditioning or refrigeration units in the field."

It is our understanding that these standards were used in lieu of applicable standards available at the time. The Code will be more accurate and less confusing with these two inappropriate references removed from the Table. Removal of these standards from this table will decrease the likelihood of inappropriate products being used in a fuel oil application.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Comment (CAH2)# 469

M89-24

IMC®: SECTION 202 (New), 309.2 (New)

Proposed Change as Submitted

Proponents: Clayton Trevillyan, City of Tucson, City of Tucson (clayton.trevillyan@tucsonaz.gov); Pete Quintela, Miami-Dade County, Miami-Dade County; Jane Gilbert, Miami-Dade County, Miami-Dade County (jane.gilbert@miamidade.gov); Stefano Schiavon, University of California, Berkeley, Self (schiavon@berkeley.edu); Ali Frazzini, Los Angeles County Chief Sustainability Office (afrazzini@cso.lacounty.gov); Mary Wright, City of Phoenix/Office of Heat Response and Mitigation, self

2024 International Mechanical Code

Add new definition as follows:

DESIGN COOLING DAY. A design parameter where air conditioning loads are determined.

Add new text as follows:

309.2 Cooling systems. Interior spaces intended for human occupancy shall be capable of maintaining an indoor temperature at or below 80°F (27°C) in the occupied zone 3 feet (914 mm) above the floor and at least 2 feet (610 mm) from exterior walls on the *design cooling day.* Where permanently installed fans capable of generating 120 fpm (0.6 m/s) air speed within the occupied zone, the indoor temperature during the *design cooling day* shall be maintained at or below 85°F (29°C). The installation of one or more portable systems shall not be used to achieve compliance with this section. **Exception:** Cooling systems shall not be required for the following:

1. Interior spaces where the primary purpose is not associated with human comfort.
2. Group F, H, S and U occupancies.

Reason: The building code requires minimum heating of spaces for the safety of the occupants. The code is silent on requirements for cooling, despite the negative impacts of elevated exterior thermal conditions on humans. The built environment is a safe haven from the effects of weather and climatic conditions, heat not being an exception for people to seek shelter from the elements. Media attention to heat-related health emergencies on the elderly and people in underserved communities demonstrates the need for improvements in the built environment[1]. As a result of increased summer temperatures, some jurisdictions have already mandated cooling be provided in new buildings and many others are considering extreme heat related ordinances. A coordinated application in the codes that can be consistently applied to new construction is warranted due to the trend in local agencies with differing requirements throughout the county.

The proposal is a performance specification to ensure safety in the built environment due to higher expected summer thermal conditions. The solution can either be active or passive systems, or a combination of these systems to provide relief from elevated thermal conditions. The active systems would include traditional central mechanical air conditioning systems that are provided in most modern homes and do not represent a significant change to how most buildings are constructed. Passive cooling systems utilize unique design features of the building that prevent heat from entering the building and/or removing heat from the building. Passive design applications include building orientation, insulation, solar control (shading and landscaping), ventilation and other methods that naturally, and without input energy, would provide and maintain thermal comfort. Passive systems could be more cost effective in both the short term and the long term as compared to active mechanical systems for circumstances where a few design changes could comply with specified interior temperature. The interior temperature of 80°F was selected as the maximum temperature for the thermal comfort of the interior environment based on ANSI/ASHRAE Standard 55-2020[2] and generally at, or above the temperature in most local ordinances.

The second sentence recognizes that air movement provides a cooling effect as experienced by the occupants of the building. ASHRAE Standard 55-2020 states that air movement of only 120 feet per minute results in the perception of 5°F cooler temperatures. Where permanent fans are installed, the resulting interior maximum temperature can be increased 5°F above the baseline temperature of 80°F that would be required for either the active or passive systems installed in accordance with the first sentence of the code change proposal. This is an additional cost-effective manner to provide the minimum cooling effect on human bodies where thermal comfort and

safety is provided in the built environment. Permanently installed fans can include ceiling fans, wall-mounted fans, bladeless ceiling fans, or any permanently installed fan that can be verified at the time of final inspection that the equipment is installed.

The third sentence is a carryover from the heating requirement, where the expectation for compliance is permanently installed equipment that can be utilized by the occupant as needed for thermal comfort and lifesaving opportunities from dangerous heat related health considerations.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

$0 - $31+ per square foot of new or renovated habitable buildings.
The immediate cost impact to construction is for newly constructed or renovated buildings. There is no immediate cost to existing buildings. This value ranges greatly depending on variables that include but are not limited to:

- If the proposed construction would include cooling regardless of this code change. Zero cost impact will apply to many regions and project scopes for new permits.
- If the project includes a system that can be further supplemented at relatively low cost due to other air handling equipment that would have otherwise been included in the project scope.
- The method of proposed cooling and quality of equipment.
- Level of efficiency and sustainability of system design.
- The climate zone of project area.

Estimated Immediate Cost Impact Justification (methodology and variables):

1. Estimation from major HVAC contractor (Watsco)

"There are a lot of variables (i.e. size of the building, type of system, region, needs, installation costs). Below are some rough estimates"

- For commercial buildings the average cost can range from $15 to $30 per sq ft for a basic system but can go up to $40+ for more complex or high efficiency systems.
- For multi-family buildings the average cost can range from $2,500-$5,000 per unit for a basic system increasing in price for high efficiency units. ($40 pf @ 2 units for 4000 sf)

Comparison necessary to isolate cost of heating systems alone (e.g. furnace/boiler systems) to identify cost differential.

2. RSMeans Data (remeansonline.com)

$8-30 per sf

M89-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee voted 14-0 to disapprove of the proposal. The committee agreed that the proposal required more specificity, as the references are not correct. The committee would like to see this proposal come back at the CAH2 hearings.

M89-24

Individual Consideration Agenda

Comment 1:

IMC®: SECTION 202, 309.2

Proponents: Clayton Trevillyan, City of Tucson, City of Tucson (clayton.trevillyan@tucsonaz.gov) requests As Modified by Committee (AMC2)

Further modify as follows:

2024 International Mechanical Code

Delete without substitution:

~~**DESIGN COOLING DAY.** A design parameter where air conditioning loads are determined.~~

Revise as follows:

309.2 Cooling systems. Dwelling units and sleeping units located in Climate Zones 0, 1, 2, 3, 4, 5A, and 5B, where the summer dry-bulb temperature is greater than 85°F (29.4°C), ~~Interior spaces intended for human occupancy~~ shall be provided with cooling systems capable of maintaining an indoor temperature at or below 80°F (26.7°C) in the occupied space ~~zone 3 feet (914 mm) above the floor and at least 2 feet (610 mm) from exterior walls on the *design cooling day*~~. Where permanently installed fans capable of generating 120 fpm (0.6 m/s) air speed ~~within~~ inside the occupied ~~zone~~ space, the ~~indoor temperature during the *design cooling day*~~ required cooling system shall be capable of ~~maintained~~ maintaining indoor temperature at or below 85°F (29.4°C). The installation of one or more portable systems shall not be used to achieve compliance with this section.

Exception: Cooling systems shall not be required for ~~the following~~:

~~1.~~ Interior spaces where the primary purpose is not associated with human comfort.

~~2. Group F, H, S and U occupancies.~~

Reason: CAH2 Reason Statement:

Code proposal M89-24 has been revised in response to comments received before, during and after the first Committee Action Hearings. The Extreme Heat Working Group has reviewed all comments received and has directly engaged additional industry experts to provide the committee with the best possible revision.

The primary arguments opposing the initial code modification identified 1) the need to specify which occupancy groups this code would apply to 2) a lack of prescriptive climate zones that the code proposal includes and 3) a lack of design condition specificity that incorporates wet and/or dry bulb temperature ranges. The revised code language now focuses on the intended occupancies that must comply by specifying in the first sentence 'dwelling units and sleeping units' thereby exempting all other occupancies. This focused applicability is intended to provide a safe haven for the public seeking shelter from extreme heat events in the most functional location.

The proposed definition has been omitted altogether to reduce possible confusion. This definition was brought up by a committee member during the hearings as the definition was unclear. It was also identified that the term 'air conditioning' in the proposed definition contradicted the working group's intent to allow a variety of cooling methods.Climate zones 0-5B and a dry bulb temperature threshold have also been added to the first sentence to provide explicit charging language to regions that will be most impacted by heat waves. A floor modification was proposed and approved by the committee to eliminate Climate Zones 5C, 6, 7, and 8. This was relocated from the exceptions to the beginning of the code section as suggest by a testifier at the hearings.

The working group acknowledges that relative humidity must also be considered and that regional differences should be considered by the adopting authority. The proposed temperature threshold is consistent with other regulations that consider heat index and relative humidity. The working group's intent is to allow enough flexibility in the code language to support all reasonable methods of cooling appropriate for the local climatic conditions.

Clarity has also been provided by rewording the allowance for air movement inside the occupied space to eliminate possible confusion related to the location of air movement equipment, as noted by a committee member during discussion portion of the committee motion for disapproval. During this comment, it was also noted by the same committee member that this is an important point, which motivated the clarification. Another committee member noted that the heating requirement is in the IBC, implying it may not be in the IMC. The heating requirement is in the IBC, IRC and IMC Section 309. Placing this requirement in the IMC is appropriate since heating is also provided for. Please note, the working group has also proposed mandatory cooling in the International Building Code, the International Residential Code, and the Property Maintenance code in addition to the current proposal for the International Mechanical Code. Every effort will be made to provide consistent code proposals for the Group B Committee Action Hearings for volumes not included in Group A.

Cost Impact: Increase

Estimated Immediate Cost Impact:

$0 - $31+ per square foot of new or renovated habitable buildings.

The immediate cost impact to construction is for newly constructed or renovated buildings. There is no immediate cost to existing buildings. This value ranges greatly depending on variables that include but are not limited to:

- If the proposed construction would include cooling regardless of this code change. Zero cost impact will apply to many regions and project scopes for new permits.
- If the project includes a system that can be further supplemented at relatively low cost due to other air handling equipment that would have otherwise been included in the project scope.
- The method of proposed cooling and quality of equipment.
- Level of efficiency and sustainability of system design.
- The climate zone of project area.

Estimated Immediate Cost Impact Justification (methodology and variables):

1. Estimation from major HVAC contractor (Watsco)"There are a lot of variables (i.e. size of the building, type of system, region, needs, installation costs). Below are some rough estimates"

- For commercial buildings the average cost can range from $15 to $30 per sq ft for a basic system but can go up to $40+ for more complex or high efficiency systems.
- For multi-family buildings the average cost can range from $2,500-$5,000 per unit for a basic system increasing in price for high efficiency units. ($40 pf @ 2 units for 4000 sf)

Comparison necessary to isolate cost of heating systems alone (e.g. furnace/boiler systems) to identify cost differential.

ISPSC: SECTION 202, SECTION 202 (New), SECTION 303, 303.1, 303.1.2 (New), TABLE 303.1.2 (New), 303.1.3 (New), 303.1.1, 303.1.2, 303.1.3, 303.2, 303.3, DOE (New)

Proposed Change as Submitted

Proponents: Maureen Guttman, Senior Fellow, Energy Solutions, California Investor-Owned Utilities

2024 International Swimming Pool and Spa Code

SECTION 202
DEFINITIONS

Add new definition as follows:

SITE-RECOVERED ENERGY. Waste energy recovered at the building site that is used to offset consumption of purchased energy supplies.

SOLAR THERMAL WATER HEATER. An assembly of components designed to heat water through the conversion of incident solar radiation at the building site.

SECTION 303
ENERGY

Revise as follows:

303.1 Energy consumption of pools and permanent spas. The energy consumption of pools and permanent spas shall be controlled by the requirements in Sections 303.1.1 through ~~303.1.3~~ 303.1.4 and with Section 317.

Add new text as follows:

303.1.1 Primary heating systems. The primary pool or spa heating system shall be one of the following:

1. A *solar thermal water heater* with a solar collector surface area equivalent to at least 65 percent of the pool or spa surface area.
2. A heat pump pool heater.
3. Systems that do not use *solar thermal water heaters* or heat pump pool heaters as their primary heat source shall derive no less than 60 percent of annual heating energy from *on-site renewable energy* or *site-recovered energy*.

Exceptions:

1. *Residential* pools and *residential* spas.
2. Portable electric spas.
3. A pool or spa heated only by a *solar thermal water heater*.

303.1.2 Pool heater efficiency. Pool heaters shall meet the minimum efficiency requirements of Table 303.1.2 when tested in accordance with the test procedure listed in DOE 10 CFR 430.23(p) and Appendix P to Subpart B of Part 430.

TABLE 303.1.2 POOL HEATER MINIMUM EFFICIENCY REQUIREMENTS

EQUIPMENT TYPE	MINIMUM EFFICIENCY
Heat Pump Pool Heater	4.0 COP rated at 50° F db 44.2° F wb outdoor air 80.0° F entering water
Gas-Fired Pool Heater	*Before 5/31/2028* *Integrated Thermal Efficiency not less than the following:* *600 (PE)/(PE + 1,619)* *where PE is the active electrical power, in Btu/h* *After 5/31/2028* *82% Et* *Before 5/31/2028* *84(QIN + 491)/(QIN + 2,536)* *where QIN is the input capacity, in Btu/h* *After 5/31/2028*

303.1.3 Heater controls. Heater controls and ignition pilots shall comply with Section 303.1.3.1 through Section 303.1.3.3.

Revise as follows:

~~**303.1.1**~~ **303.1.3.1** ~~**Heaters**~~ **Electric switches.** The electric power to heaters shall be controlled by an on-off switch with ready access that is an integral part of the heater, mounted on the exterior of the heater or external to and within 3 feet (914 mm) of the heater. Operation of such switch shall not change the setting of the heater thermostat. Such switches shall be in addition to a circuit breaker for the power to the heater. ~~Gas-fired heaters shall not be equipped with continuously burning ignition pilots.~~

~~**303.1.2**~~ **303.1.3.2 Time switches.** Time switches or other control methods that can automatically turn off and on heaters and pump motors according to a preset schedule shall be installed for heaters and pump motors. Heaters and pump motors that have built-in time switches shall be in compliance with this section.

Exceptions:

1. Where public health standards require 24-hour pump operation.
2. Pumps that operate solar- or waste-heat recovery pool heating systems.

~~**303.1.1**~~ **303.1.3.3** ~~**Heaters**~~ **Ignition pilots.** ~~The electric power to heaters shall be controlled by an on-off switch with ready access that is an integral part of the heater, mounted on the exterior of the heater or external to and within 3 feet (914 mm) of the heater. Operation of such switch shall not change the setting of the heater thermostat. Such switches shall be in addition to a circuit breaker for the power to the heater.~~ Gas-fired heaters shall not be equipped with continuously burning ignition pilots.

~~**303.1.3**~~ **303.1.4 Covers.** Outdoor heated pools and outdoor permanent spas shall be provided with a vapor-retardant cover or other *approved* vapor-retardant means in accordance with Section 104.9.1.

Exception: Where more than 75 percent of the energy for heating, computed over an operating season of not fewer than 3 calendar months, is from a heat pump or an on-site renewable energy system, covers or other vapor-retardant means shall not be required.

303.2 Portable spas. The energy consumption of electric-powered portable spas shall be controlled by the requirements of APSP 14.

303.3 Residential pools and permanent residential spas. The energy consumption of *residential* swimming pools and permanent *residential* spas shall be controlled in accordance with the requirements of APSP 15.

Add new standard(s) as follows:

DOE 10 CFR Part 430. Energy Conservation Program for Consumer Products: Test Procedures and Certification and Enforcement Requirement for Plumbing Products; and Certification and Enforcement Requirements for Residential Appliances; Final Rule; Pool heaters

Reason: This proposal, based on pool heater requirements proposed for California's 2025 energy code, requires that the primary heating system for pools and spas is either a solar thermal water heater, a heat pump pool heater or a heating system that derives no less than 60 percent of its annual heating energy from either on-site renewable energy or site-recovered energy. Natural gas or electric back-up heating systems are allowed in all cases. The proposal also includes mandatory minimum efficiency standards for pool heaters established by the U.S. Department of Energy.

The purpose of this proposal is to save energy and reduce carbon emissions from new swimming pool and spa heaters. According to CBECS 2018, the majority of pool and spa heaters installed today to heat indoor commercial pools are powered with natural gas (71%) which ties building owners to unpredictable utility costs caused by price swings in the natural gas market.

Solar thermal heating systems are cost effective alternatives to conventional gas-fired pool heaters which result in reduced energy use and lower monthly utility costs. Solar swimming pool and spa heating systems are one of the simplest and least expensive forms of solar thermal technology. The most common and least expensive type of solar swimming pool and spa heating systems are unglazed solar collectors which are made of a black plastic material that absorbs the sun's energy, converting it into heat which is then transferred to the water in the pool. Unglazed solar collectors are popular for swimming pools because they are easy to install, require little to no maintenance, and result in significantly lower monthly utility bills.

While a solar thermal heater with a backup gas-fired pool heater is more expensive than installing just a gas-fired pool heater (incremental costs are around $5,250 for a 20,000 gallon capacity pool), the reduction in monthly utility costs results in very short payback periods. A recent California CASE Study found that installing a solar pool and spa heating system with gas-fired back-up reduces natural gas use by 64 therms/year for residential pools and 45,000 therms/year for an Olympic sized pool. The same CASE study found that the reduction in natural gas use over 30 years resulted in a reduction in utility bills for solar pool and spa heating systems that were two to six times higher than the incremental cost for installing the system. The Department of Energy similarly states that the payback period for a solar pool and spa heating system alone is on the order of 1 to 7 years.

Not only do solar thermal water heaters result in reduced utility bills, but they can also reduce carbon emissions. The California CASE Study found that this requirement would reduce greenhouse gas emissions in California by approximately 37,000 metric tons of CO_2e per year. Given that commercial pools in California make up roughly 20% of the commercial pool market in the U.S., this proposal, if adopted nationwide, could result in a reduction of roughly 190,000 metric tons of CO_2e per year which is equivalent to taking 42,000 cars off the road.

As an alternative to installing a solar thermal heating system, this proposal allows for the installation of heat pump pool heaters or pool heaters which derive at least 60 percent of their annual heating energy from either on-site renewable energy or site-recovered energy. The California CASE study found that heat pump pool heaters save more energy and are more cost effective than solar thermal heating systems. This proposal exempts residential pools and spas and portable electric spas.

Bibliography: U.S. Department of Energy. *Solar Swimming Pool Heaters*. Accessed December 15, 2023. https://www.energy.gov/energysaver/solar-swimming-pool-heaters

California Energy Codes and Standards. *Codes and Standards Enhancement (CASE) Initiative 2025 California Energy Code: Swimming Pool Heating*. Revised October 2023. https://title24stakeholders.com/wp-content/uploads/2023/10/Revised-2025-T24-Final-CASE-Report_-NR-Swimming-Pool-Spa-Heating-1.pdf

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

The California CASE study found that installing a solar thermal water heaters in addition to a gas-fired pool heating system in nonresidential pools resulted in total 30-year incremental installation and maintenance costs of $18,786. The California CASE study found that heat pump pool heaters in addition to a gas-fired pool heating system result in $17,416 in incremental installation and maintenance costs over 30 years.

Estimated Immediate Cost Impact Justification (methodology and variables):

The estimated immediate incremental cost assumed that the owner installed a solar thermal water heater or a heat pump pool heater as the primary system and a gas heater as back-up. The incremental cost therefore is the full installed cost of solar thermal water heater or heat pump pool heater. The cost of the solar collectors was estimated from a database of installation cost values from the California Solar Initiative Commercial Pool Solar Thermal Rebate program. The database contains over 1,100 commercial pool solar thermal projects with data on the collector size and total project cost.

Estimated Life Cycle Cost Impact:

Over 30 years, the CASE study found that solar thermal water heaters saved between $38,000 to $150,000 for non-residential pools yielding a benefit to cost ratio between 2.0 to 6.6 depending on the Climate Zone. If one includes the immediate and maintenance costs for the solar thermal water heaters, total life cycle cost savings over 30 years are between $19,214 and $131,214 depending on the Climate Zone.

Over 30 years, the CASE study found that heat pump pool heaters saved between $40,697 to $202,301 for consumers yielding a benefit to cost ratio between 2.3 to 11.6 depending on the Climate Zone. If one includes the immediate and maintenance costs for the solar thermal water heaters, total life cycle cost savings over 30 years are between $23,281 and $184,885 depending on the Climate Zone.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

The methodology and variables for the life cycle cost impact calculation are descripted in the CASE study.

Staff Analysis: A review of the standard proposed for inclusion in the code, DOE 10CFR Part 430 *Energy Conservation Program for Consumer Products: Test Procedures and Certification and Enforcement Requirement for Plumbing Products; and Certification and Enforcement Requirements for Residential Appliances; Final Rule; Pool heaters*, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

SP3-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: These are proposed California requirements that are not appropriate for the ISPSC. (11-0)

SP3-24

Individual Consideration Agenda

Comment 1:

ISPSC: SECTION 202, 303.1, 303.1.1 (New), 303.1.2 (New), 303.1.2, TABLE 303.1.2, 303.1.2.1 (New), 303.1.2.2 (New), 303.1.3 (New),

303.1.3.1 (New), 303.1.3, 303.1.4.1 (New), 303.1.3.2, 303.1.3.3, 303.1.4, DOE (New), DOE

Proponents: Maureen Guttman, Energy Solutions, California Investor-Owned Utilities requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Swimming Pool and Spa Code

SOLAR THERMAL ~~WATER~~ POOL HEATER. An assembly of components designed to heat water for swimming pools or spas by solar thermal means, excluding pool recirculation components. ~~through the conversion of incident solar radiation at the building site.~~

303.1 Energy consumption of pools and permanent spas. The energy consumption of pools and permanent spas shall be controlled by the requirements in Sections 303.1.1 through ~~303.1.4~~ 303.1.5 and with Section 317.

303.1.1 Primary heating systems. The primary pool or spa heating systems shall be one of the following:

1. ~~2.~~ A heat pump pool heater.
2. ~~1.~~ A solar thermal pool ~~water~~ heater with a solar collector surface area equivalent to at least 65 percent of the pool or spa surface area.
3. Systems that do not use heat pump pool heaters or solar thermal pool ~~water~~ heaters or ~~heat pump pool heaters~~ as their primary heat source shall derive no less than 60 percent of annual heating energy from on-site renewable energy orsite-recovered energy.
4. A combination of solar thermal pool heater and heat pump pool heater without external supplementary heat.

Exceptions:

1. Residential pools and residential spas.
2. Portable electric spas.
3. Pool heating systems in Climate Zone 8 as identified Section 301 in the International Energy Conservation Code.
4. ~~3.~~ A pool or spa heated only by a solar thermal ~~water~~ pool heater.
5. Replacements to gas-fired heating systems for pools and spas in existing buildings.
6. A pool heating system whose annual site energy consumption is no greater than any of the pool heating systems compliant with Section 303.1.1 as determined by an approved party.

Add new text as follows:

303.1.2 Heat pump pool heater sizing. The design loads for the purpose of sizing systems and equipment for heat pump pool heaters shall comply with Sections 303.1.2.1 and 303.1.2.2.

~~**303.1.2 Pool heater efficiency.** Pool heaters shall meet the minimum efficiency requirements of Table 303.1.2 when tested in accordance with the test procedure listed in DOE 10 CFR 430.23(p) and Appendix P to Subpart B of Part 430.~~

~~**TABLE 303.1.2 POOL HEATER MINIMUM EFFICIENCY REQUIREMENTS**~~

~~EQUIPMENT TYPE~~	~~MINIMUM EFFICIENCY~~
~~Heat Pump Pool Heater~~	~~4.0 COP rated at 50°F db 44.2°F wb outdoor air 80.0°F entering water~~

~~Gas-Fired Pool Heater~~	~~Before 5/31/2028~~ ~~Integrated Thermal Efficiency not less than the following:~~ ~~600 (PE)/(PE + 1,619)~~ ~~where PE is the active electrical power, in Btu/h~~ ~~After 5/31/2028~~ ~~82% Et~~ ~~Before 5/31/2028~~ ~~84(QIN + 491)/(QIN + 2,536)~~ ~~where QIN is the input capacity, in Btu/h~~ ~~After 5/31/2028~~

303.1.2.1 Indoor pools and spas. Heat pump pool heaters serving indoor pools and spas shall comply with one of the following:

1. Heat pump pool heaters shall be sized in accordance with the manufacturer's published sizing guidelines.
2. Heat pump pool heaters without manufacturer's published sizing guidelines shall be sized in accordance with generally accepted engineering standards.

Add new text as follows:

303.1.2.2 Outdoor pools and spas. Heat pump pool heaters serving outdoor pools and spas shall comply with one of the following:

1. Heat pump pool heaters shall be sized in accordance with the manufacturer's published sizing guidelines.
2. Heat pump pool heaters without manufacturer's published sizing guidelines shall be sized using an output heating capacity no less than O_{out} calculated in accordance with Equation 3-1. **Oout = Vp x 8.33 x ΔT ÷ t (Equation 3-1)**
   where:

   O_{out} = output heating capacity of the heat pump pool heater in Btu/hr

   Vp = pool volume in gallons

   ΔT = desired pool temperature minus the average temperature for the coldest month and shall not exceed 10°F, in °F

   t = time needed for the heat pump pool heater to achieve the 10°F rise, and shall not exceed 17.5 hours, in hours

303.1.3 Supplementary pool and spa heating. Supplementary pool and spa heating systems shall be permitted if the primary pool and spa heating system does not meet the full annual heating load of the pool or spa.

303.1.3.1 Control of supplementary pool heating system. Pool and spa heating systems with an internal or an external supplementary pool heating system shall have controls that prevent supplementary heat operation when the heating load can be met by the primary pool heating system alone. Supplementary pool and spa heating system operation is permitted for setback recovery.

~~**303.1.3**~~ **303.1.4 Heater controls.** Heater controls and ignition pilots shall comply with Section ~~303.1.3.1~~ 303.1.4.1 through Section ~~303.1.3.3~~ 303.1.4.3.

~~**303.1.3.1**~~ **303.1.4.1 Electric switches.** The electric power to heaters shall be controlled by an on-off switch with ready access that is an integral part of the heater, mounted on the exterior of the heater or external to and within 3 feet (914 mm) of the heater. Operation of such switch shall not change the setting of the heater thermostat. Such switches shall be in addition to a circuit breaker for the power to the heater.

~~303.1.3.2~~ 303.1.4.2 **Time switches.** Time switches or other control methods that can automatically turn off and on heaters and pump motors according to a preset schedule shall be installed for heaters and pump motors. Heaters and pump motors that have built-in time switches shall be in compliance with this section.

Exceptions:

1. Where public health standards require 24-hour pump operation.
2. Pumps that operate solar- or waste-heat recovery pool heating systems.

~~303.1.3.3~~ 303.1.4.3 **Ignition pilots.** Gas-fired heaters shall not be equipped with continuously burning ignition pilots.

~~303.1.4~~ 303.1.5 **Covers.** Outdoor heated pools and outdoor permanent spas shall be provided with a vapor-retardant cover or other *approved* vapor-retardant means in accordance with Section 104.9.1.

Exception: Where more than 75 percent of the energy for heating, computed over an operating season of not fewer than 3 calendar months, is from a heat pump or an on-site renewable energy system, covers or other vapor-retardant means shall not be required.

Delete without substitution:

~~**DOE 10 CFR Part 430.** Energy Conservation Program for Consumer Products: Test Procedures and Certification and Enforcement Requirement for Plumbing Products; and Certification and Enforcement Requirements for Residential Appliances; Final Rule; Pool heaters~~

Reason:

This proposal is a modified version of a proposal submitted and considered at the ICC Committee Action Hearings in April. The modifications to the proposal are intended to better align this proposal with changes discussed and agreed to with pool and spa industry representatives. The principal modifications include:

1. An exemption for replacements for existing gas-fired pool heaters to account for the unique challenges facing existing buildings.
2. An exemption for pool heating systems whose site energy use consumption is less than that of the four options provided.
3. Guidance on how to appropriately size heat pump pool heaters if installed.
4. Guidance on appropriate control requirements for supplementary heating.

In addition, this proposal includes the following additional changes:

1. The proposal revises the definition for solar thermal pool heater to be consistent with the definition in the 2020 ICC 902/PHTA 902/SRCC 400 Solar Pool and Spa Heating System Standard.
2. The proposal exempts pool heating systems in Climate Zone 8 where cost effectiveness analysis shows that solar thermal pool heating systems are not appropriate.
3. The proposal removes the mandatory minimum efficiency standards for pool heaters established by the U.S. Department of Energy as well as a minor restructuring of the heaters section. Those proposed changes are included in a separate proposal.

As stated in the original reason statement, the purpose of this proposal is to save energy and reduce carbon emissions from new swimming pool and spa heaters. According to CBECS 2018, the majority of pool and spa heaters installed today to heat indoor commercial pools are powered with natural gas (71%) which ties building owners to unpredictable utility costs caused by price swings in the natural gas market.

Cost Impact: Increase

Estimated Immediate Cost Impact:

While additional exemptions provided for existing buildings, systems in Climate Zone 8, and systems whose annual site energy use consumption is lower than that of the options allowed will reduce costs nationally, the revisions made to the original proposal do not impact the cost of the proposal to an individual installation.

Estimated Immediate Cost Impact Justification (methodology and variables):

	$84(Q_{IN} + 491)/(Q_{IN} + 2,536)$ where Q_{IN} is the input capacity, in Btu/h	On or after 5/31/2028

a. Performance requirement is for commercial pool heaters and for applications outside of the U.S. Commercial pool heaters contain additional design modifications related to safety requirements for installation in commercial buildings and are not regulated as consumer products by the U.S. DOE as defined in 10 CFR 430.

b. Pool heaters in this category or subcategory are regulated as consumer products by the U.S. DOE as defined in 10 CFR 430.

~~**303.1.3.1**~~ **303.1.3** ~~**Electric switches**~~ **Heater electric switches.** The electric power to heaters shall be controlled by an on-off switch with ready access that is an integral part of the heater, mounted on the exterior of the heater or external to and within 3 feet (914 mm) of the heater. Operation of such switch shall not change the setting of the heater thermostat. Such switches shall be in addition to a circuit breaker for the power to the heater.

~~**303.1.3.2**~~ **303.1.4 Time switches.** Time switches or other control methods that can automatically turn off and on heaters and pump motors according to a preset schedule shall be installed for heaters and pump motors. Heaters and pump motors that have built-in time switches shall be in compliance with this section.

Exceptions:

1. Where public health standards require 24-hour pump operation.
2. Pumps that operate solar- or waste-heat recovery pool heating systems.

~~**303.1.3.3**~~ **303.1.5** ~~**Ignition pilots**~~ **Gas-fired heater ignition pilots.** Gas-fired heaters shall not be equipped with continuously burning ignition pilots.

~~**303.1.4**~~ **303.1.6 Covers.** Outdoor heated pools and outdoor permanent spas shall be provided with a vapor-retardant cover or other *approved* vapor-retardant means in accordance with Section 104.9.1.

Exception: Where more than 75 percent of the energy for heating, computed over an operating season of not fewer than 3 calendar months, is from a heat pump or an on-site renewable energy system, covers or other vapor-retardant means shall not be required.

~~**303.1.3 Heater controls.** Heater controls and ignition pilots shall comply with Section 303.1.3.1 through Section 303.1.3.3.~~

Reason:

This proposal is a modified version of a proposal submitted and considered at the ICC Committee Action Hearings in April. The original proposal was split into two parts. This proposal is intended to improve compliance and enforcement across a jurisdiction's adopted codes and with DOE's minimum efficiency standards for pool heaters by both aligning and clarifying code requirements.

This proposal aligns heater efficiency requirements with mandatory minimum efficiency standards for pool heaters established by the U.S. Department of Energy(DOE) and those established by the 2024 IECC and ASHRAE 90.1-2022. In 2024, minimum efficiency requirements for consumer gas-fired pool heaters with an efficiency of 82% Et are in place. DOE finalized a rule requiring manufacturers of consumer gas-fired pool heaters and consumer electric pool heaters meet new efficiency standards and new metrics beginning 5/31/2028. In addition, the 2024 IECC and ASHRAE 90.1-2022have included minimum efficiency requirements for pool heaters not covered by DOE's minimum efficiency standards. This proposal is intended to align the 2027 ISPSC with both federal requirements and requirements in the 2024 IECC and ASHRAE 90.1-2022.

To clarify pool heater requirements, this proposal also revises the heater controls section by removing the requirement that gas-fired heaters are not equipped with continuously burning ignition pilots and making that its own section.

SP17-24

ISPSC: SECTION 202 (New), SECTION 202, 316.4.1

Proposed Change as Submitted

Proponents: Gregory Ceton, Pool and Hot Tub Alliance (gceton@phta.org); Jennifer Hatfield, J. Hatfield & Associates, Pool & Hot Tub Alliance (jen@jhatfieldandassociates.com)

2024 International Swimming Pool and Spa Code

Add new definition as follows:

FREEBOARD. The vertical distance between the operating level of the pool and the level where the water would spill beyond the pool or onto the deck. For a pool with a vanishing edge, or where the coping is lower than the design pool water level, the freeboard would be zero.

Revise as follows:

SURGE CAPACITY. The storage volume in a surge tank, *gutter,* and plumbing lines that is available during operation of the pool to temporarily hold water that has been displaced from the pool by bathers, without diverting that water to waste. Water held in surge capacity shall not be in motion due to gravity, rather, only by the pumps.

316.4.1 Surge capacity. Where perimeter surface skimming systems are used, they shall be connected to a circulation system with a system surge capacity of not less than ~~1~~ 0.5 gallon for each square foot (~~40.7~~ 20.4 liters per square meter) of water surface, unless there is 2 inches (51 mm) or more of freeboard around the entirety of the pool perimeter. The capacity of the perimeter overflow system and related piping is permitted to be considered as a portion of the surge capacity.

Reason: The purpose of surge capacity is poorly understood. The idea of surge capacity is to allow the pool to fill up with people and empty out without having to divert the displaced water to waste.

1. Surge capacity should not be required on pools with adequate freeboard, because they will not dump water to waste during a high bather load event. Some pools, such as vanishing edge pools or tension edge pools, would not have adequate freeboards, for example.
2. Areas that only ever have water in motion (such as gutter pipes and gutter trenches) should not count as surge capacity, because these areas typically cannot fill up with water. For example, consider a vanishing edge pool with no main drain that has a section of sloping gutter pipe above the catch basin static water level. This pipe does not get fuller when more people come into the pool. Its fullness depends on the flow rate and pipe slope only.
3. Experience shows many areas have adopted this requirement, but few enforce it, and those that do are not consistent in how they apply it. The requirement of one gallon per square foot converts to a height of about 1.75 inches of water over the pool. Surge capacity is intended to prevent water from going to waste every time a group of bathers enters the pool. Therefore, in a typical open gutter pool, with freeboard behind the gutter dropouts, water is never diverted to waste due to high bather load, and surge capacity is not needed. All that happens in that case is the water over the gutter lip temporarily grows, and this is benign.

The current definition of surge capacity expects the excess water to go to places it will not actually go, because gutter pipes typically run partially full of flowing water down a slope. The volume held in a gutter pipe is a function of the gutter flow rate, and it does not change when some volume is displaced.

Surge capacity should be more narrowly defined, and it should only be required where freeboard is low. This proposal addresses that and adds a definition for "freeboard".

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

Difficult to estimate due to the differences in pool sizes and tank costs between projects.

Surge tanks range in price from $150-$10,000

Assuming a larger residential pool able to use a smaller surge tank under the proposal, the average decrease would likely be $1,000 to $2,000.

Estimated Immediate Cost Impact Justification (methodology and variables):

Listed prices of surge tanks, cost of installation would be unaffected by the tank size.

Estimated Life Cycle Cost Impact:

None.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

None.

SP17-24

Public Hearing Results (CAH1)

Committee Action: **As Modified by Committee**

Committee Modification:
SURGE CAPACITY. The storage volume in a surge tank, *gutter,* and plumbing lines that is available during operation of the pool to temporarily hold water that has been displaced from the pool by bathers, without diverting that water to waste.
~~Water held in surge capacity shall not be in motion due to gravity, rather, only by the pumps.~~

316.4.1 Surge capacity.
Where perimeter surface ~~skimming~~ overflow systems are used, they shall be connected to a circulation system with a system surge capacity of not less than ~~0.5~~ 1 gallon for each square foot (~~20.4~~ 40.7 liters per square meter) of water surface~~.~~ ~~unless there is 2 inches (51 mm) or more of freeboard around the entirety of the pool perimeter. The capacity of the perimeter overflow system and related piping is permitted to be considered as a portion of the surge capacity.~~
Exception: Surge capacity is not required if the following conditions are present:

1. Automatic surface skimmers that are designed to process not less than 100 percent of the turnover rate,
2. Freeboard of 2 inches (51 mm) or more around the entirety of the pool perimeter,

316.3 Skimmer sizing.
Where automatic surface skimmers are used as the sole ~~overflow~~ skimming system, not less than one surface skimmer shall be provided for the square foot (square meter) areas, or fractions thereof, indicated in Table 316.3. Skimmers shall be located to maintain effective skimming action.

Committee Reason: For the modification: The modification provides clarity to the original proposal.(11-0)
For the proposal as modified: The proposal will reduce the needed surge capacity. (11-0)

SP17-24

Individual Consideration Agenda

Comment 1:

ISPSC: SECTION 202, SECTION 316, 316.1, 316.2, 316.2.1, 316.3, TABLE 316.3, 316.4, 316.4.1, TABLE 316.4.1 (New)

Proponents: Gregory Andrew Ceton, Pool and Hot Tub Alliance (gceton@phta.org); Jennifer Hatfield, J. Hatfield & Associates, Pool & Hot Tub Alliance (jen@jhatfieldandassociates.com) requests As Modified by Committee (AMC2)

Further modify as follows:

2024 International Swimming Pool and Spa Code

FREEBOARD. The vertical distance between the operating level of the pool and the level where the water would spill beyond the pool or onto the deck. For a pool with a vanishing edge, or where the coping is lower than the design pool water level, the freeboard would be zero.

SURGE CAPACITY. The storage volume in a surge tank, *gutter,* and plumbing lines that is available during operation of the pool to temporarily hold water that has been displaced from the pool by bathers, without diverting that water to waste.

SECTION 316
~~SKIMMERS~~SURFACE SKIMMING SYSTEMS

316.1 General. The provisions of this section apply to ~~skimmers~~ surface skimming systems for pools and spas.

Exceptions:

1. Portable ~~*residential*~~ electric spas and ~~portable *residential*~~ exercise spas.
2. *Onground storable pools* supplied by the pool manufacturer as a kit that includes a skimming system that is in accordance with Section 704.

316.2 Required. A surface skimming system shall be provided for public *swimming pools* and *permanent spas,* and *residential swimming pools*. ~~Surface skimming systems shall be *listed* and *labeled* in accordance with NSF 50. Either a~~ A surface skimming system shall consist of automatic surface skimmers, or an ~~perimeter~~ overflow gutter system, or a combination of the two~~ shall be provided for permanent inground *residential* pools and permanent *residential* spas~~. Recessed automatic surface skimmers shall be *listed and labeled* in accordance with NSF 50. Where installed, surface skimming systems shall be designed and constructed to create a skimming action on the pool water surface when the water level in the pool is within operational parameters.

Exceptions:

1. Class D public pools designed in accordance with Chapter 6.
2. Skimmers that are an integral part of a spa that has been *listed* and *labeled* in accordance with UL1563 shall not be required to be *listed* and *labeled* in accordance with NSF 50.

316.2.1 Circulation systems. Public pool circulation systems shall be designed to process not less than 100 percent of the turnover rate through ~~skimmers~~their surface skimming system.

316.3 Skimmer sizing. Where automatic surface skimmers are used as the sole surface skimming system, not less than one automatic surface skimmer shall be provided for the square foot (square meter) areas, or fractions thereof, indicated in Table 316.3. Skimmers shall be located to maintain effective skimming action.

TABLE 316.3 SKIMMER SIZING TABLE

POOL OR SPA	AREA PER SKIMMER (SQ. FT)

POOL OR SPA	AREA PER SKIMMER (SQ. FT)
Public pool	500
Residential pool	800
Spas (all types)	150

For SI: 1 square foot = 0.0929 m^2.

316.4 Perimeter coverage. Where a perimeter ~~type~~ overflow gutter surface skimming system is used as the sole surface skimming system, the system shall extend around not less than 50 percent of the pool or spa perimeter.

316.4.1 Surge capacity. Where perimeter ~~surface~~ overflow gutter systems are used, they shall be connected to a circulation system with a system surge capacity of not less than the ~~1 gallon for each square foot (40.7 liters per square meter) of~~ water surface area, multiplied by the factor indicated in Table 316.4.1.

Exception: Surge capacity is not required if both of the following conditions are present:

1. Automatic surface skimmers that are designed to process not less than 100 percent of the turnover rate.
2. A minimum ~~F~~ freeboard of 2 inches (51 mm) ~~or more~~ around the entirety of ~~the~~ a pool perimeter ~~,~~ and a minimum freeboard of 4 inches (102 mm) around the entirety of a spa perimeter.

Add new text as follows:

TABLE 316.4.1 MINIMUM SURGE CAPACITY

Pool Area Type	Required surge capacity (gallons per square foot)
Spa	2
Pool area less than 1ft deep	0.5
Pool area 5 feet deep or more	0.15
All other pool areas	0.9

For SI: 1 gallon per square foot = 40.7 liters per square meter

Reason: The common meaning of "skimmer" is a single device that is about a foot wide connected to the pump suction. The Florida code and the California code both mention skimmers, meaning a single 1' wide device, without defining it, because its meaning is commonly understood.

However, the *ISPSC* uses the word "skimmer" to mean "a system of skimmers" or "the gutter" which contradicts common usage and confuses the reader. Therefore, this public comment more accurately titles this section as a "surface skimming system" as the section covers the two types of systems, skimmers and overflow gutters. This comment also aligns terms with definition changes that were adopted in SP1-24, at the first code action hearing, along with ensuring terms align with existing *ISPSC* definitions.

Section 316.2 also is cleaned up as the intent is clearly for residential pools to have the same skimming requirements as public pools, so there is no need to have separate sentences with different wordings for each set of requirements that could be confusing. The only "skimmers" that are listed and labeled to NSF 50 are Recessed Automatic Surface Skimmers, so that is also clarified.

The background for the additional changes to section 316.4.1 and new Table 316.4.1 is as follows:

- Surge is meant to absorb the displacement caused by occupants. In code action hearing #1, we approved more reliable minimum figures for the number of occupants in a pool (P19-24, Part II). The occupant will displace a volume equal to their submerged volume.
- Spas are now assigned a denser occupancy factor of one occupant per 10 square feet rather than 24 square feet. The industry is seeing a trend of spas designed with overflowing edges. If this section were left unchanged, the current 1 gallon per square foot factor would work out to each occupant in a spa displacing 10 gallons. The median adult male weight is 200 lb. while the median adult female weight is 170 lb., so 185 is the median for both sexes. For occupants weighing approximately 185 lbs., that would require each to be only 45% submerged. The proposed factor assumes that the median occupant is 90% submerged.
- Water depth of less than 1' is most likely a tanning ledge, and people do not lie down in these. They sit on the floor, or they bring a chair; therefore, less than 50% of their bodies will be submerged.
- Water depth of 5' or more is assigned 1 occupant per 150 square feet, and the proposed 0.16 factor preserves the 22.2 gallons per occupant ratio.

- For most pool areas, the occupant load will be 1 per 24 square feet, again corresponding with P19-24, Part II. For these areas, the minimum surge capacity will be 0.9 gallon per square foot, meaning 22.2 gallons are assigned per occupant. A 185 lb. occupant who is floating or fully submerged will displace 22.2 gallons of water. The median adult male weight is 200 lb. while the median adult female weight is 170 lb., so 185 is the median for both sexes, and most occupants will rest their feet on the bottom rather than float in most areas of the pool.

In summary, this public comment means to align with other proposals that were adopted in CAH#1 and made additional needed changes to further clean up this section.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

Fiberglass surge tanks range in price from $150-$10,000. Under this proposal, a larger residential pool will be able to use a smaller surge tank, resulting in an average decrease in construction costs of $1,000 to $2,000.

A similar minor increase could be expected for the proposed increase in required surge capacity for permanent inground spas.

For larger public and residential pools, the product of the proportion of pool construction cost associated with the surge tank, multiplied by the reduction in the surge tank size allowed by this revision, will rarely be more than 1% of the cost to build or operate the pool, but it will be a reduction.

Estimated Immediate Cost Impact Justification (methodology and variables):

This proposal will result in a minor reduction in construction costs for pools and a possible minor increase in construction costs for permanent spas.

The surge capacity factor in the 2024 ISPSC is 1 gallon per square foot. This proposal calls for spas to have double that amount of surge capacity, while other pools and areas of pools will have a reduced minimum surge capacity.

While spas with overflowing edges are rare, they are currently typically being designed with greater surge capacity, to ensure safe operation of pumps in scenarios with a high number of users entering and exiting the spa.

For larger public and residential pools, the current requirement to provide surge capacity generally increases total water volume by 2% to 4% and increases the area of watertight structure by 2% to 8%. Under this proposal, this portion of the cost of pool construction would be decreased by about 10% (as the factor changes from 1 gal/sf to 0.9 gal/sf), for pools between 1' and 5' deep. For depths outside of that range, the savings would be greater.

Estimated Life Cycle Cost Impact:

No change in life cycle cost.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

No changes that have an impact on life cycle costs. All costs are first costs.

Comment (CAH2)# 378

SP29-24

ISPSC: 604.2.2, APSP Chapter 11 (New)

Proposed Change as Submitted

Proponents: Gregory Andrew Ceton, Pool and Hot Tub Alliance (gceton@phta.org); Jennifer Hatfield, J. Hatfield & Associates, Pool & Hot Tub Alliance (jen@jhatfieldandassociates.com)

2024 International Swimming Pool and Spa Code

Revise as follows:

604.2.2 Reduced ~~circulation~~flow rate. ~~The circulation rate~~ The aquatic recreation facility shall be permitted to ~~be~~ reduce~~d~~ the flow rate ~~during periods that the pool is closed for use~~ when not open to bathers and provided ~~that acceptable water clarity conditions are met prior to reopening the pool for public use.~~the water quality is maintained and documented in accordance with APSP-11. Water quality shall be tested and documented prior to opening the aquatic venue to bathers. The reduced ~~circulation~~ flow rate shall not be zero~~.~~ unless approved.

APSP

Pool & Hot Tub Alliance (formerly The Association of Pool & Spa Professionals)
2111 Eisenhower Avenue, Suite 500
Alexandria, VA 22314

ANSI/APSP/ICC 11--2019 American National Standard for Water Quality in Public Pools and Spas

Reason: This change aligns the term "flow rate" which is used in PHTA–2, APSP-11, and the Model Aquatic Health Code (MAHC). The sanitation and pH guidelines incorporated by reference clarify required operation. These requirements for water quality are required by reference in other sections of the ISPSC and do not change the cost of operation.

Bibliography: ANSI/APSP/ICC-11 American National Standard for Water Quality in Public Pools and Spas

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

It is a language change and clarification to ensure similar terminology ("flow rate" as opposed to "circulation rate") is used in all referenced PHTA standards and the Model Aquatic Health Code.

SP29-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The ISPSC is a construction code and not an operation and maintenance code. How is the code official able to enforce the standard after the construction is complete? Also, there is concern about allowing the code official to approve a zero flow rate. Although in favor of a radical turn down of flow rate when the pool is closed, the flow rate should not be zero in order for automated chemical monitoring equipment to maintain proper water chemistry. (11-0)

SP29-24

Individual Consideration Agenda

Comment 1:

ISPSC: 604.2.2, APSP Chapter 11

Proponents: Gregory Andrew Ceton, Pool and Hot Tub Alliance (gceton@phta.org); Jennifer Hatfield, J. Hatfield & Associates, Pool & Hot Tub Alliance (jen@jhatfieldandassociates.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Swimming Pool and Spa Code

604.2.2 Reduced flow rate. The aquatic recreation facility shall be permitted to reduce the flow rate when not open to bathers ~~and provided the water quality is maintained and documented in accordance with APSP-11~~. Water quality shall be tested and documented prior to opening the aquatic venue to bathers. The reduced flow rate shall not be zero ~~unless approved~~.

Delete without substitution:

APSP

Pool & Hot Tub Alliance (formerly The Association of Pool & Spa Professionals)
2111 Eisenhower Avenue, Suite 500
Alexandria, VA 22314

~~ANSI/APSP/ICC-11-2019~~ ~~American National Standard for Water Quality in Public Pools and Spas~~

Reason: This public comment addresses the committees concerns and reason for disapproval.

First, it removes the requirement that the water quality be maintained and documented in accordance with APSP-11, due to the concern a code official would not be able to enforce the standard after the construction is complete.

Second, it removes the language, "unless approved," as it relates to not allowing a reduced flow rate of zero. This provided no guidance for enforcement and more importantly, runs contrary to public pool operations health and safety. PHTA has elected to remove that language to restore the sentence to its original form, addressing the committees concern.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

These comments do not change the cost impact of the proposal as originally submitted.

Comment (CAH2)# 58

SP30-24

ISPSC: SECTION 202, 202, SECTION 202 (New), TABLE 604.2, SECTION 613 (New), 613.1 (New), 613.1.1 (New), 613.1.2 (New), ASTM Chapter 11 (New)

Proposed Change as Submitted

Proponents: Jennifer Hatfield, J. Hatfield & Associates, Pool & Hot Tub Alliance (jen@jhatfieldandassociates.com); Gregory Andrew Ceton, Pool and Hot Tub Alliance (gceton@phta.org)

2024 International Swimming Pool and Spa Code

PUBLIC SWIMMING POOL (Public Pool). A pool, other than a *residential* pool, that is intended to be used for swimming or bathing and is operated by an owner, lessee, operator, licensee or concessionaire, regardless of whether a fee is charged for use. Public pools shall be further classified and defined as follows:

Class A competition pool. A pool intended for use for accredited competitive aquatic events such as Federation Internationale De Natation (FINA), USA Swimming, USA Diving, USA Synchronized Swimming, USA Water Polo, National Collegiate Athletic Association (NCAA), or the National Federation of State High School Associations (NFHS).

Class B public pool. A pool intended for public recreational use that is not identified in the other classifications of public pools.

Class C semi-public pool. A pool operated solely for and in conjunction with lodgings such as hotels, motels, apartments or condominiums.

Revise as follows:

Class D-1 wave action pool. A pool designed to simulate breaking or cyclic waves for purposes of general play ~~or surfing~~.
It does not include a *surf venue*, *surf basin* or *stationary wave system*.

Class D-2 activity pool. A pool designed for casual water play ranging from simple splashing activity to the use of attractions placed in the pool for recreation.

Class D-3 catch pool. A body of water located at the termination of a manufactured waterslide attraction. The body of water is provided for the purpose of terminating the slide action and providing a means for exit to a deck or walkway area.

Class D-4 leisure river. A manufactured stream of water of near-constant depth in which the water is moved by pumps or other means of propulsion to provide a river-like flow that transports bathers over a defined path that may include water features and play devices.

Class D-5 vortex pool. A circular pool equipped with a method of transporting water in the pool for the purpose of propelling riders at speeds dictated by the velocity of the moving stream of water.

Class D-6 interactive play attraction. A manufactured water play device or a combination of water-based play devices in which water flow volumes, pressures or patterns can be varied by the bather without negatively influencing the hydraulic conditions for other connected devices. These attractions incorporate devices or activities such as slides, climbing and crawling structures, visual effects, user-actuated mechanical devices and other elements of bather-driven and bather-controlled play.

Class E. Pools used for instruction, play or therapy and with temperatures above 86°F (30°C).

Class F. Class F pools are wading pools and are covered within the scope of this code as set forth in Section 405.
Public pools are either a diving or nondiving type. Diving types of public pools are classified into types as an indication of the suitability of a pool for use with diving equipment.

Type O. A nondiving public pool.

Types VI–IX. Public pools suitable for the installation of diving equipment by type.

Add new definition as follows:

STATIONARY WAVE SYSTEMS. A system that delivers a constantly flowing sheet of water nominally up to 24 in. thick travelling over a form allowing for patron interaction with a perpetual wave.

SURF BASIN. Mechanical devices to generate moving waves with suitable characteristics for surfing and can provide multiple different wave profiles suitable to any level of surfing.

SURF VENUE. A facility designed to accommodate a large body of water dedicated only to surfing on a surfboard or other similar surfing or wave-riding device, with bathymetry, shape, and design that can use a variety of different mechanisms to generate ocean like surfable waves that shoal and break progressively towards shallow water.

Revise as follows:

TABLE 604.2 TURNOVER TIME

CLASS OF POOL	MAXIMUM TURNOVER TIME[a] (hours)
D-1[b]	2
D-2 with less than 24 inches water depth	1
D-2 with 24 inches or greater water depth	2
D-3	1
D-4	2
D-5	1
D-6	1

For SI: 1 inch = 25.4 mm.

a. Pools with a sand bottom require a 1-hour turnover time.

b. Surf venues, surf basins, and stationary wave systems in compliance with Section 613 are not considered D-1 pools.

Add new text as follows:

SECTION 613
SURF VENUES, SURF BASINS, AND STATIONARY WAVE SYSTEMS

613.1 Surf venues. Surf venues shall comply with Section 613.1.1 or 613.1.2.

613.1.1 SURF basins. Surf basins shall comply with ASTM wk75193.

613.1.2 Stationary wave systems. Stationary wave systems shall comply with ASTM F3133.

Add new standard(s) as follows:

ASTM

ASTM International
100 Barr Harbor, P.O. Box C700
West Conshohocken, PA 19428-2959

F3133–21	Standard Practice for Classification, Design, Manufacture, Construction, Maintenance, and Operation of Stationary Wave Systems
wk75193-xx	Standard Practice for Classification, Design, Manufacture, Construction, Maintenance, and Operation of Controlled Surf(ing) Basins

Reason: The ISPSC currently addresses surf pools within Class D-1 wave action pools; however, these are two different types of pools/systems/venues. This proposal clarifies that a D-1 wave action pool is not a surf pool by striking that current wording and at the same time adding a sentence to clarify that a surf venue, surf basin or stationary wave system is not a D-1 wave action pool.

The proposal then provides new definitions to define a surf venue, surf basin and stationary wave system. These are the terms associated with this rapidly growing facet of the aquatic industry. The surf venue and surf basin definitions are based on industry code and standard work that is currently being worked on. Whereas the stationary wave system definition is based on an approved ASTM

standard.

This proposal moves to Chapter 6 to clarify in Table 604.2 that D-1 turnover requirements do not apply to surf venues, surf basins and stationary wave systems that comply with the newly proposed Section 613. This is to ensure D-1 wave pool turnover requirements are not erroneously applied to these surfing areas and systems.

The new section 613 being proposed then requires that surf venues comply with either two subsections. One subsection requires surf basins to comply with the draft ASTM standard currently being developed and the other subsection requires stationary wave systems to comply with the 2021 edition of the ASTM F3133 Standard for such systems.

This proposal is needed to both ensure these increasingly popular surfing venues and devices are a) not confused with wave action pools and their associated requirements and b) to ensure there are appropriate requirements for surf venues, basins and stationary wave system devices to protect those who utilize them. Simply put, unique surfing venues are currently not appropriately captured in the ISPSC. This proposal is a first step in doing so, recognizing that additional design guidelines will need to be added in the future.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

The decrease in cost can range from $40,000 to $2,000,000 per project due to the greater allowance in turnover time by clarifying these products are not wave pools.

Estimated Immediate Cost Impact Justification (methodology and variables):

The cost estimate range considers the filtration cost comparing the filter system required for a 2-hour D-1 wave pool turnover rate to a 6 hour turnover rate.

SP30-24

Public Hearing Results (CAH1)

Committee Action: **As Modified by Committee**

Committee Modification:

Class D-1 wave action pool. A pool designed to simulate breaking or cyclic waves for purposes of general play .
It does not include a ~~*surf venue*~~, *surf basin* or *stationary wave system*.

~~**SURF VENUE.**~~

~~A facility designed to accommodate a large body of water dedicated only to surfing on a surfboard or other similar surfing or wave-riding device, with bathymetry, shape, and design that can use a variety of different mechanisms to generate ocean like surfable waves that shoal and break progressively towards shallow water.~~

D-3	1
D-4	2
D-5	1
D-6	1

For SI: 1 inch = 25.4 mm.

a. Pools with a sand bottom require a 1-hour turnover time.

b. ~~Surf venues, s~~ Surf basins, and stationary wave systems in compliance with Section 613 are not considered D-1 pools.

SECTION 613
~~SURF VENUES,~~ SURF BASINS, AND STATIONARY WAVE SYSTEMS

~~613.1 Surf venues.~~
~~Surf venues shall comply with Section 613.1.1 or 613.1.2.~~

Committee Reason: For the modification: Appropriately removes the terms "surf venue" as this is not an industry term.(11-0)
For the proposal as modified: The Committee agreed with the published reason statement. (11-0)

SP30-24

Individual Consideration Agenda

Comment 1:

ISPSC: SECTION 202

Proponents: Jennifer Hatfield, J. Hatfield & Associates, Pool & Hot Tub Alliance (jen@jhatfieldandassociates.com); Gregory Andrew Ceton, Pool and Hot Tub Alliance (gceton@phta.org) requests As Modified by Committee (AMC2)

Further modify as follows:

2024 International Swimming Pool and Spa Code

SURF BASIN.
A constructed body of water with ~~M~~mechanical devices used to generate moving waves that shoal and break toward shallow water with suitable characteristics for surfing and can provide multiple different wave profiles suitable to any level of surfing. A surf basin is only intended to be used for surfing.

Reason: The definition of "surf basin" is expanded and clarified to make it more directly similar to the planned scope of the ASTM standard that provides the technical basis for this new section and to clarify the intended type of facility governed by this new section of the ISPSC.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

The decrease in cost can range from $40,000 to $2,000,000 per project due to the greater allowance in turnover time by clarifying these products are not wave pools.

Estimated Immediate Cost Impact Justification (methodology and variables):

The cost estimate range considers the filtration cost comparing the filter system required for a 2-hour D-1 wave pool turnover rate to a 6 hour turnover rate.

Comment (CAH2)# 679

2024 International Private Sewage Disposal Code

CHAPTER 2
DEFINITIONS

SECTION 202
GENERAL DEFINITIONS

Add new definition as follows:

COMMODE. A fixture without connection to a *sanitary drainage system* used for collecting, containing, or transporting excreta to a *compost processor*. (also dry toilet, urine diverting dry toilet, vacuum flush toilet, foam flush toilet).

COMPOST ADDITIVES. Any material such as sawdust, wood shavings, and other compostable material added to maintain operational conditions within the *composting toilet system*.

COMPOSTING TOILET SYSTEM. A system designed to safely collect and process *excreta* and c*ompost additives* into *humus* through aerobic decomposition.

COMPOST PROCESSOR. The site of aerobic decomposition transforming *excreta* and *compost additives* into *humus*.

DIVERTED URINE. Urine that is collected separately from fecal matter.

EXCRETA. Includes but is not limited to urine, feces, menses, and other human body emissions, as well as toilet paper and biodegradable cleaning products.

HUMUS. The biologically decomposed, soil-like output of the compost processor.

LEACHATE. Liquid drained from a compost processor.

SECONDARY COMPOSTING. Additional retention and continued decomposition of humus removed from compost processors in order to meet the required retention time.

URINE DIVERSION. Collection of *diverted urine* that occurs at the fixture.

URINE DIVERTING COMMODE. A commode that separates urine from other *excreta* and directs urine to a *urine diversion* system that is in accordance with the International Plumbing Code.

Revise as follows:

CHAPTER 13
~~NONLIQUID SATURATED TREATMENT SYSTEMS~~ COMPOSTING TOILET SYSTEMS

SECTION 1301
GENERAL

Revise as follows:

1301.1 Scope. The provisions of this chapter shall govern ~~nonliquid saturated treament systems~~ *composting toilet systems*.

1301.2 ~~Nonliquid saturated treatment systems~~ Maintenance responsibility. ~~The regulations for materials, design, construction and performance shall comply with NSF 41.~~The required maintenance and inspection of *composting toilet systems* shall be the responsibility of the property owner, unless otherwise required by the code official.

Add new text as follows:

1301.3 Operation. *Composting toilet systems* shall be operated and maintained in a safe and sanitary condition in accordance with the Section 1301.4.

1301.4 Operation and maintenance manual. An operation and maintenance manual shall be supplied in hardcopy with all systems. The manual shall be transferred to the new owner or tenant upon transfer of property or tenancy. The manual shall include the following items:

1. Schedule for addition of necessary *compost additives*.
2. Source or provider of necessary *compost additives*. Source may be on-site.
3. Schedule for all regular maintenance tasks.
4. Instructions for all regular maintenance tasks.
5. Expected input of and capacity for *excreta* and *compost additives* to compost toilet system specifying loading of *commode*(s) and *compost processor*(s).
6. Treatment period and expected schedule for removing *humus* from *composting processors* and *secondary composting*, where used.
7. Plan for container transfer and cleaning where transfer is used.
8. Plan for on-site disposal of *humus* or professional removal.
9. Plan for managing *leachate*.
10. For *composting toilet systems* not tested to NSF 41, a plan for microbial testing in accordance with Section 1302.5.2.

1301.5 Approved systems. Composting toilets and *composting toilet systems* shall comply with NSF 41 or shall be in accordance with Section 1302.

SECTION 1302
COMPOSTING TOILET SYSTEM DESIGN

1302.1 Approval. *Composting toilet systems* complying with this section shall be permitted for residential, commercial, and institutional applications.

1302.2 System records. The property owner is responsible for retaining test result records in accordance with the Section 1302.5.2 and making such records available to the *code official* upon request. Upon transfer of property or tenancy, all test records shall be transferred to the owner or tenant, and *humus* shall be re-tested after its first treatment period and a record retained by the property owner.

1302.3 System materials and components. All components expected to contact *excreta* or *leachate* shall be constructed of corrosion-resistant material such as stainless steel or durable polymers. Concrete in contact with *excreta* or *leachate* shall meet requirements of Section 1302.3.3.

1302.3.1 Pipes and fixtures. Pipe, pipe fittings, traps, fixtures, material, and devices used in *composting toilet systems* that are expected to contact *leachate* or *diverted urine* shall be listed by an approved agency or a third-party certification agency in accordance with Section 505 or the International Plumbing Code, unless otherwise approved by the *code official*. Products and materials shall be identified.

1302.3.2 Screening. Where screening is required to prevent the unintentional entry of insects and vermin, screening shall have openings with a maximum size of 3/32 inch (2.5mm). Screening shall be made of materials compatible with the system components in contact with screen materials. Screen materials shall not generate galvanic corrosion of system components.

1302.3.3 Concrete construction. Concrete construction shall be reinforced, watertight, and able to withstand loading in compliance with Section 1302.3.3. Where drainage is required, the *compost processor* floor shall be sloped not less than ¼-inch per foot (20mm per meter), or 2 percent. The flange of each sub-drain shall be set level.

1302.3.4 Commodes. *Commodes* shall be designed to support users of a weight not less than 300 pounds (136 kg). *Commodes* shall transport *excreta* into the *compost processor* or contain *excreta* for transfer as designed and in accordance with the operation and maintenance manual.

1302.3.4.1 Urine diversion. *Urine diversion* piping shall be connected to a *urine diversion* system in accordance with the International Plumbing Code.

1302.4 Compost processors. *Compost processors* shall maintain unsaturated aerobic composting conditions within the compost mass through the drainage, absorption or desiccation of *leachate*; and aeration of the *compost processor*.

1302.4.1 Openings. All openings shall be covered and secured to prevent tampering. Openings shall be screened or covered to prevent insect and vermin infiltration and be protected against unauthorized human entry.

1302.4.2 Transfer. Where unfinished *excreta* or *diverted urine* is transferred between *compost processors* or from *commode* to *compost processor*, transfer and cleaning of containers and provisions for limiting user exposure shall be in accordance with the operation and maintenance manual.

1302.4.3 Watertightness. *Compost processors* shall be constructed of watertight material in accordance with Section 1302.3.

1302.4.4 Insects and vermin. *Compost processors* shall be protected to prevent the unintentional entry of insects and vermin. No unsecured opening other than vents, drainage, or *commode* may exceed 1/2 inch (12.7 mm) in the least dimension.

1302.4.5 Sizing. *Compost processors* shall be sized to accommodate the maximum daily adult usage as specified by the manufacturer's or designer's published ratings. *Compost processors* shall be sized to hold at least 10 gallons (38L) of material per person per year while

allowing for the removal of the *humus*.

1302.4.6 Treatment period. The *compost processor* or processors shall be sized to compost *excreta* for a treatment period with a minimum of one year of biologically active conditions. Biologically active conditions shall be maintained at or above a daily average of 42°F (6°C).

Exception: Systems with shorter treatment periods shall be permitted where either:

1. *Humus* from the compost processor has been tested in accordance with Section 1302.5.2 and transferred to *secondary composting* in accordance with Section 1302.4.7.
2. *Humus* is removed off site for processing or disposal at an approved facility.

1302.4.7 Secondary composting. *Humus* transferred to *secondary composting* shall first be tested in accordance with Section 1302.5.2. *Secondary composting* shall be labeled and protected from human contact in a well maintained compost bin or other facility designated for the exclusive purpose of containing *humus* removed from the *compost processor*. Contact with precipitation and surface waters shall be prohibited.

1302.4.8 Venting. Negative pressure between the *commode* and *compost processor* shall be provided where the *compost processor* is connected directly to the *commode* without a trap.

1302.4.9 Vent terminals. Vent stacks shall terminate to the exterior of the building in compliance with the requirements of the International Plumbing Code.

1302.4.10 Leachate. *Leachate* shall be collected for removal or recirculation within the *compost processor*, evaporated or drained to an approved sanitary drainage system or other location approved by the *code official*.

1302.4.11 Leachate storage tanks. *Leachate* storage tanks shall be constructed of corrosion resistant materials.

1302.4.11.1 Venting. *Leachate* storage tanks shall be vented as required for pressure equalization. When required, vents shall be installed on leachate storage tanks and shall extend from the top of the tank. Storage tank vents shall be permitted to connect to the plumbing venting system at least 6 inches (150mm) above the flood level rim of the highest fixture. Vents extending to the outdoors shall terminate no less than 12 inches (300mm) above grade. The vent terminal shall be directed downward and covered screening to prevent the unintentional entry of insects and vermin.

1302.4.11.2 Vent size. Pressure equalization vents that prevent nitrogen loss by the use of restrictions, or of piping or tubing that is less than the minimum pipe diameter required by Section 1302.3.1, shall be approved by the *code official*.

1302.4.11.3 Overflow. Where storage tank overflows are installed, they shall be connected to the sanitary drainage system.

1302.4.11.4 Backwater prevention. Storage tank overflows shall be provided with a backwater valve or check valve at any point of connection to a sanitary drainage system or *private sewage disposal system* subject to backflow. The backwater valve shall be accessible for inspections and maintenance.

1302.4.11.5 Above grade. Where subject to freezing conditions, storage tanks shall be provided with an adequate means of freeze protection. Above grade leachate storage tank shall be provided with a high-water sensing device and alarm system. The alarm shall report when 80 percent volume is reached.

1302.4.11.6 Below grade. *Leachate* storage tanks installed below grade shall be structurally designed to withstand all anticipated earth or other loads. Tank covers shall be capable of supporting an earth load of not less than 300 pounds per square foot (lb/ft2) (150 kg/m2) when the tank is designed for underground installation. Below grade *leachate* tanks installed underground shall be provided with

manholes. The manhole opening shall be at least 20 inches (500 mm) in diameter and located at least 4 inches (100 mm) above the surrounding grade. The surrounding grade shall be sloped away from the manhole. Underground tanks shall be ballasted, anchored, or otherwise secured, to prevent the tank from floating out of the ground when empty. The combined hold-down capacity of the tank and hold down system shall meet or exceed the buoyancy force of the tank. Below grade *leachate* storage tank shall be provided with a high-water sensing device and alarm system.

1302.4.11.7 Marking. Where openings are provided to allow a person to enter the tank, the opening shall be marked with the following words: "DANGER—CONFINED SPACE." The letters shall be not less than 0.5 inch (12.7 mm) in height and shall be of a color in contrast with the background on which they are applied.

1302.5 Testing. Prior to permit issuance, *composting toilet systems* shall be tested for watertightness in accordance with Section 1302.5.1. Humus from the first treatment period shall be tested after the first treatment period in accordance with Section 1302.5.2.

1302.5.1 Compost processors. *Compost processors* shall be tested for watertightness by filling the system to the maximum designed liquid storage capacity of the unit for a duration of 24 hours.

1302.5.2 Humus. The owner or owner's agent of the *composting toilet system* shall verify compliance with the operation and maintenance manual after the first treatment period and before removal of *humus* from the *compost processor.* A sample of the *humus* from the first treatment period shall be submitted to a certified laboratory. Where multiple *compost processors* are used, the *humus* sample shall be removed from the last *compost processor.* The sample shall be tested in accordance with NSF 41. *Humus* shall not have a moisture content exceeding 75 percent by weight, and the most probable number (MPN) fecal coliform assay shall not exceed 200 MPN per gram (dry weight basis).

1302.5.3 Testing following repairs and alterations. If the *code official* determines that new tests are required following repairs or alterations, tests shall be conducted at the owner's expense and in accordance with Section 1302.5.

1302.6 Humus removal. *Humus* shall be removed in accordance with the operation and maintenance manual. *Humus* from the *compost processor* shall be permitted to be used around ornamental shrubs, flowers, trees, or fruit trees and shall be mixed with soil or mulch and covered with at least 3 inches (76mm) of cover material. Depositing *humus* from any *composting toilet system* around any edible vegetable or vegetation shall be prohibited.

Reason: This proposal offers two paths to composting toilet system approval: either following NSF 41 (as currently provided for in Chapter 13), or with a system inspected and tested to requirements or standards that are as strict or stricter than NSF 41 (through this proposal's new provisions). Integration of the provisions of this proposal into the IPSDC will promote time-tested, safe practices by placing clear requirements for each system component directly into the code. Under the path added by this proposal, each system installation is verified for watertightness, mandated to have a 1-year treatment period to ensure pathogen destruction, tested for proper operation, and required to document and preserve operation and maintenance information. System features that NSF 41 leaves to individual manufacturers or jurisdictions, including venting, screening for insects and vermin, leachate management, and disposal of the outputs of compost processors away from human contact, are subject to clear and enforceable requirements under this proposal.

This proposal is intended to promote the growth of a domestic component supply industry for composting toilet systems that will enable the design of systems appropriate to the scale of the installation. Because NSF 41 treats composting toilet systems as manufactured products rather than systems assembled from a variety of components, the size of composting chambers is limited. For instance, the Bullitt Center in Seattle required multiple Phoenix composting chambers, and load balancing the various chambers created maintenance headaches that were pivotal to removal of the composting toilet system.[1] Under the requirements of this proposal, larger composting chambers could be assembled on-site and tested for watertightness and treatment efficacy, potentially simplifying system design and long-term maintenance. Such site-built composting chambers have become a common feature of large-scale projects in the Netherlands and elsewhere.[2]

Urine diversion can improve the function and reduce the labor and compost additives needed to control odor in a composting toilet system. The use of urine diversion with composting toilets was a core recommendation of the Bullitt Center team. Urine diversion is connected by this proposal's Section 1302.3.4.1 to the IPC and through a parallel Urine Diversion Systems proposal for the IPC. The language in this proposal is based on the Recode Model Code, which incorporates the latest best practices from around the globe. The

Recode Model Code was created in 2015 through a consensus process with a national team of U.S. experts, and was incorporated into IAPMO'S 2017 Water Efficiency and Sanitation Standard (WE Stand), which was revised in 2020 and 2023. The latest Recode Model Code incorporates refinements from the WE Stand process and lessons learned by designers and installers in the interim.

Additionally, a change in the title of Chapter 13 is proposed from "Non-Liquid Saturated Treatment Systems" because that term is not standard in either the industry or its literature, and appears only in NSF 41. The proposed title "Composting Toilet Systems" emphasizes the entire system, rather than a single product, and is a common term used in industry literature and by NSF 41 tested manufacturers such as 'Sun Mar' and 'Advanced Composting Systems'.

(1) *The Bullitt Center Composting Toilet System A White Paper on Lessons Learned*, Bullit Foundation, Seattle, WA, 2021.

(2) Lansing, J. *Designing for Source Separation – the Key to a Regenerative Building*. Rich Earth Summit, Brattleboro, VT, 2023.

Bibliography: 1302.4.6 Treatment period.

One year is approximately twice as long as the survival time of *Ascaris* (Roundworm) eggs under active composting, per Table 6-2 of Biosolids Applied to Land. *Ascaris* are used as an indicator species for long-lived and hard-shelled pathogens.

National Research Council. 2002. *Biosolids Applied to Land*. Washington, DC: The National Academies Press. https://doi.org/10.17226/10426

1302.5.2 Humus.

Bacteriological testing requirements are per NSF 41.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

- **CT-equipment-cost.pdf**
  https://www.cdpaccess.com/proposal/10314/30802/documentation/147968/attachments/download/4627/

Justification for no cost impact:

Composting toilet systems tested to NSF 41 and those not tested to NSF 41 are comparably priced for similar feature sets and capacities. Under this proposal, systems not tested to NSF 41 will also require a fecal coliform test, which will add $30-60 to those systems; however, the equipment costs will remain comparable.

Composting toilet systems designed for full-time residential use by one to six users and with the most basic dry commode are available in sufficient variety to compare equipment prices of NSF 41 tested systems and those not tested to NSF 41. For NSF 41 tested systems meeting the above criteria, market prices range from $639 to $7700. Systems meeting the same criteria that are not tested to NSF 41 range in price from $1280 to $4745. Please see the attached table for equipment prices as of January 2024.

For engineered systems built on-site and meeting similar criteria, Nutrient Networks estimates system costs of $400 to $6000 before installation.

PSD1-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The language leaves a lot of determinations for compliance up to the code official for which they may not be qualified to make. The scope of the code doesn't cover operation and maintenance. (13-1)

~~CHAPTER 13~~
~~COMPOSTING TOILET SYSTEMS~~

Add new text as follows:

APPENDIX D
COMPOSTING TOILET SYSTEMS

1301.1 Nonliquid saturated treatment systems. The regulations for materials, design, construction and performance shall comply with NSF 41. **Exception**: *Approved composting toilet systems.*

Revise as follows:

SECTION ~~1301~~ D101
GENERAL

~~1301.1~~ D101.1 Scope. The provisions of this ~~chapter~~appendix shall govern *composting toilet systems*.

~~1301.2~~ D101.2 Maintenance responsibility. The required maintenance and inspection of *composting toilet systems* shall be the responsibility of the property owner, unless otherwise required by the *code official*.

~~1301.3~~ D101.3 Operation. *Composting toilet systems* shall be operated and maintained in a safe and sanitary condition in accordance with the Section ~~13~~D101.4.

~~1301.4~~ D101.4 Operation and maintenance manual. An operation and maintenance manual shall be supplied in hardcopy with all systems. The manual shall be transferred to the new owner or tenant upon transfer of property or tenancy. The manual shall include the following items:

1. Schedule for addition of necessary *compost additives*.
2. Source or provider of necessary *compost additives*. Source may be on-site.

3. Schedule for all regular maintenance tasks.
4. Instructions for all regular maintenance tasks.
5. Expected input of and capacity for *excreta* and *compost additives* to *composting toilet system* specifying loading of *commode*(s) and *compost processor*(s).
6. Treatment period and expected schedule for removing *humus* from *composting processors* and *secondary composting*, where used.
7. Plan for container transfer and cleaning where transfer is used.
8. Plan for on-site disposal of *humus* or professional removal of *humus* in accordance with the authority having jurisdiction.
9. Plan for managing *leachate*.
10. For *composting toilet systems* not tested to NSF 41, a plan for microbial testing in accordance with Section ~~13~~ D102.5.2.

~~1301.5~~ **D101.5 Approved systems.** Composting toilets and *composting toilet systems* shall comply with NSF 41 or shall be in accordance with Section ~~13~~D102.

SECTION ~~1302~~ D102
COMPOSTING TOILET SYSTEM DESIGN

~~1302.1~~ **D102.1 Approval.** Where approved, *c~~C~~omposting toilet systems* complying with this section shall be permitted for residential, commercial, and institutional applications.

~~1302.2~~ **D102.2 System records.** The property owner is responsible for retaining test result records in accordance with the Section ~~13~~D102.5.2 and making such records available to the *code official* upon request. Upon transfer of property or tenancy, all test records shall be transferred to the owner or tenant, and *humus* shall be re-tested after its first treatment period and a record retained by the property owner.

~~1302.3~~ **D102.3 System materials and components.** All components expected to contact *excreta* or *leachate* shall be constructed of corrosion-resistant material such as stainless steel or durable polymers. Concrete in contact with *excreta* or *leachate* shall meet requirements of Section ~~13~~D102.3.3.

~~1302.3.1~~ **D102.3.1 Pipes and fixtures.** Pipe, pipe fittings, traps, fixtures, material, and devices used in *composting toilet systems* that are expected to contact *leachate* or *diverted urine* shall be listed by an approved agency or a third-party certification agency in accordance with Section 505 or the International Plumbing Code, unless otherwise approved by the *code official*. Products and materials shall be identified.

~~1302.3.2~~ **D102.3.2 Screening.** Where screening is required to prevent the unintentional entry of insects and vermin, screening shall have openings with a maximum size of 3/32 inch (2.5mm). Screening shall be made of materials compatible with the system components in contact with screen materials. Screen materials shall not generate galvanic corrosion of system components.

~~1302.3.3~~ **D102.3.3 Concrete construction.** Concrete construction shall be reinforced, watertight, and able to withstand loading in compliance with Section ~~13~~D102.3.3. Where drainage is required, the *compost processor* floor shall be sloped not less than ¼-inch per foot (20mm per meter), or 2 percent. The flange of each sub-drain shall be set level.

~~1302.3.4~~ **D102.3.4 Commodes.** *Commodes* shall be designed to support users of a weight not less than 300 pounds (136 kg). *Commodes* shall transport *excreta* into the *compost processor* or contain *excreta* for transfer as designed and in accordance with the operation and maintenance manual.

~~1302.3.4.1~~ **D102.3.4.1 Urine diversion.** *Urine diversion* piping shall be connected to a *urine diversion* system in accordance with the International Plumbing Code.

~~1302.4~~ **D102.4 Compost processors.** *Compost processors* shall maintain unsaturated aerobic composting conditions within the compost mass through the drainage, absorption or desiccation of *leachate*; and aeration of the *compost processor*.

~~1302.4.1~~ **D102.4.1 Openings.** All openings shall be covered and secured to prevent tampering. Openings shall be screened or covered to prevent insect and vermin infiltration and be protected against unauthorized human entry.

~~1302.4.2~~ **D102.4.2 Transfer.** Where unfinished *excreta* or *diverted urine* is transferred between *compost processors* or from *commod*e to *compost processor*, transfer and cleaning of containers and provisions for limiting user exposure shall be in accordance with the operation and maintenance manual.

~~1302.4.3~~ **D102.4.3 Watertightness.** *Compost processors* shall be constructed of watertight material in accordance with Section ~~13~~D102.3.

~~1302.4.4~~ **D102.4.4 Insects and vermin.** *Compost processors* shall be protected to prevent the unintentional entry of insects and vermin. No unsecured opening other than vents, drainage, or *commode* may exceed 1/2 inch (12.7 mm) in the least dimension.

~~1302.4.5~~ **D102.4.5 Sizing.** *Compost processors* shall be sized to accommodate the maximum daily adult usage as specified by the manufacturer's or designer's published ratings. *Compost processors* shall be sized to hold at least 10 gallons (38L) of material per person per year while allowing for the removal of the *humus*.

~~1302.4.6~~ **D102.4.6 Treatment period.** The *compost processor* or processors shall be sized to compost *excreta* for a treatment period with a minimum of one year of biologically active conditions. Biologically active conditions shall be maintained at or above a daily average of 42°F (6°C).

Exception: Systems with shorter treatment periods shall be permitted where either:

1. *Humus* from the compost processor is ~~has been~~ tested in accordance with Section ~~13~~ D102.5.2 and transferred to *secondary composting* in accordance with Section ~~13~~ D102.4.7.
2. *Humus* is removed off site for processing or disposal at an approved facility.

~~1302.4.7~~ **D102.4.7 Secondary composting.** *Humus* transferred to *secondary composting* shall first be tested in accordance with Section ~~13~~D102.5.2. *Secondary composting* shall be labeled and protected from human contact in a well maintained compost bin or other facility designated for the exclusive purpose of containing *humus* removed from the *compost processor*. Contact with precipitation and surface waters shall be prohibited.

~~1302.4.8~~ **D102.4.8 Venting.** Negative pressure between the *commode* and *compost processor* shall be provided where the *compost processor* is connected directly to the *commode* without a trap.

~~1302.4.9~~ **D102.4.9 Vent terminals.** Vent stacks shall terminate to the exterior of the building in compliance with the requirements of the International Plumbing Code.

~~1302.4.10~~ **D102.4.10 Leachate.** *Leachate* shall be collected for removal or recirculation within the *compost processor*, evaporated or drained to an approved sanitary drainage system or other location approved by the *code official*.

~~1302.4.11~~ **D102.4.11 Leachate storage tanks.** *Leachate* storage tanks shall be constructed of corrosion resistant materials.

~~1302.4.11.1~~ **D102.4.11.1 Venting.** *Leachate* storage tanks shall be vented as required for pressure equalization. When required, vents shall be installed on leachate storage tanks and shall extend from the top of the tank. Storage tank vents shall be permitted to connect to the plumbing venting system at least 6 inches (150mm) above the flood level rim of the highest fixture. Vents extending to the outdoors shall terminate no less than 12 inches (300mm) above grade. The vent terminal shall be directed downward and covered screening to prevent the unintentional entry of insects and vermin.

~~1302.4.11.2~~ **D102.4.11.2 Vent size.** Pressure equalization vents that prevent nitrogen loss by the use of restrictions, or of piping or tubing

that is less than the minimum pipe diameter required by Section ~~13~~D102.3.1, shall be approved by the *code official.*

~~**1302.4.11.3**~~ **D102.4.11.3 Overflow.** Where storage tank overflows are installed, they shall be connected to the sanitary drainage system.

~~**1302.4.11.4**~~ **D102.4.11.4 Backwater prevention.** Storage tank overflows shall be provided with a backwater valve or check valve at any point of connection to a sanitary drainage system or *private sewage disposal system* subject to backflow. The backwater valve shall be accessible for inspections and maintenance.

~~**1302.4.11.5**~~ **D102.4.11.5 Above grade.** Where subject to freezing conditions, storage tanks shall be provided with an adequate means of freeze protection. Above grade leachate storage tank shall be provided with a high-water sensing device and alarm system. The alarm shall report when 80 percent volume is reached.

~~**1302.4.11.6**~~ **D102.4.11.6 Below grade.** *Leachate* storage tanks installed below grade shall be structurally designed to withstand all anticipated earth or other loads. Tank covers shall be capable of supporting an earth load of not less than 300 pounds per square foot (lb/ft2) (150 kg/m2) when the tank is designed for underground installation. Below grade *leachate* tanks installed underground shall be provided with manholes. The manhole opening shall be at least 20 inches (500 mm) in diameter and located at least 4 inches (100 mm) above the surrounding grade. The surrounding grade shall be sloped away from the manhole. Underground tanks shall be ballasted, anchored, or otherwise secured, to prevent the tank from floating out of the ground when empty. The combined hold-down capacity of the tank and hold down system shall meet or exceed the buoyancy force of the tank. Below grade *leachate* storage tank shall be provided with a high-water sensing device and alarm system.

~~**1302.4.11.7**~~ **D102.4.11.7 Marking.** Where openings are provided to allow a person to enter the tank, the opening shall be marked with the following words: “DANGER—CONFINED SPACE.” The letters shall be not less than 0.5 inch (12.7 mm) in height and shall be of a color in contrast with the background on which they are applied.

~~**1302.5**~~ **D102.5 Testing.** Prior to permit issuance, *composting toilet systems* shall be tested for watertightness in accordance with Section ~~13~~D102.5.1. Humus from the first treatment period shall be tested after the first treatment period in accordance with Section ~~13~~D102.5.2.

~~**1302.5.1**~~ **D102.5.1 Compost processors.** *Compost processors* shall be tested for watertightness by filling the system to the maximum designed liquid storage capacity of the unit for a duration of 24 hours. If the test discloses leaks, the system shall be repaired or altered and shall be reinspected and tested.

~~**1302.5.2**~~ **D102.5.2 Humus.** The owner or owner’s agent of the *composting toilet system* shall verify compliance with the operation and maintenance manual after the first treatment period and before removal of *humus* from the *compost processor*. A sample of the *humus* from the first treatment period shall be submitted to a certified laboratory. Where multiple *compost processors* are used, the *humus* sample shall be removed from the last *compost processor*. The sample shall be tested in accordance with NSF 41. *Humus* shall not have a moisture content exceeding 75 percent by weight, and the most probable number (MPN) fecal coliform assay shall not exceed 200 MPN per gram (dry weight basis).

~~**1302.5.3**~~ **D102.5.3 Testing following repairs and alterations.** If the *code official* determines that new tests are required following repairs or alterations, tests shall be conducted at the owner’s expense and in accordance with Section ~~13~~D102.5.

Delete without substitution:

~~**1302.6 Humus removal.** *Humus* shall be removed in accordance with the operation and maintenance manual. *Humus* from the *compost processor* shall be permitted to be used around ornamental shrubs, flowers, trees, or fruit trees and shall be mixed with soil or mulch and covered with at least 3 inches (76mm) of cover material. Depositing *humus* from any *composting toilet system* around any edible vegetable or vegetation shall be prohibited.~~

Reason: Proposed changes address committee comments and suggestions from testimony. The proposal is now an appendix rather than an addition to Chapter 13. The changes remove several provisions that code officials cannot verify during inspection. Changes also strengthen testing and inspection requirements.The following changes were made to address comments:

- Section 1302.6, Humus removal, could not be inspected and enforced by a code official. Now the proposal simply ensures a removal plan exists (D101.4 Operation and maintenance manual, item 8). This provision mirrors code for approval of holding tanks (805.1, Approval).

- Section D102.1, Approval, now begins with “where approved.”

- Section D102.5, Testing, removes the language about permit issuance.

- Section D102.5.1, Compost processors, now says that any leaks disclosed by the test shall be repaired, reinspected, and tested.

- Section D102.5.3, Testing following repairs and alterations, now mandates testing following repairs or alterations.

The resulting proposal is stronger, more enforceable, and more consistent with other sections of the IPSDC.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposed changes correct deficiencies in the original proposal. No changes to the installation, design, or operation are proposed.

Comment (CAH2)# 727

P1-24

IPC: SECTION 202

Proposed Change as Submitted

Proponents: Guy McMann, Jefferson County Colorado, CAPMO (gmcmann@jeffco.us)

2024 International Plumbing Code

Revise as follows:

BATHROOM GROUP. A group of fixtures consisting of a water closet, urinal, lavatory, bathtub or shower, including or excluding a bidet, an *emergency floor drain* or both. Such fixtures are located together on the same floor level.

Reason: There doesn't seem to be a technical reason to not include a urinal in a wet vented bathroom group. Currently, the fixture can't be included and is dealt with separately.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

Decrease in cost will be realized by not having to plumb the fixture separately .The estimated cost savings for a typical urinal installation is $100 to $250

Estimated Immediate Cost Impact Justification (methodology and variables):

.Material (pipe and fittings) $15 to $100 and the labor is $60 to $120 depending on the salary of the installer.

P1-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: A bathroom group of fixtures is meant to be used by a single occupant. Adding another fixture such as a urinal makes the group a multiple occupant use which could overload the wet vent system.. (14-0)

P1-24

Individual Consideration Agenda

Comment 1:

IPC: SECTION 202

Proponents: Guy McMann, Jefferson County Colorado, CAPMO (gmcmann@jeffco.us) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Plumbing Code

BATHROOM GROUP. A group of fixtures consisting of a water closet, ~~urinal,~~ lavatory, bathtub or shower, including or excluding a urinal or bidet, an *emergency floor drain* or both. Such fixtures are located together on the same floor level.

Reason: The committee was concerned of the placement of the word "urinal" so it is relocated to ad it as an option.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

Decrease in cost will be realized by not having to plumb the fixture separately. The estimated cost savings for a typical urinsl installation is $100 to $250.

Estimated Immediate Cost Impact Justification (methodology and variables):

Material (pipe and fittings) $15 to $100 and the labor is $60 to $120 depending on the salary of the installer.

P4-24 Part I

IPC: 305.4

Proposed Change as Submitted

Proponents: James Richardson, City of Columbus (Ohio), City of Columbus (Ohio) (jarichardson@columbus.gov)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE PLUMBING CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-MP CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Plumbing Code

Revise as follows:

305.4 Freezing. Water, soil and waste pipes shall not be installed outside of ~~a~~ the building~~, in attics or crawl spaces, concealed in outside walls, or in any other place subjected to freezing temperatures unless adequate provision is made to protect such pipes from freezing by insulation or heat or both~~ thermal envelope. Exterior water supply system piping shall be installed not less than 6 inches (152 mm) below the frost line and not less than 12 inches (305 mm) below grade.

Reason: The current code text is misleading to many including owners, contractors, and even design professional. Providing "heat, insulation, or both" give them the impression that there is a choice when the reality is the piping must remain in a space that has adequate heat to prevent freezing. Insulation can serve 1 of 2 purposes, it is used to prevent the loss of heat from a space or it is used to prevent the infiltration of heat into a space. The current text technically informs users that they could just provide insulation. More importantly, without direction that the piping must remain inside the thermal envelope, we have seen installations where heat and insulation were provided yet water lines still froze. In this situation, there was a bathroom that cantilevered over a portion of a an attached garage. The portion below the bathroom was provided with adequate space for insulation and was provided with a "heat run" into that space. It was discovered later after 2 consecutive years of freezing that the entire space had been filled with insulation, leaving no way for the heat to reach the pipe to keep them from freezing. Insulation along the perimeter and the bottom portion of the space would have kept the pipes within the building thermal envelope where they would not have frozen.

Bibliography: See reason statement.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal just simplifies the language in the code and will not negatively or positively affect cost of construction.

P4-24 Part I

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The proposed language needs to be improved for clarity. The proponent asked for disapproval. (13-0)

Comment (CAH2)# 389

P7-24

IPC: 306.2.4

Proposed Change as Submitted

Proponents: Guy McMann, Jefferson County Colorado, CAPMO (gmcmann@jeffco.us)

2024 International Plumbing Code

Revise as follows:

306.2.4 Tracer wire. For plastic sewer piping, an insulated copper tracer wire or other *approved* conductor shall be installed adjacent to and over the full length of the piping. Access shall be provided to the tracer wire or the tracer wire shall terminate at the cleanout between the *building drain* and *building sewer*. The tracer wire size shall be not less than ~~14~~ 18 American Wire Gauge (2.5 mm^2), shall be green in color and the insulation type shall be listed for direct burial.

Reason: Its overkill to require a 14-gauge wire when a 18 gauge wire will do the same job and is less expensive. This is consistent with what's required in the IFGC. The American Public Works Association provides color guidance for sewer pipe including blue for potable water and yellow for gas.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

This will decrease the cost of construction requiring a smaller gauge wire that is less expensive than a 14 gauge wire. "The cost savings is $15 for 100 feet of tracer wire..

Estimated Immediate Cost Impact Justification (methodology and variables):

.
There is not a difference in labor to install. The current price of 18 gauge wire is $0.09 per foot and for 14 gauge wire, $0.11 per foot.

P7-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: There has been no testing to show that the smaller wire has the necessary durability for the application. The green color could be hard to find in grass cover. (10-4)

P7-24

Individual Consideration Agenda

Comment 1:

IPC: 306.2.4

Proponents: Guy McMann, Jefferson County Colorado, CAPMO (gmcmann@jeffco.us) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Plumbing Code

306.2.4 Tracer wire. For plastic sewer piping, an insulated copper tracer wire or other *approved* conductor shall be installed adjacent to and over the full length of the piping. Access shall be provided to the tracer wire or the tracer wire shall terminate at the cleanout between the *building drain* and *building sewer*. The tracer wire size shall be not less than 18 American Wire Gauge (~~2.5~~ 1.02 mm^2), shall be green in color and the insulation type shall be listed for direct burial.

Reason:

- No testing is needed as the wire is required to be rated for direct burial.
- The color green will not be an issue because both ends of the wire terminate at the cleanout where it can be energized, The wire stars at the cleanout, follows the pipe to its end point and is turned around and follows the pipe back to the cleanout location. There was misunderstanding as how the wire was to be installed. The cleanout will be obvious to locate and the wire will be quite visible, regardless of weeds or grass, The color green is from a nations standard.
- Changing the the gauge will align with the IFGC.
- The correct metric should be an editorial addition. by staff.
- A spool of 18 gauge will cost less than a spool of14 gauge wire obviously.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

The cost will decrease will depend on how the wire is purchased.

Estimated Immediate Cost Impact Justification (methodology and variables):

A spool of 18 gauge wire will cost less than a spool of 14 gauge due ti being a thicker wire.

Comment (CAH2)# 119

P10-24

IPC: SECTION 202 (New), 308.7, 308.7.1

Proposed Change as Submitted

Proponents: James Walls, Cast Iron Soil Pipe Institute, Cast Iron Soil Pipe Institute (jwalls@cispi.org)

2024 International Plumbing Code

Add new definition as follows:

JOINT RESTRAINT. A restraint assembly to resist axial movement at a joint in a piping system.

Revise as follows:

308.7 ~~Anchorage~~ Joint restraint. ~~Anchorage~~ Joint restraint shall be provided to restrain drainage piping from axial movement.

308.7.1 Location. For ~~pipe sizes~~ *horizontal pipes* 4 inches (102 mm) and larger that convey drainage ~~greater than 4 inches (102 mm),~~ joint restraints shall be provided ~~for drain pipes~~ at all changes in direction. ~~and~~ Joint restraints shall be provided for *horizontal pipes* 4 inches (102 mm) and larger that convey drainage at all changes in diameter greater than two pipe sizes. Braces, blocks, rodding and other suitable methods as specified by the coupling manufacturer shall be utilized.

Reason: There has been a great deal of confusion between sway bracing, joint restraint, and the current code term “anchorage.” This proposal replaces the current term anchorage and replaces it with what the code is prescribing, which is joint restraint. This proposal provides a clear distinction for the users of the code as well as what is required of each. These items are specifically for drainage piping systems and the current proposal is reflective of that fact. Additionally, the language has been made consistent with related section 308.6, utilizing the language “*horizontal pipes* that convey drainage” The addition of further clarification as to change of direction as well as separating and clarifying the two distinct applications of joint restraint locations has been made. This clarifies the distinction between the two items and the requirements to accomplish each to the code official, installer, and other users of this code.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal is is a clarification and has no cost impact on the cost of construction.

P10-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: This proposal changes from "greater than 4 inch" to "4 inch and greater". This doesn't agree with cast iron piping installation instructions. (14-0)

P10-24

Individual Consideration Agenda

Comment 1:

IPC: 308.8 (New), 308.1 (New)

Proponents: James Walls, Cast Iron Soil Pipe Institute, Cast Iron Soil Pipe Institute (jwalls@cispi.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Plumbing Code

Add new text as follows:

308.8 Anchorage. Anchorage shall be provided to restrain drainage piping from axial movement.

308.1 Location. For pipe sizes greater than 4 inches (102 mm), restraint shall be provided for drain pipes at all changes in direction.

Reason: There has been a great deal of confusion between sway bracing, joint restraint, and anchorage. This proposal relocates the current term anchorage and section 308.7 and 308.7.1 it with what the code is prescribing, which is joint restraint. This proposal provides a clear distinction for the users of the code as well as what is required of each. These items are specifically for drainage piping systems and the current proposal is reflective of that fact. The addition of further clarification as to change of direction as well as separating and clarifying the two distinct applications of joint restraint locations has been made. This clarifies the distinction between the items and the requirements to accomplish each to the code official, installer, and other users of this code. This modification is to satisfy the request of the committee to retain anchorage in the code as well as correct the pipe size of these items to maintain current code requirements.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

There is no additional cost of construction with being editorial in nature.

Comment (CAH2)# 548

P19-24 Part I

IPC: TABLE 403.1; IBC: TABLE 2902.1

Proposed Change as Submitted

Proponents: Andrew Bevis, Chair, Plumbing, Mechanical and Fuel Gas Code Action Committee (pmgcac@iccsafe.org); Jeff Grove, Chair, Building Code Action Committee (BCAC) (bcac@iccsafe.org)

THIS IS A 3 PART CODE CHANGE. PART I WILL BE HEARD BY THE PLUMBING CODE COMMITTEE. PART II WILL BE HEARD BY THE IBC EGRESS CODE COMMITTEE. PART III WILL BE HEARD BY THE ISPSC CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Plumbing Code

Revise as follows:

TABLE 403.1 MINIMUM NUMBER OF REQUIRED PLUMBING FIXTURES[a] (See Sections 403.1.1 and 403.2)
Portions of table not shown remain unchanged.

NO.	CLASSIFICATION	DESCRIPTION	WATER CLOSETS (URINALS: SEE SECTION 424.2)		LAVATORIES		BATHTUBS/ SHOWERS	DRINKING FOUNTAIN (SEE SECTION 410)	OTHER
			MALE	FEMALE	MALE	FEMALE			
1	Assembly	Coliseums, arenas, skating rinks~~, pools~~ and tennis courts for indoor sporting events and activities [f]	1 per 75 for the first 1,500 and 1 per 120 for the remainder exceeding 1,500	1 per 40 for the first 1,520 and 1 per 60 for the remainder exceeding 1,520	1 per 200	1 per 150	—	1 per 1,000	1 service sink
		Indoor and outdoor swimming pools, spas and aquatic recreation facilities [f]	1 per 200	1 per 100 for the first 400 and 1 per 133 for the remaninder exceeding 400	1 per 400	1 per 300	-	1 per 1,000	1 service sink
		Stadiums, amusement parks, bleachers and grandstands for outdoor sporting events and activities [f]	1 per 75 for the first 1,500 and 1 per 120 for the remainder exceeding 1,500	1 per 40 for the first 1,520 and 1 per 60 for the remainder exceeding 1,520	1 per 200	1 per 150	—	1 per 1,000	1 service sink

a. The fixtures shown are based on one fixture being the minimum required for the number of persons indicated or any fraction of the number of persons indicated. The number of occupants shall be determined by the *International Building Code*.

b. Toilet facilities for employees shall be separate from facilities for inmates or care recipients.

c. A single-user toilet facility with one water closet and one lavatory serving not more than two adjacent care recipient sleeping units shall be permitted provided that each patient sleeping unit has direct access to the toilet room and provision for privacy for the toilet room user is provided.

d. The occupant load for seasonal outdoor seating and entertainment areas shall be included when determining the minimum number of facilities required.

e. For business and mercantile classifications with an occupant load of 15 or fewer, service sinks shall not be required.

f. ~~The required number and type of plumbing fixtures for indoor and outdoor public swimming pools shall be in accordance with Section 609 of the International Swimming Pool and Spa Code.~~ Plumbing fixture requirements are reduced or eliminated for certain Class C swimming pools. See the International Swimming Pool and Spa Code, Section 321.

2024 International Building Code

Revise as follows:

[P] TABLE 2902.1 MINIMUM NUMBER OF REQUIRED PLUMBING FIXTURES[a] (See Sections 2902.1.1 and 2902.2)
Portions of table not shown remain unchanged.

NO.	CLASSIFICATION	DESCRIPTION	WATER CLOSETS (URINALS: SEE SECTION 424.2)		LAVATORIES		BATHTUBS/ SHOWERS	DRINKING FOUNTAIN (SEE SECTION 410)	OTHER
			MALE	FEMALE	MALE	FEMALE			
1	Assembly	Coliseums, arenas, skating rinks, pools and tennis courts for indoor sporting events and activities [f]	1 per 75 for the first 1,500 and 1 per 120 for the remainder exceeding 1,500	1 per 40 for the first 1,520 and 1 per 60 for the remainder exceeding 1,520	1 per 200	1 per 150	—	1 per 1,000	1 service sink
		Indoor and outdoor swimming pools, spas and aquatic recreation facilities [f]	1 per 200	1 per 100 for the first 400 and 1 per 133 for the remaninder exceeding 400	1 per 400	1 per 300	-	1 per 1,000	1 service sink
		Stadiums, amusement parks, bleachers and grandstands for outdoor sporting events and activities [f]	1 per 75 for the first 1,500 and 1 per 120 for the remainder exceeding 1,500	1 per 40 for the first 1,520 and 1 per 60 for the remainder exceeding 1,520	1 per 200	1 per 150	—	1 per 1,000	1 service sink

a. The fixtures shown are based on one fixture being the minimum required for the number of *persons* indicated or any fraction of the number of *persons* indicated. The number of occupants shall be determined by this code.

b. Toilet *facilities* for employees shall be separate from *facilities* for inmates or care recipients.

c. A single-occupant toilet room with one water closet and one lavatory serving not more than two adjacent patient *sleeping units* shall be permitted, provided that each patient sleeping unit has direct access to the toilet room and provisions for privacy for the toilet room user are provided.

d. The *occupant load* for seasonal outdoor seating and entertainment areas shall be included when determining the minimum number of *facilities* required.

e. For business and mercantile classifications with an *occupant load* of 15 or fewer, a service sink shall not be required.

f. ~~The required number and type of plumbing fixtures for indoor and outdoor swimming pools shall be in accordance with Section 609 of the International Swimming Pool and Spa Code.~~ Plumbing fixture requirements are reduced or eliminated for certain Class C swimming pools. See the International Swimming Pool and Spa Code, Section 321.

Reason: Background

The *2024 International Swimming Pool and Spa Code* does not have any restroom fixture requirements for class A, B, or C pools. For Class D pools, the fixture count is deferred to the *2024 International Plumbing Code*. But that code does not divide pools by class, and requires a large number of plumbing fixtures for indoor pools, but none for outdoor pools. The number of plumbing fixtures is an important public health concern as bathrooms being too far away or long lines for the bathroom will encourage some people to urinate in the pool. This is true regardless of the class of the pool and regardless of its location indoors and outdoors. That said, the number of fixtures required for indoor pools has been found to be excessive. The occupants of a pool and deck area will all use the bathroom on their own relaxed schedule. They will not all go at the same time as they might at a coliseum or arena. Therefore we have an obvious need to reduce the fixture requirement for indoor pools, but apply the same requirement for outdoor pools, and make the requirements cover all pools according to their class.

Occupant loads assigned under existing codes

In the *2024 International Building Code*, the current occupant load factors for pools are 50 gross in the pool and 15 gross on the deck. We have found that both requirements are unrealistic for most pools today. Pools today are shallower, many have no deep end at all. As a result, people comfortably congregate in them more closely than they used to. When the deck area and pool area are equal, these factors are equivalent to ignoring the deck area and assigning one user per 12 square feet of water, or assigning one user per 24 square feet of deck and water surface area per occupant.

The *2024 International Swimming Pool and Spa Code* recommends that a *bather load* (this is not the same thing as *occupant load*) be assigned based on various factors that vary from 20 gross to 8 gross. Confusingly, the load factors get smaller as the deck area gets bigger. The result is that the *bather load* stops increasing with deck area once the deck area is equal to twice the pool area. In this case, the maximum bather load is 8 square feet of water surface area per bather, or, equivalently, 24 square feet of deck and water surface per bather. When the deck area is equal to the water surface area, again the math comes out to 24 square feet of deck and water surface area per bather.

For Class D pools only, the *2024 ISPSC* does assign an occupant load. It requires a much larger load, with the load factor varying from 10 gross to 8 gross, this time with deck area considered at 15 gross (this changed in 2015 to harmonize it with IBC Table 1004.5. Previously it was 50 gross). These occupant loads are aggressively larger, but only if the jurisdiction has adopted the *ISPSC.* This increased load might be reasonable for heavily used wave pools and leisure rivers, but other Class D pools can only be used by a few users at a time, for instance floating lily pad walks, climbing walls, water slides, etc, so that increase does not make much sense in these cases.

The *Model Aquatic Health Code* assigns occupant load factors ranging from 10 to 20 square feet for water surface area, but only one occupant per 50 square feet on the deck. This is roughly a mirror image of the current *International Building Code.*

Justification of changes occupant loads in IBC Table 1004.5 and ISPSC 608.1

· **Swimming pool areas with water depth exceeding 5 ft** – users do not lounge or congregate in these areas because keeping one's head above water requires constant effort. They are doing activities such as lap swimming, diving, synchronized swimming, and water polo. The highest density of these activities is water polo, with a pool area as small as 20 meters by 10 meters being used by two teams of seven players each. The result is one occupant per 150 square feet.

· **Spa areas –** The *Model Aquatic Health Code* and *Florida Building Code* both assign 1 occupant or bather per 10 square feet. It would not be conservative for the *International Building Code* to ignore this guidance.

· **Catch pools –** The slides are supervised and people are not permitted to go down the slide unless the area is clear.

· **All other swimming pool areas and decks –** Currently these areas are treated very differently. We have observed users congregating in pools tighter than one per 50 square feet. As for the deck, it is reasonable to think that people congregate in deck areas similar to unconcentrated assembly seating or airport terminal waiting areas (which both get a load factor of 15), however, most of these people "reserve" a movable chair for themselves with a towel or purse and then proceed to the pool. Increasing this factor to 24 accounts for the fact that some people stay in this area, but most reserve a space in the area before moving on to another area. Assigning the same factor to both areas is logical when you consider the increased number of tanning ledges that are being installed recently. Such areas are basically used the same as deck, mainly used by people standing or in lounge chairs, yet the load factor is different. The load factor should be the same.

· **Class D-1, D-4, and D-6 pool deep areas –** These bodies of water do not tend to have deep areas, and even when they do, ropes are placed to discourage users from using them. The occupant load factors for shallow areas and decks have been left alone so that the egress requirements for these types of pools will not change. However, in past versions of the code the Class D minimum fixture count was not based on this very high number of occupants. In the 2018 code, a Leisure River with 7500 square feet of water and 7500 square feet of deck would have 1,438 occupants but only require 2 water closets for females. We are proposing that the occupant count would remain 1,438, but that number brought to the proposed revision of Table 2902 computes to 7 water closets for females. That is roughly similar to what the current code would call for on an indoor class A, B, or C pool, and that is too high. So this proposal adds a clause to Section 608 of the *ISPSC* that Table 608 should not be used for fixture count, rather Table 1004.5 of the *IBC* should be used. This way changing a pool from Class C to Class D will have no impact on the minimum fixture count, but it would have an impact on egress and other occupant count related items. The minimum fixture count for the Leisure River mentioned above would be 4 water closets for females.

· **Other Class D pools –** This includes catch pools, activity pools, and vortex pools. These pools are meant to be used by distinct groups of supervised users one at a time. Letting them default back to one occupant per 24 square feet rather than one per 8 square feet is still conservative.

Summary of changes occupant loads resulting from this proposal

The changes to 1004.5 under this proposed change would give:

Class A, B, or C Pool, 5' deep or less, with

deck area *less than* pool area

Slightly *more* occupants

deck area *equal* to pool area

The *same* number occupants

deck area *more than* pool area

Slightly *fewer* occupants

Catch Pools

~ 100x *fewer* occupants

Wave Pools, Leisure Rivers, Interactive Water Features, 5’ deep or less

The *same* (very large) number of occupants

Activity Pools, Vortex Pools, Pool areas greater than 5’ deep

3x *fewer* occupants

Spa Pools

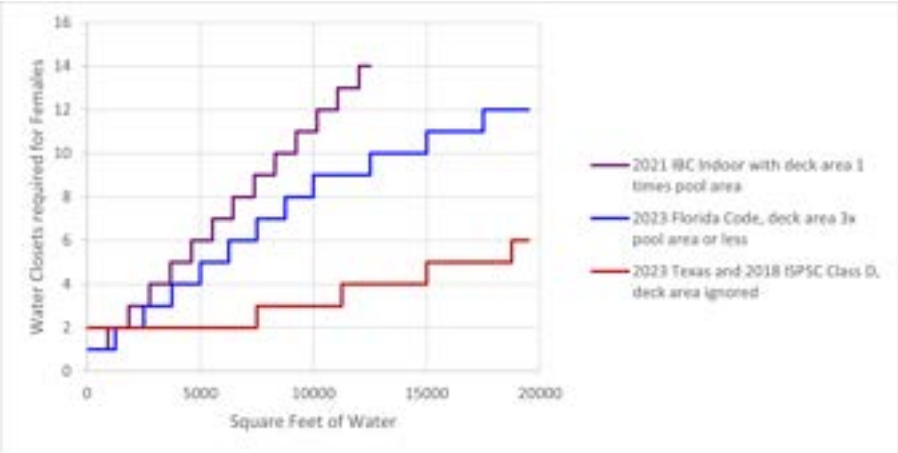
5x *more* occupants

Minimum Fixture Count in 2018 I-codes

The *International Swimming Pool and Spa Code 2018* assigned a minimum fixture count to all Class D pools. This fixture count overruled Table 2902 in the *IBC.* In this code year, the result was a Class D pool would be assigned many more occupants than a Class A, B, or C pool. But if it was indoors, it would be assigned many fewer minimum restroom fixtures than a similar Class A, B, or C pool. If it was outdoors, it would be assigned the same small number of fixtures, even though a Class A, B, or C pool would not have any minimum number of fixtures. In the 2021 code cycle, section 609 of the *International Swimming Pool and Spa Code* was truncated, leaving only a minimum number of showers, not of toilets or lavatories, for outdoor pools and Class D pools.

Minimum Fixture Count in current codes

The *International Building Code* assigns fixtures to occupants, of indoor pools, and assigns occupants both to the deck area and the pool water area. No fixtures are assigned to occupants of outdoor pools. In effect, fixtures are assigned both to areas of the deck and areas of the pool. The other state-level codes surveyed in this effort are for Florida and Texas. In Texas, the deck area is ignored entirely. In Florida, it is ignored for all deck area less than 3x of the pool area, which practically includes all pool decks. But in the current *IBC,* for indoor pools only, the deck area becomes a much more important factor than the pool area. The number of fixtures required by this code is already significantly more than Florida would require even when the deck is only 1x of the pool area. The reason is because the occupants of a pool and pool deck are treated the same as the occupants of a stadium or arena in terms of their need to use the bathroom. Meanwhile Texas, ignoring the pool area, their code gives a result that is much lower for the same pool. But Texas didn’t make this up, rather, their table comes from section 609 of the 2018 ISPSC.



Justification of new row in IBC Table 2902.1

The intent of adding a new row, rather than using the existing rows for coliseums and arenas, is to reduce the number of fixtures required. The occupants of a pool and deck area will all use the bathroom on their own relaxed schedule. They will not all go at the same time as they might at a coliseum or arena. The calculation results in the new orange lines shown in the graph below, with the existing codes still shown for reference. The new code proposal will agree closely with the Florida Code when the deck is 3x the pool area, and agree closely with the Texas code when only minimal deck is provided.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

$0

Estimated Immediate Cost Impact Justification (methodology and variables):

For indoor pools and Class D pools plumbing fixture requirement will be about the same. Indoor pool plumbing fixture requirements will be reduced. Outdoor pool plumbing fixture requirements will be increased. Overall, the number of plumbing fixtures will be slightly decreased.

P19-24 Part I

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee is favor of the proposal but the proposal needs modified to add an entry for number of required showers. (9-5)

		Stadiums, amusement parks, bleachers and grandstands for outdoor sporting events and activities [f]	1 per 75 for the first 1,500 and 1 per 120 for the remainder exceeding 1,500	1 per 40 for the first 1,520 and 1 per 60 for the remainder exceeding 1,520	1 per 200	1 per 150	—	1 per 1,000	1 service sink

a. The fixtures shown are based on one fixture being the minimum required for the number of *persons* indicated or any fraction of the number of *persons* indicated. The number of occupants shall be determined by this code.

b. Toilet *facilities* for employees shall be separate from *facilities* for inmates or care recipients.

c. A single-occupant toilet room with one water closet and one lavatory serving not more than two adjacent patient *sleeping units* shall be permitted, provided that each patient sleeping unit has direct access to the toilet room and provisions for privacy for the toilet room user are provided.

d. The *occupant load* for seasonal outdoor seating and entertainment areas shall be included when determining the minimum number of *facilities* required.

e. For business and mercantile classifications with an *occupant load* of 15 or fewer, a service sink shall not be required.

f. Plumbing fixture requirements are reduced or eliminated for certain Class C swimming pools. See the International Swimming Pool and Spa Code, Section 321.

Reason: When addressing cleansing showers, the ISPSC sends the user to the IPC and IBC Tables. However, we were remiss in putting the number of showers required and this comment rectifies that by adding in the shower/bathtub column the number required, as “1 per 300 female and 1 per 300 male.”

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This comment does not increase the cost of construction as the original proposal's cost impact already accounted for the costs.

a. Floor area in square feet per occupant.

Add new text as follows:

1004.9 Catch Pools. The *occupant load* of catch pools and designated sections of pools used as a terminus for a water slide flume shall be sum of the maximum number of users that can ride each slide that terminates in that pool or pool area at one time.

Reason: Background

The *2024 International Swimming Pool and Spa Code* does not have any restroom fixture requirements for class A, B, or C pools. For Class D pools, the fixture count is deferred to the *2024 International Plumbing Code.* But that code does not divide pools by class, and requires a large number of plumbing fixtures for indoor pools, but none for outdoor pools. The number of plumbing fixtures is an important public health concern as bathrooms being too far away or long lines for the bathroom will encourage some people to urinate in the pool. This is true regardless of the class of the pool and regardless of its location indoors and outdoors. That said, the number of fixtures required for indoor pools has been found to be excessive. The occupants of a pool and deck area will all use the bathroom on their own relaxed schedule. They will not all go at the same time as they might at a coliseum or arena. Therefore we have an obvious need to reduce the fixture requirement for indoor pools, but apply the same requirement for outdoor pools, and make the requirements cover all pools according to their class.

Occupant loads assigned under existing codes

In the *2024 International Building Code*, the current occupant load factors for pools are 50 gross in the pool and 15 gross on the deck. We have found that both requirements are unrealistic for most pools today. Pools today are shallower, many have no deep end at all. As a result, people comfortably congregate in them more closely than they used to. When the deck area and pool area are equal, these factors are equivalent to ignoring the deck area and assigning one user per 12 square feet of water, or assigning one user per 24 square feet of deck and water surface area per occupant.

The *2024 International Swimming Pool and Spa Code* recommends that a *bather load* (this is not the same thing as *occupant load*) be assigned based on various factors that vary from 20 gross to 8 gross. Confusingly, the load factors get smaller as the deck area gets bigger. The result is that the *bather load* stops increasing with deck area once the deck area is equal to twice the pool area. In this case, the maximum bather load is 8 square feet of water surface area per bather, or, equivalently, 24 square feet of deck and water surface per bather. When the deck area is equal to the water surface area, again the math comes out to 24 square feet of deck and water surface area per bather.

For Class D pools only, the *2024 ISPSC* does assign an occupant load. It requires a much larger load, with the load factor varying from 10 gross to 8 gross, this time with deck area considered at 15 gross (this changed in 2015 to harmonize it with IBC Table 1004.5. Previously it was 50 gross). These occupant loads are aggressively larger, but only if the jurisdiction has adopted the *ISPSC.* This increased load might be reasonable for heavily used wave pools and leisure rivers, but other Class D pools can only be used by a few users at a time, for instance floating lily pad walks, climbing walls, water slides, etc, so that increase does not make much sense in these cases.

The *Model Aquatic Health Code* assigns occupant load factors ranging from 10 to 20 square feet for water surface area, but only one occupant per 50 square feet on the deck. This is roughly a mirror image of the current *International Building Code.*

Justification of changes occupant loads in IBC Table 1004.5 and ISPSC 608.1

· **Swimming pool areas with water depth exceeding 5 ft** – users do not lounge or congregate in these areas because keeping one's head above water requires constant effort. They are doing activities such as lap swimming, diving, synchronized swimming, and water polo. The highest density of these activities is water polo, with a pool area as small as 20 meters by 10 meters being used by two teams of seven players each. The result is one occupant per 150 square feet.

· **Spa areas –** The *Model Aquatic Health Code* and *Florida Building Code* both assign 1 occupant or bather per 10 square feet. It would not be conservative for the *International Building Code* to ignore this guidance.

· **Catch pools –** The slides are supervised and people are not permitted to go down the slide unless the area is clear.

· **All other swimming pool areas and decks –** Currently these areas are treated very differently. We have observed users congregating in pools tighter than one per 50 square feet. As for the deck, it is reasonable to think that people congregate in deck areas similar to unconcentrated assembly seating or airport terminal waiting areas (which both get a load factor of 15), however, most of these people "reserve" a movable chair for themselves with a towel or purse and then proceed to the pool. Increasing this factor to 24 accounts for the fact that some people stay in this area, but most reserve a space in the area before moving on to another area. Assigning the same factor to both areas is logical when you consider the increased number of tanning ledges that are being installed recently. Such areas are basically used the same as deck, mainly used by people standing or in lounge chairs, yet the load factor is different. The load factor should be the same.

· **Class D-1, D-4, and D-6 pool deep areas –** These bodies of water do not tend to have deep areas, and even when they do, ropes are placed to discourage users from using them. The occupant load factors for shallow areas and decks have been left alone so that the egress requirements for these types of pools will not change. However, in past versions of the code the Class D minimum fixture count was not based on this very high number of occupants. In the 2018 code, a Leisure River with 7500 square feet of water and 7500 square feet of deck would have 1,438 occupants but only require 2 water closets for females. We are proposing that the occupant count would remain 1,438, but that number brought to the proposed revision of Table 2902 computes to 7 water closets for females. That is roughly similar to what the current code would call for on an indoor class A, B, or C pool, and that is too high. So this proposal adds a clause to Section 608 of the *ISPSC* that Table 608 should not be used for fixture count, rather Table 1004.5 of the *IBC* should be used. This way changing a pool from Class C to Class D will have no impact on the minimum fixture count, but it would have an impact on egress and other occupant count related items. The minimum fixture count for the Leisure River mentioned above would be 4 water closets for females.

· **Other Class D pools –** This includes catch pools, activity pools, and vortex pools. These pools are meant to be used by distinct groups of supervised users one at a time. Letting them default back to one occupant per 24 square feet rather than one per 8 square feet is still conservative.

Summary of changes occupant loads resulting from this proposal

The changes to 1004.5 under this proposed change would give:

Class A, B, or C Pool, 5' deep or less, with

deck area *less than* pool area

Slightly *more* occupants

deck area *equal* to pool area

The *same* number occupants

deck area *more than* pool area

Slightly *fewer* occupants

Catch Pools

~ 100x *fewer* occupants

Wave Pools, Leisure Rivers, Interactive Water Features, 5’ deep or less

The *same* (very large) number of occupants

Activity Pools, Vortex Pools, Pool areas greater than 5’ deep

3x *fewer* occupants

Spa Pools

5x *more* occupants

Minimum Fixture Count in 2018 I-codes

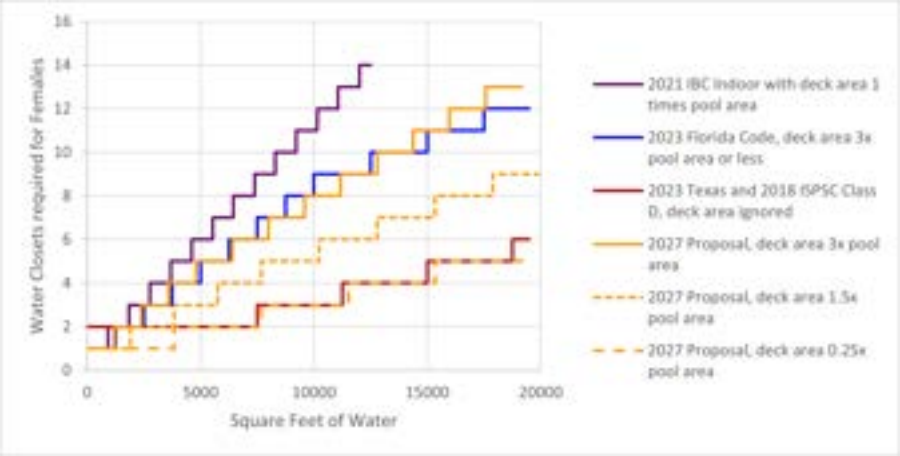
The *International Swimming Pool and Spa Code 2018* assigned a minimum fixture count to all Class D pools. This fixture count overruled Table 2902 in the *IBC.* In this code year, the result was a Class D pool would be assigned many more occupants than a Class A, B, or C pool. But if it was indoors, it would be assigned many fewer minimum restroom fixtures than a similar Class A, B, or C pool. If it was outdoors, it would be assigned the same small number of fixtures, even though a Class A, B, or C pool would not have any minimum number of fixtures. In the 2021 code cycle, section 609 of the *International Swimming Pool and Spa Code* was truncated, leaving only a minimum number of showers, not of toilets or lavatories, for outdoor pools and Class D pools.

Minimum Fixture Count in current codes

The *International Building Code* assigns fixtures to occupants, of indoor pools, and assigns occupants both to the deck area and the pool water area. No fixtures are assigned to occupants of outdoor pools. In effect, fixtures are assigned both to areas of the deck and areas of the pool. The other state-level codes surveyed in this effort are for Florida and Texas. In Texas, the deck area is ignored entirely. In Florida, it is ignored for all deck area less than 3x of the pool area, which practically includes all pool decks. But in the current *IBC,* for indoor pools only, the deck area becomes a much more important factor than the pool area. The number of fixtures required by this code is already significantly more than Florida would require even when the deck is only 1x of the pool area. The reason is because the occupants of a pool and pool deck are treated the same as the occupants of a stadium or arena in terms of their need to use the bathroom. Meanwhile Texas, ignoring the pool area, their code gives a result that is much lower for the same pool. But Texas didn’t make this up, rather, their table comes from section 609 of the 2018 ISPSC.

Justification of new row in IBC Table 2902.1

The intent of adding a new row, rather than using the existing rows for coliseums and arenas, is to reduce the number of fixtures required. The occupants of a pool and deck area will all use the bathroom on their own relaxed schedule. They will not all go at the same time as they might at a coliseum or arena. The calculation results in the new orange lines shown in the graph below, with the existing codes still shown for reference. The new code proposal will agree closely with the Florida Code when the deck is 3x the pool area, and agree closely with the Texas code when only minimal deck is provided.



Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

$0

Estimated Immediate Cost Impact Justification (methodology and variables):

For indoor pools and Class D pools plumbing fixture requirement will be about the same. Indoor pool plumbing fixture requirements will be reduced. Outdoor pool plumbing fixture requirements will be increased. Overall, the number of plumbing fixtures will be slightly decreased.

P19-24 Part II

Public Hearing Results (CAH1)

Committee Action: **As Submitted**

Committee Reason: The calculation of occupant load by pool type will improve accuracy for determining egress for these types of facilities. (Vote: 13-0)

2024 International Swimming Pool and Spa Code

Add new definition as follows:

SHOWER. A device that sprays water on the body.

Cleansing. A shower located within a hygiene facility using warm water and soap. The purpose of showers is to remove contaminants including perianal fecal material, sweat, skin cells, personal care products, and dirt before bathers enter the aquatic venue.

Rinse. A shower typically located in the pool deck area with ambient temperature water. The main purpose is to remove dirt, sand, or organic material prior to entering the aquatic venue to reduce the introduction of contaminants and the formation of disinfection byproduct.

Add new text as follows:

SECTION 321
DRESSING AND SANITARY FACILITIES

321.1 General. Dressing and sanitary facilities for public pools, public spas and aquatic recreation facilities shall be provided in accordance with the minimum requirements of the *International Building Code*, the *International Plumbing Code* and Sections 321.2 through 321.9. These facilities shall be located within a 300 foot path of travel from the pool area.

321.2 Number of fixtures. The minimum number of required water closets, urinals, lavatories, and drinking fountains fixtures shall be provided in accordance with the minimum requirements of the *International Building Code* and the *International Plumbing Code*.
Exception: For Class C swimming pools, fixtures dedicated to the pool area shall not be required where all dwelling units meet all of the following requirements:

1. The dwelling units have private facilities.
2. The dwelling units are within a 300 feet path of travel from the pool area.
3. The dwelling units are not more than one story above or below the pool area.

For Class C swimming pools where some but not all dwelling units meet the requirements of this exception, the minimum occupant load used to calculate the minimum fixture requirements shall be reduced by a factor equal to the number of dwelling units meeting these requirements, divided by the total number of dwelling units served by the pools.

321.2.1 Dressing facilties and rinsing showers. Dressing facilities and the number of rinse showers shall be provided in accordance with Sections 321.2.1.1 and 321.2.1.2.

321.2.1.1 Dressing Facilities. Public pools, public spas and aquatic recreation facilities shall have dressing facilities.
Exception: This section shall not apply to Class C pools.

321.2.1.2 Rinse shower. In addition to the requirement for cleansing showers in the International Plumbing Code and International Building Code, not less than one rinse shower shall be provided on the deck of, or at the entrance of, each pool.

321.3 Water heater and mixing valve. Bather access to water heaters and thermostatically controlled mixing valves for showers shall be prohibited.

321.3.1 Temperature. At each cleansing showerhead, hot or tempered water shall be provided as required by the *International Plumbing Code*. **Exception:** Water supplied to rinse showers shall not be required to be heated

321.4 Soap dispensers. . Soap dispensers shall be in accordance with Sections 329.4.1 and 329.4.2.

321.4.1 Liquid or powdered soap. Soap dispensers shall be provided at each lavatory and cleansing shower. Soap dispensers shall dispense liquid or powdered soap. Reusable cake soap shall be prohibited. Soap dispensers and soap shall not be provided at rinse showers.

321.4.2 Metal or plastic dispenser. Soap dispensers shall be made of metal or plastic. Glass materials shall be prohibited.

321.5 Toilet tissue holder. A toilet tissue holder shall be provided at each water closet

321,6 Mirrors. Where provided, mirrors shall be shatter resistant

321.7 Sanitary napkin receptacles. Sanitary napkin receptacles shall be provided in each water closet compartment for females and in the cleansing area of the showers for female use only.

321.8 Sanitary napkin dispensers. A sanitary napkin dispenser shall be provided in each toilet facility for females.

321.9 Infant care. Baby-changing tables shall be provided in toilet facilities

SECTION 410
SANITARY FACILITIES

Revise as follows:

410.1 ~~Toilet facilities~~ General. ~~Class A and B pools~~ Public pools and public spas shall be provided with ~~toilet facilities~~ dressing and sanitary facilities ~~having the required number of plumbing fixtures~~ in accordance with Section 321.~~the *International Building Code* or the *International Plumbing Code*.~~

SECTION 608
NUMBER OF OCCUPANTS

Revise as follows:

608.1 Occupant load. The occupant load for the Class D-1, D-4, and D-6 pools ~~or spas~~ in the facility shall be calculated in accordance with Table 608.1~~.~~ , however the occupant load used for the minimum fixture count shall be calculated in accordance with Table 1004.5 of the International Building Code. The occupant load for all other pools shall be calculated in accordance with Table 1004.5 of the International Building Code.

~~The occupant load shall be the combined total of the number of users based on the pool or spa water surface area and the deck area surrounding the pool or spa. The deck area occupant load shall be based on the occupant load calculated where a deck is provided or based on an assumed 4-foot-wide (1219 mm) deck surrounding the entire perimeter of the pool or spa, whichever is greater.~~

TABLE 608.1 INCREASED OCCUPANT LOAD FOR CLASS D-1, D-4, AND D-6 POOLS

SHALLOW OR WADING ZERO DEPTH AREAS	DEEP AREA ~~(NOT INCLUDING THE DIVING AREA)~~	~~DIVING AREA (PER EACH DIVING BOARD)~~	DRY DECK AREA	
Vessel water surface area	8 sq. ft per user	~~10 sq. ft. per user~~	300 sq. ft. per user	—
Deck area	—	—	—	1 user per 15 sq. ft.

For SI: 1 square foot = 0.0929 m^2.

Delete without substitution:

~~**608.2 Facility capacity.** For multiple pools and spas in a single aquatic recreation facility, the total facility occupant capacity shall not be limited by the number of occupants calculated in accordance with Section 608.1.~~

SECTION 609
DRESSING AND SANITARY FACILITIES

Revise as follows:

609.1 General. Dressing and sanitary facilities shall be provided in accordance with the minimum requirements of Section 321. ~~the *International Building Code* and *International Plumbing Code* and Sections 609.2 through 609.9.~~

Delete without substitution:

~~**609.2 Number of fixtures.** The minimum number of required water closets, urinals, lavatory, and drinking fountain fixtures shall be provided as required by the *International Building Code* and *International Plumbing Code* and the dressing facilities and number of cleansing and rinse showers shall be provided in accordance with Sections 609.2.1, 609.2.2, and 609.3.1.~~

~~**609.2.1 Water area less than 7500 square feet.** Facilities that have less than 7500 gross square feet (697 m^2) of water area available for bather access shall have dressing facilities and not less than one cleansing shower for males and one cleansing shower for females.~~

~~**Exception:** This requirement shall not apply to Class C semipublic pools.~~

~~**609.2.2 Water area 7500 square feet or more.** Facilities that have 7500 gross square feet (697 m^2) or more of water area available for bather access shall have dressing facilities and not less than one cleansing shower for males, and one cleansing shower for females for every 7500 square feet (697 m^2) or portion thereof. Where the result of the fixture calculation is a portion of a whole number, the result shall be rounded up to the nearest whole number.~~

~~**609.3 Showers.** Showers shall be in accordance with Sections 609.3.1 through 609.3.3.~~

~~**609.3.1 Rinse shower.** In addition to the requirement for cleansing showers in Sections 609.2.1 and 609.2.2, not less than one rinse showershall be provided on the deck of or at the entrance of each pool.~~

~~**609.3.2 Water heater and mixing valve.** Bather access to water heaters and thermostatically controlled mixing valves for showers shall be prohibited.~~

~~**609.3.3 Temperature.** At each cleansing showerhead, the heated shower water temperature shall be not less than 90°F (32°C) and not greater than 120°F (49°C). Water supplied to rinse showers shall not be required to be heated.~~

~~**609.4 Soap dispensers.** Soap dispensers shall be in accordance with Sections 609.4.1 and 609.4.2.~~

~~**609.4.1 Liquid or powder.** Soap dispensers shall be provided at each lavatory and cleansing shower. Soap dispensers shall dispense liquid or powdered soap. Reusable cake soap is prohibited. Soap dispensers and soap shall not be provided at rinse showers.~~

~~**609.4.2 Metal or plastic.** Soap dispensers shall be made of metal or plastic. Glass materials shall be prohibited.~~

~~**609.5 Toilet tissue holder.** A toilet paper holder shall be provided at each water closet.~~

~~**609.6 Lavatory mirror.** Where mirrors are provided, they shall be shatter resistant.~~

~~**609.7 Sanitary napkin receptacles.** Sanitary napkin receptacles shall be provided in each water closet compartment for females and in the cleansing area of the showers for female use only.~~

~~**609.8 Sanitary napkin dispensers.** A sanitary napkin dispenser shall be provided in each toilet facility for females.~~

~~**609.9 Infant care.** Baby changing tables shall be provided in toilet facilities having two or more water closets.~~

Reason: Background

The *2024 International Swimming Pool and Spa Code* does not have any restroom fixture requirements for class A, B, or C pools. For Class D pools, the fixture count is deferred to the *2024 International Plumbing Code.* But that code does not divide pools by class, and requires a large number of plumbing fixtures for indoor pools, but none for outdoor pools. The number of plumbing fixtures is an important public health concern as bathrooms being too far away or long lines for the bathroom will encourage some people to urinate in the pool. This is true regardless of the class of the pool and regardless of its location indoors and outdoors. That said, the number of fixtures required for indoor pools has been found to be excessive. The occupants of a pool and deck area will all use the bathroom on their own relaxed schedule. They will not all go at the same time as they might at a coliseum or arena. Therefore we have an obvious need to reduce the fixture requirement for indoor pools, but apply the same requirement for outdoor pools, and make the requirements cover all pools according to their class.

Occupant loads assigned under existing codes

In the *2024 International Building Code*, the current occupant load factors for pools are 50 gross in the pool and 15 gross on the deck. We have found that both requirements are unrealistic for most pools today. Pools today are shallower, many have no deep end at all. As a result, people comfortably congregate in them more closely than they used to. When the deck area and pool area are equal, these factors are equivalent to ignoring the deck area and assigning one user per 12 square feet of water, or assigning one user per 24 square feet of deck and water surface area per occupant.

The *2024 International Swimming Pool and Spa Code* recommends that a *bather load* (this is not the same thing as *occupant load*) be assigned based on various factors that vary from 20 gross to 8 gross. Confusingly, the load factors get smaller as the deck area gets bigger. The result is that the *bather load* stops increasing with deck area once the deck area is equal to twice the pool area. In this case, the maximum bather load is 8 square feet of water surface area per bather, or, equivalently, 24 square feet of deck and water surface per bather. When the deck area is equal to the water surface area, again the math comes out to 24 square feet of deck and water surface area per bather.

For Class D pools only, the *2024 ISPSC* does assign an occupant load. It requires a much larger load, with the load factor varying from 10 gross to 8 gross, this time with deck area considered at 15 gross (this changed in 2015 to harmonize it with IBC Table 1004.5. Previously it was 50 gross). These occupant loads are aggressively larger, but only if the jurisdiction has adopted the *ISPSC.* This increased load might be reasonable for heavily used wave pools and leisure rivers, but other Class D pools can only be used by a few users at a time, for instance floating lily pad walks, climbing walls, water slides, etc, so that increase does not make much sense in these cases.

The *Model Aquatic Health Code* assigns occupant load factors ranging from 10 to 20 square feet for water surface area, but only one occupant per 50 square feet on the deck. This is roughly a mirror image of the current *International Building Code.*

Justification of changes occupant loads in IBC Table 1004.5 and ISPSC 608.1

· **Swimming pool areas with water depth exceeding 5 ft** – users do not lounge or congregate in these areas because keeping one's head above water requires constant effort. They are doing activities such as lap swimming, diving, synchronized swimming, and water polo. The highest density of these activities is water polo, with a pool area as small as 20 meters by 10 meters being used by two teams of seven players each. The result is one occupant per 150 square feet.

· **Spa areas –** The *Model Aquatic Health Code* and *Florida Building Code* both assign 1 occupant or bather per 10 square feet. It would not be conservative for the *International Building Code* to ignore this guidance.

· **Catch pools –** The slides are supervised and people are not permitted to go down the slide unless the area is clear.

· **All other swimming pool areas and decks –** Currently these areas are treated very differently. We have observed users congregating in pools tighter than one per 50 square feet. As for the deck, it is reasonable to think that people congregate in deck areas similar to unconcentrated assembly seating or airport terminal waiting areas (which both get a load factor of 15), however, most of these people "reserve" a movable chair for themselves with a towel or purse and then proceed to the pool. Increasing this factor to 24 accounts for the fact that some people stay in this area, but most reserve a space in the area before moving on to another area. Assigning the same factor to both areas is logical when you consider the increased number of tanning ledges that are being installed recently. Such areas are basically used the same as deck, mainly used by people standing or in lounge chairs, yet the load factor is different. The load factor should be the same.

· **Class D-1, D-4, and D-6 pool deep areas –** These bodies of water do not tend to have deep areas, and even when they do, ropes are placed to discourage users from using them. The occupant load factors for shallow areas and decks have been left alone so that the egress requirements for these types of pools will not change. However, in past versions of the code the Class D minimum fixture count was not based on this very high number of occupants. In the 2018 code, a Leisure River with 7500 square feet of water and 7500 square feet of deck would have 1,438 occupants but only require 2 water closets for females. We are proposing that the occupant count would remain 1,438, but that number brought to the proposed revision of Table 2902 computes to 7 water closets for females. That is roughly similar to what the current code would call for on an indoor class A, B, or C pool, and that is too high. So this proposal adds a clause to Section 608 of the *ISPSC* that Table 608 should not be used for fixture count, rather Table 1004.5 of the *IBC* should be used. This way changing a pool from Class C to Class D will have no impact on the minimum fixture count, but it would have an impact on egress and other occupant count related items. The minimum fixture count for the Leisure River mentioned above would be 4 water closets for females.

· **Other Class D pools –** This includes catch pools, activity pools, and vortex pools. These pools are meant to be used by distinct groups of supervised users one at a time. Letting them default back to one occupant per 24 square feet rather than one per 8 square feet is still conservative.

Summary of changes occupant loads resulting from this proposal

The changes to 1004.5 under this proposed change would give:

Class A, B, or C Pool, 5' deep or less, with

deck area *less than* pool area

Slightly *more* occupants

deck area *equal* to pool area

The *same* number occupants

deck area *more than* pool area

Slightly *fewer* occupants

Catch Pools

~ 100x *fewer* occupants

Wave Pools, Leisure Rivers, Interactive Water Features, 5' deep or less

The *same* (very large) number of occupants

Activity Pools, Vortex Pools, Pool areas greater than 5' deep

3x *fewer* occupants

Spa Pools

5x *more* occupants

Minimum Fixture Count in 2018 I-codes

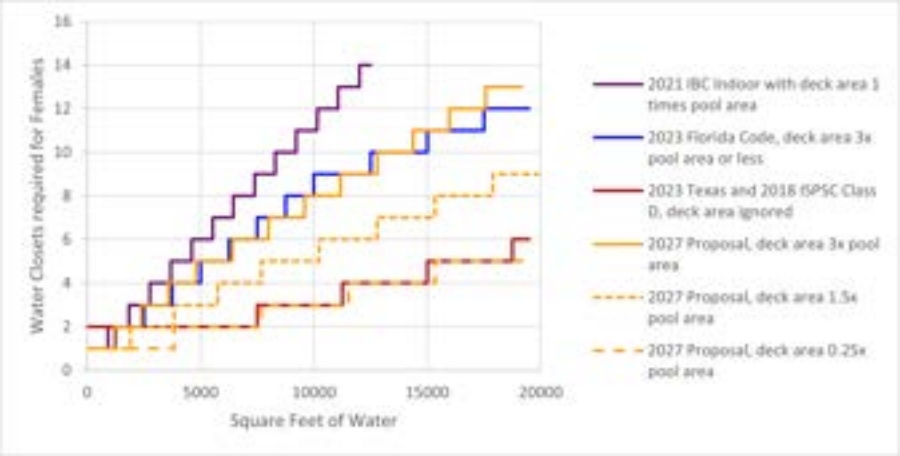
The *International Swimming Pool and Spa Code 2018* assigned a minimum fixture count to all Class D pools. This fixture count overruled Table 2902 in the *IBC.* In this code year, the result was a Class D pool would be assigned many more occupants than a Class A, B, or C pool. But if it was indoors, it would be assigned many fewer minimum restroom fixtures than a similar Class A, B, or C pool. If it was outdoors, it would be assigned the same small number of fixtures, even though a Class A, B, or C pool would not have any minimum number of fixtures. In the 2021 code cycle, section 609 of the *International Swimming Pool and Spa Code* was truncated, leaving only a minimum number of showers, not of toilets or lavatories, for outdoor pools and Class D pools.

Minimum Fixture Count in current codes

The *International Building Code* assigns fixtures to occupants, of indoor pools, and assigns occupants both to the deck area and the pool water area. No fixtures are assigned to occupants of outdoor pools. In effect, fixtures are assigned both to areas of the deck and areas of the pool. The other state-level codes surveyed in this effort are for Florida and Texas. In Texas, the deck area is ignored entirely. In Florida, it is ignored for all deck area less than 3x of the pool area, which practically includes all pool decks. But in the current *IBC,* for indoor pools only, the deck area becomes a much more important factor than the pool area. The number of fixtures required by this code is already significantly more than Florida would require even when the deck is only 1x of the pool area. The reason is because the occupants of a pool and pool deck are treated the same as the occupants of a stadium or arena in terms of their need to use the bathroom. Meanwhile Texas, ignoring the pool area, their code gives a result that is much lower for the same pool. But Texas didn't make this up, rather, their table comes from section 609 of the 2018 ISPSC.

Justification of new row in IBC Table 2902.1

The intent of adding a new row, rather than using the existing rows for coliseums and arenas, is to reduce the number of fixtures required. The occupants of a pool and deck area will all use the bathroom on their own relaxed schedule. They will not all go at the same time as they might at a coliseum or arena. The calculation results in the new orange lines shown in the graph below, with the existing codes still shown for reference. The new code proposal will agree closely with the Florida Code when the deck is 3x the pool area, and agree closely with the Texas code when only minimal deck is provided.



Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

$0

Estimated Immediate Cost Impact Justification (methodology and variables):

For indoor pools and Class D pools plumbing fixture requirement will be about the same. Indoor pool plumbing fixture requirements will be reduced. Outdoor pool plumbing fixture requirements will be increased. Overall, the number of plumbing fixtures will be slightly decreased.

P19-24 Part III

Public Hearing Results (CAH1)

Committee Action: **As Modified by Committee**

Committee Modification:
321.2 Number of fixtures.
The minimum number of required water closets, urinals, lavatories, and drinking fountains fixtures shall be provided in accordance with the minimum requirements of the *International Building Code* and the *International Plumbing Code*.

Exception: For Class C swimming pools, fixtures dedicated to the pool area shall not be required where all sleeping or dwelling units meet all of the following requirements:

1. The sleeping or dwelling units have private facilities.
2. The sleeping or dwelling units are within a 300 feet path of travel from the pool area.
3. The sleeping or dwelling units are not more than one story above or below the pool area.

For Class C swimming pools where some but not all sleeping or dwelling units meet the requirements of this exception, the minimum occupant load used to calculate the minimum fixture requirements shall be reduced by a factor equal to the number of sleeping or dwelling units meeting these requirements, divided by the total number of sleeping or dwelling units served by the pools.

Committee Reason: For the modification: The language needed to include hotel and motel occupancies. (11-0)
For the proposal as modified: This proposal achieves the goal of the pool industry to have better clarity for which types of showers are needed for different pools. The Committee would welcome further input from opponents at CAH#2 to improve the proposals. The Committee suggested that the opponents can work with PHTA. (11-0)

Individual Consideration Agenda

Comment 1:

ISPSC: 321.2

Proponents: Andrew Bevis, Chair, Plumbing, Mechanical and Fuel Gas Code Action Committee (pmgcac@iccsafe.org) requests As Modified by Committee (AMC2)

Further modify as follows:

2024 International Swimming Pool and Spa Code

Revise as follows:

321.2 Number of fixtures. The minimum number of required water closets, urinals, lavatories, and drinking fountains fixtures shall be provided in accordance with the minimum requirements of the *International Building Code* and the *International Plumbing Code*.

Exception: For Class C swimming pools, fixtures dedicated to the pool area shall not be required where all sleeping or dwelling units meet all of the following requirements:

1. The sleeping or dwelling units have private facilities.
2. The sleeping or dwelling units are within a 300 feet path of travel from the pool area.
3. The sleeping or dwelling units are not more than ~~one story~~ three stories above or below the pool area, or more than three stories where serviced by an elevator.

For Class C swimming pools where some but not all dwelling units meet the requirements of this exception, the minimum occupant load used to calculate the minimum fixture requirements shall be reduced by a factor equal to the number of dwelling units meeting these requirements, divided by the total number of dwelling units served by the pools.

Reason: Class C pools are associated with buildings that already have private toilet facilities for the people who dwell or sleep in those buildings. Where those buildings are 3 stories or less are served by an elevator and the travel distance is not more than 300 feet, past experience has shown that this arrangement is adequate for serving the needs of pools users.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The original proposal limited the travel distance to 300 feet. This comment simply clarifies that the path of travel could involve an elevator where buildings are 3 stories or less. The comment does not require any additional materials or labor and thus there is no cost impact.

Comment (CAH2)# 331

Comment 2:

ISPSC: SECTION 202, 321.3.1

Proponents: Misty Guard, Regulosity LLC, Regulosity LLC (misty.guard@regulosity.com); Jennifer Hatfield, J. Hatfield & Associates, Pool & Hot Tub Alliance (jen@jhatfieldandassociates.com) requests As Modified by Committee (AMC2)

Further modify as follows:

2024 International Swimming Pool and Spa Code

Revise as follows:

SHOWER. A device that sprays water on the body.

Cleansing.
A shower located within a hygiene facility using ~~warm~~ water and soap. The purpose of showers is to remove contaminants including perianal fecal material, sweat, skin cells, personal care products, and dirt before bathers enter the aquatic venue.

Rinse. A shower typically located in the pool deck area ~~with ambient temperature water~~. The main purpose is to remove dirt, sand, or organic material prior to entering the aquatic venue to reduce the introduction of contaminants and the formation of disinfection byproduct.

321.3.1 Temperature. At each cleansing shower~~head~~, hot or tempered water shall be provided as required by the *International Plumbing Code*. Where hot and cold water is supplied to a rinse shower, the temperature of the water supply shall only be controlled by a thermostatic mixing valve, a limiting device, or a water heater as required by the International Plumbing Code.

~~**Exception:** Water supplied to rinse showers shall not be required to be heated~~

Reason: This proposal clarifies the language in the ISPSC. These modifications align with existing IPC requirements that cleansing and rinse showers currently comply with, if provided with hot and cold water. Rinse showers are specific to the ISPSC. The modification includes water temperature safety device requirements from the IPC to ensure the water temperature requirements for rinse showers in the ISPSC meet shower water temperature safety requirements in the IPC.

Bibliography: None

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

There will be no increase in the cost of construction. This proposal clarifies the language in the ISPSC. These modifications align with existing IPC requirements that cleansing and rinse showers currently comply with, if provided with hot and cold water.

IPC: 403.3; IBC: [P] 2902.3

Proposed Change as Submitted

Proponents: Andrew Klein, A S Klein Engineering, PLLC, Self Storage Association (andrew@asklein.com)

2024 International Plumbing Code

Revise as follows:

403.3 Employee and public toilet facilities. For structures and tenant spaces intended for public utilization, customers, patrons and visitors shall be provided with *public* toilet facilities. Employees associated with structures and tenant spaces shall be provided with toilet facilities. The number of plumbing fixtures located within the required toilet facilities shall be provided in accordance with Section 403 for all users. Employee toilet facilities shall be either separate or combined employee and *public* toilet facilities. **Exception:** *Public* toilet facilities shall not be required for:

1. Parking garages and self-service storage facilities operated without ~~parking~~ attendants.
2. Structures and tenant spaces intended for quick transactions, including takeout, pickup and drop-off, having a public access area less than or equal to 300 square feet (28 m^2).

2024 International Building Code

Revise as follows:

[P] 2902.3 Employee and public toilet facilities. For *structures* and tenant spaces intended for public utilization, customers, patrons and visitors shall be provided with public toilet *facilities*. Employees associated with *structures* and tenant spaces shall be provided with toilet *facilities*. The number of plumbing fixtures located within the required toilet *facilities* shall be provided in accordance with Section 2902 for all users. Employee toilet *facilities* shall be either separate or combined employee and public toilet *facilities*. **Exception:** Public toilet *facilities* shall not be required for:

1. Parking garages and self-service storage facilities operated without ~~parking~~ attendants.
2. *Structures* and tenant spaces intended for quick transactions, including takeout, pickup and drop-off, having a public access area less than or equal to 300 square feet (28 m^2).

Reason: Self-service storage facilities are low occupancy. Facilities operating without attendants are often exempted from the restroom requirements by local building code officials for the same reason unattended parking garages are exempted. Codifying this helps maintain continuity in the Code.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

- $20,000 to - $25,000 per restroom not required.

Estimated Immediate Cost Impact Justification (methodology and variables):

A single-unit restroom costs about $20,000 - $25,000.

Restroom privacy and sensible construction - Page 5 of 5 - Construction Specifier (www.constructionspecifier.com/restroom-privacy-and-sensible-construction/5/), accessed 1/26/2024

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The Committee can't justify allowing deletion of facilities where employees are present. (14-0)

Individual Consideration Agenda

Comment 1:

Proponents: Andrew Klein, A S Klein Engineering, PLLC, Self Storage Association (andrew@asklein.com) requests As Submitted

Reason: Self-service storage facilities are low occupancy. Facilities operating without attendants are often exempted from the restroom requirements by local building code officials for the same reason unattended parking garages are exempted. Unattended restrooms present a security concern. Codifying this helps maintain continuity in the Code and helps avoid unsafe conditions.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

P30-24

IPC: 405.3.4 (New), 405.3.4, 405.3.5, CHAPTER 15, IAPMO Chapter 15 (New)

Proposed Change as Submitted

Proponents: Julius Ballanco, P.E., JB Engineering and Code Consulting, P.C., Bradley Corp. (jbengineer@aol.com)

2024 International Plumbing Code

Add new text as follows:

405.3.4 Premanufactured water closet and urinal partitions. Premanufactured partitions for water closets or urinals shall comply with IAPMO Z124.10.

Revise as follows:

~~**405.3.4**~~**405.3.5 Water closet privacy ~~compartment~~.** Each water closet utilized by the public or employees shall occupy a separate compartment with walls or partitions and a door enclosing the fixtures to ensure privacy. Premanufactured partitions for water closets located in separate gender toilet or bathing rooms shall comply with the Type B privacy requirements of IAPMO Z124.10. Water closets located in all gender toilet rooms shall be enclosed by premanufactured partitions complying with the Type A privacy requirements of IAPMO Z124.10 or the water closet shall be located in separate room with a lockable door. **Exceptions:**

1. Water closet compartments shall not be required in a single-occupant toilet room with a lockable door.
2. Toilet facilities located in child day care facilities and containing two or more water closets shall be permitted to have one water closet without an enclosing compartment.
3. This provision is not applicable to toilet areas located within Group I-3 housing areas.

~~**405.3.5**~~**405.3.6 Urinal ~~partitions~~ privacy.** Each urinal utilized by the public or employees shall occupy a separate area with walls or partitions to provide privacy. Premanufactured partitions for urinals located in separate gender toilet or bathing rooms shall comply with the Type C privacy requirements of IAPMO Z124.10. The horizontal dimension between walls ~~or partitions~~ at each urinal shall be not less than 30 inches (762 mm). The walls ~~or partitions~~ shall ~~begin at a height not greater than 12 inches (305 mm) from and~~ extend not less than 60 inches (1524 mm) above the finished floor surface. The walls ~~or partitions~~ shall extend from the wall surface at each side of the urinal not less than 18 inches (457 mm) or to a point not less than 6 inches (152 mm) beyond the outermost front lip of the urinal measured from the finished backwall surface, whichever is greater. Urinals located in all gender toilet rooms shall be enclosed by premanufactured partitions complying with the Type A privacy requirements of IAPMO Z124.10 or the urinals shall be located in a separate room. **Exceptions:**

1. Urinal partitions shall not be required in a single occupant or family/assisted-use toilet room with a lockable door.
2. Toilet facilities located in child day care facilities and containing two or more urinals shall be permitted to have one urinal without partitions.

CHAPTER 15
REFERENCED STANDARDS

Add new standard(s) as follows:

IAPMO

IAPMO Group
4755 E. Philadelphia Street
Ontario, CA 91761 USA

Z124.10-22	Standard for Water Closets and Urinal Partitions

Reason: IAPMO Z124.10 is a new standard that regulates water closet and urinal partitions. The standard was published in 2022. The standard specified three different privacy ratings. In addition, there are tests for the quality of the partition. The tests include load, coating, surface examination, subsurface, colorfastness, stain resistance, wear and cleanability, chemical resistance, and stress test to name a few.

Type A privacy partitions are intended for all gender toilet rooms and provide the highest level of privacy. The standard states the following privacy requirements, “The bottom edge of the partition including the door shall be located less than or equal to 100 mm (4 in) off the finished floor. The top edge of the partition including the door shall be located greater than or equal to 2.13 m (84 in) above the finished floor. The full height of the door to the partitions on both sides shall prevent any visual observation from the outside of the partition enclosure. Doors shall be lockable from the inside of the partition enclosure. The door locking device shall be readily distinguishable as locked from the outside of the partition enclosure.” Furthermore, the standard requires a visual indication that the compartment is occupied when the partition door lock is activated.

Type B privacy partitions are standard water closet partitions found in separate gender toilet rooms. The standard states the following for privacy, “The bottom edge of the partition including the door shall be located within 406 mm (16 in) of the finished floor. The top edge of the partition including the door shall be located greater than or equal to 1.75 m (69 in) above the finished floor. The door to the partitions shall have a maximum of 13 mm (½ in) gap between the edge of the door and the wall of the partition. Doors shall be lockable from the inside of the partition enclosure.”

Type C privacy partitions are urinal partitions. The standard specifies the following requirements, “The bottom of the urinal partition shall be located a maximum of 406 mm (16 in) above the finished floor. The top of the urinal partition shall be a minimum of 1.5 m (60 in) above the finished floor. The urinal partition shall extend a minimum of 457 mm (18 in) from the wall.”

With the increase in the number of all gender toilet rooms, it is important to have proper privacy requirements to assure both privacy and security. This proposed change will require water closets and urinals in all gender toilet rooms to be enclosed in Type A privacy partitions or be located in a separate room. This will provide the highest level of privacy and security.

Type B privacy partitions are standard water closet partitions found in men’s and ladies’ rooms today. However, the gap between partition sections or between the door and frame have been reduced to ½ inch. Currently, there is no regulation on the gap in partitions nor are there any regulations for the quality of the partitions.

Type C privacy partitions are urinal partitions currently found in men’s rooms. Type C partitions are only intended for separate gender toilet rooms. In all gender toilet rooms, urinals are located similar to water closets to ensure privacy.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

$0.12 to $6.04 per partition, dependent on partition production volume.

Estimated Immediate Cost Impact Justification (methodology and variables):

This change could increase the cost of construction. It should be noted that manufacturers are prohibited by Federal Law to discuss prices. That being stated, one can review the cost of listing a product on-line. Compliance with the standard will add a cost to manufacturers for the testing and listing of partitions. In an attempt to find out the listing costs, one can check the ICC-ES website. The questions of what a cost of a listing is results in the following answer: Fees may vary. Contact us for a Statement of Work and/or an initial estimate. Similarly, IAPMO R&T does not publish fees. One can only request a quote for a listing. A Google search for the cost of a UL listing identified the cost as ranging between $5,000 and $50,000. Intertek advertises an annual listing fee of $6,040 for a single sanitary product, which is what a partition would likely be classified as. Hence, the exact dollar amount for a listing is unknown. That listing cost may or may not be added to the cost of the product. If it is added to the cost of the product, that additional cost will add to the cost of construction. However, manufacturers do not indicate if listing costs increase the cost of the product (construction). Hence, the impact is unknown. If one assumes the Intertek price for a listing and further assumes that the manufacturer sells 50,000 partitions a year, the increase cost of construction per partition could be assumed to be $0.12. If they only sell 1,000 partitions, the increased cost per partition would be $6.04.

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: There is ambiguity about the fire testing requirements in the standard. The cost of testing for the listing of the products will be onerous. This language puts the requirements for Type C units in the code. So what happens if the standard changes? Would the code need to change to math the standard? (8-7)

Individual Consideration Agenda

Comment 1:

IPC: 405.3.4

Proponents: Tim Earl, GBH International, Self (tearl@gbhint.com) requests As Modified by Committee (AMC2)

Further modify as follows:

2024 International Plumbing Code

Revise as follows:

405.3.4 Premanufactured water closet and urinal partitions. Premanufactured partitions for water closets or urinals shall comply with IAPMO Z124.10. High-density polyethylene (HDPE) and polypropylene (PP) partitions shall also comply with Section 803.9 of the *International Building Code.*

Reason: The committee disapproved this proposal in part due to "ambiguity about the fire testing requirements in the standard." This comment addresses that.

Section 803.9 of the IBC contains fire test requirements for HDPE and PP used as interior finish. Toilet room partitions are included in the IBC definition of interior finish. Therefore, they must comply with Section 803.9 of the IBC. The test referenced in 803.9 is necessary to obtain meaningful performance data from these materials, whose melting and dripping behavior can produce misleadingly positive results in other fire tests.

Since IAPMO Z124.10 contains a different fire test, users may erroneously believe that no other fire testing is required of partitions. The addition of this specific reference to 803.9 for HDPE and PP will ensure that the proper testing is not overlooked.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Since this is simply a pointer to the applicable section of the IBC, there is no impact on cost.

Comment (CAH2)# 61

Comment 2:

Proponents: Julius Ballanco, P.E., JB Engineering and Code Consulting, P.C., Bradley Corp. (jbengineer@aol.com) requests As Submitted

Reason: The Committee stated that there is ambiguity regarding the fire testing requirements. That is not correct. The IAPMO Z124.10 standard has fire testing similar to other IAPMO Z124 products. These tests are based on plumbing requirements. Other products requiring IAPMO A124 fire tests includes shower enclosures, Section 421.1 references CSA B45.5/IAPMO Z124, lavatories, Section 419.1 references CSA B45.5/IAPMO Z124, laundry trays, Section 418.1 references CSA B45.5/IAPMO Z124, sinks, Section 422.1 references CSA B45.5/IAPMO Z124, urinals, Section 424.1 references CSA B45.5/IAPMO Z124, and water closets, Section 425.1 references CSA B45.5/IAPMO Z124. The Building Code has separate requirements for certain building materials. Any fire test requirement is specified in the Building Code, not the Plumbing Code. The Codes always work together. The majority of partitions regulated by IAPMO Z124.10 do not have any additional fire testing required by the Building Code.

Another reason given for disapproval was that the cost of listing is onerous. Section 303.4 requires all plumbing products that must comply with a standard to be third party listed. If it is considered onerous for partitions, it should be considered onerous for every plumbing product. However, plumbing manufacturers recognize and accept that a part of doing business requires their products to be listed by a third-party agency. Bradley has all of its plumbing products listed. While some may consider it onerous, it is the cost of doing business in the profession.

When the first IPC was published in 1995, listing by a third-party agency was not required. The code officials proposed a change to a later edition to require all plumbing products to be listed by a third-party agency. None of the plumbing manufacturers objected to this change since it was already standard practice in the profession. Therefore, it should not be considered any more onerous for a premanufactured partition to be listed than any other plumbing product.

The final reason given for disapproval was regarding the dimensions for a urinal partition. Type C urinal partitions regulated by IAPMO Z124.10 have dimensional requirements that currently match what is listed in the code. If for some reason the dimensions in IAPMO Z124.10 are modified, there would not be a need to propose any changes for consistency. The dimensions listed in the Plumbing Code are for walls or partitions that are not premanufactured. Hence, the dimensions do not have to match, but in all likelihood, they probably always will. This is not a technical reason for disapproving of the proposed change.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Comment (CAH2)# 241

P31-24

IPC: 405.4.3

Proposed Change as Submitted

Proponents: Justin Cassamassino, ASME, A112 Main Committee (cassamassinoj@asme.org)

2024 International Plumbing Code

Revise as follows:

405.4.3 Securing wall-hung water closet bowls and urinals. Wall-hung water closet bowls and urinals shall be supported by a concealed metal carrier that is attached to the building structural members so that strain is not transmitted to the fixture connector or any other part of the plumbing system. The carrier shall conform to ASME A112.6.1M or ASME A112.6.2.

Reason: The ASME A112.6.1 and ASME A112.6.2 standards includes requirements for floor-affixed supports that can be used to secure off the floor water closets and as well as urinals.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Clarification of which fixtures the standards includes, supports already used for urinals and water closets.

P31-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: Urinals do not need carriers as users are not sitting on urinals like they do for wall hung water closets. (11-3)

P31-24

Individual Consideration Agenda

Comment 1:

Proponents: Julius Ballanco, P.E., JB Engineering and Code Consulting, P.C., Self (jbengineer@aol.com) requests As Submitted

Reason: The reason given for rejection is that urinals do not need carriers since the user is not sitting on the urinal. This statement is inaccurate. The use of carriers is not based on someone sitting on a fixture. The carrier facilitates the proper installation of the fixture. When a fixture, such as a water closet, has a load based on a person sitting on the fixture, additional load testing is required by the standard. For a urinal carrier that are no such load tests, but that are tests for proper connection and support of the urinal.

The urinal fixture standard, ASME A112.19.2/CSA B45.1 states that a carrier is required for a wall-hung urinal. This is consistent with the language in the proposed change.

It should be recognized that I am a member of ASME A112 Committee, however, I am NOT authorized to submit this comment on behalf

of the Committee.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Comment (CAH2)# 652

P33-24

IPC: SECTION 202 (New), SECTION 202, 410.4

Proposed Change as Submitted

Proponents: Eirene Knott, BRR Architecture, Metropolitan Kansas City Chapter of the ICC (eirene.knott@brrarch.com)

2024 International Plumbing Code

Add new definition as follows:

BOTTLE FILLING STATION. A plumbing fixture that is manually controlled by the user for the purpose of dispensing potable drinking water into water bottles or containers not less than 10 inches (254 mm) in height. Such fixture is connected to both the potable water distribution system and sanitary drainage system of the premises. See also *water dispenser.*

Revise as follows:

WATER DISPENSER. A plumbing fixture that is manually controlled by the user for the purpose of dispensing potable drinking water into a receptacle such as a cup, glass or bottle. Such fixture is connected to the potable water distribution system of the premises. Such fixtures include bottle filling stations.

410.4 Substitution. Where restaurants provide drinking water in a container free of charge, drinking fountains shall not be required in those restaurants. In other *occupancies* ~~where three or more drinking fountains are required, *water dispensers*~~ bottle filling stations not combined with a drinking fountain shall be permitted to be substituted for not more than 50 percent of the required number of drinking fountains. Bottle filling stations combined with a drinking fountain shall be permitted to be substituted for all drinking fountains.

Reason: When Covid hit the country in 2020, every single drinking fountain in the country was no longer available. Since the IPC has been designed to make sure that the general public has access to free drinking water at all times, this created a problem. What I'm trying to do with this code change is allow the use of a bottle filling station to be used in lieu of a drinking fountain in all occupancy groups. If a bottle filling station is associated with a drinking fountain, then those can be substituted directly for a drinking fountain. If the bottle filling station does not also contain a drinking fountain, then the substitution ratio is fifty percent.

Just during the 2023 year, Michigan, Illinois, Vermont, Maine and Delaware passed legislation to require for bottle filling stations in educational occupancies. Both Maine and Vermont have language that specifically states "sanitary reasons" for the use of the bottle filler. Many states allow for the use of a combination drinking fountain/bottle filling station as an option for the required drinking fountain. In addition, the State of Washington allows for the bottle filling station and/or combination of a drinking fountain/bottle filling station for each drinking fountain required. Their point is to eliminate public waste with all the plastic bottles. Pennsylvania also has legislation encouraging the reduction in the use of plastics by allowing substitution of the bottle filling station for the required drinking fountains.

The State of Massachusetts recently enacted a ban on the purchase of single use plastic bottles for state agencies. The National Park Service began phasing out the sale of single use plastic bottles in 2022.

In September 2023, the United Nations published the "Zero Draft of the Plastics Treaty", which a portion addresses the plastics pollution concern.

Do we want plumbing fixtures to be dictated by state or even national requirements or by the building and/or plumbing code? The IPC needs to be the leader here and allow for the substitution of bottle filling stations for drinking fountains.

I have modified the definition of water dispenser to include a bottle filling station, as a bottle filling station meets these requirements. In addition, I have provided a definition of a bottle filling station to account for the minimum requirements needed to provide for a bottle or similar container. A bottle filling station would comply with the requirements of UL 399 as noted in IPC 410.1.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

$0 to $1100

Estimated Immediate Cost Impact Justification (methodology and variables):

I opted to reflect the increase as the cost of a bottle filling station may be more than that of a drinking fountain. However, a decrease may actually occur.
There may be minimal cost impact due to the legislative requirements in many states.

Based upon pricing available online, a typical hi-lo drinking fountain runs between $1000 and $2200 depending on the aesthetics of the fountain.

A single bottle filling stating ranges from $590 to $1100 depending on aesthetics and whether or not the filling station also includes a drinking fountain.

A dual hi-lo drinking fountain combined with a bottle filling station can range from $1400 to $1900.

Based on these numbers, no increase may occur. If a dual hi-lo drinking fountain is installed and a bottle filling station is installed in addition to the drinking fountain, then an increase of up to $1100 could occur.

However, if a combination hi-lo drinking fountain combined with a bottle filling station is installed, a decrease may occur depending on the aesthetics of the units provided.

Estimated Life Cycle Cost Impact:

N/A

Estimated Life Cycle Cost Impact Justification (methodology and variables):

N/A

P33-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The proposal needs rework as the proponent tried tro present multiple modifications (all ruled out of order) where they attempted to fix the proposal. (11-3)

P33-24

Individual Consideration Agenda

Comment 1:

IPC: SECTION 202, 410.4

Proponents: Eirene Knott, BRR Architecture, BRR Architecture (eirene.knott@brrarch.com); Andrew Bevis, Chair, Plumbing, Mechanical and Fuel Gas Code Action Committee (pmgcac@iccsafe.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Plumbing Code

Revise as follows:

BOTTLE FILLING STATION. A plumbing fixture that is ~~manually~~ controlled by the user for the purpose of dispensing potable drinking water into water bottles or containers not less than 10 inches (254 mm) in height. Such fixture is connected to both the potable water distribution system and sanitary drainage system of the premises. See also *water dispenser.*

WATER DISPENSER. A plumbing fixture that is manually controlled by the user for the purpose of dispensing potable drinking water into a receptacle such as a cup, glass or bottle. Such fixture is connected to the potable water distribution system of the premises. Such fixtures include bottle filling stations.

Revise as follows:

410.4 Substitution. Where restaurants provide drinking water in a container free of charge, drinking fountains shall not be required in those restaurants. In other *occupancies* water dispensers or bottle filling stations not combined with a drinking fountain shall be permitted to be substituted for not more than 50 percent of the required number of drinking fountains. Bottle filling stations combined with a drinking fountain shall be permitted to be substituted for all drinking fountains.

Reason: This proposed modification incorporates floor modifications that were attempted to be brought up for discussion at the Orlando Hearings. Manually has be removed from the definition of bottle filling station. Water dispenser was added to the permitted substitution at the 50 percent level.

Cost Impact: Increase

Estimated Immediate Cost Impact:

See original proposal for impact.

Estimated Immediate Cost Impact Justification (methodology and variables):

See original proposal for cost estimate

Estimated Life Cycle Cost Impact:

N/A

Estimated Life Cycle Cost Impact Justification (methodology and variables):

Comment (CAH2)# 268

NOTE: P42-24 PART I DID NOT RECEIVE A COMMENT (CAH2) AND IS REPRODUCED FOR INFORMATIONAL PURPOSES ONLY

P42-24 Part I

IPC: 413.1, ASME Chapter 15 (New)

Proposed Change as Submitted

Proponents: Justin Cassamassino, ASME, A112 Main Committee (cassamassinoj@asme.org)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE PLUMBING CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-MP CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Plumbing Code

Revise as follows:

413.1 Approval. Floor drains shall conform to ASME A112.3.1~~,~~ or ASME A112.6.3 ~~or CSA B79~~. Trench drains shall comply with ASME ~~A112.6.3~~ A112.6.8/CSA B79.8.

Add new standard(s) as follows:

ASME

American Society of Mechanical Engineers
Two Park Avenue
New York, NY 10016-5990

A112.6.8/CSA B79.8–2022 Trench Drains

Reason: The ASME A112.6.3 was harmonized with CSA B79 such that the CSA B79 designation is not used. The updated standard designation will be proposed in Group B Administrative standard updates. Trench drains are now covered under ASME A112.6.8/CSA B79.3.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Clarification as to which standard is applicable to which product. Drains were already using the ASME standards for certification.

Staff Analysis: A review of the standard proposed for inclusion in the code, SME A112.6.8/CSA B79.8-2022 T*rench Drains*, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

P42-24 Part I

Public Hearing Results (CAH1)

Errata: This proposal includes published errata Errata: The proponent's name was missing from the proposal. See the Consolidated Monograph Updates document; https://www.iccsafe.org/wp-content/uploads/2024-Group-A-Consolidated-Monograph-Updates.pdf

Committee Action: **As Submitted**

Committee Reason: The Committee agreed with the published reason statement. (14-0)

P42-24 Part II

IRC: TABLE P2701.1, P2719.1, ASME Chapter 44 (New)

Proposed Change as Submitted

Proponents: Justin Cassamassino, ASME, A112 Main Committee (cassamassinoj@asme.org)

2024 International Residential Code

Revise as follows:

TABLE P2701.1 PLUMBING FIXTURES, FAUCETS AND FIXTURE FITTINGS

Portions of table not shown remain unchanged.

MATERIAL	STANDARD
Air gap fittings for use with plumbing fixtures, appliances and appurtenances	ASME A112.1.3
Bathtub/whirlpool pressure-sealed doors	ASME A112.19.15
Diverters for faucets with hose spray, anti-syphon type, residential application	ASME A112.18.1/CSA B125.1
Enameled cast-iron plumbing fixtures	ASME A112.19.1/CSA B45.2
Floor drains	ASME A112.6.3
Framing-affixed supports for off-the-floor water closets with concealed tanks	ASME A112.6.2
Hose connection vacuum breaker	ASSE 1052
Hot water dispensers, household storage type, electrical	ASSE 1023
Household disposers	ASSE 1008
Hydraulic performance for water closets and urinals	ASME A112.19.2/CSA B45.1
Individual automatic compensating valves for individual fixture fittings	ASME A112.18.1/CSA B125.1
Individual shower control valves anti-scald	ASSE 1016/ASME A112.1016/CSA B125.16
Macerating toilet systems and related components	ASME A112.3.4/CSA B45.9
Nonvitreous ceramic plumbing fixtures	ASME A112.19.2/CSA B45.1
Plastic bathtub units	CSA B45.5/IAPMO Z124; ASME A112.19.2/CSA B45.1
Plastic lavatories	CSA B45.5/IAPMO Z124
Plastic shower receptors and shower stalls	CSA B45.5/IAPMO Z124
Plastic sinks	CSA B45.5/IAPMO Z124
Plastic water closet bowls and tanks	CSA B45.5/IAPMO Z124
Plumbing fixture fittings	ASME A112.18.1/CSA B125.1
Plumbing fixture waste fittings	ASME A112.18.2/CSA B125.2; ASTM F409
Porcelain-enameled formed steel plumbing fixtures	ASME A112.19.1/CSA B45.2
Pressurized flushing devices for plumbing fixtures	ASSE 1016/ASME 112.1016/CSA B125.16; CSA B125.3
Specification for copper sheet and strip for building construction	ASTM B370
Stainless steel plumbing fixtures	ASME A112.19.3/CSA B45.4
Suction fittings for use in whirlpool bathtub appliances	ASME A112.19.7/CSA B45.10
Temperature-actuated, flow reduction valves to individual fixture fittings	ASSE 1062
Thermoplastic accessible and replaceable plastic tube and tubular fittings	ASTM F409
Trench drains	~~ASME A112.6.3~~ ASME A112.6.8/CSA B79.8
Trim for water closet bowls, tanks and urinals	ASME A112.19.5/CSA B45.15
Vacuum breaker wall hydrant-frost-resistant, automatic-draining type	ASSE 1019
Vitreous china plumbing fixtures	ASME A112.19.2/CSA B45.1
Wall-mounted and pedestal-mounted, adjustable and pivoting lavatory and sink carrier systems	ASME A112.19.12
Water closet flush tank fill valves	ASSE 1002/ASME A112.1002/CSA B125.12; CSA B125.3
Whirlpool bathtub appliances	ASME A112.19.7/CSA B45.10

P2719.1 Floor and trench drains. *Floor drains* shall comply to ASME A112.6.3. Trench drains shall comply to ASME A112.6.8/CSA B79.8. *Floor drains* shall have waste outlets not less than 2 inches (51 mm) in diameter and a removable strainer. *Floor drains* shall be constructed so that the drain can be cleaned. Access shall be provided to the drain inlet. *Floor drains* shall not be located under or have their access restricted by permanently installed appliances.

Add new standard(s) as follows:

ASME

American Society of Mechanical Engineers
Two Park Avenue
New York, NY 10016-5990

A112.6.8/CSA B79.8–2022 Trench Drains

Reason: The ASME A112.6.3 was harmonized with CSA B79 such that the CSA B79 designation is not used. The updated standard designation will be proposed in Group B Administrative standard updates. Trench drains are now covered under ASME A112.6.8/CSA B79.3.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Clarification as to which standard is applicable to which product. Drains were already using the ASME standards for certification.

Staff Analysis: A review of the standard proposed for inclusion in the code, SME A112.6.8/CSA B79.8-2022 T*rench Drains*, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

P42-24 Part II

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The staff analysis of new standard did not indicate that staff had reviewed the standard. (6-4)

P42-24 Part II

Individual Consideration Agenda

Comment 1:

Proponents: Andrew Bevis, Chair, Plumbing, Mechanical and Fuel Gas Code Action Committee (pmgcac@iccsafe.org) requests As Submitted

Reason: For CAH1, there was an omission in the New Standards Analysis document that was posted online for the Committee to review. The standard ASME A112.6.8/CSA B79.8-2022 Trench Drains was not listed even though ICC had the standard by the submission deadline. Also, the standard was not posted online for the Committee review.

The New Standards Analysis document has been updated and the standard is now on the Committee standards viewing website.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Comment (CAH2)# 147

P44-24

IPC: 419.5

Proposed Change as Submitted

Proponents: James Richardson, City of Columbus (Ohio), City of Columbus (Ohio) (jarichardson@columbus.gov)

2024 International Plumbing Code

Revise as follows:

419.5 Tempered water for public hand-washing facilities. ~~*Tempered water* shall be delivered from lavatories and group wash fixtures located in *public* toilet facilities provided for customers, patrons and visitors.~~ Tempered water shall be delivered from lavatories and group wash fixtures located in public toilet facilities provided for any occupancy with primary users being children, such as elementary schools, Sunday bible schools, and child daycare facilities or for any occupancy serving primarily elderly or other vulnerable occupants, and for any lavatories and group wash fixtures located in public use toilet facilities that are provided with a single delivered temperature faucet. *Tempered water* shall be delivered through an *approved* water-temperature limiting device that conforms to ASSE 1070/ASME A112.1070/CSA B125.70.

Reason: Tempered water for public handwashing fixtures was the result of an overreach associated to trying to protect the users of bathtubs and showers from sudden changes in temperature. The protection for users of bathtubs and showers makes sense because the user is "captive" to the fixture when they use it. The same cannot be said for handwashing fixtures. This requirement was a massive overreach because the same risk level just isn't there. If a user of a handwashing fixture senses water is too hot or too cold, they can simply remove their hands from the stream of water. This proposal will still require protection for public facility users that would be most at risk, such as children and senior citizens in assisted care facilities.

Bibliography: See reason statement.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

Between $200-$500 for each unit that would no longer be required to be installed.

Estimated Immediate Cost Impact Justification (methodology and variables):

$100-$200 per unit and between $100-$300 for labor depending on the local labor costs.

P44-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The term "vulnerable occupants" is open to broad interpretation, Also, the use of "such as" opens the door for inclusion of many other applications. (13-0)

P44-24

Individual Consideration Agenda

Comment 1:

IPC: 419.5

Proponents: James Richardson, City of Columbus (Ohio), City of Columbus (Ohio) (jarichardson@columbus.gov) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Plumbing Code

Revise as follows:

419.5 Tempered water for public hand-washing facilities. Tempered water shall be delivered from lavatories and group wash fixtures located in public toilet facilities provided for anyGroup E, Group I-1, Group I-2, Group I-3, or Group I-4 occupancy and occupancies that are referenced in sections 305.2 through 305.4 of the International Building Code, and for any lavatories and group wash fixtures located in public use toilet facilities that are provided with a single delivered temperature faucet not controlled by the user. *Tempered water* shall be delivered through an *approved* water-temperature limiting device that conforms to ASSE 1070/ASME A112.1070/CSA B125.70.

Reason: Tempered water for public handwashing fixtures was the result of an overreach associated to trying to protect the users of bathtubs and showers from sudden changes in temperature. The protection for users of bathtubs and showers makes sense because the user is "captive" to the fixture when they use it. The same cannot be said for handwashing fixtures. This requirement was a massive overreach because the same risk level just isn't there. If a user of a handwashing fixture senses water is too hot or too cold, they can simply remove their hands from the stream of water. This proposal will still require protection for public facility users that would be most at risk by referencing the specific use groups as well as some special occupancies listed in section 308.5.2 though 308.5.3 of the IBC.

Bibliography: As suggested by members of the IPC Code Development Committee during CAH #1, the language was modified to reference the use groups rather than "vulnerable occupants".

Cost Impact: Decrease

Estimated Immediate Cost Impact:

Between $200-$500 for each unit that would no longer be required to be installed.

Estimated Immediate Cost Impact Justification (methodology and variables):

$100-$200 per unit and between $100-$300 for labor depending on the local labor costs.

Comment (CAH2)# 392

P52-24 Part I

IPC: SECTION 202 (New), 501.10 (New), ASSE Chapter 15 (New)

Proposed Change as Submitted

Proponents: David Nickelson, Uponor, Uponor (david.nickelson@uponor.com)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE PLUMBING CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-MP CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Plumbing Code

Add new definition as follows:

HEAT INTERFACE UNIT. A unit including one or more double wall heat exchangers and control devices for transferring heat from a primary to a secondary system. The primary system may be a hot water heating system. The secondary system is the domestic hot water system within the dwelling or other space.

Add new text as follows:

501.10 Heat Interface Unit. Installed heat interface units shall contain a proportional control valve that is third-party certified to ASSE 1379.

Add new standard(s) as follows:

ASSE

ASSE International
18927 Hickory Creek Drive, Suite 220
Mokena, IL 60448

1379-20xx	Proportional Flow Control Devices, with Protection from Cross Connection via Hydronic Water, for use in Potable Water Installation

Reason: The Heat Interface Unit helps improve water quality, water and energy efficiency, water and energy conservation, and system performance.

A Heat Interface Unit system eliminates more than 50% of the Domestic Hot Water (DHW) volume. This is accomplished by eliminating much of the hot water piping and all the recirculation line piping. Since much of the hot water piping has been eliminated with a Heat Interface Unit system there is a much higher turnover of fresh water in the domestic system. The domestic hot-water piping that remains in the building is only the in-suite piping on the other side of the Heat Interface Unit. These are short runs of smaller-diameter piping that have little volume of water and cool quickly after use to help minimize the time in the optimal-bacterial-growth temperature range.

When designed properly, a Heat Interface Unit system can realize up to 35% reduction of energy used in the building by eliminating a central DHW system with its recirculation piping and pumps, and just using the 4-pipe HVAC system to distribute hot water to the Heat Interface Units.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

$0

Estimated Immediate Cost Impact Justification (methodology and variables):

The inclusion of an additional option does not in and of itself increase or decrease the overall cost impact of the code, because an option may or may not be chosen. The existing options are still relevant, and if chosen, have no cost impact on the actual code requirements.

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: Section 608 would be a better location for this information. (12-1)

P52-24 Part I

Individual Consideration Agenda

Comment 1:

IPC: SECTION 202, 501.10, 608.14.10 (New), ASSE Chapter 15

Proponents: David Nickelson, Uponor, Uponor (david.nickelson@uponor.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Plumbing Code

Revise as follows:

HEAT INTERFACE UNIT. ~~A unit including one or more double wall heat exchangers and control devices for transferring heat from a primary to a secondary system. The primary system may be a hot water heating system. The secondary system is the domestic hot water system within the dwelling or other space.~~ A prefabricated, water-heating device that utilizes a building's hydronic hot water system along with a double wall heat exchanger and a proportional flow control valve or other acceptable means of temperature control, to create domestic potable hot water for a dwelling unit.

501.10 Heat Interface Unit. ~~Installed heat interface units shall contain a proportional control valve that is third-party certified to ASSE 1379.~~ Heat interface units shall be sized and installed in accordance with the manufacturer's installation requirements. Heat interface units shall contain a means to control output temperature to the designed temperature and shall limit the water supplied to the potable hot water distribution system to a temperature of 140ºF (60ºC) or less.

Add new text as follows:

608.14.10 Proportional flow control devices. Where proportional flow control devices contain protection from cross-connection via hydronic water, such devices shall conform to ASSE 1379.

Revise as follows:

ASSE

ASSE International
18927 Hickory Creek Drive, Suite 220
Mokena, IL 60448

1379-20~~xx~~24	Proportional Flow Control Devices, with Protection from Cross-Connection via Hydronic Water, for use in Potable Water Installations

Reason: This comment revises the original proposal by moving the cross-connection requirements to Section 608 as discussed at the CAH#1. This comment also revises the definition of Heat Interface Unit as it was discussed in testimony that this definition is too broad

and all encompassing. Requirements for design and installation are added to Section 501.10. Additional information is provided in the attached files for clarification.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

The inclusion of an additional option does not in and of itself increase or decrease the overall cost impact of the code, because an option may or may not be chosen. The existing options are still relevant, and if chosen, have no cost impact on the actual code requirements.

Estimated Immediate Cost Impact Justification (methodology and variables):

This is an option to the existing code. It does not add or remove existing options or solutions to the existing code. If this option is not chosen the existing solutions/options are the existing costs of the previous code language.

Comment (CAH2)# 440

Comment 2:

IPC: SECTION 202, 501.10, ASSE Chapter 15

Proponents: Jason Shank, ASSE International, ASSE International (jshank@plumbers55.com) requests As Submitted

Reason: The Standard ASSE 1379 is an published ANSI Standard which it was not at the CAH #1 Group A in April 2024.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Comment (CAH2)# 672

P52-24 Part II

IRC: SECTION 202 (New), P2805 (New), P2805.1 (New), ASSE Chapter 44 (New)

Proposed Change as Submitted

Proponents: David Nickelson, Uponor, Uponor (david.nickelson@uponor.com)

2024 International Residential Code

Add new definition as follows:

HEAT INTERFACE UNIT. A unit including one or more double wall heat exchangers and control elements for transferring heat from a primary to a secondary system. The primary system may be a hot water heating system. The secondary system is the domestic hot water system within the dwelling or other space.

Add new text as follows:

P2805
HEAT INTERFACE UNIT

P2805.1 Heat interface unit. Installed heat interface units shall contain proportional control valves that are third-party certified to ASSE 1379.

Add new standard(s) as follows:

ASSE

ASSE International
18927 Hickory Creek Drive, Suite 220
Mokena, IL 60448

1379-20xx	Proportional Flow Control Devices, with Protection from Cross Connection via Hydronic Water, for use in Potable Water Installations

Reason: The Heat Interface Unit helps improve water quality, water and energy efficiency, water and energy conservation, and system performance.

A Heat Interface Unit system eliminates more than 50% of the Domestic Hot Water (DHW) volume. This is accomplished by eliminating much of the hot water piping and all the recirculation line piping. Since much of the hot water piping has been eliminated with a Heat Interface Unit system there is a much higher turnover of fresh water in the domestic system. The domestic hot-water piping that remains in the building is only the in-suite piping on the other side of the Heat Interface Unit. These are short runs of smaller-diameter piping that have little volume of water and cool quickly after use to help minimize the time in the optimal-bacterial-growth temperature range.

When designed properly, a Heat Interface Unit system can realize up to 35% reduction of energy used in the building by eliminating a central DHW system with its recirculation piping and pumps, and just using the 4-pipe HVAC system to distribute hot water to the Heat Interface Units.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

$0

Estimated Immediate Cost Impact Justification (methodology and variables):

The inclusion of an additional option does not in and of itself increase or decrease the overall cost impact of the code, because an option may or may not be chosen. The existing options are still relevant, and if chosen, have no cost impact on the actual code requirements.

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: Standard is not complete. Definition is too broad and confusing. What is or is not a Heat Interface unit? (10-0)

P52-24 Part II

Individual Consideration Agenda

Comment 1:

IRC: SECTION 202, P2805, P2805.1, P2902.3.8 (New), ASSE Chapter 44

Proponents: David Nickelson, Uponor, Uponor (david.nickelson@uponor.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Residential Code

Revise as follows:

HEAT INTERFACE UNIT. ~~A unit including one or more double wall heat exchangers and control elements for transferring heat from a primary to a secondary system. The primary system may be a hot water heating system. The secondary system is the domestic hot water system within the dwelling or other space.~~
A prefabricated, water-heating device that utilizes a building's hydronic hot water system along with a double wall heat exchanger and a proportional flow control valve, or other acceptable means of temperature control, to create domestic potable hot water for a dwelling unit

P2805
HEAT INTERFACE UNIT

P2805.1 Heat interface unit. ~~Installed heat interface units shall contain proportional control valves that are third-party certified to ASSE 1379.~~ Heat interface units shall be sized and installed in accordance with the manufacturer's installation requirements. Heat interface units shall contain a means to control output temperature to the designed temperature, and shall limit the water supplied to the potable hot water distribution system to a temperature of 140°F (60°C) or less.

Add new text as follows:

P2902.3.8 Proportional flow control devices. Where proportional flow control devices contain protection from cross-connection via hydronic water, such devices shall conform to ASSE 1379.

ASSE

ASSE International
18927 Hickory Creek Drive, Suite 220
Mokena, IL 60448

1379-20~~xx~~24	Proportional Flow Control Devices, with Protection from Cross-Connection via Hydronic Water, for use in Potable Water Installations

Reason: This comment revises the original proposal by moving the cross-connection requirements to Section P2902.3 as discussed at the CAH#1. This comment also revises the definition of Heat Interface Unit as it was discussed in testimony that this definition is too broad and all encompassing. Requirements for design and installation are added to Section P2805. Additional information is provided in the attached files for clarification.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

The inclusion of an additional option does not in and of itself increase or decrease the overall cost impact of the code, because an option may or may not be chosen. The existing options are still relevant, and if chosen, have no cost impact on the actual code requirements.

Estimated Immediate Cost Impact Justification (methodology and variables):

This is an option to the existing code. It does not add or remove existing options or solutions to the existing code. If this option is not chosen the existing solutions/options are the existing costs of the previous code language.

IPC: SECTION 202 (New), 501.10 (New), ASSE Chapter 15 (New)

Proposed Change as Submitted

Proponents: David Nickelson, Uponor, Uponor (david.nickelson@uponor.com)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE PLUMBING CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-MP CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Plumbing Code

Add new definition as follows:

INDIRECT-FIRED WATER HEATER. A water heater equipped with an internal or external heat exchanger used to transfer heat from an external source to heat potable water. The equipment either contains heated potable water or water supplied from an external source.

Add new text as follows:

501.10 Indirect-fired water heaters. Where indirect-fired water heaters contain proportional control valves, such valves shall be third-party certified to ASSE 1379.

Add new standard(s) as follows:

ASSE

ASSE International
18927 Hickory Creek Drive, Suite 220
Mokena, IL 60448

1379-20xx	Proportional Flow Control Devices, with Protection from Cross Connection via Hydronic Water, for use in Potable Water Installations

Reason: An indirect-fired water heater helps improve water quality, water and energy efficiency, water and energy conservation, and system performance.

An indirect-fired water heater system eliminates more than 50% of the Domestic Hot Water (DHW) volume. This is accomplished by eliminating much of the hot water piping and all the recirculation line piping. Since much of the hot water piping has been eliminated with an indirect-fired water heater system there is a much higher turnover of fresh water in the domestic system. The domestic hot-water piping that remains in the building is only the in-suite piping on the other side of the indirect-fired water heater. These are short runs of smaller-diameter piping that have little volume of water and cool quickly after use to help minimize the time in the optimal-bacterial-growth temperature range. When designed properly, an indirect-fired water heater system can realize up to 35% reduction of energy used in the building by eliminating a central DHW system with its recirculation piping and pumps, and just using the 4-pipe HVAC system to distribute hot water to the indirect-fired water heater.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

$0

Estimated Immediate Cost Impact Justification (methodology and variables):

The inclusion of an additional option does not in and of itself increase or decrease the overall cost impact of the code, because an option may or may not be chosen. The existing options are still relevant, and if chosen, have no cost impact on the actual code requirements.

Estimated Life Cycle Cost Impact:

Estimated Life Cycle Cost Impact Justification (methodology and variables):

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: ASSE 1379 is only in draft form and is not complete. These valves are part of an equipment package. Indirect "fired" seems to be an inappropriate term to be used in the definition. (13-0)

P53-24 Part I

Individual Consideration Agenda

Comment 1:

IPC: SECTION 202, 501.10, 608.14.10 (New), ASSE Chapter 15

Proponents: David Nickelson, Uponor, Uponor (david.nickelson@uponor.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Plumbing Code

Revise as follows:

INDIRECT ~~FIRED~~ WATER HEATER. ~~A water heater equipped with an internal or external heat exchanger used to transfer heat from an external source to heat potable water. The equipment either contains heated potable water or water supplied from an external source.~~
A prefabricated, water-heating device that utilizes a building's hydronic hot water system along with a double wall heat exchanger and a proportional flow control valve, or other acceptable means of temperature control, to create domestic potable hot water for a dwelling unit.

501.10 Indirect ~~fired~~ water heaters. ~~Where indirect fired water heaters contain proportional control valves, such valves shall be third-party certified to ASSE 1379.~~
Indirect water heaters shall be sized and installed in accordance with the manufacturer's installation requirements. Indirect water heaters shall contain a means to control output temperature to the designed temperature, and shall limit the water supplied to the potable hot water distribution system to a temperature of 140°F (60°C) or less.

Add new text as follows:

608.14.10 Proportional flow control devices. Where proportional flow control devices contain protection from cross-connection via hydronic water, such devices shall conform to ASSE 1379.

Revise as follows:

ASSE

ASSE International
18927 Hickory Creek Drive, Suite 220
Mokena, IL 60448

ASSE/IAPMO/ANSI/CAN 1379-2024 ~~1379-20xx~~	~~Proportional Flow Control Devices, with Protection from Cross-Connection via Hydronic Water, for use in Potable Water Installations~~ Performance Requirements for Proportional Flow Control Devices, with Protection from Cross-Connection via Hydronic Water, for use in Potable Water Installations

Reason: This comment revises the original proposal by moving the cross-connection requirements to Section 608 as discussed at the CAH#1. This comment also revises the definition of Indirect Water Heater as it was discussed in testimony that this definition is too broad and all encompassing. This also removes the word "fired" from the definition title as the committee expressed issues with this term. The US Department of Energy also describes Indirect Water Heaters on this site: Tankless Coil and Indirect Water Heaters | Department of Energy
Requirements for design and installation are added to Section 501.10. Additional information is provided in the attached files for clarification.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

The inclusion of an additional option does not in and of itself increase or decrease the overall cost impact of the code, because an option may or may not be chosen. The existing options are still relevant, and if chosen, have no cost impact on the actual code requirements.

Estimated Immediate Cost Impact Justification (methodology and variables):

This is an option to the existing code. It does not add or remove existing options or solutions to the existing code. If this option is not chosen the existing solutions/options are the existing costs of the previous code language.

Comment (CAH2)# 680

P53-24 Part II

IRC: SECTION 202 (New), SECTION P2805 (New), P2805.1 (New), ASSE Chapter 44 (New)

Proposed Change as Submitted

Proponents: David Nickelson, Uponor, Uponor (david.nickelson@uponor.com)

2024 International Residential Code

Add new definition as follows:

[MP] INDIRECT-FIRED WATER HEATER. A water heater equipped with an internal or external heat exchanger used to transfer heat from an external source to heat potable water. The equipment either contains heated potable water or water supplied from an external source.

Add new text as follows:

SECTION P2805
INDIRECT-FIRED WATER HEATERS

P2805.1 Indirect-fired water heaters. Where indirect-fired water heaters contain a proportional control valve, such valves shall be third-party certified to ASSE 1379.

Add new standard(s) as follows:

ASSE

ASSE International
18927 Hickory Creek Drive, Suite 220
Mokena, IL 60448

1379-20xx	Proportional Flow Control Devices, with Protection from Cross Connection via Hydronic Water, for use in Potable Water Installation

Reason: An indirect-fired water heater helps improve water quality, water and energy efficiency, water and energy conservation, and system performance.

An indirect-fired water heater system eliminates more than 50% of the Domestic Hot Water (DHW) volume. This is accomplished by eliminating much of the hot water piping and all the recirculation line piping. Since much of the hot water piping has been eliminated with an indirect-fired water heater system there is a much higher turnover of fresh water in the domestic system. The domestic hot-water piping that remains in the building is only the in-suite piping on the other side of the indirect-fired water heater. These are short runs of smaller-diameter piping that have little volume of water and cool quickly after use to help minimize the time in the optimal-bacterial-growth temperature range. When designed properly, an indirect-fired water heater system can realize up to 35% reduction of energy used in the building by eliminating a central DHW system with its recirculation piping and pumps, and just using the 4-pipe HVAC system to distribute hot water to the indirect-fired water heater.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

$0

Estimated Immediate Cost Impact Justification (methodology and variables):

The inclusion of an additional option does not in and of itself increase or decrease the overall cost impact of the code, because an option may or may not be chosen. The existing options are still relevant, and if chosen, have no cost impact on the actual code requirements.

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: Standard is not complete. Definition is confusing. (10-0)

P53-24 Part II

Individual Consideration Agenda

Comment 1:

IRC: SECTION 202, SECTION P2805, P2805.1, P2902.3.8 (New), ASSE Chapter 44

Proponents: David Nickelson, Uponor, Uponor (david.nickelson@uponor.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Residential Code

Revise as follows:

[MP] INDIRECT-~~FIRED~~ WATER HEATER. ~~A water heater equipped with an internal or external heat exchanger used to transfer heat from an external source to heat potable water. The equipment either contains heated potable water or water supplied from an external source.~~

A prefabricated, water-heating device that utilizes a building's hydronic hot water system along with a double wall heat exchanger and a proportional flow control valve, or other acceptable means of temperature control, to create domestic potable hot water for a dwelling unit.

SECTION P2805
INDIRECT-~~FIRED~~ WATER HEATERS

P2805.1 Indirect-~~fired~~ water heaters. ~~Where indirect fired water heaters contain a proportional control valve, such valves shall be third-party certified to ASSE 1379.~~

Indirect water heaters shall be sized and installed in accordance with the manufacturer's installation requirements. Indirect water heaters shall contain a means to control output temperature to the designed temperature and shall limit the water supplied to the potable hot water distribution system to a temperature of 140°F (60°C) or less.

Add new text as follows:

P2902.3.8 Proportional flow control devices. Where proportional flow control devices contain protection from cross-connection via hydronic water, such devices shall conform to ASSE 1379

ASSE

ASSE International
18927 Hickory Creek Drive, Suite 220
Mokena, IL 60448

ASSE/IAPMO/ANSI/CAN 1379-2024 ~~1379-20xx~~	~~Proportional Flow Control Devices, with Protection from Cross-Connection via Hydronic Water, for use in Potable Water Installations~~ Performance Requirements for Proportional Flow Control Devices, with Protection from Cross-Connection via Hydronic Water, for use in Potable Water Installations

Reason: This comment revises the original proposal by moving the cross-connection requirements to Section P2902 as discussed at the CAH#1. This comment also revises the definition of Indirect Water Heater as it was discussed in testimony that this definition is too broad and all encompassing. This also removes the word "fired" from the definition title as the committee expressed issues with this term. The US Department of Energy also describes Indirect Water Heaters on this site:

Tankless Coil and Indirect Water Heaters | Department of Energy
Requirements for design and installation are added to Section P2805. Additional information is provided in the attached files for clarification.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

The inclusion of an additional option does not in and of itself increase or decrease the overall cost impact of the code, because an option may or may not be chosen. The existing options are still relevant, and if chosen, have no cost impact on the actual code requirements.

Estimated Immediate Cost Impact Justification (methodology and variables):

This is an option to the existing code. It does not add or remove existing options or solutions to the existing code. If this option is not chosen the existing solutions/options are the existing costs of the previous code language.

Proposed Change as Submitted

Proponents: Jim Lutz, self (jdlutz@hotwaterresearch.net), Gary Klein (gary@garykleinassociates.com)

2024 International Plumbing Code

Add new definition as follows:

WATER HEATER, HEAT PUMP, AIR SOURCE. A water heating system, containing a heat pump and storage tank, where the heat pump uses ambient air as a heat source to heat water. There are two types:

1. Unitary systems where the heat pump and storage tank are a single assembly. The heat pump is generally mounted on top of the storage tank.
2. Split systems where the heat pump and storage tank are separate assemblies.

SECTION 502
INSTALLATION

Revise as follows:

502.1 General. Water heaters shall be installed in accordance with the manufacturer's instructions. Oil-fired water heaters shall conform to the requirements of this code and the *International Mechanical Code*. Electric water heaters shall conform to the requirements of this code and provisions of NFPA 70. Gas-fired water heaters shall conform to the requirements of the *International Fuel Gas Code*. Solar thermal water heating systems shall conform to the requirements of the *International Mechanical Code* and ICC 900/SRCC 300. Air source heat pump water heaters shall be installed in accordance with Section 506.

Add new text as follows:

SECTION 506
Heat Pump Water Heaters

506.1 Air-source heat pump water heaters (HPWH). Air-source heat pump water heaters (HPWH) shall comply with Sections 506.2. through 506.5.

506.2 Obstructions and clearances. Air intakes, exhaust outlets, filters, heating elements, wiring connections, condensate drains, temperature and pressure relief valves shall not be obstructed. Clearances shall be provided for maintenance and replacement in accordance with Section 502.5.

506.3 Seismic Supports. Seismic supports shall comply with Section 502.4. Restraints shall not obstruct components specified in Section 506.2.

506.3.1 Unitary HPWH. Seismic restraints for unitary HPWHs shall be located at points within the upper one-third and lower one-third of the vertical dimensions of the storage tank, and not on the heat pump portion.

506.3.2 Split System HPWH. For split systems, the seismic restraints for the storage tank shall be in accordance with Section 506.3.1.

The heat pump portion of the split system shall be installed in accordance with the manufacturer's instructions.

506.4 Condensate Drains. Condensate drain lines from air source HPWHs shall be in accordance with Section 314.2.

506.5 Ventilation. The ventilation requirements for air-source HPWH shall be in accordance with Sections 506.5.1 through 506.5.4. The minimum dimensions for the space volume where the HPWH is installed shall be 3.5 x 3.5 x 8 = 98 cubic feet.

506.5.1 Space volume method. Ventilation shall comply with the provisions Table 506.5.1.

TABLE 506.5.1 MINIMUM SPACE VOLUME FOR INSTALLING AIR-SOURCE HPW

Heat Pump Capacity (BTU/Hour)	<1,000	≥1,000 and <2,000	≥2,000 and <3,000	≥3,000 and <4,000	≥4,000 and <5,000	≥5,000 and <6,000	≥6,000 and <7,000	≥7,000 and <8,000	≥8,000 and <9,000	≥9,000 and <10,000	≥10,000 and <11,000	≥11,000 and <12,000	≥12,000 and <13,000	≥13,000 and <14,000	≥14,000 and <15,000	≥15,000 and <16,000	≥16,000 and <17,000	≥17,000 and <18,000
Space Volume (cubic feet)	175	350	525	700	875	1,050	1,225	1,400	1,575	1,750	1,925	2,100	2,275	2,450	2,625	2,800	2,975	3,150

For SI units: 1 cubic foot = 0.0283 m^3, 1000 British thermal units per hour = 0.293 kW

506.5.2 Passive ventilation method. Where the location of the HPWH is in a space smaller than required in Table 506.5.1, additional ventilation shall be provided in accordance with Table 506.5.2. Passive ventilation shall be into an adjacent space that shares the same pressure zone with the HPWH. The sum of the volume of the space where the HPWH is located and the volume in the adjacent space shall be not less than the space volume required for the capacity shown in Table 506.5.2. The net free area of the passive ventilation shall be equally distributed between high and low openings. These openings shall be in the top quarter and bottom quarter of the space where the HPWH is located.

TABLE 506.5.2 MINIMUM NET FREE AREA FOR INSTALLING AIR-SOURCE HPWH

Space Volume (cubic feet)	Heat Pump Capacity (BTU/Hour) <1,000	≥1,000 and <2,000	≥2,000 and <3,000	≥3,000 and <4,000	≥4,000 and <5,000	≥5,000 and <6,000	≥6,000 and <7,000	≥7,000 and <8,000	≥8,000 and <9,000	≥9,000 and <10,000	≥10,000 and <11,000	≥11,000 and <12,000	≥12,000 and <13,000	≥13,000 and <14,000	≥14,000 and <15,000	≥15,000 and <16,000	≥16,000 and <17,000	≥17,000 and <18,000

<100	70	140	210	280	350	420	490	560	630	700	770	840	910	980	1050	1120	1190	1260	

For SI units: 1 cubic foot = 0.0283 m3, 1000 British thermal units per hour = 0.293 kW

506.5.3 Ducted ventilation method. Where the location of the HPWH is in a space smaller than required in Table 506.5.1, and it is not possible to comply with the provisions for passive ventilation in accordance with Table 506.5.2, the HPWH shall be ducted in accordance with the manufacturer's instructions. Air intake and exhaust ducts shall come from and go to the same pressure zone. The termination of the ducts in the remote space shall be directed so that they draw from and exhaust to different parts of the pressure zone. It is permissible to install a combination of passive and ducted ventilation to meet the air flow requirements of the HPWH.

506.5.4 New construction. Ventilation shall comply with the provisions in Sections 506.5.1, 506.5.2 and 506.5.3 for the 18,000 BTU per Hour capacity column in Tables 506.5.1 and 506.5.2. **Exception:** For HPWHs larger than 18,000 BTU per hour, the minimum space volume shall be not less than 0.175 cubic feet per BTU per hour as rated by the manufacturer. Net free area and ducting shall be in accordance with the manufacturer's instructions.

Reason: The purpose of this proposal is to add an option to the plumbing code so that installers of heat pump water heaters (HPWH) have clear provisions in the chapterson Water Heaters regarding their proper installation. HPWH are water heaters, and most of the provisions regarding the installation of all water heaters apply. A key requirement that does not exist is that they need to be installed so that they operate in heat pump mode for the majority of their duty cycle.

For air source HPWH, the type of water heater discussed in this proposal, this means special attention must be paid to the air flow requirements. They need a source of "warm" air to extract energy and they need a sink for the cold air they discharge to be absorbed. The source and the sink need be matched. This can be challenging in cold climates.

To accommodate the energy exchange required by the source and the sink, the sizes of which depend on the capacity of the heat pump, there needs to be

1. A minimum volume of the space where the HPWH is installed. Energy exchange happens within that space.

2. Passive ventilation into an adjacent space if the space where the HPWH is located is not large enough. The volume of the two spaces must meet the minimum volume requirements for the HPWH's capacity. The two spaces must share a common pressure zone.

3. Ducted ventilation into an adjacent or remote space if the minimum volume or passive ventilation requirements cannot be me. The HPWH needs to be ducted to and from a location with the ability to support required energy exchange. When ducted, the remote terminals for the intake need to come from, and exhaust ducts to, the same pressure zone so that they do not adversely affect the performance of other mechanical systems.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal adds an option to the existing code. It does not add or remove existing options or solutions to the existing code. If this option is not chosen, the existing solutions/options are the existing costs of the previous code language.

P54-24 Part I

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The proposal is overly prescriptive and fails to coordinate with current manufacturer's instructions. This information should be located in the IMC. (14-0)

P54-24 Part I

Individual Consideration Agenda

Comment 1:

IPC: SECTION 202

Proponents: Gary Klein, Gary Klein and Associates, Inc., Self (gary@garykleinassociates.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Plumbing Code

Revise as follows:

WATER HEATER, HEAT PUMP, AIR SOURCE. A water heater that transfers thermal energy from one temperature level to another temperature level for the purpose of heating water, including all ancillary equipment such as fans, storage tanks, pumps, or controls necessary for the device to perform its function. There are two types of air source heat pump water heaters: ~~A water heating system, containing a heat pump and storage tank, where the heat pump uses ambient air as a heat source to heat water. There are two types:~~

1. Unitary systems where the heat pump and storage tank are a single assembly. The heat pump is generally mounted on top of the storage tank.
2. Split systems where the heat pump and storage tank are separate assemblies.

Reason: The US Department of Energy (DOE) defines the various types of water heaters sold in the United States. It makes sense to align the definition in this code with the one provided by DOE.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposed change is to the definition. This has no impact on the cost to install this type of water heater.

Comment 2:

IPC: 502.1

Proponents: Gary Klein, Gary Klein and Associates, Inc., Self (gary@garykleinassociates.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Plumbing Code

Revise as follows:

502.1 General. Water heaters shall be installed in accordance with the manufacturer's instructions. Oil-fired water heaters shall conform to the requirements of this code and the *International Mechanical Code*. Electric water heaters shall conform to the requirements of this code and provisions of NFPA 70. Gas-fired water heaters shall conform to the requirements of the *International Fuel Gas Code*. Solar thermal water heating systems shall conform to the requirements of the *International Mechanical Code* and ICC 900/SRCC 300. Electric air ~~Air~~ source heat pump water heaters shall be installed in accordance with Section 506.

Reason: The proposed change clarifies that the provisions apply to electric air source heat pump water heaters.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Clarifying that the provisions apply to electric air source heat pump water heaters does not increase the cost to comply with the provisions in the section.

Comment 3:

IPC: 506.1

Proponents: Gary Klein, Gary Klein and Associates, Inc., Self (gary@garykleinassociates.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Plumbing Code

Revise as follows:

506.1 Air-source heat pump water heaters (HPWH). Electric air~~Air~~ source heat pump water heaters (HPWH) shall comply with Sections 506.2. through 506.5.

Reason: The proposed change clarifies that the provisions apply to electric air source heat pump water heaters.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Clarifying that the provisions apply to electric air source heat pump water heaters does not increase the cost to comply with the provisions in the section.

Comment (CAH2)# 596

Comment 4:

IPC: 506.2

Proponents: Gary Klein, Gary Klein and Associates, Inc., Self (gary@garykleinassociates.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Plumbing Code

Revise as follows:

506.2 Obstructions and clearances. Air intakes, exhaust outlets, filters, heating elements, wiring connections, condensate drains, temperature and pressure relief valves shall not be obstructed. Clearances shall be provided for maintenance and replacement in accordance with Section 502.5. Cold air discharged from HPWHs shall not blow on or otherwise affect the operation of the space conditioning thermostat.

Reason: I learned about this issue since the first Committee Action Hearing while in conversation with industry.

It is not appropriate for cold air discharged from the electric air source heat pump water heater to blow onto or otherwise affect the operation of the thermostat that regulates the indoor temperature of the building. In the winter, it will cause the space heating system to come on when the majority of the building is at the desired temperature. In the summer, it will cause the space cooling system to turn off when the majority of the building is not at the desired temperature. In the swing seasons, the thermostat will be confused.

The cold air can blow onto the thermostat. It can also cool the wall behind the thermostat. Either case can result in an inappropriate response from the space conditioning system.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is a revision to provisions for a new section in the code that has not yet been adopted. The overall proposal adds an option to the existing code. It does not add or remove existing options or solutions to the existing code. If this option is not chosen, the existing solutions/options are the existing costs of the previous code language.

Comment (CAH2)# 598

Comment 5:

IPC: 506.5, 506.5.1, 506.5.1.1 (New), 506.5.1.2 (New), 506.5.1.3 (New), TABLE 506.5.1, 506.5.2, 506.5.2.1 (New), 506.5.2.2 (New), 506.5.2.3 (New), TABLE 506.5.2, 506.5.3, 506.5.3.1 (New), 506.5.4, 506.5.4.1 (New), 506.5.4.2 (New), 506.5.4.3 (New)

Proponents: Gary Klein, Gary Klein and Associates, Inc., Self (gary@garykleinassociates.com) requests As Modified by Committee (AMC2)

Modify as follows:

Revise as follows:

506.5 Air flow for water heating ~~Ventilation.~~ The ~~ventilation~~ airflow requirements for air-source HPWH shall be in accordance with Sections 506.5.1 through 506.5.4. Intake air shall come from, and exhaust air shall be discharged to the same pressure zone.Where installed inside a building, the ~~The~~ minimum dimensions for the location ~~spacevolume~~ where a unitary HPWH or the heat pump portion of a split system HPWH *i*s installed shall be 3.5 feet x 3.5 feet x 8 feet for each HPWH, ~~= 98 cubic feet~~, or the minimum dimensions required by the manufacturer, whichever is greater. Access and service space shall conform to the requirements of Section 306 of the *International Mechanical Code*.

506.5.1 Conditioned air ~~Space volume method.~~ Air-source HPWH shall be *listed* and *labeled* for use with conditioned air. ~~Ventilation shall comply with the provisions Table 506.5.1~~.

Add new text as follows:

506.5.1.1 Direct Access. HPWH shall be installed in spaces where the energy supplied by the heating and cooling system is equal to or greater than the capacity of the heat pump portion of the HPWH.

506.5.1.2 Indirect access. Where installed in an enclosed space with inadequate heat rate, the energy supplied by the heating and cooling system for the sum of the enclosed space and the adjacent conditioned space shall be equal to or greater than the capacity of the heat pump portion of the HPWH. Where installed in an enclosed space that has only indirect access to conditioned air, HPWH shall be installed in accordance with Section 506.5.3 or 506.5.4 as applicable.

506.5.1.3 Available energy. The energy supplied by the heating and cooling system shall be determined in accordance with Section 312 of the *International Mechanical Code*. Where the installation does not conform with the provisions in Sections 506.5.1.1 or 506.5.1.2 backup heating shall be provided.

Delete without substitution:

For SI units: 1 cubic foot = 0.0283 m3, 1000 British thermal units per hour = 0.293 kW

Revise as follows:

506.5.3 Gravity airflow Ducted ventilation method. Gravity airflow shall be sized to provide not less than 75 square inches of free area per 100 watts of compressor, fan, and control power, or the minimum total free area as determined by the manufacturer, whichever is greater, inclusive of all HPWH installed in the enclosed space.

Where the location of the HPWH is in a space smaller than required in Table 506.5.1, and it is not possible to comply with the provisions for passive ventilation in accordance with Table 506.5.2, the HPWH shall be ducted in accordance with the manufacturer's instructions. Air intake and exhaust ducts shall come from and go to the same pressure zone. The termination of the ducts in the remote space shall be directed so that they draw from and exhaust to different parts of the pressure zone. It is permissible to install a combination of passive and ducted ventilation to meet the air flow requirements of the HPWH.

Add new text as follows:

506.5.3.1 Louvers and openings. The enclosed space shall be connected to the adjacent space using fully louvered doors or two openings of equal area, one located within 12 inches from the enclosure top and one located within 12 inches from the enclosure bottom. Louvers and grilles shall be fixed in the open position. Louvered doors and openings shall be permitted to be combined to meet the free area.

Revise as follows:

506.5.4 Forced airflow New construction. Forced airflow shall be sized to provide not less than 60 cfm per 100 watts of compressor, fan, and control power, or the minimum duct diameter as determined by the manufacturer, whichever is greater, inclusive of all HPWH installed in the enclosed space. Ventilation shall comply with the provisions in Sections 506.5.1, 506.5.2 and 506.5.3 for the 18,000 BTU per Hour capacity column in Tables 506.5.1 and 506.5.2.

Exception: For HPWHs larger than 18,000 BTU per hour, the minimum space volume shall be not less than 0.175 cubic feet per BTU per hour as rated by the manufacturer. Net free area and ducting shall be in accordance with the manufacturer's instructions.

Add new text as follows:

506.5.4.1 Ducts. Ducts that transfer air between conditioned and unconditioned space shall be insulated to not less than R-6. Where duct termination points are close together, they shall be directed away from each other.

506.5.4.2 Combined gravity and forced airflow. Intake and exhaust air shall be permitted to be ducted, or to use gravity airflow for either the intake or the exhaust. The openings for gravity airflow shall not be less than half the area required in Section 506.5.3.

Add new text as follows:

506.5.4.3 Fan assist. Where the fan included with the HPWH cannot deliver the minimum airflow, a transfer fan or inline fan shall be installed to meet or exceed the minimum airflow.

Reason: Introduction
This public comment is intended to improve the original proposal to include the minimum installation requirements for electric air-source heat pump water heaters into the plumbing code.

Since submitting the proposal in January and listening to comments at the Committee Action Hearing in April, I have been communicating with manufacturers and others working with these water heaters to clarify, refine and simplify the installation requirements. The overall public comment proposes minor revisions to a few sections. Most of the sections included in the original proposal remain.

Based on the feedback from the CAH comments and ongoing discussions with industry, the focus of this public comment is on the ventilation provisions related to ensuring that there is enough sensible air flow for the air-source heat pump water heaters to operate as heat pumps. Air flow is everything, having enough air flow is critical to the real-world performance of air source heat pump water heaters.

The space volume provisions allowing the installation of air source heat pump water heaters in an enclosed space that only can access new energy via conduction through the surfaces of the enclosure should be removed. As discussed below, such enclosed spaces limit the amount of hot water that can be made each day in heat pump mode. Additionally, future make and model HPWHs will likely have more powerful compressors that can extract more heat from the surrounding air. Thus, if HPWHs are allowed to be installed in enclosed spaces, future makes and models will not be able to operate at their rated performance level when installed into the enclosed space designed for today's HPWHs.

The provisions that explain how to provide air via passive or ducted ventilation have been simplified.

- For passive ventilation, the minimum net free area is proposed to be 75 square inches per 100 watts of compressor, fan, and control power.
- For ducted ventilation, the minimum air flow rate is proposed to be 60 cubic feet per minute (CFM) per 100 watts of compressor, fan, and control power.
- The derivation of these values is discussed below.

Table of Contents

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is a revision to provisions for a new section in the code that has not yet been adopted. The overall proposal adds an option to the existing code. It does not add or remove existing options or solutions to the existing code. If this option is not chosen, the existing solutions/options are the existing costs of the previous code language.

Comment (CAH2)# 605

Comment 6:

IPC: 506.5, 506.5.5 (New)

Proponents: Gary Klein, Gary Klein and Associates, Inc., Self (gary@garykleinassociates.com) requests As Modified by Committee

(AMC2)

Modify as follows:

2024 International Plumbing Code

Revise as follows:

506.5 Air flow for water heating ~~Ventilation.~~ ~~The ventilation requirements for air-source HPWH shall be in accordance with Sections 506.5.1 through 506.5.4. The minimum dimensions for the space volume where the HPWH is installed shall be 3.5 x 3.5 x 8 = 98 cubic feet.~~

The airflow requirements for air-source HPWH shall be in accordance with Sections 506.5.1 through 506.5.5. Intake air shall come from, and exhaust air shall be discharged to the same pressure zone. Where installed inside a building, the minimum dimensions for the location where a unitary HPWH or the heat pump portion of a split system HPWH is installed shall be 3.5 feet x 3.5 feet x 8 feet for each HPWH, or the minimum dimensions required by the manufacturer, whichever is greater. Access and service space shall conform to the requirements of Section 306 of the *International Mechanical Code*.

Add new text as follows:

506.5.5 New water heater installations. Where the installation is not a replacement for an existing water heater, and the HPWH is installed in an enclosed space that has only indirect access to air in accordance with Sections 506.5.1 and 506.5.2 intake and exhaust airflow shall be provided for a HPWH with not less than 1,500 watts of compressor, fan, and control power in accordance with Sections 506.5.3 and 506.5.4.

Reason: This proposal specifies that, for new water heating installations, in locations with indirect access to a source of "warm" air, the airflow for the intake and exhaust shall be installed for a HPWH with the same heat rates as a typical electric resistance water heater (4,500 Watts, 240VAC. It does not specify that the HPWH that is being installed be that large. However, if the HPWH that is being installed is larger than 1500 watts, the airflow must match the needs for the larger heat pump.

Since about 45 percent of the country has an electric resistance water heater, they will be able to get the same recovery time with the HPWH. If the other 45 percent of the country that has gas water heaters installs the larger HPWH, it will only take twice as long as they are used to recover the daily hot water use, instead of the 7-8 times longer that current HPWH take.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is a revision to provisions for a new section in the code that has not yet been adopted. The overall proposal adds an option to the existing code. It does not add or remove existing options or solutions to the existing code. If this option is not chosen, the existing solutions/options are the existing costs of the previous code language.

Proposed Change as Submitted

Proponents: Jim Lutz, self (jdlutz@hotwaterresearch.net), Gary Klein (gary@garykleinassociates.com)

2024 International Residential Code

Add new definition as follows:

Water Heater, Heat Pump, Air Source. A water heating system, containing a heat pump and storage tank, where the heat pump uses ambient air as a heat source to heat water. There are two types:(1) Unitary systems where the heat pump and storage tank are a single assembly. The heat pump is generally mounted on top of the storage tank.(2) Split systems where the heat pump and storage tank are separate assemblies.

CHAPTER 20
BOILERS AND WATER HEATERS

SECTION M2005
WATER HEATERS

Revise as follows:

M2005.1 General. Water heaters shall be installed in accordance with Chapter 28, the manufacturer's instructions and the requirements of this code. Water heaters installed in an *attic* shall comply with the requirements of Section M1305.1.2. Gas-fired water heaters shall comply with the requirements in Chapter 24. Domestic electric water heaters shall comply with UL 174. Oiled-fired water heaters shall comply with UL 732. Solar thermal water heating systems shall comply with Chapter 23 and ICC 900/SRCC 300. Solid fuel-fired water heaters shall comply with UL 2523. Air source heat pump water heaters shall comply with the requirements in Section P2805.

Add new text as follows:

P2805
Heat Pump Water Heaters

P2805.1 Air-source HPWHs. Air-source heat pump water heaters (HPWH) shall comply with Section P2805.2. through Section P2805.5.

P2805.2 Obstructions and clearances. Air intakes, exhaust outlets, filters, heating elements, wiring connections, condensate drains, temperature and pressure relief valves shall not be obstructed. Clearances shall be provided for maintenance and replacement in accordance with Section M1305.

P2805.3 Seismic bracing. Seismic bracing shall comply with Section P2801.8. Restraints shall not obstruct components specified in Section P2805.2.

P2805.3.1 Unitary HPWH. For unitary HPWHs seismic restraints shall be located at points within the upper one-third and lower one-third of the vertical dimensions of the storage tank, and not on the heat pump portion.

P2805.3.2 Split System HPWH. For split systems the seismic restraints for the storage tank shall be in accordance with Section P2805.3.1. The heat pump portion of the split system shall be installed in accordance with the manufacturer's instructions.

P2805.4 Condensate drains. Condensate drain lines from air source HPWHs shall be in accordance with Section M1411.3.

P2805.5 Ventilation. The ventilation requirements for air-source HPWH shall be in accordance with Sections P2805.5.1 through P2805.5.4. The minimum dimensions for the space volume where the HPWH is installed shall be 3.5 x 3.5 x 8 = 98 cubic feet.

P2805.5.1 Space volume method. Ventilation shall comply with the provisions Table P2805.5.1.

TABLE 2805.5.1 MINIMUM SPACE VOLUME FOR INSTALLING AIR-SOURCE HPW

Heat Pump Capacity (BTU/Hour)	<1,000	≥1,000 and <2,000	≥2,000 and <3,000	≥3,000 and <4,000	≥4,000 and <5,000	≥5,000 and <6,000	≥6,000 and <7,000	≥7,000 and <8,000	≥8,000 and <9,000	≥9,000 and <10,000	≥10,000 and <11,000	≥11,000 and <12,000	≥12,000 and <13,000	≥13,000 and <14,000	≥14,000 and <15,000	≥15,000 and <16,000	≥16,000 and <17,000	≥17,000 and <18,000
Space Volume (cubic feet)	175	350	525	700	875	1,050	1,225	1,400	1,575	1,750	1,925	2,100	2,275	2,450	2,625	2,800	2,975	3,150

For SI units: 1 cubic foot = 0.0283 m^3, 1000 British thermal units per hour = 0.293 kW

P2805.5.2 Passive ventilation method. Where the location of the HPWH is in a space smaller than required in Table P2805.5.1, additional ventilation shall be provided in accordance with Table P2805.5.2. Passive ventilation shall be into an adjacent space that shares the same pressure zone with the HPWH. The sum of the volume of the space where the HPWH is located and the volume in the adjacent space shall be not less than the space volume required for the capacity shown in Table P2805.5.2. The net free area of the passive ventilation shall be equally distributed between high and low openings. These openings shall be in the top quarter and bottom quarter of the space where the HPWH is located.

TABLE 2805.5.2 MINIMUM NET FREE AREA FOR INSTALLING AIR-SOURCE HPWH

Space Volume (cubic feet)	Heat Pump Capacity (BTU/Hour) <1,000	≥1,000 and <2,000	≥2,000 and <3,000	≥3,000 and <4,000	≥4,000 and <5,000	≥5,000 and <6,000	≥6,000 and <7,000	≥7,000 and <8,000	≥8,000 and <9,000	≥9,000 and <10,000	≥10,000 and <11,000	≥11,000 and <12,000	≥12,000 and <13,000	≥13,000 and <14,000	≥14,000 and <15,000	≥15,000 and <16,000	≥16,000 and <17,000	≥17,000 and <18,000

<100	70	140	210	280	350	420	490	560	630	700	770	840	910	980	1050	1120	1190	1260	

For SI units: 1 cubic foot = 0.0283 m3, 1000 British thermal units per hour = 0.293 kW

P2805.5.3 Ducted ventilation method. Where the location of the HPWH is in a space smaller than required in Table P2805.5.1, and it is not possible to comply with the provisions for passive ventilation in accordance with Table P2805.5.2, the HPWH shall be ducted in accordance with the manufacturer's instructions. Air intake and exhaust ducts shall come from and go to the same pressure zone. The termination of the ducts in the remote space shall be directed so that they draw from and exhaust to different parts of the pressure zone. It is permissible to install a combination of passive and ducted ventilation to meet the air flow requirements of the HPWH.

P2805.5.4 New construction. Ventilation shall comply with the provisions in Sections P2805.5.1, P2805.5.2 and P2805.5.3 for the 18,000 BTU per Hour capacity column in Tables P2805.5.1 and P2805.5.2. **Exception:** For HPWHs larger than 18,000 BTU per hour, the minimum space volume shall be not less than 0.175 cubic feet per BTU per hour as rated by the manufacturer. Net free area and ducting shall be in accordance with the manufacturer's instructions.

Reason: The purpose of this proposal is to add an option to the plumbing code so that installers of heat pump water heaters (HPWH) have clear provisions in the chapterson Water Heaters regarding their proper installation. HPWH are water heaters, and most of the provisions regarding the installation of all water heaters apply. A key requirement that does not exist is that they need to be installed so that they operate in heat pump mode for the majority of their duty cycle.

For air source HPWH, the type of water heater discussed in this proposal, this means special attention must be paid to the air flow requirements. They need a source of "warm" air to extract energy and they need a sink for the cold air they discharge to be absorbed. The source and the sink need be matched. This can be challenging in cold climates.

To accommodate the energy exchange required by the source and the sink, the sizes of which depend on the capacity of the heat pump, there needs to be

1. A minimum volume of the space where the HPWH is installed. Energy exchange happens within that space.

2. Passive ventilation into an adjacent space if the space where the HPWH is located is not large enough. The volume of the two spaces must meet the minimum volume requirements for the HPWH's capacity. The two spaces must share a common pressure zone.

3. Ducted ventilation into an adjacent or remote space if the minimum volume or passive ventilation requirements cannot be me. The HPWH needs to be ducted to and from a location with the ability to support required energy exchange. When ducted, the remote terminals for the intake need to come from, and exhaust ducts to, the same pressure zone so that they do not adversely affect the performance of other mechanical systems.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal adds an option to the existing code. It does not add or remove existing options or solutions to the existing code. If this option is not chosen, the existing solutions/options are the existing costs of the previous code language.

P54-24 Part II

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The heat pump water heater industry is in flux with changeover of refrigerants. Too difficult to come up with universal space/volume requirements for these units. The manufacturer's installation instructions for the specific unit must be followed. Also, complex tables as presented in the proposal are discouraged. (10-0)

P54-24 Part II

Individual Consideration Agenda

Comment 1:

IRC: SECTION 202

Proponents: Gary Klein, Gary Klein and Associates, Inc., Self (gary@garykleinassociates.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Residential Code

Revise as follows:

Water Heater, Heat Pump, Air Source. A water heater that transfers thermal energy from one temperature level to another temperature level for the purpose of heating water, including all ancillary equipment such as fans, storage tanks, pumps, or controls necessary for the device to perform its function. There are two types of air source heat pump water heaters: ~~A water heating system, containing a heat pump and storage tank, where the heat pump uses ambient air as a heat source to heat water. There are two types:~~
(1) Unitary systems where the heat pump and storage tank are a single assembly. The heat pump is generally mounted on top of the storage tank.(2) Split systems where the heat pump and storage tank are separate assemblies.

Reason: The US Department of Energy (DOE) defines the various types of water heaters sold in the United States. It makes sense to align the definition in this code with the one provided by DOE.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposed change is to the definition. This has no impact on the cost to install this type of water heater.

Comment (CAH2)# 610

Comment 2:

Water heaters installed in an *attic* shall comply with the requirements of Section M1305.1.2. Gas-fired water heaters shall comply with the requirements in Chapter 24. Domestic electric water heaters shall comply with UL 174. Oiled-fired water heaters shall comply with UL 732. Solar thermal water heating systems shall comply with Chapter 23 and ICC 900/SRCC 300. Solid fuel-fired water heaters shall comply with UL 2523. Electric air ~~Air~~ source heat pump water heaters shall comply with the requirements in Section M2005.3 and Section P2805.

Reason:
The proposed change clarifies that electric air source heat pump water heaters must also comply with the provisions for electric water heaters in Section M2005.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Clarifying that the provisions apply to electric air source heat pump water heaters and that these water heaters must also comply with the provisions for any electric water heater does not increase the cost to comply with the provisions in the section.

Comment (CAH2)# 611

Comment 3:

IRC: P2805, P2805.1

Proponents: Gary Klein, Gary Klein and Associates, Inc., Self (gary@garykleinassociates.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Residential Code

P2805

Heat Pump Water Heaters

Revise as follows:

P2805.1 Air-source HPWHs. ~~Air~~ Electric air-source heat pump water heaters (HPWH) shall comply with Section P2805.2. through Section P2805.5.

Reason: The proposed change clarifies that the provisions apply to electric air source heat pump water heaters.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Clarifying that the provisions apply to electric air source heat pump water heaters does not increase the cost to comply with the provisions in the section.

Comment (CAH2)# 612

Comment 4:

IRC: P2805.2

Proponents: Gary Klein, Gary Klein and Associates, Inc., Self (gary@garykleinassociates.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Residential Code

Revise as follows:

P2805.2 Obstructions and clearances. Air intakes, exhaust outlets, filters, heating elements, wiring connections, condensate drains, temperature and pressure relief valves shall not be obstructed. Clearances shall be provided for maintenance and replacement in accordance with Section M1305.
Cold air discharged from HPWHs shall not blow on or otherwise affect the operation of the space conditioning thermostat.

Reason: I learned about this issue since the first Committee Action Hearing while in conversation with industry.

It is not appropriate for cold air discharged from the electric air source heat pump water heater to blow onto or otherwise affect the operation of the thermostat that regulates the indoor temperature of the building. In the winter, it will cause the space heating system to come on when the majority of the building is at the desired temperature. In the summer, it will cause the space cooling system to turn off when the majority of the building is not at the desired temperature. In the swing seasons, the thermostat will be confused.

The cold air can blow onto the thermostat. It can also cool the wall behind the thermostat. Either case can result in an inappropriate response from the space conditioning system.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is a revision to provisions for a new section in the code that has not yet been adopted. The overall proposal adds an option to the existing code. It does not add or remove existing options or solutions to the existing code. If this option is not chosen, the existing solutions/options are the existing costs of the previous code language.

Proponents: Gary Klein, Gary Klein and Associates, Inc., Self (gary@garykleinassociates.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Residential Code

Revise as follows:

P2805.5 Airflow for water heating ~~Ventilation.~~ The ~~ventilation~~ airflow requirements for air-source HPWH shall be in accordance with Sections P2805.5.1 through P2805.5.4 ~~2805.5.5.~~ Intake air shall come from, and exhaust air shall be discharged to the same pressure zone. Where installed inside a building, the ~~The~~ minimum dimensions for the location ~~space volume~~ where a unitary HPWH or the heat pump portion of a split system HPWH is installed shall be 3.5 feet x 3.5 feet x 8 feet for each HPWH ~~= 98 cubic feet~~, or the minimum dimensions required by the manufacturer, whichever are greater. Access and service space shall conform to the requirements of Section M1305.

P2805.5.1 Conditioned air ~~Space volume method.~~ Air-source HPWH shall be *listed* and *labeled* for use with conditioned air. ~~Ventilation shall comply with the provisions Table P2805.5.1.~~

Add new text as follows:

P2805.5.1.1 Direct access. HPWH shall be installed in spaces where the energy supplied by the heating and cooling system is equal to or greater than the capacity of the heat pump portion of the HPWH.

P2805.5.1.2 Indirect access. Where installed in an enclosed space with inadequate heat rate, the energy supplied by the heating and cooling system for the sum of the enclosed space and the adjacent conditioned space shall be equal to or greater than the capacity of the heat pump portion of the HPWH. Where installed in an enclosed space that has only indirect access to conditioned air, HPWH shall be installed in accordance with Section P2805.5.3 or P2805.5.4 as applicable.

P2805.5.1.3 Available energy. The energy supplied by the heating and cooling system shall be determined in accordance with Section M1305.Where the installation does not conform with the provisions in Sections P2805.5.1.1 or P2805.5.1.2 backup heating shall be provided.

Delete without substitution:

~~TABLE 2805.5.1 MINIMUM SPACE VOLUME FOR INSTALLING AIR-SOURCE HPW~~

~~Heat Pump Capacity (BTU/Hour)~~	~~<1,000~~	~~≥1,000 and <2,000~~	~~≥2,000 and <3,000~~	~~≥3,000 and <4,000~~	~~≥4,000 and <5,000~~	~~≥5,000 and <6,000~~	~~≥6,000 and <7,000~~	~~≥7,000 and <8,000~~	~~≥8,000 and <9,000~~	~~≥9,000 and <10,000~~	~~≥10,000 and <11,000~~	~~≥11,000 and <12,000~~	~~≥12,000 and <13,000~~	~~≥13,000 and <14,000~~	~~≥14,000 and <15,000~~	~~≥15,000 and <16,000~~	~~≥16,000 and <17,000~~	~~≥17,000 and <18,000~~

~~For SI units: 1 cubic foot = 0.0283 m^3, 1000 British thermal units per hour = 0.293 kW~~

Revise as follows:

P2805.5.2 Unconditioned and outdoor air ~~Passive ventilation method~~. Where installed to utilize unconditioned or outdoor air, air-source unitary HPWH and split system HPWH shall be *listed* and *labeled* for use with outdoor air based on the climate zone where the HPWH is being installed. Unless the HPWH are *listed* and *labeled* for use with outdoor air, backup heating is required.

~~Where the location of the HPWH is in a space smaller than required in Table P2805.5.1, additional ventilation shall be provided in accordance with Table P2805.5.2. Passive ventilation shall be into an adjacent space that shares the same pressure zone with the HPWH. The sum of the volume of the space where the HPWH is located and the volume in the adjacent space shall be not less than the space volume required for the capacity shown in Table P2805.5.2. The net free area of the passive ventilation shall be equally distributed between high and low openings. These openings shall be in the top quarter and bottom quarter of the space where the HPWH is located.~~

Add new text as follows:

P2805.5.2.1 Direct access. The heat pump portion of the HPWH shall be provided with direct access to unconditioned or outdoor air and installed in accordance with manufacturer's instructions.

P2805.5.2.2 Indirect access. Where installed in an enclosed space that has only indirect access to unconditioned or outdoor air, HPWH shall be installed in accordance with Section P2805.5.3 or P2805.5.4 as applicable, or backup heating shall be provided.

P2805.5.2.3 Available energy. The energy supplied to unconditioned spaces shall be determined in accordance with Section M1305. Where the energy supplied to the unconditioned space is not equal to or greater than the capacity of the heat pump portion of the HPWH, backup heating shall be provided.

For SI units: 1 cubic foot = 0.0283 m3, 1000 British thermal units per hour = 0.293 kW

Revise as follows:

P2805.5.3 Gravity airflow Ducted ventilation method. Gravity airflow shall be sized to provide not less than 75 square inches of free area per 100 watts of compressor, fan, and control power, or the minimum total free area as determined by the manufacturer, whichever is greater, inclusive of all HPWH installed in the enclosed space. Where the location of the HPWH is in a space smaller than required in Table P2805.5.1, and it is not possible to comply with the provisions for passive ventilation in accordance with Table P2805.5.2, the HPWH shall be ducted in accordance with the manufacturer's instructions. Air intake and exhaust ducts shall come from and go to the same pressure zone. The termination of the ducts in the remote space shall be directed so that they draw from and exhaust to different parts of the pressure zone. It is permissible to install a combination of passive and ducted ventilation to meet the air flow requirements of the HPWH.

Add new text as follows:

P2805.5.3.1 Louvers and openings. The enclosed space shall be connected to the adjacent space using fully louvered doors or two openings of equal area, one located within 12 inches from the enclosure top and one located within 12 inches from the enclosure bottom. Louvers and grilles shall be fixed in the open position. Louvered doors and openings shall be permitted to be combined to meet the free area.

Revise as follows:

P2805.5.4 New water heater installations New construction. Where the installation is not a replacement for an existing water heater, and the HPWH is installed in an enclosed space that has only indirect access to air in accordance with Sections 2805.5.1 and 2805.5.2 intake and exhaust airflow shall be provided for a HPWH with not less than 1,500 watts of compressor, fan, and control power in accordance with Sections 2805.5.3 and 2805.5.4.
Ventilation shall comply with the provisions in Sections P2805.5.1, P2805.5.2 and P2805.5.3 for the 18,000 BTU per Hour capacity column in Tables P2805.5.1 and P2805.5.2.

Exception: For HPWHs larger than 18,000 BTU per hour, the minimum space volume shall be not less than 0.175 cubic feet per BTU per hour as rated by the manufacturer. Net free area and ducting shall be in accordance with the manufacturer's instructions.

Reason: Introduction This public comment is intended to improve the original proposal to include the minimum installation requirements

for electric air-source heat pump water heaters into the plumbing code.

Since submitting the proposal in January and listening to comments at the Committee Action Hearing in April, I have been communicating with manufacturers and others working with these water heaters to clarify, refine and simplify the installation requirements. The overall public comment proposes minor revisions to a few sections. Most of the sections included in the original proposal remain.

Based on the feedback from the CAH comments and ongoing discussions with industry, the focus of this public comment is on the ventilation provisions related to ensuring that there is enough sensible air flow for the air-source heat pump water heaters to operate as heat pumps. Air flow is everything, having enough air flow is critical to the real-world performance of air source heat pump water heaters.

The space volume provisions allowing the installation of air source heat pump water heaters in an enclosed space that only can access new energy via conduction through the surfaces of the enclosure should be removed. As discussed below, such enclosed spaces limit the amount of hot water that can be made each day in heat pump mode. Additionally, future make and model HPWHs will likely have more powerful compressors that can extract more heat from the surrounding air. Thus, if HPWHs are allowed to be installed in enclosed spaces, future makes and models will not be able to operate at their rated performance level when installed into the enclosed space designed for today's HPWHs.
The provisions that explain how to provide air via passive or ducted ventilation have been simplified.

- For passive ventilation, the minimum net free area is proposed to be 75 square inches per 100 watts of compressor, fan, and control power.
- For ducted ventilation, the minimum air flow rate is proposed to be 60 cubic feet per minute (CFM) per 100 watts of compressor, fan, and control power.
- The derivation of these values is discussed below.

Table of Contents

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is a revision to provisions for a new section in the code that has not yet been adopted. The overall proposal adds an option to the existing code. It does not add or remove existing options or solutions to the existing code. If this option is not chosen, the existing solutions/options are the existing costs of the previous code language.

Comment (CAH2)# 614

Comment 6:

IRC: P2805, P2805.5, P2805.5.5 (New)

Proponents: Gary Klein, Gary Klein and Associates, Inc., Self (gary@garykleinassociates.com) requests As Modified by Committee

(AMC2)

Modify as follows:

2024 International Residential Code

P2805
Heat Pump Water Heaters

Revise as follows:

P2805.5 Air flow for water heating ~~Ventilation.~~ ~~The ventilation requirements for air-source HPWH shall be in accordance with Sections P2805.5.1 through P2805.5.4. The minimum dimensions for the space volume where the HPWH is installed shall be 3.5 x 3.5 x 8 = 98 cubic feet.~~ The airflow requirements for air-source HPWH shall be in accordance with Sections P2805.5.1 through P2805.5.5. Intake air shall come from, and exhaust air shall be discharged to the same pressure zone. Where installed inside a building, the minimum dimensions for the location where a unitary HPWH or the heat pump portion of a split system HPWH is installed shall be 3.5 feet x 3.5 feet x 8 feet for each HPWH, or the minimum dimensions required by the manufacturer, whichever are greater. Access and service space shall conform to the requirements of Section M1305.

Add new text as follows:

P2805.5.5 New water heater installations. Where the installation is not a replacement for an existing water heater, and the HPWH is installed in an enclosed space that has only indirect access to air in accordance with SectionsP2805.5.1 and P2805.5.2, intake and exhaust airflow shall be provided for a HPWH with not less than 1,500 watts of compressor, fan, and control power in accordance with Sections P2805.5.3 and P2805.5.4.

Reason: This proposal specifies that, for new water heating installations, in locations with indirect access to a source of "warm" air, the airflow for the intake and exhaust shall be installed for a HPWH with at least the same heat rates as aa typical electric resistance water heater (4,500 Watts, 240VAC). It does not specify that the HPWH that is being installed be that large. However, if the HPWH that is being installed is larger than 1500 watts, the airflow must match the needs for the larger heat pump. Since about 45 percent of the country has an electric resistance water heater, they will be able to get the same recovery time with the HPWH. If the other 45 percent of the country that has gas water heaters installs the larger HPWH, it will only take twice as long as they are used to recover the daily hot water use, instead of the 7-8 times longer that current HPWH take.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is a revision to provisions for a new section in the code that has not yet been adopted. The overall proposal adds an option to the existing code. It does not add or remove existing options or solutions to the existing code. If this option is not chosen, the existing solutions/options are the existing costs of the previous code language.

Comment (CAH2)# 615

P55-24

IPC: 502.11 (New)

Proposed Change as Submitted

Proponents: Ronald George, Plumb-Tech Design & Consulting Services LLC, Self (ron@plumb-techllc.com)

2024 International Plumbing Code

Add new text as follows:

502.11 Hot water Generators, Heat Exchangers, Pre-heaters, Solar water heaters. Hot water generators, heat exchangers, pre-heaters, and solar water heaters that utilize heat exchangers to heat or pre-heat domestic hot water shall have a temperature-actuated mixing valve complying with ASSE 1017 located downstream of any hot water generators, heat exchangers, pre-heaters, or solar water heaters to limit and control the water temperature supplied to the potable hot water distribution system to a stable, temperature. The potability of the water shall be maintained throughout the domestic hot water distribution system. Requirements for the heat source piping systems shall be in accordance with the International Mechanical Code.

Reason: Heat exchangers used as pre-heaters or hot water generators have the ability to overheat the domestic hot water when steam or heating hot water valves stick open or when flue gasses are extremely hot. This code change assures that a temperature actuated mixing valve will mix the hot water downstream of the device to a stable and desired temperature. A specific temperature is not given, because in some applications the distribution temperature may need to be slightly above 140 F in order to keep the circulated return above a Legionella bacteria growth temperature in larger buildings with significant heat loss in the system. Having the mixing valve downstream of these heat exchangers and HW generators can control the temperature when the heat recovery or pre-heater system heats the water well beyond the desired hot water system temperature.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

This will slightly increase the cost of construction, but adds a significant level of safety.

The retail cost of a 3/4-inch valves starts at $88.89 and the wholesale price is typically 40% less than retail price. The installed cost with a labor rate of $95/hr can start at $183.

Estimated Immediate Cost Impact Justification (methodology and variables):

This will save lives for as little as $183.00 on smaller systems and up to a few thousand dollars on larger systems. The value of this safety device is cheap compared to the increase in safety. This code change is needed to provide a safe hot water distribution system. The retail cost of a 3/4-inch valves starts at $88.89 and the wholesale price is typically 40% less than retail price. The installed cost starts at about $183 for Water heaters up to 80 gallons or a maximum of gpm.

For larger systems, Bronze Thermostatic Mixing Valves 1” in size cost is about $100.00 to $300.00; Bronze Tempering Valves 3" in size cost about $2,400.00 to $3,925.00.

.

Estimated Life Cycle Cost Impact:

This cost is much less than the cost of a burn injury which can reach millions of dollars in medical costs, and affect entire families who have to help care for burn victims. The physical, emotional, phycological and ongoing medical costs can be immense. Then add any litigation costs associated with litigation. Insurance companies should support this as a safer installation and a total reduction in overall medical and liability costs.
When a facility has an unsafe hot water system (Without temperature controls to prevent overheating conditions) injuries and deaths can occur. injuries include costs for medical treatment which includes burn care, debridement to scrape off dead tissue still attached to the body, skin grafting to cover burned areas with skin from the burn victim to prevent rejection issues, Ongoing surgeries to splice in skin as

the body grows, because the scar tissue does not grow or have elasticity. Additional medical costs associated with related medical conditions, psychological counseling, etc. Another cost not accounted for is the Litigation cost associated with a burn injury.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

The average size of a cold water make-up valve in an institutional building is about 3 inches in size.

In my experience dealing with scald litigation, the judge and jury awards for scald cases have included costs to cover medical expenses, and ongoing medical equipment, assistance and treatments including punitive damages totaling in excess of 16 million dollars for one incident at a facility that had hot water systems that were not safely designed, controlled and maintained and caused burn injuries. According to Internet research, In Western countries and other democracies, estimates for the value of a statistical life typically range from $1 million US dollars to $10 million US Dollars; for example, the United States Federal Emergency Management Agency (FEMA) estimated the value of a statistical life at $7.5 million US Dollars in 2020.
The cost of a valve is far less expensive than the injury, pain, suffering, Medical and physical therapy expenses, and litigation expenses. Or the emotional issues from a serious burns or loss of life from a scald injury.

P55-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: There is a debate that there could be another valve in this language. The language is very broad. The potability of water was stated and the committee was not sure how that fits into this section. (12-1)

P55-24

Individual Consideration Agenda

Comment 1:

Proponents: Ronald George, Plumb-Tech Design & Consulting Services LLC, Self (ron@plumb-techllc.com) requests As Submitted

Reason: Heat exchangers used as pre-heaters or hot water generators have the ability to overheat the domestic hot water when steam or heating hot water valves stick open or when flue gasses are extremely hot.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Comment (CAH2)# 779

P59-24

IPC: 504.6

Proposed Change as Submitted

Proponents: James Richardson, City of Columbus (Ohio), City of Columbus (Ohio) (jarichardson@columbus.gov)

2024 International Plumbing Code

Revise as follows:

504.6 Requirements for discharge piping. The discharge piping serving a pressure relief valve, temperature relief valve or combination thereof shall:

1. Not be directly connected to the drainage system.
2. Discharge through an *air gap* located in the same room as the water heater.
3. Not be smaller than the diameter of the outlet of the valve served and shall discharge full size to the *air gap*.
4. Serve a single relief device and shall not connect to piping serving any other relief device or equipment.
5. Discharge to the floor, to the pan serving the water heater or storage tank <u>where the water heater or storage tank is not elevated off of the floor</u>, to a waste receptor<u>,</u> or to the outdoors.
6. Discharge in a manner that does not cause personal injury or structural damage.
7. Discharge to a termination point that is readily observable by the building occupants.
8. Not be trapped.
9. Be installed so as to flow by gravity.
10. Terminate not more than 6 inches (152 mm) above and not less than two times the discharge pipe diameter above the floor or *flood level rim* of the waste receptor.
11. Not have a threaded connection at the end of such piping.
12. Not have valves or tee fittings.
13. Be constructed of those materials listed in Section 605.4 or materials tested, rated and *approved* for such use in accordance with ASME A112.4.1.
14. Be one nominal size larger than the size of the relief valve outlet, where the relief valve discharge piping is installed with insert fittings. The outlet end of such tubing shall be fastened in place.

Reason: When water heaters are elevated off the floor, discharging to the pan can create splashing that will result in scalding if persons are standing near the water heater or below the water heater. This potential would violate item #6 of this section.

Bibliography: See reason statement.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal is for clarification only to ensure that people are not put at risk by ensuring users of the code understand the section and how it should be applied.

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: What is the elevation where there is concern about personal injury? (14-0)

P59-24

Individual Consideration Agenda

Comment 1:

IPC: 504.6

Proponents: James Richardson, City of Columbus (Ohio), City of Columbus (Ohio) (jarichardson@columbus.gov) requests As Submitted

Reason: When water heaters are elevated off the floor, discharging to the pan can create splashing that will result in scalding if persons are standing near the water heater or below the water heater. This potential would violate item #6 of this section. To address some particular questions asked during CAH #1, specifically that note # 6 of the section already covers this, I would like to reference the 2021 IPC Commentary -

The relief valve discharge pipe must terminate not more than 6 inches (152 mm) but not less than two times the pipe diameter above the floor surface or a waste receptor (including a floor drain) in order to prevent hot water discharge from being directed onto a building occupant

[see Commentary Figure 504.6(1)]. The relief valve discharge pipe is also allowed to discharge to the pan serving the water heater or hot water storage tank [see Commentary Figure 504.6(2)]. For termination points to the floor, the floor must be a suitable location (e.g., garage floor that slopes toward a garage door for vehicle entry). Otherwise, a floor drain or waste receptor must be provided to capture discharges from the discharge pipe. Note that the code only requires the air gap to be in the same room as the water heater. In other words, the floor drain or waste receptor could be located in another room or possibly another floor level. This allows for unique solutions for capturing discharges. For example, in some multilevel buildings where water heaters are nearly in the same location on each floor, a discharge collection piping system could be designed to direct all of the discharges to a single waste receptor on the lowest level [see Commentary Figure 504.6(3)] or to the outdoors. The code is silent as to the size/shape of capturing receptors at each water heater and the size of the common collection piping down to the lowest level.

Discharge of a relief valve to laundry trays/tubs, kitchen/utility sinks and shower floors are not suitable locations as this violates Item 6 of this code section.

Persons using the fixture could be injured by hot water and steam that could come from the pipe.

Code users often go to the commentary for assistance in interpreting code requirements. Even the commentary is silent as to how this applies, so in many instances the code and commentary do not provide clear direction on this matter.

Bibliography: See reason statement.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Comment (CAH2)# 394

P60-24

IPC: 504.6

Proposed Change as Submitted

Proponents: George Istefan, Watts Water Technologies (george.istefan@wattswater.com)

2024 International Plumbing Code

Revise as follows:

504.6 Requirements for discharge piping. The discharge piping serving a pressure relief valve, temperature relief valve or combination thereof shall:

1. Not be directly connected to the drainage system.
2. Discharge through an *air gap* located in the same room as the water heater.
3. Not be smaller than the diameter of the outlet of the valve served and shall discharge full size to the *air gap*.
4. Serve a single relief device and shall not connect to piping serving any other relief device or equipment.
5. Discharge to the floor, to the pan serving the water heater or storage tank, to a waste receptor or to the outdoors.
6. Discharge in a manner that does not cause personal injury or structural damage.
7. Discharge to a termination point that is readily observable by the building occupants. Where the discharge termination point is not readily visible and observable, a leak detection monitoring device with alarm notification (and not automatic shut-off), or a building management system shall be required.
8. Not be trapped.
9. Be installed so as to flow by gravity.
10. Terminate not more than 6 inches (152 mm) above and not less than two times the discharge pipe diameter above the floor or *flood level rim* of the waste receptor.
11. Not have a threaded connection at the end of such piping.
12. Not have valves or tee fittings.
13. Be constructed of those materials listed in Section 605.4 or materials tested, rated and *approved* for such use in accordance with ASME A112.4.1.
14. Be one nominal size larger than the size of the relief valve outlet, where the relief valve discharge piping is installed with insert fittings. The outlet end of such tubing shall be fastened in place.

Reason: Approval of this code change will allow design flexibility, and more importantly, provide for the allowance of leak detection technology to warn building occupants and managers of a problem with a safety device.

Current code language just requires visibility of the termination point, but if there is a significant discharge of the valve there may not be any awareness of the problem for an extended period. This can especially be a problem when a building is unoccupied and then significant flood damage can result.

This proposal does not intend to require the devices, just allow their use if the termination point is not visible. The allowance of leak detection technology makes for safer, smarter buildings.

https://www.prowaterheatersupply.com/sentinel-hydrosolutions-leak-defense-system-lds-3-200.html

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

Residential: Moen retail $50

Commercial: Sentinel Systems $2,500 - $3,500 retail depending on size

Residential Installation Cost: $0

Commercial Installation Cost: Labor 2 hours at $100/hr.

Estimated Immediate Cost Impact Justification (methodology and variables):

Residential: Moen retail $50

Commercial: Sentinel Systems $2,500 - $3,500 retail depending on size

Residential Installation Cost: $0

Commercial Installation Cost: Labor 2 hours at $100/hr.

Estimated Life Cycle Cost Impact:

Life Cycle Cost: $0

Estimated Life Cycle Cost Impact Justification (methodology and variables):

Life Cycle Cost: $0

P60-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The added language is an oxymoron. The first sentence requires the end to be readily visible and the new sentence speaks to when the end is not readily visible. Use of parenthesis in code text is not appropriate. (14-0)

P60-24

Individual Consideration Agenda

Comment 1:

IPC: 504.6

Proponents: George Istefan, Watts Water Technologies (george.istefan@wattswater.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Plumbing Code

Revise as follows:

504.6 Requirements for discharge piping. The discharge piping serving a pressure relief valve, temperature relief valve or combination thereof shall:

1. Not be directly connected to the drainage system.
2. Discharge through an *air gap* located in the same room as the water heater.
3. Not be smaller than the diameter of the outlet of the valve served and shall discharge full size to the *air gap*.
4. Serve a single relief device and shall not connect to piping serving any other relief device or equipment.
5. Discharge to the floor, to the pan serving the water heater or storage tank, to a waste receptor or to the outdoors.
6. Discharge in a manner that does not cause personal injury or structural damage.
7. Discharge to a termination point that is readily observable by the building occupants. ~~Where the discharge termination point is not readily visible and observable, a leak detection monitoring device with alarm notification (and not automatic shut off), or a building management system shall be required.~~ and a leak detection or monitoring device with a visible or audible alarm, or a connection to a building management system, shall be installed when required by the local authority having jurisdiction.
8. Not be trapped.
9. Be installed so as to flow by gravity.
10. Terminate not more than 6 inches (152 mm) above and not less than two times the discharge pipe diameter above the floor or *flood level rim* of the waste receptor.
11. Not have a threaded connection at the end of such piping.
12. Not have valves or tee fittings.
13. Be constructed of those materials listed in Section 605.4 or materials tested, rated and *approved* for such use in accordance with ASME A112.4.1.
14. Be one nominal size larger than the size of the relief valve outlet, where the relief valve discharge piping is installed with insert fittings. The outlet end of such tubing shall be fastened in place.

Reason: Revised proposal to address committee's concerns about removing the requirement for readily observable termination port.

Cost Impact: Increase

Estimated Immediate Cost Impact:

The proposed modification does not change the immediate cost impact of the proposal, with the modification, as the modification does not add any additional materials or installation labor.

Residential: Moen retail $50

Commercial: Sentinel Systems $2,500 - $3,500 retail depending on size

Residential Installation Cost: $0

Commercial Installation Cost: Labor 2 hours at $100/hr.

Estimated Immediate Cost Impact Justification (methodology and variables):

Residential: Moen retail $50

Commercial: Sentinel Systems $2,500 - $3,500 retail depending on size

Residential Installation Cost: $0

Commercial Installation Cost: Labor 2 hours at $100/hr.

Comment (CAH2)# 773

P62-24 Part II

IRC: P2801.5.1, IAPMO Chapter 44 (New)

Proposed Change as Submitted

Proponents: Jay Peters, Codes and Standards International LLC, IPS Corporation (peters.jay@me.com)

2024 International Residential Code

Revise as follows:

P2801.5.1 Pan size and drain. The pan shall be not less than $1^1/_2$ inches (38 mm) deep and shall be of sufficient size and shape to receive dripping or condensate from the tank or water heater. The pan shall be drained by an *indirect waste pipe* of not less than $^3/_4$ inch (19 mm) diameter or be equipped with a device complying with CAN/IAPMO Z1349 to automatically shut off the water supply to the water heater upon detection of a leak. Piping for safety pan drains shall be of those materials indicated in Table P2906.5. Where a pan drain was not previously installed, a pan drain shall not be required for a replacement water heater installation when equipped with a device complying with CAN/IAPMO Z1349 to automatically shut off the water supply to the water heater upon detection of a leak.

Add new standard(s) as follows:

IAPMO

IAPMO Group
4755 E. Philadelphia Street
Ontario, CA 91761-USA

ANSI/CAN/IAPMO Z1349-2021 Devices for Detection, Monitoring or Control of Plumbing Systems

Reason: The pan and drainage piping are intended to relieve small leaks. Although it might be small, a leak should not occur and is the first sign of a possible pending catastrophic event with no indication to the owner of any possible problem, as it is typically out of sight. In other instances, it can be extremely onerous to provide piping to an approved location in existing construction.

These listed devices are approved as options in many jurisdictions across Texas, California and more. In come cases, they are required in lieu of a pan and/or drain. They are reliable and sense a minuscule bit of moisture (one drop) and immediately shut off the water supply to the specific appliance. There are multiple manufacturers and well over a million units have been installed. Many water heater manufacturers, such as Rheem and AO Smith, have already incorporated this leak sensing technology into the equipment. This provision will raise the level of safety and protection for installations without integral devices.

T**he first change above** provides an option, could be a less expensive installation in some cases, raises the level of safety, has the potential to reduce injuries and save millions of dollars in water damages to structures.

T**he second change above** provides a much higher level of safety and corrects a potential safety hazard. The original provision allows for a noncompliant (unsafe) installation to be replaced and remain noncompliant in perpetuity regardless of whether it is above an occupied space or any other potential unsafe location. If a leak occurs above an occupied space, the pan may collect and have no place to drain. This new addition would now require a replacement water heater to have a pan drain or have an integral device or an approved external device to shut off the water to the heater in the event of a leak.

The code should not incentivize substandard installations and provide exceptions for noncompliant unsafe conditions that could cause damage and bodily harm just because it was already done previously.

Sample Local Jurisdiction Code Language:

Fort Worth, Texas

Exception: When a water heater retrofit or replacement occurs on a slab foundation and the line cannot be discharged to an approved location the T& P discharge line can be piped to the water heater pan provided with all of the following:

1. the water heater when water is detected inside the pan;

2. A device is installed that will sound an audible alarm when water is detected inside the pan to alert the occupants that a leak has occurred.

Frisco Texas

P2801.9 Water heaters installed in attics or with living space below: Water heaters, other than tankless, when located in an attic space or a space located above living space, shall be equipped with a WAGS, Floodstop or other approved device to automatically shut off the water supply if a water leak is detected.**Exception:** Replacement water heaters that were permitted on or before December 31, 2013, shall not be required to be equipped with an automatic Shut off device.

The following standard for the testing and certification of these devices has also beed proposed to the list of approved standards in the IRC and the IPC. **ANSI/CAN/IAPMO Z1349 Standard for Devices for Detection, Monitoring or Control of Plumbing Systems.**

This standard supports the proposals in the IRC and IPC to allow these devices as an additional option. It is an ANSI Standard

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

No Cost Impact. ($0)

Estimated Immediate Cost Impact Justification (methodology and variables):

The proposal only provides an additional option that could potentially reduce construction and installation costs and does not have a cost impact since it is merely an option.
This provision could save construction and installation costs, not to mention prevent leaks from becoming damaging over time or even catastrophic. Since it is **only another option, and not a required provision, it should never increase the cost of construction** if the decision is made on cost alone.The proposal corrects an unsafe provision and could also potentially save tens thousands of dollars per leak incident.

Estimated Life Cycle Cost Impact:

None

Estimated Life Cycle Cost Impact Justification (methodology and variables):

None

Staff Analysis: A review of the standard proposed for inclusion in the code, ANSI/CAN/IAPMO Z1349-21 *Standard for Devices for Detection, Monitoring or Control of Plumbing Systems*, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

P62-24 Part II

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: There is a concern that if water is shut off to the water heater that the elements could burn out. (10-0)

P62-24 Part II

Individual Consideration Agenda

Comment 1:

Proponents: Jay Peters, Codes and Standards International LLC, IPS Corporation (peters.jay@me.com) requests As Submitted

Reason: Proven protection of occupants and structures from water heater leaks should not be sacrificed to preserve an already damaged and potentially dangerous appliance. There has not been any data or reported issues in the millions of installations by multiple manufacturers. It was not also a concern to the technical committee members and industry stakeholders that developed the ANSI product safety standard for this product. Although only a hypothetical concern at this point, many installations are used for gas fired water heaters (without heating elements) so the pool of possible problems with elements is greatly reduced and a nonissue. Mineral build up, faulty wiring, and pockets of air (airlock) can cause damage not only to the heating element but can create leaks. An automatic shut off would not likely be the reason for an element burn-out. The safety device would only activate due to the presence of water or a leak. If a water heater is leaking, damage has most likely already occurred to the heater and components/elements. If the water heater is leaking, concern about an internal heating element or any other component will not improve the safety or reduce damage. Listed Automatic shut-offs prevent further damage, both in water claims, and structural damage. Please accept as originally submitted.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Comment (CAH2)# 688

P67-24

IPC: 604.4, 604.4.1 (New), 604.4.2 (New), TABLE 604.4

Proposed Change as Submitted

Proponents: Julius Ballanco, P.E., JB Engineering and Code Consulting, P.C., Bradley Corp. (jbengineer@aol.com)

2024 International Plumbing Code

Revise as follows:

604.4 Maximum flow and water consumption. The maximum water consumption flow rates and quantities for all plumbing fixtures and fixture fittings shall be in accordance with Table 604.4. ~~**Exceptions:**~~

1. ~~Blowout design water closets having a water consumption not greater than 3 1/2 gallons (13 L) per flushing cycle.~~
2. ~~Vegetable sprays.~~
3. ~~Clinical sinks having a water consumption not greater than 4 1/2 gallons (17 L) per flushing cycle.~~
4. ~~Service sinks.~~
5. ~~Emergency showers.~~

Add new text as follows:

604.4.1 Group wash fixtures. Group wash fixtures used as public lavatories shall have a maximum water consumption flow rate in accordance with Table 604.4 based on each 16 inches of rim space.

604.4.2 Emergency fixtures. The maximum flow rates in Table 604.4 shall not apply to emergency fixtures.

Revise as follows:

TABLE 604.4 MAXIMUM FLOW RATES AND CONSUMPTION FOR PLUMBING FIXTURES AND FIXTURE FITTINGS

PLUMBING FIXTURE OR FIXTURE FITTING	MAXIMUM FLOW RATE OR QUANTITY[b]
Clinical sink	4.5 gallons per flushing cycle
Lavatory, private	2.2 gpm at 60 psi
Lavatory, public (metering)	0.25 gallon per metering cycle
Lavatory, public (other than metering)	0.5 gpm at 60 psi
Shower head[a, c]	2.0 gpm at 80 psi
~~Sink~~ Kitchen sink faucet	2.2 gpm at 60 psi
Urinal	1.0 gallon per flushing cycle
Water closet	1.6 gallons per flushing cycle
Water closet, blowout	3.5 gallons per flushing cycle

For SI: 1 gallon = 3.785 L, 1 gallon per minute = 3.785 L/m, 1 pound per square inch = 6.895 kPa.

a. A hand-held shower spray is a shower head.

b. Consumption tolerances shall be determined from referenced standards.

c. Shower heads shall comply with all requirements for high-efficiency showerheads in ASME A112.18.1-2020/CSA B125.1.

Reason: This proposal is an alternative approach for addressing the exceptions currently listed in Section 604.4. Clinical sink and blowout water closets have been added to the table since there are water consumption requirements. These are not exceptions. The other change to the table is the addition of the word “kitchen” in front of sink faucet in Table 604.4. The Federal water conservation

requirements are very clear in listing kitchen faucets. The use of the term “sink faucets” has led to some of the confusion regarding what sinks are regulated for water conservation.

A new subsection is proposed for determining the water consumption use for group wash fixtures used as public lavatories. Section 419.1 lists a rim space to be classified as a lavatory. However, for water consumption applications, the spacing listed is not consistent with the use of the fixture. The manufacturers have allocated the water use for each 16 inches of rim space.

The other new subsection states that emergency fixtures, showers, eyewash, or facewash, are not regulated by Table 604.4. This is consistent with the Federal requirements.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This change is editorial. If one reviews the change, they will notice that there is no additional requirements for plumbing fixtures. The text is simplified into a table format for better understanding. Hence, this has no impact on the cost of construction.

P67-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The proponent wanted to fix his proposal with a floor modification but it was ruled out of order. The proposal needs to come back with a public comment. (14-0)

P67-24

Individual Consideration Agenda

Comment 1:

IPC: 604.4.1

Proponents: Julius Ballanco, P.E., JB Engineering and Code Consulting, P.C., Bradley Corp. (jbengineer@aol.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Plumbing Code

~~**604.4.1 Group wash fixtures.** Group wash fixtures used as public lavatories shall have a maximum water consumption flow rate in accordance with Table 604.4 based on each 16 inches of rim space.~~

Reason: During the first hearing, a modification was submitted to strike Section 604.4.1 Group wash fixtures. Everyone, including the proponent, was in agreement to strike this section as being inappropriate to add. Unfortunately, the modification was ruled out of order. Had the modification been accepted, in all likelihood this change would have been accepted.
Two changes were proposed to modify this section. The Committee was asked to decide which approach they liked the best. There

appeared to be complete agreement that P67-24 was preferred over P68-24. For that reason, a public comment is only being proposed to P67-24 with the requested modification.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This change strikes a section originally proposed to be included. Therefore, there is no cost impact.

Comment (CAH2)# 242

P73-24 Part I

IPC: 604.8, ASSE Chapter 15 (New)

Proposed Change as Submitted

Proponents: George Istefan, Watts Water Technologies (george.istefan@wattswater.com)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE PLUMBING CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-MP CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Plumbing Code

Revise as follows:

604.8 Water pressure-reducing valve or regulator. Where water pressure within a building exceeds 80 psi (552 kPa) static, an *approved* water pressure-reducing valve conforming to ASSE 1003, ASSE 1103, or CSA B356 with strainer shall be installed to reduce the pressure in the building water distribution piping to not greater than 80 psi (552 kPa) static. **Exception:** Service lines to sill cocks and outside hydrants, and main supply risers where pressure from the mains is reduced to 80 psi (552 kPa) or less at individual fixtures.

Add new standard(s) as follows:

ASSE

ASSE International
18927 Hickory Creek Drive, Suite 220
Mokena, IL 60448

1103-202x Pilot operated Water Pressure Reducing Valves for Potable Water

Reason: There are currently 2 types of pressure reducing valves allowed in the plumbing code. The ASSE 1003 Water Pressure Reducing Valves for Potable Water Distribution Systems, a directing acting valve in sizes ½" through 4" and the AWWA C530 Pilot Operated Control Valve. The ASSE 1103 valve is as the title states, a pilot operated valve in sizes 1-1/2" through 60". AWWA C530 valves were approved in the 2024 code cycle to provide an approved pressure reducing valve larger than 4" for systems that have larger volume requirements.

The new ASSE Standard 1103 "Pilot Operated Water Pressure Reducing Valves for Potable Water" will allow the use of pilot operated pressure control valves that are specifically intended for potable water applications. As such the standard requires compliance with NSF 61 and NSF 372.

The approval of this proposal will allow designers the flexibility to specify, and AHJs to approve, potable water pressure controllers with a valve specifically intended for use in potable water systems.

Pilot operated: https://masterbuildermercantile.com/products/zurn-wilkins-212-zw209-2-1-2-pressure-reducing-valve-pilot-controlled-lead-free

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

Product Cost: 2½" Zurn ASSE 1003 PRV @ Zorro - $2,635 vs Pilot operated $2,089

Installation Cost: Same cost to install

Estimated Immediate Cost Impact Justification (methodology and variables):

Product Cost: 2½" Zurn ASSE 1003 PRV @ Zorro - $2,635 vs Pilot operated $2,089

Installation Cost: Same cost to install

Estimated Life Cycle Cost Impact:

Comparatively same cost for repair/maintenance kits for each, so no increase or reduction. 30year Lifetime repair cost estimated $200-$300, parts and labor.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

Comparatively same cost for repair/maintenance kits for each, so no increase or reduction. 30year Lifetime repair cost estimated $200-$300, parts and labor.

Staff Analysis: A review of the standard proposed for inclusion in the code, ASSE 1103-202x *Pilot operated Water Pressure Reducing Valves for Potable Water*, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

P73-24 Part I

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The standard is still in draft form. (13-1)

P73-24 Part I

Individual Consideration Agenda

Comment 1:

Proponents: George Istefan, Watts Water Technologies (george.istefan@wattswater.com) requests As Submitted

Reason: ASSE 1103 is officially published as an ANSI Standard

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Comment (CAH2)# 768

Comment 2:

Proponents: Jason Shank, ASSE International, ASSE International (jshank@plumbers55.com) requests As Submitted

Reason: The ASSE 1103 Standard is now a Published Standard under ANSI

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

P73-24 Part II

IRC: P2903.3.2, ASSE Chapter 44 (New)

Proposed Change as Submitted

Proponents: George Istefan, Watts Water Technologies (george.istefan@wattswater.com)

2024 International Residential Code

Revise as follows:

P2903.3.2 Maximum pressure. The static water pressure shall be not greater than 80 psi (551 kPa). Where the *main* pressure exceeds 80 psi (551 kPa), an *approved* pressure-reducing valve conforming to ASSE 1003, ASSE 1103, or CSA B356 shall be installed on the domestic water branch *main* or riser at the connection to the water service pipe.

Add new standard(s) as follows:

ASSE

ASSE International
18927 Hickory Creek Drive, Suite 220
Mokena, IL 60448

1103-202x Pilot operated Water Pressure Reducing Valves for Potable Water

Reason: The addition of the new ASSE Standard 1103 Pilot Operated Water Pressure Reducing Valves for Potable Water will allow system designers another option for valve selection, particularly when sizes than 3" are required. These types of valves are capable of maintaining tighter control of the set pressure. The standard also requires their compliance with NSF 61 and NSF 372 in applications where the water is intended for human consumption.

Bibliography: Link Date: 01/02/2024

Direct acting: https://www.zoro.com/zurn-water-pressure-reducing-valve-2-12-in-212-500xl/i/G5064236/?campaignid=19725397607&productid=G5064236&v=&gad_source=1

Pilot operated: https://masterbuildermercantile.com/products/zurn-wilkins-212-zw209-2-1-2-pressure-reducing-valve-pilot-controlled-lead-free

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

Product Cost: 2½" Zurn ASSE 1003 PRV @ Zorro - $2,635 vs Pilot operated $2,089

Installation Cost: Same cost to install

Estimated Immediate Cost Impact Justification (methodology and variables):

Product Cost: 2½" Zurn ASSE 1003 PRV @ Zorro - $2,635 vs Pilot operated $2,089

Installation Cost: Same cost to install

Estimated Life Cycle Cost Impact:

Life Cycle Cost: Comparatively same cost for repair/maintenance kits for each, so no increase or reduction. 30year Lifetime repair cost estimated $200-$300, parts and labor.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

Life Cycle Cost: Comparatively same cost for repair/maintenance kits for each, so no increase or reduction. 30year Lifetime repair cost estimated $200-$300, parts and labor.

Staff Analysis: A review of the standard proposed for inclusion in the code, ASSE 1103-202x *Pilot operated Water Pressure Reducing Valves for Potable Water*, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

P73-24 Part II

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The standard is not complete. (10-0)

P73-24 Part II

Individual Consideration Agenda

Comment 1:

Proponents: George Istefan, Watts Water Technologies (george.istefan@wattswater.com) requests As Submitted

Reason: ASSE 1103 is officially published as an ANSI Standard

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Comment (CAH2)# 769

Comment 2:

Proponents: Jason Shank, ASSE International, ASSE International (jshank@plumbers55.com) requests As Submitted

Reason: The ASSE 1103 Standard is now a published ANSI Standard

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Comment (CAH2)# 686

P83-24

IPC: TABLE 608.1, 608.17.1.2, ASSE Chapter 15 (New)

Proposed Change as Submitted

Proponents: George Istefan, Watts Water Technologies (george.istefan@wattswater.com)

2024 International Plumbing Code

Revise as follows:

TABLE 608.1 APPLICATION OF BACKFLOW PREVENTERS

Portions of table not shown remain unchanged.

DEVICE	DEGREE OF HAZARD[a]	APPLICATION[b]	APPLICABLE STANDARDS
Backflow preventer plumbing devices:			
Antisiphon-type fill valves for gravity water closet flush tanks	High hazard	Backsiphonage only	ASSE 1002/ASME A112.1002/CSA B125.12; CSA B125.3
Backflow preventer for carbonated beverage machines	Low hazard	Backpressure or backsiphonage Sizes $^1/_4$″ – $^1/_2$″	ASSE 1022
Backflow preventer for carbonated and non-carbonated beverage machines.	Low Hazard	Backpressure or backsiphonage Sizes 1/4″–1/2″	ASSE 1032
Backflow preventer with intermediate atmospheric vents	Low hazard	Backpressure or backsiphonage Sizes $^1/_4$″–$^3/_4$″	ASSE 1012; CSA B64.3
Backflow preventer with intermediate atmospheric vent and pressure-reducing valve.	Low hazard	Backpressure or backsiphonage Sizes $^1/_2$″–$^3/_4$″	ASSE 1081
Dual-check-valve-type backflow preventer	Low hazard	Backpressure or backsiphonage Sizes $^1/_4$″–2″	ASSE 1024; CSA B64.6
Hose connection backflow preventer	High or low hazard	Low head backpressure, rated working pressure, backpressure or backsiphonage Sizes $^1/_2$″–1″	ASME A112.21.3; ASSE 1052; CSA B64.2.1.1
Hose connection vacuum breaker	High or low hazard	Low head backpressure or backsiphonage Sizes $^1/_2$″, $^3/_4$″, 1″	ASME A112.21.3; ASSE 1011; CSA B64.2; CSA B64.2.1
Laboratory faucet backflow preventer	High or low hazard	Low head backpressure and backsiphonage	ASSE 1035; CSA B64.7
Pipe-applied atmospheric-type vacuum breaker	High or low hazard	Backsiphonage only Sizes $^1/_8$″–8″	ASSE 1001; CSA B64.1.1
Vacuum breaker wall hydrants, frost-resistant, automatic-draining-type	High or low hazard	Low head backpressure or backsiphonage Sizes $^3/_4$″, 1″	ASME A112.21.3; ASSE 1019; CSA B64.2.2

For SI: 1 inch = 25.4 mm.

a. Low hazard—See Pollution (Section 202).

   High hazard—See Contamination (Section 202).

b. See Backpressure, low head (Section 202, Backflow).

   See Backsiphonage (Section 202, Backflow).

608.17.1.2 Coffee machines and noncarbonated drink dispensers. The water supply connection to each coffee machine and each noncarbonated beverage dispenser shall be protected against backflow by a backflow preventer conforming to ASSE 1022 or ASSE 1024, ASSE 1032, or protected by an *air gap*.

Add new standard(s) as follows:

ASSE

ASSE International
18927 Hickory Creek Drive, Suite 220
Mokena, IL 60448

ASSE/ANSI 1032-23 Dual Check Valve Type Backflow Preventers for Carbonated Beverage Dispensers, Post Mix Type, and Non-Carbonated Beverage Dispensers

Reason: ASSE/ANSI 1032-2023 *"Dual Check Valve Type Backflow Preventers for Carbonated Beverage Dispensers, Post Mix Type, and Non-Carbonated Beverage Dispensers"* has been published and the title was updated to include the approval for applications that

are carbonated and non-carbonated. The previous version of the standard did not include non-carbonated and was the basis for rejection in the last code cycle. ASSE technical committees reviewed the design and materials of the ASSE 1032 backflow preventors and verified that they exceed the requirements for non-carbonated applications. This title change will provide increased design flexibility and inclusion in the IPC will allow acceptance by AHJs.

Bibliography: Links date: 11-29-2023

Zurn 1022

https://www.grainger.com/product/454N98?gucid=N:N:PS:Paid:GGL:CSM-2295:4P7A1P:20501231&gad_source=1&gclid=EAIaIQobChMI6d_p9Z37ggMVRmJHAR1O-gkwEAQYASABEgLT8fD_BwE&gclsrc=aw.ds

Zurn 1032

https://www.grainger.com/product/454N98?gucid=N:N:PS:Paid:GGL:CSM-2295:4P7A1P:20501231&gad_source=1&gclid=EAIaIQobChMI6d_p9Z37ggMVRmJHAR1O-gkwEAQYASABEgLT8fD_BwE&gclsrc=aw.ds

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The approval of this proposal will allow designers the flexibility to specify, and AHJs to approve check valves specifically intended for use in potable water systems. Costs for the original purchase, installation and life cycle of the proposed additional valve are very similar to the currently approved check valve. These valves are small and are generally replaced versus being field repaired.

Staff Analysis: A review of the standard proposed for inclusion in the code, ASSE 1032-23 *Dual Check Valve Type Backflow Preventers for Carbonated Beverage Dispensers, Post Mix Type, and Non-Carbonated Beverage Dispensers* , with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

P83-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The word "carbonated" needs to be stricken from the new line in the table. (14-0)

P83-24

Individual Consideration Agenda

Comment 1:

IPC: TABLE 608.1

Proponents: George Istefan, Watts Water Technologies (george.istefan@wattswater.com) requests As Modified by Committee (AMC2)

Modify as follows:

TABLE 608.1 APPLICATION OF BACKFLOW PREVENTERS

DEVICE	DEGREE OF HAZARD[a]	APPLICATION[b]	APPLICABLE STANDARDS
Backflow preventer plumbing devices:			
Antisiphon-type fill valves for gravity water closet flush tanks	High hazard	Backsiphonage only	ASSE 1002/ASME A112.1002/CSA B125.12; CSA B125.3
Backflow preventer for carbonated beverage machines	Low hazard	Backpressure or backsiphonage Sizes $^1/_4$″– $^1/_2$″	ASSE 1022
Backflow preventer for ~~carbonated and~~ non-carbonated beverage machines.	Low Hazard	Backpressure or backsiphonage Sizes 1/4″–1/2″	ASSE 1032
Backflow preventer with intermediate atmospheric vents	Low hazard	Backpressure or backsiphonage Sizes $^1/_4$″–$^3/_4$″	ASSE 1012; CSA B64.3
Backflow preventer with intermediate atmospheric vent and pressure-reducing valve.	Low hazard	Backpressure or backsiphonage Sizes $^1/_2$″–$^3/_4$″	ASSE 1081
Dual-check-valve-type backflow preventer	Low hazard	Backpressure or backsiphonage Sizes $^1/_4$″–2″	ASSE 1024; CSA B64.6
Hose connection backflow preventer	High or low hazard	Low head backpressure, rated working pressure, backpressure or backsiphonage Sizes $^1/_2$″–1″	ASME A112.21.3; ASSE 1052; CSA B64.2.1.1
Hose connection vacuum breaker	High or low hazard	Low head backpressure or backsiphonage Sizes $^1/_2$″, $^3/_4$″, 1″	ASME A112.21.3; ASSE 1011; CSA B64.2; CSA B64.2.1
Laboratory faucet backflow preventer	High or low hazard	Low head backpressure and backsiphonage	ASSE 1035; CSA B64.7
Pipe-applied atmospheric-type vacuum breaker	High or low hazard	Backsiphonage only Sizes $^1/_8$″–8″	ASSE 1001; CSA B64.1.1
Vacuum breaker wall hydrants, frost-resistant, automatic-draining-type	High or low hazard	Low head backpressure or backsiphonage Sizes $^3/_4$″, 1″	ASME A112.21.3; ASSE 1019; CSA B64.2.2

For SI: 1 inch = 25.4 mm.

a. Low hazard—See Pollution (Section 202).

   High hazard—See Contamination (Section 202).

b. See Backpressure, low head (Section 202, Backflow).

   See Backsiphonage (Section 202, Backflow).

Reason: Removed the carbonated beverage dispensers application from Table 608.1 due to concern regarding the reaction of CO2 gases with copper piping.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

corrected the language of the original proposal to address the committee's concerns, no cost changes to the original proposal.

Comment (CAH2)# 771

P93-24

IPC: SECTION 609, 609.1, 609.3 (New), 609.3.1 (New), 609.3

Proposed Change as Submitted

Proponents: Jeff O'Neil, Chair, Committee on Healthcare (ahc@iccsafe.org)

2024 International Plumbing Code

SECTION 609
HEALTH CARE PLUMBING

609.1 Scope. This section shall govern those aspects of health care plumbing systems that differ from plumbing systems in other structures. Health care plumbing systems shall conform to the requirements of this section in addition to the other requirements of this code. The provisions of this section shall apply to the special devices and equipment installed and maintained in the following *occupancies* : Group I-1, Group I-2, ambulatory care facilities, medical offices, research and testing laboratories, and Group F facilities manufacturing pharmaceutical drugs and medicines.

Add new text as follows:

609.3 Water. Water shall be provided in health care facilities in accordance with Section 609.3.1 and 609.3.2.

609.3.1 Hand-washing water. Hand-washing water shall be provided to all dedicated handwashing stations. Water with a temperature not less than 45 degrees F (13 C) and not greater than 85 F degrees (32 C) or not less than 105 degrees F (40 C) to 120 degrees F (49 C), shall be delivered from dedicated hand-washing stations. Water shall be delivered through an approved water-temperature limiting device that conforms to ASSE 1070/ASME A112.1070/CSA B125.70.

Revise as follows:

~~**609.3**~~ **609.3.2 Hot water.** Other than at dedicated hand washing stations, *hot* ~~*Hot*~~ *water* shall be provided to supply all of the hospital fixture, kitchen and laundry requirements. Special fixtures and equipment shall have hot water supplied at a temperature specified by the manufacturer. The hot water system shall be installed in accordance with Section 607.

Reason: The purpose of this change is to allow for maximum amount of handwashing options in a hospital setting, while considering optimal operating performance of systems. In addition to the proven effectiveness of handwashing against COVID-19, other pathogens such as Legionella are a primary concern for healthcare facilities. Water systems are constantly being optimized to In addition, use of higher water temperature increases energy consumption, and therefore having alternate options for handwashing would be beneficial from an environmental standpoint. Even if ABHR is used, it is not recommended for use when hands are heavily soiled or greasy, also per the CDC (Show Me the Science – When & How to Use Hand Sanitizer in Community Settings | Handwashing | CDC). From that article, the “CDC recommends washing hands with soap and water whenever possible because handwashing reduces the amounts of all types of germs and chemicals on hands.”

Hospital water systems do not directly reflect outside weather conditions in terms of temperature. Systems generally receive water from municipal mains at about 45 degrees minimum. To combat pathogens such as Legionella, CDC recommendations are to maintain cold water temperature at approximately 68 degrees, based on standard ASHRAE 12-2020. This is achieved by simple circulation of the water through the interior system of the hospital, where indoor air temperatures are maintained. Systems heat water, and also chilled water, to operational temperatures, but water from the cold water tap is not extreme in temperature. This dispels the notion of the “Minnesota Effect,” which was a concern in the debate and discussion during the Committee Action Hearings on this code change.

Also, during proper handwashing, use of soap accounts for most of the 20 seconds recommended for hand scrubbing. Hands are only under the water briefly at the beginning, to rinse hands, and then at the end to rinse off the soap. Based on CDC observations, found at Frequent Questions About Hand Hygiene | Handwashing | CDC the effectiveness of the soap is not related to water temperature. Per the

CDC, on the topic of use of warm water or cold water for handwashing, “[u]se your preferred water temperature – cold or warm – to wash your hands. Warm and cold water remove the same number of germs from your hands. The water helps create soap lather that removes germs from your skin when you wash your hands. Water itself does not usually kill germs; to kill germs, water would need to be hot enough to scald your hands.” Other studies suggest that cold water handwashing is actually more effective than warm water handwashing, including elimination of a number of pathogens as noted in Quantifying the Effects of Water Temperature, Soap Volume, Lather Time, and Antimicrobial Soap as Variables in the Removal of Escherichia coli ATCC 11229 from Hands (https://meridian.allenpress.com/jfp/article/80/6/1022/200017/Quantifying-the-Effects-of-Water-Temperature-Soap). In brief, “the results of this study indicate that water temperature is not a critical factor for the removal of transient microorganisms from hands.”

Regarding data surrounding Legionella testing, ASHRAE 188-2017 requires a testing program to determine growth of Legionella at cooling towers and domestic water systems. The purpose for testing is to treat the water before the pathogen grows to lethal levels. In 2017, as noted in Legionellosis Report 2017 (pa.gov), the top jurisdictions had a total of 7,458 cases of Legionella. The monumental Legionnaires Disease outbreak of 1976 at the Bellevue Stratford Hotel in Philadelphia had 182 reported cases with 29 deaths, for a 15.9% death rate. There have been more recent outbreaks in 2017 at Lenox Hill Hospital in New York, and in relation to the Flint, MI water crisis in 2019. Water testing programs are instituted throughout the united states to avoid such a catastrophic result, so systems can be properly cleaned before they reach an outbreak level.The complexities of encouraging handwashing, while mitigating pathogens such as Legionella and COVID-19, are a balance that hospitals face regularly. This change to allow cold handwashing affords another tool to successfully create the safest environment possible.

This proposal is submitted by the ICC Committee for Healthcare (CHC).
The Committee on Healthcare (CHC) was established by the ICC Board of Directors in 2011 to pursue opportunities to study and develop effective and efficient provisions for Hospital, Nursing Homes, Assisted Living and Ambulatory Care Facilities. This committee was formed in cooperation with the American Society for Healthcare Engineering (ASHE). In July of 2017, the ICC Board made CHC a standing committee. In 2023 the CHC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the CHC website at CHC webpage.

Bibliography: 1. Carrico AR, Spoden M, Wallston KA, Vandenbergh MP. The Environmental Cost of Misinformation: Why the Recommendation to Use Elevated Temperatures for Handwashing is Problematic. Int J Consum Stud. 2013;37(4):433-441. doi:10.1111/ijcs.12012

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is an option for hospitals for water temperature and will not change the requirements for construction of the dedicated handwashing stations or the piping.

Staff Analysis: The proposed standard is in the current edition of the code.

P93-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The proposal is confusing and needs to be brought back at CAH2 with clearer language. (14-0)

Individual Consideration Agenda

Comment 1:

IPC: SECTION 609, 609.1, 609.3, 609.3.1, 609.3.2

Proponents: Jeff O'Neil, Chair, Committee on Healthcare (ahc@iccsafe.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Plumbing Code

SECTION 609
HEALTH CARE PLUMBING

609.1 Scope. This section shall govern those aspects of health care plumbing systems that differ from plumbing systems in other structures. Health care plumbing systems shall conform to the requirements of this section in addition to the other requirements of this code. The provisions of this section shall apply to the special devices and equipment installed and maintained in the following *occupancies* : Group I-1, Group I-2, ambulatory care facilities, medical offices, research and testing laboratories, and Group F facilities manufacturing pharmaceutical drugs and medicines.

609.3 Water. Water shall be provided in health care facilities in accordance with Section 609.3.1 and 609.3.2.

609.3.1 Hand-washing water. Hand-washing water shall be ~~provided to all~~ delivered from dedicated handwashing stations. Water ~~with a~~ temperature shall be either:

1. Cold water not ~~Not~~ less than 45 degrees F (13 C) and not greater than 85 F degrees (32 C)
2. ~~nor~~ Hot water not less than 105 degrees F (40 C) ~~to~~ and not greater 120 degrees F (49 C) ~~, shall be delivered from dedicated hand-washing stations~~.

Water shall be delivered through an approved water-temperature limiting device that conforms to ASSE 1070/ASME A112.1070/CSA B125.70.

Exception: Tempered water shall be permitted where the water management program has alternate control measures implemented to provide protection from waterborne pathogens. Tempered water shall be controlled in accordance with Section 607.1.2.

609.3.2 Hot water. Other than at lavatories and dedicated hand washing stations, *hot water* shall be provided to supply all of the hospital fixture, kitchen and laundry requirements. Special fixtures and equipment shall have hot water supplied at a temperature specified by the manufacturer. The hot water system shall be installed in accordance with Section 607.

Reason: Hand washing stations are clearly defined in healthcare facilities by Facility Guideline Institute (FGI). See the reason statement for the original proposal for the purpose of the original change.

The committee reason was that the language was confusing. The new section has been revised to be consistent with the language for lavatories in IPC Section 419.5. A list separated the options for water colder or hotter than tempered water for clarity.

> **419.5 Tempered water for public hand-washing facilities.** Tempered water shall be delivered from lavatories and group wash fixtures located in public toilet facilities provided for customers, patrons and visitors. Tempered water shall be delivered through an approved water-temperature limiting device that conforms to ASSE 1070/ASME A112.1070/CSA B125.70.

The new exception is for location, such as Texas, where the municipal water comes in hotter than 85 degrees. Allowing for tempered

water to be treated instead of cooling or heating the water provides an additional option to address the spread of pathogens in water necessary in hospitals, and will save energy.

The definition of tempered water is as follows.

TEMPERED WATER. Water having a temperature range between 85°F (29°C) and 110°F (43°C).

This proposal is submitted by the ICC Committee for Healthcare (CHC).
The Committee on Healthcare (CHC) was established by the ICC Board of Directors in 2011 to pursue opportunities to study and develop effective and efficient provisions for Hospital, Nursing Homes, Assisted Living and Ambulatory Care Facilities. This committee was formed in cooperation with the American Society for Healthcare Engineering (ASHE). In July of 2017, the ICC Board made CHC a standing committee. In 2024 the CHC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the CHC website at CHC webpage.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is an option for hospitals for water temperature and will not change the requirements for construction of the dedicated handwashing stations or the piping.

Comment (CAH2)# 200

Comment 2:

IPC: 609.3, 609.3.1, 609.3.2, 609.3.2 (New)

Proponents: Julius Ballanco, P.E., JB Engineering and Code Consulting, P.C., Self (jbengineer@aol.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Plumbing Code

609.3 Hot and tempered water ~~Water~~. *Hot* and *tempered water* ~~*Water*~~ shall be provided in health care facilities in accordance with Section 609.3.1 and 609.3.2.

Delete without substitution:

~~**609.3.1 Hand-washing water.** Hand-washing water shall be provided to all dedicated handwashing stations. Water with a temperature not less than 45 degrees F (13 C) and not greater than 85 F degrees (32 C) or not less than 105 degrees F (40 C) to 120 degrees F (49 C), shall be delivered from dedicated hand-washing stations. Water shall be delivered through an approved water temperature limiting device that conforms to ASSE 1070/ASME A112.1070/CSA B125.70.~~

~~**609.3.2**~~ **609.3.1 Hot water.** ~~Other than at dedicated hand washing stations *hot.*~~ *Hot water* shall be provided to supply all of the hospital fixture, kitchen and laundry requirements. Special fixtures and equipment shall have hot water supplied at a temperature specified by the manufacturer. The hot water system shall be installed in accordance with Section 607.

Add new text as follows:

609.3.2 Tempered water. *Tempered water* shall be provided to all hand washing stations. *Tempered water* shall be controlled in accordance with Section 607.1.2.

Reason: It appeared that the intent of the original change was to allow the use of tempered water for hand washing stations. By adding the heading "water" there needed to be requirements for cold water to hospital fixtures, however, that does not appear. Therefore, the modification changes the section to "hot and tempered water." Thus, the two following sections only address special requirements for hospital and health care facilities.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is only an editorial change of the original proposal. The original proposal listed the cost impact as being editorial in nature.

Comment (CAH2)# 653

P95-24

IPC: 611.1, Table 611.1 (New), ASSE Chapter 15 (New), NSF Chapter 15 (New)

Proposed Change as Submitted

Proponents: Jason Shank, ASSE International, ASSE International (jshank@plumbers55.com)

2024 International Plumbing Code

Revise as follows:

611.1 Design. Point-of-use reverse osmosis drinking water treatment units shall comply with CSA B483.1 or NSF 58. Drinking water treatment units shall meet the requirements of CSA B483.1, NSF 42, NSF 44, NSF 53 or NSF 62. Commercial and food service water treatment equipment shall comply with ASSE 1087. Table 611.1 shall be used to determine the applicable standards for the applications and uses for the requirements of this section.

Add new text as follows:

Table 611.1 Drinking Water Treatment Units

Application	Point of Use	Point of Entry
Aesthetic Contaminant Reduction Filters	NSF/ANSI 42 or CSA B483.1	NSF/ANSI 42 or CSA B483.1
Distillation Systems	NSF/ANSI 62 or CSA B483.1	NSF/ANSI 62 or CSA B483.1
Health Related Contaminant Reduction Filters	NSF/ANSI 53 or CSA B483.1	NSF/ANSI 53 or CSA B483.1
Reverse Osmosis	NSF/ANSI 58 or CSA B483.1	-
Ultraviolet Water Treatment	NSF/ANSI 55 or CSA B483.1	NSF/ANSI 55 or CSA B483.1
Water Softeners	-	Up to 1.25 in. inlet: NSF/ANSI 44, or CSA B483.1 greater than 1.25 in, inlet : ASSE 1087

Add new standard(s) as follows:

ASSE

ASSE International
18927 Hickory Creek Drive, Suite 220
Mokena, IL 60448

1087 - 2022	Performance Requirements for Commercial and Food Service Water Treatment Equipment Utilizing Drinking Water

NSF

NSF International
789 N. Dixboro Road P.O. Box 130140
Ann Arbor, MI 48105

55 - 2022	Ultraviolet Microbiological Water Treatment Systems

Reason: The proposal to add this language and chart is to define what ASSE 1087 standard covers in regards to the other standards listed currently in this section and what they cover in the Code. The table also includes the applications, point of use and point of entry for each standard listed in this section.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

These are optional items in a building and are not required. It is up to the Owner of the building to decide if they wish these or not.

Staff Analysis: A review of the standard proposed for inclusion in the code, NSF 55-2022 *Ultraviolet (UV) Water Treatment Systems* and ASSE 1087-2022 *Commercial and Food Service Water Treatment Equipment Utilizing Drinking Water*, with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

P95-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The proponent indicated that there are issues with ASSE 1087 and it is not complete. (14-0)

P95-24

Individual Consideration Agenda

Comment 1:

IPC: 611.1, Table 611.1, ASSE Chapter 15

Proponents: Jeremy Brown, NSF International, NSF International (brown@nsf.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Plumbing Code

Revise as follows:

611.1 Design. Point-of-use reverse osmosis drinking water treatment units shall comply with CSA B483.1 or NSF 58. Drinking water treatment units shall meet the requirements of CSA B483.1, NSF/ANSI 42, NSF/ANSI 44, NSF/ANSI 53, NSF/ANSI 55 or NSF/ANSI 62. ~~Commercial and food service water treatment equipment shall comply with ASSE 1087.~~ Table 611.1 shall be used to determine the applicable standards for the applications and uses for the requirements of this section.

Table 611.1 Drinking Water Treatment Units

Application	Point of Use	Point of Entry

18927 Hickory Creek Drive, Suite 220
Mokena, IL 60448

~~1087 - 2022~~	~~Performance Requirements for Commercial and Food Service Water Treatment Equipment Utilizing Drinking Water~~

Reason: This code change introduces a couple of standards, ASSE 1087 and NSF/ANSI 55. Since the appropriateness of ASSE 1087 is being disputed, this comment proposes to add only NSF/ANSI 55 for which there is no dispute. NSF/ANSI 55 establishes minimum structural, material safety and performance health claims for treatment systems that reduce microorganisms using UV radiation. This standard was originally published in 1991 and is the American National Standard for UV treatment technology. This standard is referenced by the other major model plumbing code in the US as well as several states. Notice I am also adding ANSI to the name of these NSF Standards which represents their proper names. A copy has been provided to the committee and the public can obtain a free copy for consideration of this code change by emailing brown@nsf.org.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Adding this standard only offers another option for water treatment but does not mandate the use of UV systems, therefore it does not add cost to construction.

Comment (CAH2)# 79

P97-24

IPC: TABLE 702.1, TABLE 702.2, TABLE 702.4

Proposed Change as Submitted

Proponents: Abraham MURRA, Abraham Murra Consulting, Georg Fischer

2024 International Plumbing Code

Revise as follows:

TABLE 702.1 ABOVE-GROUND DRAINAGE AND VENT PIPE

MATERIAL	STANDARD
Acrylonitrile butadiene styrene (ABS) plastic pipe in IPS diameters, including Schedule 40, DR 22 (PS 200) and DR 24 (PS 140); with a solid, cellular core or composite wall	ASTM D2661; ASTM F628; ASTM F1488; CSA B181.1
Cast-iron pipe	ASTM A74; ASTM A888; CISPI 301
Copper or copper-alloy pipe	ASTM B42; ASTM B43; ASTM B302
Copper or copper-alloy tubing (Type K, L, M or DWV)	ASTM B75; ASTM B88; ASTM B251; ASTM B306
Chlorinated polyvinylchloride (CPVC) plastic pipe, Schedule 80	ASTM F441/F441M, CSA B181.2
Galvanized steel pipe	ASTM A53
Glass pipe	ASTM C1053
Polyolefin pipe	ASTM F1412; ASTM F3371; CSA B181.3
Polyvinyl chloride (PVC) plastic pipe in IPS diameters, including Schedule 40, DR 22 (PS 200), and DR 24 (PS 140); with a solid, cellular core or composite wall	ASTM D2665; ASTM F891; ASTM F1488; CSA B181.2
Polyvinyl chloride (PVC) plastic pipe with a 3.25-inch O.D. and a solid, cellular core or composite wall	ASTM D2949; ASTM F1488
Polyvinylidene fluoride (PVDF) plastic pipe	ASTM F1673; CSA B181.3
Stainless steel drainage systems, Types 304 and 316L	ASME A112.3.1

TABLE 702.2 UNDERGROUND BUILDING DRAINAGE AND VENT PIPE

MATERIAL	STANDARD
Acrylonitrile butadiene styrene (ABS) plastic pipe in IPS diameters, including Schedule 40, DR 22 (PS 200) and DR 24 (PS 140); with a solid, cellular core or composite wall	ASTM D2661; ASTM F628; ASTM F1488; CSA B181.1

Polyvinylidene fluoride (PVDF) plastic pipe	ASTM F1673; CSA B181.3
Stainless steel drainage systems, Type 316L	ASME A112.3.1

For SI: 1 inch = 25.4 mm.

TABLE 702.4 PIPE FITTINGS

MATERIAL	STANDARD
Acrylonitrile butadiene styrene (ABS) plastic pipe in IPS diameters	ASME A112.4.4; ASTM D2661; ASTM F628; CSA B181.1
Acrylonitrile butadiene styrene (ABS) plastic pipe in sewer and drain diameters	ASTM D2751
Cast iron	ASME B16.4; ASME B16.12; ASTM A74; ASTM A888; CISPI 301
Copper or copper alloy	ASME B16.15; ASME B16.18; ASME B16.22; ASME B16.23; ASME B16.26; ASME B16.29
Chlorinated polyvinylchloride (CPVC), Schedule 80	ASTM F439, CSA B181.2
Glass	ASTM C1053
Gray iron and ductile iron	AWWA C110/A21.10
Polyethylene	ASTM D2683
Polyolefin	ASTM F1412; ASTM F3371; CSA B181.3
Polyvinyl chloride (PVC) plastic in IPS diameters	ASME A112.4.4; ASTM D2665; ASTM F1866
Polyvinyl chloride (PVC) plastic pipe in sewer and drain diameters	ASTM D3034
Polyvinyl chloride (PVC) plastic pipe with a 3.25-inch O.D.	ASTM D2949
Polyvinylidene fluoride (PVDF) plastic pipe	ASTM F1673; CSA B181.3
Stainless steel drainage systems, Types 304 and 316L	ASME A112.3.1
Steel	ASME B16.9; ASME B16.11; ASME B16.28
Vitrified clay	ASTM C700

For SI: 1 inch = 25.4 mm.

Reason: CPVC is a widely used and accepted piping material and adding it to Tables 702.1, 702.2, and 702.3 will give users of the IPC a broader choice of materials.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposal adds a piping material, thus giving users more options to choose from, without any cost impact because of the new alternative.

Staff Analysis: The proposed standards are in the current edition of the code.

P97-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The proponent had floor modifications which were ruled out of order. The proposal should be brought back at CAH1 with corrections, (14-0)

P97-24

Polyvinylidene fluoride (PVDF) plastic pipe	ASTM F1673; CSA B181.3
Stainless steel drainage systems, Types 304 and 316L	ASME A112.3.1
Steel	ASME B16.9; ASME B16.11; ASME B16.28
Vitrified clay	ASTM C700

For SI: 1 inch = 25.4 mm.

a. For vacuum drainage piping systems only

Reason: CPVC is a widely used and accepted piping material and adding it to Tables 702.1, 702.2, and 702.3 will give users of the IPC a broader choice of materials. The comment on proposal P97-24 addresses the concerns of the IPC Committee at the CAH #1 as follows:

1. Removes “Schedule 80”, allowing pipe with different wall thicknesses to be used
2. Adds a use restriction indicating that CPVC is intended to be used only in vacuum drainage piping systems; and
3. Removes the reference to ASTM F439 in Table 702.4

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposal adds a material for drainage piping, AS AN OPTION, and therefore has no cost impact on the cost of construction.

Comment (CAH2)# 214

P99-24 Part I

IPC: 702.2, ASTM Chapter 15 (New)

Proposed Change as Submitted

Proponents: James Richardson, City of Columbus (Ohio), City of Columbus (Ohio) (jarichardson@columbus.gov); Brian Conner, Charlotte Pipe and Foundry (bconner@charlottepipe.com)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE PLUMBING CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-MP CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Plumbing Code

Revise as follows:

702.2 Underground building sanitary drainage and vent pipe. Underground building sanitary drainage and vent pipe shall conform to one of the standards listed in Table 702.2. Thermoplastic pipe and fittings shall be installed in accordance with ASTM D2321.

Add new standard(s) as follows:

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box C700
West Conshohocken, PA 19428-2959

D2321-20	Standard Practice for Underground Installation of Thermoplastic Pipe for Sewers and Other Gravity-Flow Applications

Reason: Every manufacturer of thermoplastic pipe has in their instruction a reference to the ASTM D 2321 standard for underground installations. The problem is that there is nothing in the code that also references this important standard except section 303.2. Inspectors do not necessarily have the time to read through every manufacturer's installation instructions during an inspection, however, if the installation standard was referenced in the code then the jurisdiction would be responsible for providing access to the standard for verification purposes.

Bibliography: See reason statement.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal will make it easier to ensure installation are in compliance with the manufacturer's requirements and should not technically have any impact on the cost of construction if the installers were following these requirements as they should have been.

P99-24 Part I

Public Hearing Results (CAH1)

Committee Action: **As Submitted**

Committee Reason: The Committee agreed with the published reason statement. (8-5)

P99-24 Part I

Individual Consideration Agenda

Comment 1:

IPC: 702.2, ASTM Chapter 15

Proponents: Michael Cudahy, PPFA Plastic Pipe and Fittings Association, PPFA Plastic Pipe and Fittings Association (mikec@cmservices.com) requests As Modified by Committee (AMC2)

Further modify as follows:

2024 International Plumbing Code

702.2 Underground building sanitary drainage and vent pipe. Underground building sanitary drainage and vent pipe shall conform to one of the standards listed in Table 702.2~~. Thermoplastic pipe and fittings~~ and shall be installed in accordance with this code or in accordance with ASTM D2321.

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box C700
West Conshohocken, PA 19428-2959

D2321-20	Standard Practice for Underground Installation of Thermoplastic Pipe for Sewers and Other Gravity-Flow Applications

Reason: PPFA supports this plastic pipe installation standard, especially for unusual soils and larger diameters of plastic piping, but for typical plumbing installations, in a Note in the standard, the standard simply refers users right back to the plumbing code requirements. It should be an option, and contains much that is useful, but it makes no sense to require obtaining the standard just to be sent back to the code in most circumstances. Worse if the note is not noticed and a simple installation is over complicated.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Making the standard an option would not alter costs, and would save the installer the cost of buying the standard in many cases.

Comment (CAH2)# 325

Comment 2:

Proponents: Andrew Bevis, Chair, Plumbing, Mechanical and Fuel Gas Code Action Committee (pmgcac@iccsafe.org) requests Disapproved

Reason: If this proposal remains approved As Submitted it will create several conflicts within the IPC and further sets the stage for a circular work path that allows either the code regulations to prevail or maybe the new ASTM 2321-20 Standard's, it's just not clear.

IPC Section 306.2 already addresses any perceived problems with invoking the ASTM 2321-20 Standard provisions where required. It states that "where the manufacturers installation instructions are more restrictive than those prescribed by code the material shall be installed with the most restrictive requirements."

The referenced **ASTM 2321-20 Standard Scope, Section 1.1**, contains the statement that "it is "recommendations" for installation of buried thermoplastic pipe…." Not written in prescriptive mandatory language and therefore subjective in nature. In **Section 1.2, Note 3**, it references that "most plumbing codes and some building codes have provisions for the installation of underground "building drains and building sewers." See them for plumbing piping applications." thus creating previous circular path in any underground application without ever clearly determining which set of provisions prevails. It is simply not clear which provisions are more restrictive?

The proponent never offered up exactly how the current code is broken and how the addition of the referenced Standard fixes anything. Instead, the addition of this Standard creates a direct conflict with the following sections:

306.2 Trenching and bedding. This Section allows the trench bed to be the support for the piping.

ASTM D2321-20 Section 7.2.2 requires engineering and/or the trench have a minimum of 4 inches of bedding installed.

306.2.1 Overexcavation. This Section requires that when a trench is overexcavated that it shall be backfilled with compacted sand or fine gravel, in lifts not to exceed 6 inches, to the bottom of the pipe.

ASTM D2321-20 Section 7.2.4 requires the use the Table 3 of the Standard where multiple applications are referenced based on soil conditions.

306.2.2 Rock removal. This Section requires that when rock is encountered during excavation the rock shall be removed not less than 3 inches below the pipe bottom and backfilled with tamped sand up to the bottom of the pipe to provide uniform bearing.

ASTM D2321-20 Section 6.5 requires that when rock is encountered, excavate a minimum of 6 inches below the bottom of the pipe and replace with "proper embedment."

306.2.3 Soft load-bearing materials. This Section requires that when poor load bearing materials are encountered during excavation, the materials be removed not less than 2 pipe diameters below the bottom of pipe. The poor bearing material shall be replaced with fine gravel, crushed stone or a concrete foundation.

ASTM D2321-20 Section 7.2.2 requires the use the Table 3 of the Standard where multiple applications are referenced based on soil conditions. Or for severe conditions an engineer may require a "special foundation."

306.3 Backfilling. This Section requires that backfill, free from construction debris, rocks, broken concrete and frozen chunks, shall be placed in a maximum of 6-inch lifts and tamped in place until the pipe is covered by 12 inches of backfill. And goes further to once again reiterate that "in instances where the manufacturer's instructions for materials are more restrictive than those prescribed by the code, the material shall be installed in accordance with the more restrictive requirement."

ASTM D2321-20 Section 7.6 requires engineering or a minimum of 24 inches of cover or at least one pipe diameter, whichever is greater.

These IPC Sections are longstanding, time-tested methods to install underground piping and as stated earlier the proponent has failed to provide any evidence that the code is not working well to provide the best practices while maintaining its scope of "minimum standards." If enforcement of the existing Chapter 3 regulations is the problem, then adding more confusing provisions in Chapter 7 will not resolve the issue, it will just compound.

The location of the suggested additional Standard ASTM 2321-20 is misplaced in the incorrect Section. The Standard addresses trenching, bedding and backfilling and as previously identified the IPC currently has Chapter 3 General Regulations, Sections 306.1 Support of piping, 306.2 Trenching and bedding, 306.2.1 Overexcavation, 306.2.2 Rock removal 306.2.3 Soft load-bearing materials- 306.3 Backfilling that all adequately cover trenching, bedding and backfill.

The term "thermoplastic" is not defined in the ASTM 2321-20, IPC or referenced in any piping material Tables. So, it is unclear when this Standard is to be referenced and exactly under what type of material application?

The referenced Standard ASTM 2321-20 is based on soil classification and backfill material combinations. It could be easily interpreted that a geotechnical engineer will need to be involved for any and all underground installations no matter how large or small the project.

The referenced Standard ASTM 2321-20 requires the minimum trench width "shall be not less than the greater of either the pipe outside diameter plus 16 inches or the pipe outside diameter times 1.25, plus 12 inches." This creates a tremendous hardship for a hand-digging installations and eliminates the use of a 12" backhoe bucket, both of which have been used successfully for as long as the codes have been in existence. There is simply no technical justification for this extremely over cumbersome requirement.

The referenced Standard ASTM 2321-20 appears to be much more appropriate for larger piping installations, but it never states exactly what size, and if approved it will apply to any and all underground installations both inside and outside the structure. ASTM D 2321-20

Section 7.5 even talks about tamping in place the “haunching” material which is the material that is placed on the from the trench bottom alongside the piping up to the springline. This is just one clear example that would indicate its applicability to larger piping systems.

This has the appearance of an overburdensome regulation that unfairly targets a specific piping material. This begs the question, why would these same trenching, bedding and backfill requirements NOT be applicable to all piping materials the same way the requirements of Chapter 3 currently address them? For past decades, the minimum trenching, bedding and backfill provisions have been “material neutral.” Now with no technical justification the rules will become tremendously more weighted towards one piping material industry.

Lastly, is the cost impact statement. This proposal will in fact increase the cost of construction. Not just through the issues raised throughout this reason statement but the cost of the ASTM 2321-20 Standard itself needs to be factored into the cost impact on all installers, code officials, designers and users of the code.

PMGCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 PMGCAC has held 33 virtual meetings open to any interested party. In addition, there were several virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the PMGCAC website at PMGCAC.

Cost Impact: No change to code.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Comment (CAH2)# 145

P99-24 Part II

IRC: P3002.1, P3002.2, ASTM Chapter 44 (New)

Proposed Change as Submitted

Proponents: James Richardson, City of Columbus (Ohio), City of Columbus (Ohio) (jarichardson@columbus.gov); Brian Conner, Charlotte Pipe and Foundry (bconner@charlottepipe.com)

2024 International Residential Code

Revise as follows:

P3002.1 Piping within buildings. Drain, waste and vent (DWV) piping in *buildings* shall be as indicated in Tables P3002.1(1) and P3002.1(2) except that galvanized wrought-iron or galvanized steel pipe shall not be used underground and shall be maintained not less than 6 inches (152 mm) above ground. Allowance shall be made for the thermal expansion and contraction of plastic piping. Thermoplastic pipe and fittings shall be installed in accordance with ASTM D 2321.

P3002.2 Building sewer. *Building sewer* piping shall be as indicated in Table P3002.2 Forced main sewer piping shall conform to one of the standards for ABS plastic pipe, copper or copper-alloy tubing, PVC plastic pipe or pressure-rated pipe indicated in Table P3002.2. Thermoplastic pipe and fittings shall be installed in accordance with ASTM D 2321.

Add new standard(s) as follows:

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box C700
West Conshohocken, PA 19428

D2321-20	Standard Practice for Underground Installation of Thermoplastic Pipe for Sewers and Other Gravity-Flow Applications

Reason: Every manufacturer of thermoplastic pipe has in their instruction a reference to the ASTM D 2321 standard for underground installations. The problem is that there is nothing in the code that also references this important standard except section 303.2. Inspectors do not necessarily have the time to read through every manufacturer's installation instructions during an inspection, however, if the installation standard was referenced in the code then the jurisdiction would be responsible for providing access to the standard for verification purposes.

Bibliography: See reason statement.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal will make it easier to ensure installation are in compliance with the manufacturer's requirements and should not technically have any impact on the cost of construction if the installers were following these requirements as they should have been.

P99-24 Part II

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The ASTM standard is not appropriate for the application. The cost impact states editorial but in reality, there is a

substantial cost impact. (10-0)

P99-24 Part II

Individual Consideration Agenda

Comment 1:

IRC: P3002.1, P3002.2, ASTM Chapter 44

Proponents: James Richardson, City of Columbus (Ohio), City of Columbus (Ohio) (jarichardson@columbus.gov) requests As Submitted

Reason: Every manufacturer of thermoplastic pipe has in their installation instructions a reference to the ASTM D 2321 standard for underground installations. The problem is that there is nothing in the code that also references this important standard except section 303.2. Inspectors do not necessarily have the time to read through every manufacturer's installation instructions during an inspection, however, if the installation standard was referenced in the code then the jurisdiction would be responsible for providing access to the standard for verification purposes.

Regardless of the comments made by some installers at CAH #1, just because you have been doing something for years does not mean you have been doing it correctly.

Additionally, the same proposal was accepted for the IPC at CAH #1.

Bibliography: See reason statement.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Comment (CAH2)# 403

P104-24 Part I

IPC: 714.3, 714.1

Proposed Change as Submitted

Proponents: James Richardson, City of Columbus (Ohio), City of Columbus (Ohio) (jarichardson@columbus.gov)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE PLUMBING CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-MP CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Plumbing Code

Revise as follows:

714.3 ~~Location~~ Installation. Backwater valves shall be installed so that *access* is provided to the working parts.

714.1 Sewage backflow. Where plumbing fixtures are installed on a floor with a finished floor elevation below the elevation of the manhole cover of the next upstream manhole in the public *sewer,* such fixtures shall be protected by a backwater valve installed in the *building drain*, or horizontal *branch* serving such fixtures. ~~Plumbing fixtures installed on a floor with a finished floor elevation above the elevation of the manhole cover of the next upstream manhole in the public *sewer* shall not discharge through a backwater valve.~~The backwater valve shall be of the normally open type.

~~**Exception:** In existing buildings, fixtures above the elevation of the manhole cover of the next upstream manhole in the public *sewer* shall not be prohibited from discharging through a backwater valve.~~**Exception:** Normally closed backwater valve installations for *existing buildings* shall not be prohibited.Normally closed backwater valves shall be provided with a venting method in accordance with one of the methods in Chapter 9 upstream of the backwater valve.

Reason: The title of the section was improper to begin with, "Location", the entire section was referencing installation requirements. The remainder of the proposal is focused on the fact that most floor drains are installed as part of a combination waste and vent system, however, since most backwater valves are manufactured as normally closed backwater valves, this interrupts the pathway for venting in a combination waste and vent system. Additionally, a normally closed backwater valve poses a resistance to flow until a certain amount of flow is present to force the valve open. This results in slowing the flow below the desired flow rate and impedes the ability of the waste flow to scour the pipe as it flows. A normally open backwater valve will avoid both of these associated complications from backwater valves. Additionally, allowing normally closed backwater valves to be installed to serve an entire existing building results in restricting the ability of the sewer systems to use building DWV system to assist in providing a venting pathway to atmosphere. This results in less pathways and increased positive and/or negative pressures within the sewer network and ultimately can negatively impact the DWV system of surrounding buildings.

Bibliography: See reason statement.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal doesn't create any additional requirements and should technically result in lower overall maintenance costs.

P104-24 Part I

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee disagrees with the removal of the sentence in Section714.1 because if a surcharge situation occurs then the surcharge will flood into the basement. (13-0)

P104-24 Part I

Individual Consideration Agenda

Comment 1:

IPC: 714.1

Proponents: James Richardson, City of Columbus (Ohio), City of Columbus (Ohio) (jarichardson@columbus.gov) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Plumbing Code

Revise as follows:

714.1 Sewage backflow. Where plumbing fixtures are installed on a floor with a finished floor elevation below the elevation of the manhole cover of the next upstream manhole in the public *sewer,* such fixtures shall be protected by a backwater valve installed in the *building drain*, or horizontal *branch* serving such fixtures. In existing buildings, fixtures above the elevation of the manhole cover of the next upstream manhole in the public *sewer* shall not be prohibited from discharging through a backwater valve. The backwater valve shall be of the normally open type.

Exception: Normally closed backwater valve installations for existing buildings shall not be prohibited. ~~Normally closed backwater valves shall be provided with a venting method in accordance with one of the methods in Chapter 9 upstream of the backwater valve.~~ Normally closed backwater valves shall be permitted provided that a venting method in accordance with Chapter 9 is used upstream of the backwater valve.

Reason: The title of the section was improper to begin with, "Location", the entire section was referencing installation requirements. The remainder of the proposal is focused on the fact that most floor drains are installed as part of a combination waste and vent system, however, since most backwater valves are manufactured as normally closed backwater valves, this interrupts the pathway for venting in a combination waste and vent system. Additionally, a normally closed backwater valve poses a resistance to flow until a certain amount of flow is present to force the valve open. This results in slowing the flow below the desired flow rate and impedes the ability of the waste flow to scour the pipe as it flows. A normally open backwater valve will avoid both of these associated complications from backwater valves. The exception for existing buildings has been moved into the body and exception that still allows for a normally closed backwater valve to be used is included in the exception portion.
These changes should address the concerns raised by the IPC Code Development Committee at CAH #1.

Bibliography: See reason statement.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal doesn't create any additional requirements, allows for additional products, and makes sure a proper venting method is provided where needed.

Comment (CAH2)# 406

P104-24 Part II

IRC: P3008.2

Proposed Change as Submitted

Proponents: James Richardson, City of Columbus (Ohio), City of Columbus (Ohio) (jarichardson@columbus.gov)

2024 International Residential Code

Revise as follows:

P3008.2 Allowable installations. Where plumbing fixtures are installed on a floor with a finished floor elevation above the elevation of the manhole cover of the next upstream manhole in the public sewer, ~~and~~ a backwater valve ~~is~~ shall be installed in the *building drain* or *horizontal branch* serving such fixtures. ~~, the~~ The backwater valve shall be of the normally open type.

Exception: Normally closed backwater valve installations for *existing buildings* shall not be prohibited. Normally closed backwater valves shall be provided with a venting method in accordance with one of the methods in Chapter 9 upstream of the backwater valve.

Reason: The title of the section was improper to begin with, "Location", the entire section was referencing installation requirements. The remainder of the proposal is focused on the fact that most floor drains are installed as part of a combination waste and vent system, however, since most backwater valves are manufactured as normally closed backwater valves, this interrupts the pathway for venting in a combination waste and vent system. Additionally, a normally closed backwater valve poses a resistance to flow until a certain amount of flow is present to force the valve open. This results in slowing the flow below the desired flow rate and impedes the ability of the waste flow to scour the pipe as it flows. A normally open backwater valve will avoid both of these associated complications from backwater valves. Additionally, allowing normally closed backwater valves to be installed to serve an entire existing building results in restricting the ability of the sewer systems to use building DWV system to assist in providing a venting pathway to atmosphere. This results in less pathways and increased positive and/or negative pressures within the sewer network and ultimately can negatively impact the DWV system of surrounding buildings.

Bibliography: See reason statement.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal doesn't create any additional requirements and should technically result in lower overall maintenance costs.

P104-24 Part II

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: Proposal removes a viable option from the code. Would cause every horizontal branch to have a backwater valve. Cost impact would be significant. (10-0)

P104-24 Part II

Individual Consideration Agenda

Comment 1:

IRC: P3008.2

Proponents: James Richardson, City of Columbus (Ohio), City of Columbus (Ohio) (jarichardson@columbus.gov) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Residential Code

Revise as follows:

P3008.2 Allowable installations. Where plumbing fixtures are installed on a floor with a finished floor elevation ~~above~~ below the elevation of the manhole cover of the next upstream manhole in the public *sewer,* a backwater valve shall be installed in the *building drain*, or horizontal *branch* serving such fixtures. In existing buildings, fixtures above the elevation of the manhole cover of the next upstream manhole in the public *sewer* shall not be prohibited from discharging through a backwater valve. The backwater valve shall be of the normally open type.

Exception: Normally closed backwater valve installations for *existing buildings* shall not be prohibited.Normally closed backwater valves shall be permitted provided ~~with~~ that a venting method in accordance with one of the methods in Chapter 9 is used upstream of the backwater valve.

Reason: Though the code section does already require the preferrable method for providing backflow protection, normally open valves, the exception does not address the need to provide a normally closed backwater valve with a venting method upstream of the valve. Additionally, the portion dealing with existing buildings should be moved to the body and reserve the exception for allowing the use of normally closed backwater valves as long as a venting method is provided upstream as previously stated.

An additional small change was added to harmonize this text with the text in the IPC. In the first sentence the word above was changed to below in relation to the next upstream manhole as that was the intent all along.

Bibliography: See reason statement.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal doesn't create any additional requirements, it actually allows for additional products to be used as long as proper venting is provided upstream of the backwater valve.

Comment (CAH2)# 405

P105-24

IPC: 715.2, CSA Chapter 15 (New)

Proposed Change as Submitted

Proponents: Abraham MURRA, Abraham Murra Consulting, Jets Vacuum AS, Norway

2024 International Plumbing Code

Revise as follows:

715.2 System design. Vacuum drainage systems shall be designed in accordance with the vacuum drainage system manufacturer's instructions. The system layout, including piping layout, tank assemblies, vacuum pump assembly and other components necessary for proper function of the system shall be in accordance with CSA B45.13/IAPMO Z1700 and with the manufacturer's instructions. Plans, specifications and other data for such systems shall be submitted to the code official for review and approval prior to installation.

Add new standard(s) as follows:

CSA

CSA Group
8501 East Pleasant Valley Road
Cleveland, OH 44131-5516

CSA B45.13:19/IAPMO Z1700-2019	Vacuum waste-collection systems

Reason: Adding a reference to CSA B45.13/IAPMO Z1700 —a consensus standard that specifies requirements for materials, construction, performance testing, and markings— in the system design section of the IPC will standardize vacuum waste-collection systems. Mandating that such systems comply only with the manufacturer's instructions allows installation of substandard systems that do not benefit users or regulators.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Adding CSA B45.13/IAPMO Z1700 as a referenced standard to the IPC should not have a cost impact as major manufacturers of vacuum waste-collection systems are already listed to the standard.

P105-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The standard doesn't address all the items listed in the sentence. The proposal needs reworded to correct. (12-2)

P105-24

Individual Consideration Agenda

Comment 1:

IPC: 715.2

Proponents: Abraham MURRA, Abraham Murra Consulting, Abraham Murra Consulting requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Plumbing Code

715.2 System design. Vacuum drainage systems shall be designed in accordance with the vacuum drainage system manufacturer's instructions and shall comply with CSA B45.13/IAPMO Z1700. The system layout, including piping layout, tank assemblies, vacuum pump assembly and other components necessary for proper function of the system shall be in accordance with ~~CSA B45.13/IAPMO Z1700 and with~~ the manufacturer's instructions. Plans, specifications and other data for such systems shall be submitted to the code official for review and approval prior to installation.

Reason:
The comment on proposal P105-24 addresses the concern expressed by the IPC Committee by mandating compliance with CSA B45.13/IAPMO Z1700 in accordance with the scope of the standard.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Adding CSA B45.13/IAPMO Z1700 as a referenced standard to the IPC does not have a cost impact as major manufacturers of vacuum systems are listed to the standard.

Comment (CAH2)# 226

P106-24

IPC: 717.1, ASSE Chapter 15 (New)

Proposed Change as Submitted

Proponents: Sidney Lee Cavanaugh, Cavanaugh Consulting, WRT (sidneycavanaugh@yahoo.com)

2024 International Plumbing Code

Revise as follows:

717.1 General. This section shall govern the relining of existing *building sewers* and building drainage piping. Required Inspections shall be conducted by a ANSI/ASSE/IAPMO Series 28000 qualified inspector.

Add new standard(s) as follows:

ASSE

ASSE International
18927 Hickory Creek Drive, Suite 220
Mokena, IL 60448

ANSI/ASSE/IAPMO Series 28000-Standard 28001-xx	Professional Qualifications Standard for Inspectors of CIPP (Cured-in-Place-Pipe) Rehabilitation of Building Sewer and Drain, Waste and Vent Piping Systems (DRAFT)

Reason: The new ANSI/ASSE/IAPMO Series 2800 standard assures that the inspector and inspection of piping using CIPP is done appropriately. Unfortunately, many inspectors are not knowledgeable concerning CIPP rehabilitation, and the necessary requirements demanded for proper installation and inspection. This requirement is necessary and needed in the code.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Proper inspection is not only a cost built into the code but necessary to protect it's users ultimate health and safety.

P106-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The standard is not posted so we don't know what the qualifications for the inspectors will be. Everything is too vague yet. A better place for this requirement would be in Section 717.9. The proposal states that there is no cost impact but clearly there is. (14-0)

P106-24

Individual Consideration Agenda

Comment 1:

Proponents: Sidney Lee Cavanaugh, Cavanaugh Consulting, WRT (sidneycavanaugh@yahoo.com) requests As Submitted

Reason: The Committee denied the code change because of the standard still being under development. It is now completed and should be added to the code to assure that the inspector and the inspection of piping using CIPP is done appropriately.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Comment (CAH2)# 411

P107-24

IPC: 717.1

Proposed Change as Submitted

Proponents: Sidney Lee Cavanaugh, Cavanaugh Consulting, WRT (sidneycavanaugh@yahoo.com)

2024 International Plumbing Code

Revise as follows:

717.1 General. This section shall govern the relining of existing *building sewers* and building drainage system piping.

Reason: The title and scope of both Secton 717 and 718 are for Building sewers and Building drains. Building drains can include sanitary and storm water. A more inclusive and proper scope for both 717 and 718 would be to use Drainage System piping instead of drainage piping which are both defined in Section 3 of the code. This would eliminate confusion and recognize all piping covered under the requirements of these Sections.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Just as my reason states: This code change simply clarifies current requirements in the code and would add no additional cost to installation and technology currently used in Section 717.

P107-24

Public Hearing Results (CAH1)

Committee Action: **As Submitted**

Committee Reason: The additional word captures all that needs to be included. (13-1)

P107-24

Individual Consideration Agenda

Comment 1:

IPC: 717.1

Proponents: Joanne Carroll, Subtegic Group Inc, Subtegic Group Inc (jcarroll@subtegic.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Plumbing Code

717.1 General. This section shall govern the relining and rehabilitation of existing *building sewers* and building drainage system piping.

Reason: Editorial change for clarity and alignment with reference standards for cured-in-place pipe (CIPP) from Section 718 which is proposed and approved (CAH#1) to be moved to Section 717. The change is to add the term "rehabilitation" as CIPP is used to rehabilitate existing pipelines, and this is the term that is used within existing, new and proposed reference standards. Whereas, the term "relining" is not used in these standards. Confusion will be reduced by adding this term in the Section 717.1 General.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The modification to this proposal simply edit the terminology slightly to better conform to industry and reference standards. The requirements are not changed by this modification.

Comment (CAH2)# 733

P108-24

IPC: 717.2

Proposed Change as Submitted

Proponents: Luther Grant Whittle, Nu Flow Technologies, "self" (gwhittle@nuflow.com)

2024 International Plumbing Code

Revise as follows:

717.2 Applicability. The relining of existing *building sewers* and building drainage piping shall be limited to gravity drainage piping 2"~~4~~ inches (~~102~~50 mm) in diameter and larger. The relined piping shall be of the same nominal size as the existing piping.

Reason: CIPP in building drains is routinely used in sizes down to 2". The scope of ASTM F1216-22 governs the usage of CIPP down to 2".

Documentation is provided that shows the ability to routinely preserve flow capacity while increasing scouring velocities in sizes down to 2", with typical CIPP thicknesses. It is recognized that the DFU design capacity requires preservation. The nominal pipe size is not altered.

The provided flow analysis chart does not take into consideration the inherent conservatism of DFU design being based upon data from cast iron pipe collected in the 1930s. As far as actually maintaining the original design DFUs, all CIPP relined pipes should be compared to iron pipe flows as the basis of their original DFU design capacity. What is apparent, is that CIPP does not negatively alter nominal sizing nor DFU capacity at typical installed thicknesses. Scouring velocity also greatly improves, further helping to correct for minor flow issues in the existing piping.

Bibliography: ASTM F1216-22 Scope

"1.1 This practice describes the procedures for the reconstruction of pipelines and conduits (**2 in.** to 108 in. diameter) by the installation of a resin-impregnated, flexible tube which is inverted into the existing conduit by use of a hydrostatic head or air pressure."

NuFlow Flow Analysis Chart to be attached.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal merely expands the applicable size range down to 2" with the same comparative cost impacts as are typical of relining / rehabilitation for repair or replacement with Cured-in-Place Pipe (CIPP) versus exhume and replace with other piping materials, as already otherwise approved for use within Sections 717 and 718 of the Code.

This proposal to expand the size range down to 2" creates no significant cost impact alteration as compared to the considerations behind the existing code inclusion of CIPP.

Attached Files

- **TECH BRIEF - NuDrain Flow Analysis - 20201117 Rev Lvl 1.1.pdf**
  https://www.cdpaccess.com/proposal/10434/30667/files/download/4388/

P108-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The current code does not have ASTM F1216 so it would be premature to approve this proposal based on information from a standard that is not yet part of the code.. (13-1)

P108-24

Individual Consideration Agenda

Comment 1:

IPC: 717.2

Proponents: Joanne Carroll, Subtegic Group Inc, Subtegic Group Inc (jcarroll@subtegic.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Plumbing Code

Revise as follows:

717.2 Applicability. The relining of existing *building sewers* and building drainage system piping shall be limited to gravity drainage piping 3~~2"~~ inches (~~50~~80 mm) in diameter and larger. The relined piping shall be of the same nominal size as the existing piping.

Reason:

This proposal was denied by CAH1 due to ASTM F1216 not yet being a part of the code. Therefore, a change in the reasoning was made to a current reference standard ASTM F2561 which includes piping down to 3 inch diameter. CIPP is routinely used to rehabilitate building drainage system piping in sizes down to 3 inch diameter.

Bibliography: ASTM F2561 - Standard Practice for Rehabilitation of a Sewer Service Lateral and Its Connection to the Main Using a One Piece Main and Lateral Cured-in-Place Liner

*1. Scope**
1.1 This practice covers requirements and test methods for the reconstruction of a sewer service lateral pipe having an inner diameter of 3 to 12 in. (7.6 to 30.5 cm) and its connection to the main pipe having an inner diameter of 6 to 24 in. (15.2 to 61.0 cm) and up the lateral a maximum of 150 ft (46 m) without excavation.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The modifications to this proposal expand the diameter of existing piping in which CIPP may be used in accordance with referenced standards.

Comment (CAH2)# 748

P110-24

IPC: 717.5

Proposed Change as Submitted

Proponents: Luther Grant Whittle, Nu Flow Technologies, "self" (gwhittle@nuflow.com)

2024 International Plumbing Code

Revise as follows:

717.5 Prohibited applications. Where review of the preinstallation recorded video camera survey reveals that piping systems are not installed correctly or defects exist, that will not be corrected by relining, then relining shall not be permitted without correction of such defects prior to cured-in place-pipe relining. ~~The defective portions of piping shall be exposed and repaired with pipe and fittings in accordance with this code. Defects include, but are not limited to, backgrade or insufficient slope, complete pipe wall deterioration or complete separations such as from tree root invasion or improper support.~~

Reason: The deleted language is erroneous regarding the capabilities and limitations of CIPP and confusingly complicated. The revised opening language more appropriately covers the guidance required by AHJs to make informed decisions on when to prohibit the use of CIPP.

There seems to be the erroneous assumption that CIPP is only ever a "repair" option and not capable of being a "replacement" option. The industry consensus standards and their design equations (as found in the design appendix of ASTM F1216) provide for the use of CIPP as a structural replacement as well as a performance repair system.

The installation of CIPP as a "repair" in conjunction with the preparation of the existing pipe for relining can readily correct defects such as flow disruption by scaling or tuberculation (which can be mistaken for backgrade or insufficient slope) prior to cleaning. Although CIPP cannot correct significant line and grade issues, the improved flow characteristics (including the increased scouring velocity) frequently rectifies any sedimentation issues associated with minor bellies in piping. Properly designed in compliance with the IPC, CIPP does NOT reduce the nominal sizing, the original design flow capacity, or the original design DFU count.

CIPP can also reliably eliminate leakage and root penetration from failed joint seals and even function as "replacement" piping for missing sections of buried piping. CIPP can structurally "replace" pipe sections with "channel rot" and can also structurally "replace" pipes with missing pipe sections; there are also reliable methods to fill voids around the pipe wall while restoring the proper flow line for code compliance. Soil voiding in such smaller diameter CIPP applications is expected to fully reconsolidate within 2 to 3 years to restore proper soil support, with the CIPP structurally spanning the void in the interim.

Where existing pipe defects are capable of being corrected through pipe "replacement" with CIPP, there should be no reason to disallow a reviewed permit installation of certified and listed CIPP systems by a responsible, licensed contractor. The 2024 code language is unnecessarily restrictive.

Bibliography: The ASTM F1216 design appendix provides an industry consensus design approach for use of CIPP as a structural replacement for piping.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The clarifications are in regard to proper applicability for use as either "repair" or "replacement."

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: There is a lot of work to do in this grouping of proposals [P109-P112]. Fixing defects in pipe is something that you are going to do any way, There needs to be more clarification. The proposal is removing reasons for the code official to not allow the work to take place. The proposal is making the situation worse instead of better. (14-0)

P110-24

Individual Consideration Agenda

Comment 1:

IPC: 717.5

Proponents: Joanne Carroll, Subtegic Group Inc, Subtegic Group Inc (jcarroll@subtegic.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Plumbing Code

Revise as follows:

717.5 Prohibited applications. Where review of the preinstallation recorded video camera survey reveals that piping systems are not installed correctly, obstructions have not been removed, or defects exist that prevent proper installation of the rehabilitation system, ~~that will not be corrected by relining, then~~ relining shall not be permitted until corrected or removed in accordance with this code.~~without correction of such defects prior to cured-in-place pipe relining.~~ Defects and obstructions include, but are not limited to, complete pipe wall deterioration or complete separations such as from tree root invasion or improper support, collapsed or crushed pipe, and reductions in the cross-sectional area of more than 20% of the inside pipe diameter.

Reason: This proposal was denied by CAH1 citing the need for more clarification. The changes are made to align the code to reference and industry standards providing additional clarity with the addition of CIPP to section 717.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The modifications to this proposal provide additional information which through added clarity can prevent improper installations which could impact cost where removal or excavation of improper relining applications may be required.

Comment (CAH2)# 752

P111-24

IPC: 717.6, ASTM Chapter 15 (New)

Proposed Change as Submitted

Proponents: Luther Grant Whittle, Nu Flow Technologies, "self" (gwhittle@nuflow.com)

2024 International Plumbing Code

Revise as follows:

717.6 Relining materials. The relining materials shall be manufactured in compliance with applicable standards and certified as required in Section 303. Cured-in-place-pipe reline materials shall comply with ASTM F1216, ASTM F1743, ASTM F2561, ASTM F2599 or ASTM F3541. Fold-and-form pipe reline materials shall be manufactured in compliance with ASTM F1504 or ASTM F1871.

Add new standard(s) as follows:

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box C700
West Conshohocken, PA 19428-2959

F1216-22	Standard Practice for Rehabilitation of Existing Pipelines and Conduits by the Inversion and Curing of a Resin-Impregnated Tube
F1743-22	Standard Practice for Rehabilitation of Existing Pipelines and Conduits by Pulled-in-Place Installation of Cured-in-Place Thermosetting Resin Pipe (CIPP)
F2599-22	Standard Practice for Sectional Repair of Damaged Pipe By Means of an Inverted Cured-In-Place Liner
F3541-22	Standard Practice for Sectional Repair of Existing Gravity Flow, Non-Pressure Pipelines and Conduits by Pushed or Pulled-In-Place Installation of Cured-In-Place Thermosetting Resin Pipe (CIPP)

Reason: The scope of Section 717 with its detailed guidance is clearly intended to include usage with Cured-in-Place Pipe (CIPP) reline materials. The Fold & Form PVC reline materials standards (ASTM F1871 & ASTM F1504) have never had a product certified and listed by ICC-ES and have exceptionally minimal usage in Building Sewer applications only.

This section needs to include the ASTM standards to which ICC-ES is actively certifying and listing CIPP systems to provide more thorough guidance to AHJs; currently, products are certified and listed to ASTM F1216-22 (with ICC required mandatory language) for inversion and ASTM F1743-22 (expected mandatory language revision in 2024 -- currently balloting) for pull-in-place CIPP.

We also propose that the recently passed standard of ASTM F3541-22 be included within this section. ASTM F3541 is for segmental relining by CIPP and closely reflects the actual installation practices utilized within Building Sewer and Building Drain applications. ASTM F3541 includes by reference the same performance property requirements of ASTM F1743 to which ICC-ES currently certifies CIPP systems.

We are also recommending the inclusion of ASTM F2599 (segmental CIPP lining by inversion with patented gaskets) and ASTM F2561 (utility sewer lateral to utility main connection CIPP lining with patented gaskets) that are currently included in the otherwise redundant (same title scope) Section 718. Note that no CIPP systems has ever been certified and listed for use to these standards. Any products applicable to ASTM F2599 or ASTM F2561 will also comply with the same performance property requirements of ASTM F1216 to which ICC-ES already certifies CIPP systems. As such, the inclusion of these proprietary standards is a bit redundant.

Bibliography: F1216-22 Standard Practice for Rehabilitation of Existing Pipelines and Conduits by the Inversion and Curing of a Resin-Impregnated Tube

ASTM F1743-24 (expected) [F1743-22] Standard Practice for Rehabilitation of Existing Pipelines and Conduits by Pulled-in-Place Installation of Cured-in-Place Thermosetting Resin Pipe (CIPP)

ASTM F2561-20 Standard Practice for Rehabilitation of a Sewer Service Lateral and Its Connection to the Main Using a One Piece Main and Lateral Cured-in-Place Liner

ASTM F2599-22 Standard Practice for Sectional Repair of Damaged Pipe By Means of an Inverted Cured-In-Place Liner

ASTM F3541-22 Standard Practice for Sectional Repair of Existing Gravity Flow, Non-Pressure Pipelines and Conduits by Pushed or Pulled-In-Place Installation of Cured-In-Place Thermosetting Resin Pipe (CIPP)

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposal only requests referencing standards of materials already otherwise governed by this Code section (thereby is editorial in nature or a clarification), and as such there is no new cost impact.

The addition of existing and newly referenced standards into Section 717 provides no significant cost impact alteration as compared to the existing costs impacts behind the existing code inclusion.

For those interested, we will further expound upon the comparative cost impacts between relining / rehabilitation with Cured-in-Place Pipe (CIPP) versus exhumation and replacement with other piping materials.

The unit costs of CIPP "materials" are typically about the same as other code approved piping alternatives. But depending upon the project scope and site conditions, the unit costs of CIPP "as constructed" are HIGHLY variable as compared to the alternative of exhuming existing piping and replacing with other code approved piping alternatives (refer to the attached project cost analysis documentation).

CIPP "project costs" are significantly driven by the site conditions (and the ancillary "costs" of facility operational disruption tend to also weigh into choosing relining / rehabilitation versus exhumation & replacement) rather than the piping materials cost differences. Hence, a more direct cost comparison to other piping materials' costs is not truly relevant or particularly useful.

So, we will explore how site conditions and operational disruptions create relevant "cost impacts" deserving of thoughtful consideration.

SITE CONDITIONS: Where surface structure restoration costs are exceptionally high, avoidance of such site restoration costs through the remote installation of CIPP (with limited site disruption) can provide significant project cost savings as compared to exhuming the existing piping and replacing with alternative code approved piping materials. The "ancillary" surface structure restoration costs associated with piping exhumation, removal, and replacement is frequently the primary driver of project cost differentials.

Exhumation and replacement can often negatively impact load bearing components of a structure resulting in exceptionally high restoration costs that can be avoided by pipe relining / rehabilitation with CIPP.

Relining / rehabilitation with CIPP can also greatly reduce site safety risks associated with exhumation and prospectively confined space entry. Exhumation and replacement can have environmental and health impacts such as disruption of encapsulated asbestos, lead paint or other hazardous materials, requiring high remediation and disposal costs, as well as subjecting workers and facility occupants to unnecessary risks. Relining / rehabilitation with CIPP can be leveraged to avoid such risks and costs.

Where surface structure restoration and/or remediation costs and risks are high, the higher materials, specialty labor, and equipment costs associated with CIPP installation are generally absorbed and frequently exceeded, resulting in the potential for significant cost savings with CIPP.

OPERATIONAL DISRUPTION & BROADER SOCIAL COSTS: In addition to direct construction costs and risks, the indirect costs and risks of operational disruption often weigh into any project "cost" comparison between a relining / rehabilitation installation with CIPP versus exhumation and replacement with other piping materials.

With facilities such as hospitals, jails, court houses, schools, etc. (even the Pentagon & White House on multiple occasions), the "social costs" of operational disruption from exhumation and replacement are frequently deemed to be entirely unacceptable. Relining / rehabilitation with CIPP can reduce the "social costs" to a more acceptable level.

Schools with emergency piping issues do not have the facility capacity and cannot afford the “social costs” to the community that would be caused by unscheduled shutting down of classrooms for extensive exhumation and replacement of piping during the school year. Jails and other government facilities often have security and operational concerns that are alleviated through remote pipe relining / rehabilitation with CIPP versus direct secure zone entry and disruption that is required for exhumation and replacement.

Staff Analysis: A review of the standards proposed for inclusion in the code, ASTM F1216-22 *Standard Practice for Rehabilitation of Existing Pipelines and Conduits by the Inversion and Curing of a Resin-Impregnated Tube*, ASTM F1743-22 *Standard Practice for Rehabilitation of Existing Pipelines and Conduits by Pulled-in-Place Installation of Cured-in-Place Thermosetting Resin Pipe (CIPP)* and ASTM F2599-22 *Standard Practice for Sectional Repair of Damaged Pipe By Means of an Inverted Cured-In-Place Liner1,* ASTM F3541-22 *Standard Practice for Sectional Repair of Existing Gravity Flow, Non-Pressure Pipelines and Conduits by Pushed or Pulled-In-Place Installation of Cured-In-Place Thermosetting Resin Pipe (CIPP)1,* with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

The proposed standard ASTM F2561 is in the current edition of the code.

P111-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The standard is not written in enforceable language. (11-3)

P111-24

Individual Consideration Agenda

Comment 1:

IPC: 717.6

Proponents: Joanne Carroll, Subtegic Group Inc, Subtegic Group Inc (jcarroll@subtegic.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Plumbing Code

717.6 Relining materials. The relining materials shall be manufactured in compliance with applicable standards and certified as

required in Section 303. Cured-in-place-pipe (CIPP) ~~reline~~ materials shall be in accordance ~~comply~~ with ASTM F1216, ASTM F1743, ASTM F2561, ASTM F2599 or ASTM F3541. Hydrophilic rings or gaskets in CIPP rehabililtation shall be in accordance with ASTM F3240.Fold-and-form pipe reline materials shall be manufactured in compliance with ASTM F1504 or ASTM F1871.

Reason: This proposal was denied by CAH1 citing the standard is not written in enforceable language. The revised versions of ASTM F1216 and ASTM F1743 are anticipated to be approved by the date of the CAH#2. The addition of cured-in-place pipe materials to this section are made to define these materials within Section 717 given the approval during CAH#1 to move Section 718 to 717.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The modifications to this proposal simply move existing code from Section 718 to Section 717 and add industry standards. The requirements are not changed by this modification.

Comment (CAH2)# 755

P113-24

IPC: 717.6, 717.7 (New), 717.8 (New), ASTM Chapter 15 (New)

Proposed Change as Submitted

Proponents: Sidney Lee Cavanaugh, Cavanaugh Consulting, WRT (sidneycavanaugh@yahoo.com)

2024 International Plumbing Code

Revise as follows:

717.6 Relining materials. The relining materials shall be manufactured in compliance with applicable standards and certified as required in Section 303.~~Fold-and-form pipe reline materials shall be manufactured in compliance with ASTM F1504 or ASTM F1871.~~

Add new text as follows:

717.7 Fold in form. Sectional repair using fold-and-form pipe reline materials shall be manufactured in compliance with ASTM F1504 or ASTM F1871.

717.8 Cured-in-Place-Pipe. Sectional repair using push or pull in place cure-in-place pipe (CIPP) shall be in compliance with ASTM F3541 using gaskets in accordance with ASTM F3240 to ensure water tightness and elimination of ground water penetration. Sectional repair using inversion cure-in-place pipe (CIPP)shall be in compliance with ASTMF1216 or ASTM F2599 using gaskets in accordance with ASTM F3240 to ensure water tightness and elimination of ground water penetration. Main and lateral cured-in-place rehabilitation of building sewer and sewer service lateral pipe and their connections to the main sewer pipe shall be in accordance with ASTM F2561 using gaskets in accordance with ASTM F3240 to ensure water tightness and elimination of ground water penetration.

Add new standard(s) as follows:

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box C700
West Conshohocken, PA 19428-2959

F1216-22	Standard Practice for Rehabilitation of Existing Pipelines and Conduits by the Inversion and Curing of a Resin-Impregnated Tube
F3541-22	Standard Practice for Sectional Repair of Existing Gravity Fow, Non-Pressure Pipelines and Conduits by Pushed or Pulled-in-Place Installation of Cured-In-Place Thermosetting Resin Pipe (CIPP)

Reason: ASTM F3541 is the preferred method of rehabilitation using CIPP technology inside the building parameter and ASTM F1216 is referenced for requirements in all other CIPP standards in Section 718. adding more clarification regarding Hydrophilic gaskets and rings is consistent with the requirements in Section 718 currently and is an health and safety issue.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

there is no material cost added to this code as the standards referenced are currently referenced in the code and the standards reference each other in most cases such as ASTM F1216 and ASTM F3541. ASTM F3240, and the required use of hydrophilic gaskets, is in Section 718 where the minimal cost is already recognized by the code.

Staff Analysis: A review of the standard proposed for inclusion in the code, ASTM F1216-22 *Standard Practice for Rehabilitation of Existing Pipelines and Conduits by the Inversion and Curing of a Resin-Impregnated Tube1,2* and ASTM F3541-22 *Standard Practice for Sectional Repair of Existing Gravity Flow, Non-Pressure Pipelines and Conduits by Pushed or Pulled-In-Place Installation of Cured-In-Place Thermosetting Resin Pipe (CIPP)1,* with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The words about 'fold and form' method need to be eliminated. (11-3)

P113-24

Individual Consideration Agenda

Comment 1:

IPC: 717.8

Proponents: Sidney Lee Cavanaugh, Cavanaugh Consulting, WRT (sidneycavanaugh@yahoo.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Plumbing Code

717.8 Cured-in-Place-Pipe. Sectional repair using push or pull in place cure-in-place pipe (CIPP) shall be in compliance with ASTM F3541 using gaskets in accordance with ASTM F3240 ~~to ensure water tightness and elimination of ground water penetration~~. Sectional repair using inversion cure-in-place pipe (CIPP)shall be in compliance with ASTMF1216 or ASTM F2599 using gaskets in accordance with ASTM F3240 ~~to ensure water tightness and elimination of ground water penetration~~. Main and lateral cured-in-place rehabilitation of building sewer and sewer service lateral pipe and their connections to the main sewer pipe shall be in accordance with ASTM F2561 using gaskets in accordance with ASTM F3240 ~~to ensure water tightness and elimination of ground water penetration~~.

Reason: We would like to see the Committee accept this item with modifications. Those modifications would be to delete the wording "to ensure water tightness and elimination of ground eater penetration" after each mention of F3240. This action would be consistent with the Committee action on P 114.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The reason is the same as for the original submittal.

Comment (CAH2)# 580

P115-24

IPC: 717.10 (New), 717.10

Proposed Change as Submitted

Proponents: Sidney Lee Cavanaugh, Cavanaugh Consulting, WRT (sidneycavanaugh@yahoo.com)

2024 International Plumbing Code

Add new text as follows:

717.10 Pressure Testing. The rehabilitated piping system shall be tested in accordance with Section 312.

Revise as follows:

~~**717.10**~~ **717.11 Approval.** Upon verification of compliance with the requirements of Sections 717.1 through ~~717.9~~ 717.10, the code official shall approve the installation.

Reason: All sanitary drainage systems must be pressure tested in accordance with Section 312 as is noted in Section 701.6 and 716.8 in Chapter 7. It also needs to be clarified in Section 717 and 718 that this is necessary.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Pressure testing is required in multiple Sections of the code currently and the cost allowance is already recognized.

P115-24

Public Hearing Results (CAH1)

Committee Action: **As Submitted**

Committee Reason: The code needs to be clarified that pressure testing needs to be performed on relined piping. The presence of Section 312 is not sufficient. (11-3)

P115-24

Individual Consideration Agenda

Comment 1:

IPC: 717.10

Proponents: Joanne Carroll, Subtegic Group Inc, Subtegic Group Inc (jcarroll@subtegic.com) requests As Modified by Committee (AMC2)

Further modify as follows:

2024 International Plumbing Code

Revise as follows:

717.10 Tests ~~Pressure Testing~~. ~~Upon verification of compliance with the requirements of Sections 717.1 through 717.9, the code official shall approve the installation.~~The rehabilitated piping system shall be tested in accordance with Section 312.

Reason: Editorial for consistency with the code. "312 Tests and Inspections." " 701.6 Tests." "pressure testing" is not used.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The modifications to this proposal are editorial. The requirements are not changed by this modification.

Comment (CAH2)# 758

P116-24

IPC: SECTION 202 (New), 718.1, ASTM Chapter 15 (New)

Proposed Change as Submitted

Proponents: Joanne Carroll, Subtegic Group Inc., Subtegic Group Inc (jcarroll@subtegic.com)

2024 International Plumbing Code

Add new definition as follows:

CURED-IN-PLACE PIPE (CIPP). A system consisting of a flexible textile tube saturated with a thermosetting resin used to rehabilitate existing pipe in-place by insertion and cure within an existing pipe.

Revise as follows:

718.1 Cured-in-place pipe (CIPP). The cured-in-place pipe (CIPP) materials shall be manufactured in compliance with applicable standards and certified as required in Section 303. ~~Sectional cure-in-place~~ CIPP rehabilitation of building drain and *building sewer* piping ~~and *sewer* service lateral piping~~ shall be installed in accordance with ASTM F1216, ASTM F3541, or F2599. ~~Main and lateral cure-in-place~~ CIPP rehabilitation of a *building sewer* ~~and *sewer* service lateral pipe~~ and ~~their~~ its connection~~s~~ to the main *sewer* pipe shall be installed in accordance with ASTM F2561. Seamless molded ~~H~~ hydrophilic ~~rings or~~ gaskets in ~~cure-in-place~~ CIPP rehabilitation of ~~*building sewer* piping and *sewer* service~~ lateral~~s~~ pipelines shall be installed in accordance with ASTM F3240 ~~to ensure water tightness and elimination of ground water penetration~~.

Add new standard(s) as follows:

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box C700
West Conshohocken, PA 19428-2959

F1216 - 2022	Standard Practice for Rehabilitation of Existing Pipelines and Conduits by the Inversion and Curing of a Resin-Impregnated Tube
F3541 - 2022	Standard Practice for Sectional Repair of Existing Gravity Flow, Non-Pressure Pipelines and Conduits by Pushed or Pulled-In-Place Installation of Cured-In-Place Thermosetting Resin Pipe (CIPP)

Reason: As is the case with all plumbing-related pipe, materials, fittings and fixtures, in order to ensure quality and appropriateness for the intended use, CIPP lining materials must be manufactured in accordance with an industry standard.

The addition of CIPP installation standards ASTM F1216 and ASTM F3541 cover the requirements for the installation of CIPP when using the inversion or pushed or pulled-in place installation methods.

Reference to ASTM F2561 is made to clearly describe the scope of F2561 as appropriate for the reference to installation of CIPP for the rehabilitation of a building sewer and its connection to the main. Reference to ASTM F3240 is clarified to the scope of ASTM F3240 that is specific to covering the requirements for the installation of seamless molded hydrophilic gaskets in the CIPP rehabilitation of main and lateral pipelines.

Bibliography: Scope from ASTM F2561 - "*1.1 This practice covers requirements and test methods for the reconstruction of a sewer service lateral pipe having an inner diameter of 3 to 12 in. (7.6 to 30.5 cm) and its connection to the main pipe having an inner diameter of 6 to 24 in. (15.2 to 61.0 cm) and up the lateral a maximum of 150 ft (46 m) without excavation."*

Scope from ASTM F3240 - *"1.1 This practice covers the requirements for the installation of seamless molded hydrophilic gaskets (SMHG) in cured-inplace pipe (CIPP) rehabilitation of main and lateral pipelines."*

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The change proposal adds industry standards and provides clarity for the application of CIPP already included in the code.

P116-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: ASTM F1216 has unenforceable language. (12-2)

P116-24

Individual Consideration Agenda

Comment 1:

IPC: SECTION 202, 718.1

Proponents: Joanne Carroll, Subtegic Group Inc, Subtegic Group Inc (jcarroll@subtegic.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Plumbing Code

Delete without substitution:

~~**CURED-IN-PLACE PIPE (CIPP).** A system consisting of a flexible textile tube saturated with a thermosetting resin used to rehabilitate existing pipe in place by insertion and cure within an existing pipe.~~

Revise as follows:

718.1 Cured-in-place pipe (CIPP). The cured-in-place pipe (CIPP) materials shall be manufactured in compliance with applicable standards and certified as required in Section 303. CIPP rehabilitation of building drainage system piping and *building* ~~*sewer*~~ *sewers* ~~piping~~ shall be installed in accordance with ASTM F1216, ASTM F3541, or ASTM F2599. CIPP rehabilitation of a *building sewer* and its connection to the main *sewer* pipe shall be installed in accordance with ASTM F2561. ~~Seamless molded hydrophilic~~ Hydrophilic rings or gaskets in CIPP rehabilitation of building sewer piping ~~lateral pipelines~~ shall be installed in accordance with ASTM F3240.

Reason: This proposal was denied by CAH1 citing the standard is not written in enforceable language. Since this is a new standard proposed for inclusion in the code and submitted in the proposal in at least a consensus draft form in accordance with Section 4.4 of CP28, changes have been made to the listed Sections in ASTM F1216 following the ANSI development process and anticipated to be completed and readily available prior to the Public Comment Hearing in accordance with Section 4.6.3.1.1.

ASTM F1216 is the oldest and foremost industry referenced standard for cured-in-place pipe. Compliance to ASTM F1216 is required in all of the existing referenced standards in the 2024 IPC - ASTM F2599, ASTM F2561 and ASTM F3240. Because cured-in-place pipe materials are produced by a variety of individual manufacturers, the addition of ASTM F1216 provides critical product material and installation instructions necessary for the installed product to work properly that is not included within the existing referenced standards.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The modifications to this proposal provide alternatives for the installation of CIPP in accordance with recognized industry standards.

Comment (CAH2)# 765

P117-24 Part I

IPC: 718.1, ASTM Chapter 15 (New)

Proposed Change as Submitted

Proponents: Kevin Duerr-Clark, NYS DOS, NYS DOS (kevin.duerr-clark@dos.ny.gov); Jeanne Rice, NYSDOS (jeanne.rice@dos.ny.gov); China Clarke, New York State Dept of State, Manager Technical Support Unit (china.clarke@dos.ny.gov); Chad Sievers, NYS, NYS DOS (chad.sievers@dos.ny.gov); John R Addario - NYS Department of State, NEW YORK STATE CODES DIVISION, New York State Department of State Division of Building Standards and Codes (john.addario@dos.ny.gov)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE PLUMBING CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-MP CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Plumbing Code

Revise as follows:

718.1 Cure-in-place. ~~Sectional c~~Cure-in-place rehabilitation of *building sewer* piping and *sewer* service lateral piping shall be in accordance with ASTM F1216, ASTM F1743, ASTM F2561, or ASTM F2599. ~~Main and lateral cure-in-place rehabilitation of *building sewer* and *sewer* service lateral pipe and their connections to the main *sewer* pipe shall be in accordance with ASTM F2561.~~ Hydrophilic rings or gaskets in cure-in-place rehabilitation of *building sewer* piping and *sewer* service laterals shall be in accordance with ASTM F3240 to ensure water tightness and elimination of ground water penetration.

Add new standard(s) as follows:

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box C700
West Conshohocken, PA 19428-2959

F1216 - 22	Standard Practice for Rehabilitation of Existing Pipelines and Conduits by the Inversion and Curing of a Resin-Impregnated Tube
ASTM F1743 - 22	Standard Practice for Rehabilitation of Existing Pipelines and Conduits by Pulled-in-Place Installation of Cured in-Place Thermosetting Resin Pipe (CIPP)

Reason: Cure-in-place pipe lining is a commonly used method of rehabilitating existing sewer piping and laterals. The 2021 International Plumbing Code added this new Section 718, but left off several important ASTM reference standards that are necessary to allow different methods of cure-in-place lining to be used properly. This proposal adds two additional reference standards as noted.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This code change is simply adding options for methods of rehabilitating existing sewers and laterals by cured-in-place lining. Owners and designers may chose to rehabilitate sewers via this method, and then chose which standards are most appropriate for their project. Therefore, nothing new is being mandated by this change; the change only provides more options.

P117-24 Part I

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: Some of the proposed standards are written in unenforceable language. (13-1)

P117-24 Part I

Individual Consideration Agenda

Comment 1:

IPC: 718.1

Proponents: Jeanne Rice, NYSDOS (jeanne.rice@dos.ny.gov); Chad Sievers, NYS, NYS DOS (chad.sievers@dos.ny.gov); Kevin Duerr-Clark, NYS DOS, NYS DOS (kevin.duerr-clark@dos.ny.gov); Stephen Van Hoose, NYS DOS, NYS DOS (stephen.vanhoose@dos.ny.gov); China Clarke, New York State Dept of State, Manager Technical Support Unit (china.clarke@dos.ny.gov) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Plumbing Code

718.1 Cured-in-place pipe (CIPP). Cured-in-place pipe (CIPP) rehabilitation of *building sewer* piping and *sewer* service lateral piping shall be in accordance with ASTM F1216, ASTM F1743, ASTM F2561, or ASTM F2599. Hydrophilic rings or gaskets in ~~cure-in-place~~ CIPP rehabilitation of *building sewer* piping and *sewer* service laterals shall be installed in accordance with ASTM F3240 ~~to ensure water tightness and elimination of ground water penetration~~.

Reason: This proposal was denied by CAH1 due to one of the ASTM standards having unenforceable language, with a request to bring the proposal back at the next committee action hearing. The revised version of this standard, ASTM F1216, is anticipated to be approved by the date of the second committee action hearing.

Additionally, editorial changes were made to utilize standard industry terminology: "Cured-in-Place Pipe (CIPP)," and to remove unnecessary language which is better suited to be commentary.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The modifications to this proposal simply edit the terminology slightly to better conform to industry standards. The requirements are not changed by this modification.

Comment (CAH2)# 446

P117-24 Part II

IRC: P3012.1 (New), ASTM Chapter 44 (New)

Proposed Change as Submitted

Proponents: Kevin Duerr-Clark, NYS DOS, NYS DOS (kevin.duerr-clark@dos.ny.gov); Brian Tollisen, NYS Department of State, NYS Department of State (brian.tollisen@dos.ny.gov); China Clarke, New York State Dept of State, Manager Technical Support Unit (china.clarke@dos.ny.gov); Chad Sievers, NYS, NYS DOS (chad.sievers@dos.ny.gov); John R Addario - NYS Department of State, NEW YORK STATE CODES DIVISION, New York State Department of State Division of Building Standards and Codes (john.addario@dos.ny.gov); Jeanne Rice, NYSDOS (jeanne.rice@dos.ny.gov)

2024 International Residential Code

Add new text as follows:

P3012.1 Cure-in-place. Cure-in-place rehabilitation of building sewer piping and sewer service lateral piping shall be in accordance with ASTM F1216, ASTM F1743, ASTM F2561, or ASTM F2599. Hydrophilic rings or gaskets in cure-in-place rehabilitation of building sewer piping and sewer service laterals shall be in accordance with ASTM F3240 to ensure water tightness and elimination of ground water penetration.

Add new standard(s) as follows:

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box C700
West Conshohocken, PA 19428

F1216 - 22	Standard Practice for Rehabilitation of Existing Pipelines and Conduits by the Inversion and Curing of a Resin-Impregnated Tube
F1743 - 22	Standard Practice for Rehabilitation of Existing Pipelines and Conduits by Pulled-in-Place Installation of Cured in-Place Thermosetting Resin Pipe (CIPP)
F2599-22	Standard Practice for Sectional Repair of Damaged Pipe By Means of an Inverted Cured-In-Place Line
F3240-19 (2023)	Standard Practice for Installation of Seamless Molded Hydrophilic Gaskets (SMHG) for Long-Term Watertightness of Cured-in-Place Rehabilitation of Main and Lateral Pipelines

Reason: Cure-in-place pipe lining is a commonly used method of rehabilitating existing sewer piping and laterals. The 2021 International Plumbing Code added a new Section 718 to the IPC, but nothing was added for the Residential Provisions and 718 left off several important ASTM reference standards that are necessary to allow different methods of cure-in-place lining to be used properly. This proposal pulls in the language from the IPC and adds two additional reference standards as noted.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This code change is simply adding options for methods of rehabilitating existing sewers and laterals by cured-in-place lining. Owners and designers may chose to rehabilitate sewers via this method, and then chose which standards are most appropriate for their project. Therefore, nothing new is being mandated by this change; the change only provides more options.

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: There didn't appear to a major section (P3012) in the code for this new section to be placed under. (10-0)

P117-24 Part II

Individual Consideration Agenda

Comment 1:

IRC: SECTION 3012 (New), P3012.1, ASTM Chapter 44 (New)

Proponents: Jeanne Rice, NYSDOS (jeanne.rice@dos.ny.gov); Chad Sievers, NYS, NYS DOS (chad.sievers@dos.ny.gov); Kevin Duerr-Clark, NYS DOS, NYS DOS (kevin.duerr-clark@dos.ny.gov); Stephen Van Hoose, NYS DOS, NYS DOS (stephen.vanhoose@dos.ny.gov); China Clarke, New York State Dept of State, Manager Technical Support Unit (china.clarke@dos.ny.gov) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Residential Code

Add new text as follows:

SECTION 3012
REHABILITATION OF BUILDING SEWERS AND DRAINS

Revise as follows:

P3012.1 Cured-in-place pipe (CIPP). Cured-in-place pipe (CIPP) rehabilitation of building sewer piping and sewer service lateral piping shall be in accordance with ASTM F1216, ASTM F1743, ASTM F2561, or ASTM F2599. Hydrophilic rings or gaskets in ~~cure-in-place~~ CIPP rehabilitation of building sewer piping and sewer service laterals shall be in accordance with ASTM F3240 ~~to ensure water tightness and elimination of ground water penetration~~.

Add new text as follows:

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box C700
West Conshohocken, PA 19428

F2561-20 Standard Practice for Sectional Repair of Damaged Pipe By Means of an Inverted Cured-In-Place Line

Reason: The proposal was initially submitted without the creation of section 3012 which subsection 3012.1 would fall under. This modification adds the section to address the committee comments.

Additionally, editorial changes were made to utilize standard industry terminology: "Cured-in-Place Pipe (CIPP)," and to conform to changes made to part 1 of this proposal.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The modifications to this proposal simply edit the terminology slightly to better conform to industry standards. The requirements are not changed by this modification.

Comment (CAH2)# 454

P120-24

IPC: SECTION 202 (New), 802.1.9 (New)

Proposed Change as Submitted

Proponents: James Richardson, City of Columbus (Ohio), City of Columbus (Ohio) (jarichardson@columbus.gov)

2024 International Plumbing Code

Add new definition as follows:

DUMP SINK. A sink provided in food service operations for the sole purpose of dumping leftover liquids from drinking containers, these sinks can be stand-alone fixtures or in combination with a 3-compartment sink.

Add new text as follows:

802.1.9 Dump sinks. When dump sinks are required, they shall discharge directly or indirectly through an air gap or air break to the drainage system.

Reason: Public health agencies are requiring these fixtures in an effort to keep food service operation staff from dumping leftover liquids/beverages into food preparation sinks where they could cause a potential contamination issue. This proposal is intended to provide direction for how these fixtures should be viewed and how they will be permitted to discharge to the drainage systems.

Bibliography: See reason statement.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

These sinks are already being required by public health agencies so there would be no additional costs.

P120-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The dump sink definition needs to be two sentences. (10-3)

P120-24

Individual Consideration Agenda

Comment 1:

IPC: SECTION 202

Proponents: James Richardson, City of Columbus (Ohio), City of Columbus (Ohio) (jarichardson@columbus.gov) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Plumbing Code

Revise as follows:

DUMP SINK. A sink provided in food service operations for the sole purpose of dumping leftover liquids~~.~~. These ~~these~~ sinks can be stand-alone fixtures or in combination with a 3-compartment sink.

Reason: Public health agencies are requiring these fixtures in an effort to keep food service operation staff from dumping leftover liquids/beverages into food preparation sinks where they could cause a potential contamination issue. This proposal is intended to provide direction for how these fixtures should be viewed and how they will be permitted to discharge to the drainage systems.

Changes have been made as suggested by the IPC Code Development Committee during CAH #1.

Bibliography: See reason statement.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

These sinks are already being required by public health agencies so there would be no additional costs.

Comment (CAH2)# 408

P121-24

IPC: 802.4, 802.4.3

Proposed Change as Submitted

Proponents: James Richardson, City of Columbus (Ohio), City of Columbus (Ohio) (jarichardson@columbus.gov)

2024 International Plumbing Code

Revise as follows:

802.4 Waste receptors. For other than hub drains that receive only clear-water waste and standpipes, a removable strainer or basket shall cover the outlet of waste receptors. Waste receptors shall not be installed in concealed spaces. Waste receptors shall not be installed in plenums, crawl spaces, attics, interstitial spaces above ceilings and below floors. *Ready access* shall be provided to waste receptors. **Exception:** *Access* shall be provided for automatic clothes washer standpipe drains for rodding.

802.4.3 Standpipes. Standpipes shall be individually trapped. Standpipes shall extend not less than 18 inches (457 mm) but not greater than 42 inches (1067 mm) above the trap weir. ~~*Access* shall be provided to standpipes and drains for rodding.~~

Reason: It is imperative that indirect waste receptors are provided with 'Ready Access" since they receive indirect waste discharge. Without the clear view of the waste receptor, a backup in the drainage system can result in damage due to the concealed location of the waste receptor. The portion of this section which previously indicated standpipes shall be provided with "Access" allows for all standpipes to be concealed in some fashion. Allowing for "Access" to be provided specifically for automatic clothes washer standpipe makes sense due to the fact there is a minimum and maximum height the standpipe is permitted to extend above the trap which results in many of these being concealed by the automatic clothes washers. However, if only providing "Access" is permitted for all types of standpipes, it results in standpipes located under counters behind cabinet doors where they will not be observable to the occupants.

Bibliography: See reason statement.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal does not positively or negatively impact costs, it just clarifies which waste receptors are required to be provided with "Ready Access" and which ones are required to be provided with "Access".

P121-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The original sentence places the access requirements where they belong. (9-4)

P121-24

Individual Consideration Agenda

Comment 1:

IPC: 802.4, 802.4.3

Proponents: James Richardson, City of Columbus (Ohio), City of Columbus (Ohio) (jarichardson@columbus.gov) requests As Submitted

Reason: Section 802.4 covers all waste receptors that receive indirect waste discharge, and as the definition of a waste receptor indicates, this includes all standpipes, including Automatic clothes washers. The section also includes areas where waste receptor should not be installed and a requirement for waste receptors to be provided with "Ready Access". Since the primary section speaks to the access for maintenance that must be provided, it is in this section where any exceptions to that level of access should be listed, and since it is a specific exception it should remain as an exception and not in the body of the section.

- **ACCESS (TO).** That which enables a fixture, appliance or equipment to be reached by *ready access* or by a means that first requires the removal or movement of a panel or similar obstruction (see "*Ready access*").
- **READY ACCESS.** That which enables a fixture, appliance or equipment to be directly reached without requiring the removal or movement of any panel or similar obstruction and without the use of a portable ladder, step stool or similar device.
- **WASTE RECEPTOR.** A floor sink, standpipe, hub drain or floor drain that receives the discharge of one or more indirect waste pipes.

It is imperative that indirect waste receptors are provided with 'Ready Access" since they receive indirect waste discharge. Without the clear view of the waste receptor, a backup in the drainage system can result in damage due to the concealed location of the waste receptor. The portion of this section which previously indicated standpipes shall be provided with "Access" allows for all standpipes to be concealed in some fashion. Allowing for "Access" to be provided specifically for automatic clothes washer standpipe makes sense due to the fact there is a minimum and maximum height the standpipe is permitted to extend above the trap which results in many of these being concealed by the automatic clothes washers. However, if only providing "Access" is permitted for all types of standpipes, it results in standpipes located under counters behind cabinet doors where they will not be observable to the occupants.

Comment (CAH2)# 410

P125-24 Part I

IPC: 905.2

Proposed Change as Submitted

Proponents: James Richardson, City of Columbus (Ohio), City of Columbus (Ohio) (jarichardson@columbus.gov)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE PLUMBING CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-MP CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Plumbing Code

Revise as follows:

905.2 Grade. Horizontal ~~Vent~~ vent and *branch vent* pipes shall be installed level, or sloped ~~so graded and connected as~~ to drain back to the drainage pipe by gravity.

Reason: The intent of this section is to ensure vent systems are installed in a manner that does not result in a situation where condensate can collect in sufficient quantities which would result in a blockage of a vent. A vent pipe that is run level could not retain enough water to cause this to occur, at best, a residual amount of water could be left behind on the invert of the pipe due to surface tension. This residual water would never be enough to block or substantially restrict the emission or admission of air for balancing the system.

Bibliography: See reason statement.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal adds no additional requirements for an installation, but rather provides more options for compliance.

P125-24 Part I

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: Vent piping should be sloped to promote drainage back to the drainage system. (13-0)

P125-24 Part I

Individual Consideration Agenda

Comment 1:

IPC: 905.2

Proponents: James Richardson, City of Columbus (Ohio), City of Columbus (Ohio) (jarichardson@columbus.gov) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Plumbing Code

Revise as follows:

905.2 Grade. Horizontal vent and branch vent pipes shall be installed level or be sloped, and supported to allow moisture and condensate to drain back to the drainage pipe by gravity.

Reason: The intent of this section is to ensure vent systems are installed in a manner that does not result in a situation where condensate can collect in sufficient quantities which would result in a blockage of a vent. A vent pipe that is run level could not retain enough water to cause this to occur, at best, a residual amount of water could be left behind on the invert of the pipe due to surface tension. This residual water would never be enough to block or substantially restrict the emission or admission of air for balancing the system. Although the residential committee also disapproved this during CAH #1, they just asked that the additional language I have included in this proposal be kept from the original code language. This practice is used internationally as well as in the UPC and simply provides an option for installers.

Bibliography: See reason statement.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal adds no additional requirements for an installation, but rather provides more options for compliance.

Comment (CAH2)# 511

P125-24 Part II

IRC: P3104.2

Proposed Change as Submitted

Proponents: James Richardson, City of Columbus (Ohio), City of Columbus (Ohio) (jarichardson@columbus.gov)

2024 International Residential Code

Revise as follows:

P3104.2 Grade. Horizontal ~~Vent~~ vent and branch vent pipes shall installed level, or be ~~graded~~ sloped~~, connected and supported to allow moisture and condensate~~ to drain back to the ~~soil or waste~~ drainage pipe by gravity.

Reason: The intent of this section is to ensure vent systems are installed in a manner that does not result in a situation where condensate can collect in sufficient quantities which would result in a blockage of a vent. A vent pipe that is run level could not retain enough water to cause this to occur, at best, a residual amount of water could be left behind on the invert of the pipe due to surface tension. This residual water would never be enough to block or substantially restrict the emission or admission of air for balancing the system.

Bibliography: See reason statement.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal adds no additional requirements for an installation, but rather provides more options for compliance.

P125-24 Part II

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The phrase "connected and supported" needs to remain in the code. (10-0)

P125-24 Part II

Individual Consideration Agenda

Comment 1:

IRC: P3104.2

Proponents: James Richardson, City of Columbus (Ohio), City of Columbus (Ohio) (jarichardson@columbus.gov) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Residential Code

Revise as follows:

P3104.2 Grade. Horizontal vent and branch vent pipes shall be installed level or be sloped, and supported to allow moisture and condensate to drain back to the drainage pipe by gravity.

Reason: The intent of this section is to ensure vent systems are installed in a manner that does not result in a situation where condensate can collect in sufficient quantities which would result in a blockage of a vent. A vent pipe that is run level could not retain enough water to cause this to occur, at best, a residual amount of water could be left behind on the invert of the pipe due to surface tension. This residual water would never be enough to block or substantially restrict the emission or admission of air for balancing the system.

I have added back in the language the committee suggested should be kept from the original text.

Bibliography: See reason statement.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal adds no additional requirements for an installation, but rather provides more options for compliance.

  https://www.cdpaccess.com/proposal/9710/30405/documentation/145586/attachments/download/4236/

Estimated Immediate Cost Impact:

The cost of a single stack pipe system is less than that of an equivalent conventional two-stack pipe system.

Estimated Immediate Cost Impact Justification (methodology and variables):

See Cost Impact Calculations attachment.

P127-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: This device has not been tested for pressures that could occur during a sewer surcharge event. Language would be better placed in Section 917. (12-1)

P127-24

Individual Consideration Agenda

Comment 1:

Proponents: steven white, Aliaxis, Aliaxis (swhite@aliaxis.com) requests As Submitted

Reason: 1: Device Testing for Sewer Surcharge Events Transient The objection that the device has not been tested for pressures that could occur during a sewer surcharge event is unfounded. The device has been specifically designed and tested to handle sewer surcharge transient events at the base of stacks and offsets. These transient surcharge pressures should not exceed +400 Pa (1.6 inch WG), as this is the threshold where positive or negative transients begin to affect the appliance water trap seals.

The device has been developed to attenuate positive transients. According to ASSE 1030, Chapter 3.5 “Device Characteristic Performance Test,” Chapter 3.6 “Device Opening Time Test,” and Chapter 3.7 “Device Filling Time Test,” the performance of the device in attenuating positive transients has been thoroughly addressed.

2: Pressure from Sewer Surcharge Events

The second objection may concerns the pressure from a sewer surcharge event, which occurs when the drainage pipe becomes surcharged at the base of the stack or offsets due to: a) Hydraulic flow exceeding the hydraulic performance of the pipe size. b) A restriction caused by a partial or full blockage.

In such cases, the positive pressure will not be transient but will rise more slowly, leading to a hydrostatic event. This scenario is partially addressed within the IPC Drainage and Vent Water Test:

Drainage and Vent Water Test: A water test shall be applied to the drainage system either in its entirety or in sections. If applied to the entire system, all openings in the piping shall be tightly closed, except the highest opening, and the system shall be filled with water to the point of overflow. If the system is tested in sections, each opening shall be tightly plugged except the highest openings of the section under test, and each section shall be filled with water, but sections shall not be tested with less than a 10-foot (3048 mm) head of water. In testing successive sections, not less than the upper 10 feet (3048 mm) of the next preceding section shall be tested so that no joint or pipe in the building, except the uppermost 10 feet (3048 mm) of the system, shall have been submitted to a test of less than a 10-foot (3048 mm) head of water. This pressure shall be held for not less than 15 minutes. The system shall then be tight at all points.

In this test, the pressure would be 4.27 psi (29.4 kPa)
According to ASSE 1030, Chapter 3.1 “Air Tightness Test,” the units are tested to 5 psi (34.5 kPa). This indicates that the device has been tested to withstand a hydrostatic (surcharge) event equivalent to a 10-foot (3 m) surcharge before the device. Therefore, the objection that the device has not been tested is incorrect, as the device tested to ASSE 1030 has been evaluated for both positive transients and surcharge pressures.

As P127- 24 is for offsets the image attached shows the surcharge event in the offset, and how a vent bypass or the device (PTA pressure transient attenuator) with AAV can vent the offset, which is the purpose of the P127-24 to allow the device with AAV as an alternative venting solution with better or same performance as a bypass vent.

Also see attached file for the PAPA best practice guide where guidance is offered on the offsets as well as the whole system.

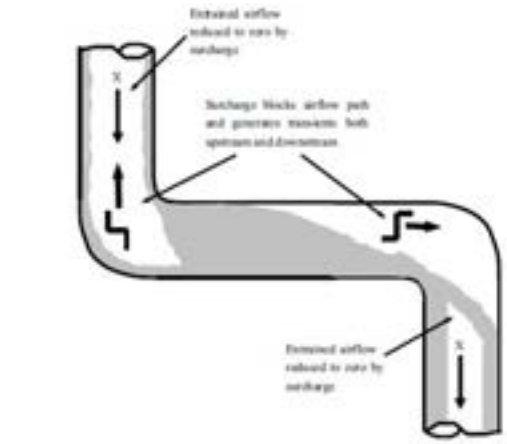

Figure 4.35 Offset surcharge in a vertical stack

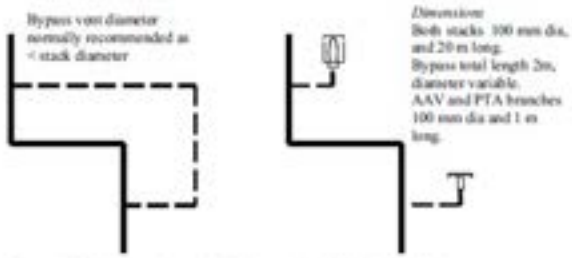

Figure 4.36 Offset venting or installation of an AAV / PTA combination

Comment (CAH2)# 499

Comment 2:

Proponents: Ken Smithart Jr, IPS Corporation, Studor (ken.smithart@ipscorp.com) requests As Submitted

Reason: The objection that this device has not been tested for pressures that could occur during a sewer surcharge event, is not correct: Devices conforming to ASSE 1030 are tested to 5 psi (36Kpa).However, in a sewer surcharge event, positive pressures in the system will vent out through the open vent that is required in the manufacturer's installation instructions. The attached paper also explains the air pressure associated with the surcharge from the sewer into the building, as you can see the Positive Air Pressure Attenuator (PAPA) and Air Admittance Valve (AAV) are cited as a solution to protect the building from these events. Note that the pressure rating in ASSE 1030 is based on 312.2 of the IPC requirements:312.2 Drainage and vent water test. A water test shall be applied to the drainage system either in its entirety or in sections. If applied to the entire system, all openings in the piping shall be tightly closed, except the highest opening, and the system shall be filled with water to the point of overflow. If the system is tested in sections, each opening shall be tightly plugged except the highest openings of the section under test, and each section shall be filled with water, but sections shall not be tested with less than a 10-foot (3048 mm) head of water. In testing successive sections, not less than the upper 10 feet (3048 mm) of the next preceding section shall be tested so that no joint or pipe in the building, except the uppermost 10 feet (3048 mm) of the system, shall have been submitted to a test of less than a 10-foot (3048 mm) head of water. This pressure shall be held for not less than 15 minutes. The system shall then be tight at all points.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

P128-24

IPC: 907.2, ASSE Chapter 15 (New)

Proposed Change as Submitted

Proponents: Ken Smithart Jr, IPS Corporation, Studor (ken.smithart@ipscorp.com)

2024 International Plumbing Code

Revise as follows:

907.2 Upper section. The upper section of the drainage *stack* shall be vented as a separate *stack* with a vent *stack* connection installed in accordance with Section 904.4, or in single stack drainage systems, a positive pressure reduction device conforming to ASSE 1030 shall be installed above the offset in the stack in accordance with the manufacturer's instructions. The offset shall be considered to be the base of the *stack*.

Add new standard(s) as follows:

ASSE

ASSE International
18927 Hickory Creek Drive, Suite 220
Mokena, IL 60448

1030-2016 Performance Requirements for Positive Pressure Reduction Devices for Sanitary Drainage Systems

Reason: The current language does not address single stack drainage systems with offsets where positive pressure reduction devices (PPRDs) conforming to ASSE 1030 are used to protect the trap seals on branches from positive pressure transients. PPRDs are used to reduce positive pressures at the base of the stack.

Bibliography: ASSE 1030 standard for Performance Requirements for Positive Pressure Reduction Devices for Sanitary Drainage Systems
Studor Engineered Products Manual - 10th Edition

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

The cost of a single stack pipe system is less than that of an equivalent conventional two-stack pipe system

Estimated Immediate Cost Impact Justification (methodology and variables):

See Cost Impact Calculations attachment.

Estimated Life Cycle Cost Impact:

Staff Analysis: A review of the standard proposed for inclusion in the code, ASSE 1030-2016 *Performance Requirements for Positive Pressure Reduction Devices for Sanitary Drainage Systems,* with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

P128-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The added language would be better as an exception in Section 917. (11-2)

Comment (CAH2)# 780

Comment 2:

Proponents: steven white, Aliaxis, Aliaxis (swhite@aliaxis.com) requests As Submitted

Reason: The active drainage single stack system has an equal to better performance, as a secondary vent system, this system has been fully researched and tested, and installed in high-rise buildings around the world since 2003, it is part of the Australian plumbing code the AS3500-2 standard since the early 2000's. The system has been fully researched and reviewed, and I recommend reading the "Swaffield, J.A. (2010). Transient airflow in building drainage systems. Spon Press, Oxon, UK" to understand the fluid mechanics of DWV systems for taller buildings. The following could be used for understanding to support the current wording changes or an addition to the section 917 (single stack)

Causes and behaviour of air pressure transients in building drainage systems: Air pressure transients generated within the building drainage system obey the same mechanisms that govern transient generation and propagation in any fluid carrying system. In general terms, pressure transients are generated as a consequence of changes to the flow conditions at some point within the system and are the means by which such changes are
communicated throughout the system (Swaffield, 2010). The Joukowsky expression provides the fundamental relationship between pressure rise, wave speed, fluid density and flow velocity:

$\Delta p = -pc\Delta V$

where Δp is pressure change, p is the fluid density, c is the wave speed and ΔV is flow velocity change. The significance of the negative sign means that pressure increases with a decrease of velocity, and vice versa.

Within the building drainage system, air pressure transients are generated due to changes in the entrained airflow as a consequence of changes to the annular water downflow initiated by the random discharge of system appliances. Increasing annular downflow generates an enhanced entrained airflow which reduces the system pressure. Slowing-down or stopping the airflow, due to some blockage of the passage of air caused by the formation of a water curtain by either wastewater flowing from a branch into the stack or by the change of

flow direction at an offset or the stack base, generates positive air transients (Swaffield et al., 2004). Pressure fluctuations from external events, such as surcharging of the main sewer, can also generate transients within the system. These low-amplitude air pressure transients, whose magnitude are dependent upon the rate of change of system conditions, are transmitted and or reflected at all boundaries within the system including open terminations, connections to the sewer, appliance trap seals, and pipe junctions. An openended pipe, such an open stack termination, has a reflection coefficient of -1, while a closedended pipe, such as an appliance trap seal, has a reflection coefficient of +1. Changes in the system characteristics, such as a change in diameter or the inclusion of a pipe junction, will alter the transmitted wave and induce a reflection.

What portion of the transient is reflected and transmitted, is dictated by both the pipe material (which affects wave speed) and pipe diameter. The time taken for a transient to travel to a reflecting boundary and return to its source is known as the pipe period and is given by the expression: pipe period=2L/c

where L is the pipe length and c is the wave speed. For most stack to branch situations this relates the division of a pressure transient to the ratio of pipe cross sectional areas, however when a positive pressure reduction devices (PPRDs) is included in the design the division is much greater since the positive pressure reduction devices (PPRDs) also operates on the wave speed (c in equation 2-4 above). This is means that in a fully vented system using traditional pipe junctions a parallel vent pipe of at least 200 mm and a length of 100 m would be required to achieve the same reduction in positive air pressure transient. Consequences of air pressure transients in building drainage systems:

While the air pressure transients generated within the building drainage system are of low amplitude, they are, however, responsible for compromising system integrity and enabling cross-contamination of habitable space through the destruction of water trap seals. Negative air pressure transients are capable of depleting the water trap seal by either induced or self-siphonage by creating a suction pressure within the pipe adjacent to the trap. Positive air pressure transients are capable of displacing the water trap seal upwards towards the appliance which will either force air through the water seal into the appliance, or if of sufficient magnitude, cause the water seal to be completely displaced into the appliance, leaving the trap wither wholly or partially depleted. A depleted trap seal permits airflow both into and out of the drainage system, thus allowing foul air to exit the system and enter habitable space.

Control and suppression of air pressure transients Air pressure transients are an unwanted consequence of normal system operation and, although unavoidable, it is possible to protect water trap seal integrity through the correct alleviation of any pressure fluctuations. Traditionally, this has been approached through passive solutions which rely on the provision of cross connections and vertical stacks vented to atmosphere. However, this approach, while both proven and traditional, has inherent limitations (Swaffield, 2006). The key to maintaining a balance of pressure within the building drainage system is to provide pressure relief as close to the source as possible; long pipe runs and remote vent terminations lead to delays in the arrival of relieving reflections and therefore compromise system integrity. More recently, active solutions to the control and suppression of air pressure transients have been developed providing necessary localised relief.

Negative air pressure transients, which communicate the need for more air and represents a suction force, can be alleviated by air admittance valves (AAVs) which, responding directly to the local pressure conditions, opens as the pressure falls to allow inward relief airflow, hence limiting the pressure excursions experienced by the water trap seal. To avoid compromising system integrity by allowing foul sewer gases to enter the building, the AAV is designed with a fail-safe mechanism which ensures that it remains closed when not in use or when the local pressure exceeds atmospheric. AAVs can be installed locally to the water trap seal or at the stack termination to avoid the need for a roof penetration

Positive air pressure transients, which communicate the need to reduce the airflow and represents a pushing force, can be alleviated by variable volume containment attenuators (positive pressure reduction devices (PPRDs)) which absorb the airflow driven by positive air pressure transients. The positive pressure reduction devices (PPRDs), consisting of a variable volume bag that expands under the influence of a positive pressure transient, is capable of reducing the magnitude of a positive air pressure transient by up to 90% (Swaffield et al., 2005a, 2005b) by providing an alternative route which diverts and attenuates the system airflows gradually due to the significantly reduced wave speed within the positive pressure reduction devices (PPRDs). due to the properties of its elastic pipe construction. Designed as a collapsible reservoir, the variable volume bag provides an additional volume unseen by the system when the pressure regime at that point is sub-atmospheric, which absorbs the extra air induced by the positive air pressure transient.

Each positive pressure reduction devices (PPRDs) must meet the testing requirements of ASSE 1030

Base of stack.

The base of the stack is the most likely place for a blockage in the airflow to occur. As the distance between the base of the stack and the top stack termination is the maximum distance possible within the system, then a blockage at this location will lead to the greatest possible pressure rise. It is therefore recommended to use two PPRDs in series at the base of the stack. The devices should be located below the first branch connected to the stack. Note that is it still recommend that branches in the lower part of the stack be connected directly to the horizontal drainage and not to the main stack.
Offsets within the vertical stack, which in the past were wrongfully thought to “slow down” the water flow in tall buildings, can also be the cause of significant positive pressure
transients as they forcibly change the flow direction. It is recommended to use PPRDs above the offset.

Top of stack
It is optional to have a PPRDs located immediately below the top of the stack above the highest branch in the building. It should be noted that this point does not need to be at the top of the building, but merely above the last branch. The system can be terminated with an AAV to provide ventilation, and a PPRDs to assist in attenuating any positive transients in the system.

Distributed locations
As the operation of system appliances, which discharge wastewater into the system and hence govern the conditions necessary for air entrainment and pressure transient propagation, are entirely random, it is virtually impossible to predict where the greatest area of risk in the system will be. Given also, that the volume of extra air within the system, as a result of the propagating positive pressure transients, is dependent upon airflow rate, blockage closure time, and the system pipe period; all of which will change, then to accommodate these uncertainties, PPRDs should be distributed strategically throughout the height of the stack

Number of Devices
The number of devices installed in a system depends on the height of the building and the risk of air pressure transients being generated. This can be determined, in the main, using the building, and in particularly the intensity of usage.

For example, a stadium design, Recommended installation of PPRDs due to the expected surges from sanitary appliances at peak usage times.

PPRDs Design Table for 4” and 6” (100mmDN/150mm DN) drainage stacks

3-10 floors	One unit on the base
11-15 floors	One unit on the base, one halfway
16-25 Floors	One unit on the base, one unit on floor 5, one Halfway between the remaining floors above floor 5
26+ floors	Two units in series on the base, then one unit on every 5th floor to the 25th floor, then one every 10th floor thereafter
Offsets	ne unit must be installed above offsets of less than 10 floors Two units must be installed above offsets more than of 20 floors

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Comment (CAH2)# 578

P129-24

IPC: 907.3, ASSE Chapter 15 (New)

Proposed Change as Submitted

Proponents: Ken Smithart Jr, IPS Corporation, Studor (ken.smithart@ipscorp.com)

2024 International Plumbing Code

Revise as follows:

907.3 Lower section. The lower section of the drainage *stack* shall be vented by a yoke vent connecting between the offset and the next lower horizontal *branch*. The yoke vent connection shall be permitted to be a vertical extension of the drainage *stack*. The size of the yoke vent and connection shall be not less than the size required for the vent *stack* of the drainage *stack*, or in single stack drainage systems, a positive pressure reduction device conforming to ASSE 1030 shall be installed in accordance with the manufacturer's instructions and stack type air admittance valves shall be installed at the top of offset drainage stacks in accordance with ASSE 1050.

Add new standard(s) as follows:

ASSE

ASSE International
18927 Hickory Creek Drive, Suite 220
Mokena, IL 60448

1030-2016 Performance Requirements for Positive Pressure Reduction Devices for Sanitary Drainage Systems

Reason: The current language does not address single stack drainage systems with offsets where positive pressure reduction devices conforming to ASSE 1030 are used to protect the trap seals on branches from positive pressure transients.

Bibliography: ASSE 1030 standard for Performance Requirements for Positive Pressure Reduction Devices for Sanitary Drainage Systems
Studor Engineered Products Manual - 10th Edition

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

The cost of a single stack pipe system is less than that of an equivalent conventional two-stack pipe system.

Estimated Immediate Cost Impact Justification (methodology and variables):

See Cost Impact Calculations attachment.

Staff Analysis: A review of the standard proposed for inclusion in the code, ASSE 1030-2016 *Performance Requirements for Positive Pressure Reduction Devices for Sanitary Drainage Systems,* with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

P129-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The added language would be better as an exception. (13-0)

Individual Consideration Agenda

Comment 1:

Proponents: steven white, Aliaxis, Aliaxis (swhite@aliaxis.com) requests As Submitted

Reason: The active drainage single stack system has an equal to better performance, as a secondary vent system, this system has been fully researched and tested, and installed in high-rise buildings around the world since 2003, it is part of the Australian plumbing code the AS3500-2 standard since the early 2000's. The system has been fully researched and reviewed, and I recommend reading the "Swaffield, J.A. (2010). Transient airflow in building drainage systems. Spon Press, Oxon, UK" to understand the fluid mechanics of DWV systems for taller buildings. The following could be used for understanding to support the current wording changes or an addition to the section 917 (single stack)

Causes and behaviour of air pressure transients in building drainage systems: Air pressure transients generated within the building drainage system obey the same mechanisms that govern transient generation and propagation in any fluid carrying system. In general terms, pressure transients are generated as a consequence of changes to the flow conditions at some point within the system and are the means by which such changes are communicated throughout the system (Swaffield, 2010). The Joukowsky expression provides the fundamental relationship between pressure rise, wave speed, fluid density and flow velocity:

$\Delta p=-pc\Delta V$

where Δp is pressure change, p is the fluid density, c is the wave speed and ΔV is flow velocity change. The significance of the negative sign means that pressure increases with a decrease of velocity, and vice versa. Within the building drainage system, air pressure transients are generated due to changes in the entrained airflow as a consequence of changes to the annular water downflow initiated by the random discharge of system appliances. Increasing annular downflow generates an enhanced entrained airflow which reduces the system pressure. Slowing-down or stopping the airflow, due to some blockage of the passage of air caused by the formation of a water curtain by either wastewater flowing from a branch into the stack or by the change of flow direction at an offset or the stack base, generates positive air transients (Swaffield et al., 2004). Pressure fluctuations from external events, such as surcharging of the main sewer, can also generate transients within the system. These low-amplitude air pressure transients, whose magnitude are dependent upon the rate of change of system conditions, are transmitted and or reflected at all boundaries within the system including open terminations, connections to the sewer, appliance trap seals, and pipe junctions. An openended pipe, such an open stack termination, has a reflection coefficient of -1, while a closedended pipe, such as an appliance trap seal, has a reflection coefficient of +1. Changes in the system characteristics, such as a change in diameter or the inclusion of a pipe junction, will alter the transmitted wave and induce a reflection.

What portion of the transient is reflected and transmitted, is dictated by both the pipe material (which affects wave speed) and pipe diameter. The time taken for a transient to travel to a reflecting boundary and return to its source is known as the pipe period and is given by the expression:

$\text{pipe period}=2L/c$

where L is the pipe length and c is the wave speed.

For most stack to branch situations this relates the division of a pressure transient to the ratio of pipe cross sectional areas, however when a positive pressure reduction devices (PPRDs) is included in the design the division is much greater since the positive pressure reduction devices (PPRDs) also operates on the wave speed (c in equation 2-4 above). This is means that in a fully vented system using traditional pipe junctions a parallel vent pipe of at least 200 mm and a length of 100 m would be required to achieve the same reduction in positive air pressure transient.

Consequences of air pressure transients in building drainage systems: While the air pressure transients generated within the building drainage system are of low amplitude, they are, however, responsible for compromising system integrity and enabling cross-contamination of habitable space through the destruction of water trap seals. Negative air pressure transients are capable of depleting

the water trap seal by either induced or self-siphonage by creating a suction pressure within the pipe adjacent to the trap. Positive air pressure transients are capable of displacing the water trap seal upwards towards the appliance which will either force air through the water seal into the appliance, or if of sufficient magnitude, cause the water seal to be completely displaced into the appliance, leaving the trap wither wholly or partially depleted. A depleted trap seal permits airflow both into and out of the drainage system, thus allowing foul air to exit the system and enter habitable space.

Control and suppression of air pressure transients
Air pressure transients are an unwanted consequence of normal system operation and, although unavoidable, it is possible to protect water trap seal integrity through the correct alleviation of any pressure fluctuations. Traditionally, this has been approached through passive solutions which rely on the provision of cross connections and vertical stacks vented to atmosphere. However, this approach, while both proven and traditional, has inherent limitations (Swaffield, 2006). The key to maintaining a balance of pressure within the building drainage system is to provide pressure relief as close to the source as possible; long pipe runs and remote vent terminations lead to delays in the arrival of relieving reflections and therefore compromise system integrity. More recently, active solutions to the control and suppression of air pressure transients have been developed providing necessary localised relief.

Negative air pressure transients, which communicate the need for more air and represents a suction force, can be alleviated by air admittance valves (AAVs) which, responding directly to the local pressure conditions, opens as the pressure falls to allow inward relief airflow, hence limiting the pressure excursions experienced by the water trap seal. To avoid compromising system integrity by allowing foul sewer gases to enter the building, the AAV is designed with a fail-safe mechanism which ensures that it remains closed when not in use or when the local pressure exceeds atmospheric. AAVs can be installed locally to the water trap seal or at the stack termination to avoid the need for a roof penetration

Positive air pressure transients, which communicate the need to reduce the airflow and represents a pushing force, can be alleviated by variable volume containment attenuators (positive pressure reduction devices (PPRDs)) which absorb the airflow driven by positive air pressure transients. The positive pressure reduction devices (PPRDs), consisting of a variable volume bag that expands under the influence of a positive pressure transient, is capable of reducing the magnitude of a positive air pressure transient by up to 90% (Swaffield et al., 2005a, 2005b) by providing an alternative route which diverts and attenuates the system airflows gradually due to the significantly reduced wave speed within the positive pressure reduction devices (PPRDs). due to the properties of its elastic pipe construction. Designed as a collapsible reservoir, the variable volume bag provides an additional volume unseen by the system when the pressure regime at that point is sub-atmospheric, which absorbs the extra air induced by the positive air pressure transient.
Each positive pressure reduction devices (PPRDs) must meet the testing requirements of ASSE 1030

Base of stack
The base of the stack is the most likely place for a blockage in the airflow to occur. As the distance between the base of the stack and the top stack termination is the maximum distance possible within the system, then a blockage at this location will lead to the greatest possible pressure rise. It is therefore recommended to use two PPRDs in series at the base of the stack. The devices should be located below the first branch connected to the stack. Note that is it still recommend that branches in the lower part of the stack be connected directly to the horizontal drainage and not to the main stack.
Offsets within the vertical stack, which in the past were wrongfully thought to “slow down” the water flow in tall buildings, can also be the cause of significant positive pressure
transients as they forcibly change the flow direction. It is recommended to use PPRDs above the offset.

Top of stack
It is optional to have a PPRDs located immediately below the top of the stack above the highest branch in the building. It should be noted that this point does not need to be at the top of the building, but merely above the last branch. The system can be terminated with an AAV to provide ventilation, and a PPRDs to assist in attenuating any positive transients in the system.

Distributed locations
As the operation of system appliances, which discharge wastewater into the system and hence govern the conditions necessary for air entrainment and pressure transient propagation, are entirely random, it is virtually impossible to predict where the greatest area of risk in the system will be. Given also, that the volume of extra air within the system, as a result of the propagating positive pressure transients, is dependent upon airflow rate, blockage closure time, and the system pipe period; all of which will change, then to accommodate these uncertainties, PPRDs should be distributed strategically throughout the height of the stack

Number of Devices

The number of devices installed in a system depends on the height of the building and the risk of air pressure transients being generated. This can be determined, in the main, using the building, and in particularly the intensity of usage.

For example, a stadium design, Recommended installation of PPRDs due to the expected surges from sanitary appliances at peak usage times.

PPRDs Design Table for 4” and 6” (100mmDN/150mm DN) drainage stacks

3-10 floors	One unit on the base
11-15 floors	One unit on the base, one halfway
16-25 Floors	One unit on the base, one unit on floor 5, one Halfway between the remaining floors above floor 5
26+ floors	Two units in series on the base, then one unit on every 5th floor to the 25th floor, then one every 10th floor thereafter
Offsets	ne unit must be installed above offsets of less than 10 floors Two units must be installed above offsets more than of 20 floors

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Comment (CAH2)# 577

P130-24

IPC: 908.1, ASSE Chapter 15 (New)

Proposed Change as Submitted

Proponents: Ken Smithart Jr, IPS Corporation, Studor (ken.smithart@ipscorp.com)

2024 International Plumbing Code

Revise as follows:

908.1 Where required. Soil and waste *stacks* in buildings having more than 10 *branch intervals* shall be provided with a relief vent at each tenth interval installed, beginning with the top floor.When a single stack drainage system is installed utilizing a combination of air admittance valves and positive pressure reduction devices (PPRDs), a PPRD shall be permitted to serve as a relief vent for the stack when the PPRDs are located no greater than six (6) branch intervals apart, and installed in accordance with the manufacturer's instructions.

Add new standard(s) as follows:

ASSE

ASSE International
18927 Hickory Creek Drive, Suite 220
Mokena, IL 60448

1030-2016 Performance Requirements for Positive Pressure Reduction Devices for Sanitary Drainage Systems

Reason: The current code language does not address relief vents for single stack drainage systems. Positive pressure reduction devices conforming to ASSE 1030 installed in accordance with the manufacturer's instructions provide relief from positive pressure transients in waste stacks.

Bibliography: ASSE 1030 standard for Performance Requirements for Positive Pressure Reduction Devices for Sanitary Drainage Systems
Studor Engineered Products Manual - 10th Edition

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

The cost of a single stack pipe system is less than that of an equivalent conventional two-stack pipe system.

Estimated Immediate Cost Impact Justification (methodology and variables):

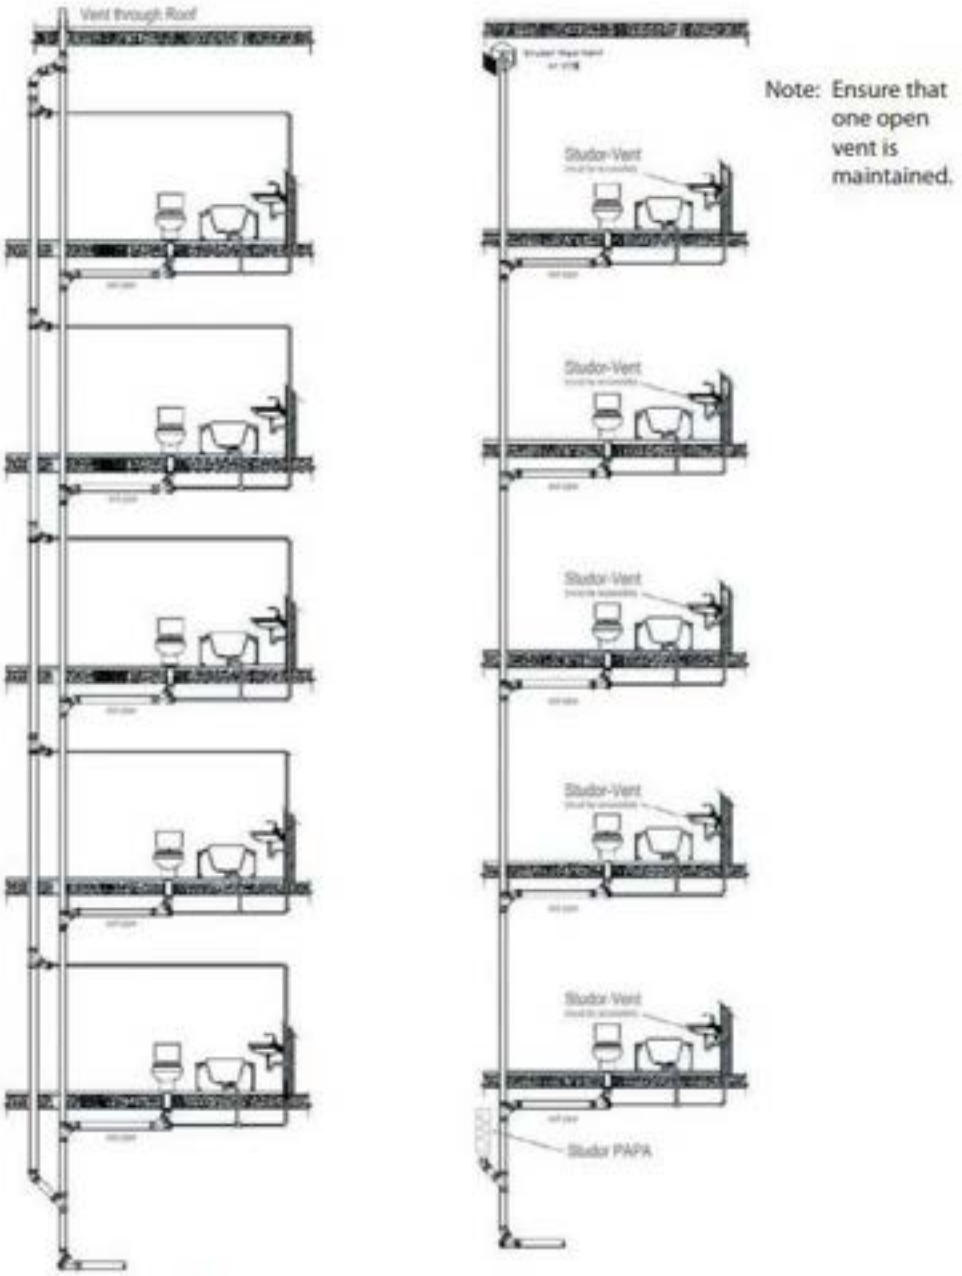
See Cost Impact Calculations

The cost of a single stack pipe system is less than that of an equivalent conventional two-stack pipe system.

Single Stack Costs	Units per Floor	Cost	Ext. Cost	Notes
Positive Pressure Reduction Device – one every 6 floors, per stack	0.167	$1,100.00	$ 183.70	
Stack-Type AAV – one per stack*	0.04	$ 95.00	$ 3.80	*calculation based upon 25 story example below
Branch-Type AAV – one per floor, per stack	1	$ 50.00	$ 50.00	
2" elbow coupling – one per floor, per stack	1	$ 20.00	$ 20.00	
2" hubless connectors – $8 (qty 2) = $16 per floor, per stack	2	$ 8.00	$ 16.00	
Labor – $95/hr x 10 hours (six floors, one stack)	0.167	$ 950.00	$ 158.65	
Total Cost per Floor, per stack for Single Stack System:			$ 432.15	
Conventional Two-Stack Costs:	**Units per Floor**	**Cost**	**Ext. Cost**	**Notes**
4" CI pipe (10 ft) – one per floor, per stack	1	$ 227.00	$ 227.00	
4" x 2" CI sanitary tee – one per floor, per stack	1	$ 39.00	$ 39.00	
4" hubless connector – two per floor, per stack	2	$ 18.00	$ 36.00	
2" hubless connector – five per floor, per stack	5	$ 8.00	$ 40.00	
2" CI pipe (10 ft) – three per floor, per stack	3	$ 103.00	$ 309.00	
2" Clevis hangers – four per floor, per stack	4	$ 24.00	$ 96.00	
2" All thread rod – four per floor, per stack	4	$ 3.00	$ 12.00	
2" Attachment device – four per floor, per stack	4	$ 14.00	$ 56.00	
4" Riser clamp – one per floor, per stack	1	$ 12.00	$ 12.00	
4" Fire stopping – one per hole/floor, per stack	1	$ 18.00	$ 18.00	
Labor – $95/hr x 72 hours (six floors, one stack)	0.167	$6,840.00	$1,142.28	
Labor – $28 to core each 6" ID hole in 4" slab - one per floor, per stack	1	$ 28.00	$ 28.00	
Total Cost per Floor for Conventional Two-Stack System:			$2,015.28	
Total Cost Savings per Floor, per Stack:			$1,583.13	

For example, in a 25-story condominium building with 24 waste stacks, the cost savings would be:
$1,583.13 cost x 25 stories = $39,578.25 per stack.
$39,578.25 cost per stack x 24 stacks in the building = $949,878.00 total savings.

STUDOR Risers with P.A.P.A. Devices and Studor Air Admittance Valves



Staff Analysis: A review of the standard proposed for inclusion in the code, ASSE 1030-2016 *Performance Requirements for Positive Pressure Reduction Devices for Sanitary Drainage Systems,* with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

Comment 2:

Proponents: steven white, Aliaxis, Aliaxis (swhite@aliaxis.com) requests As Submitted

Reason: The active drainage single stack system has an equal to better performance, as a secondary vent system, this system has been fully researched and tested, and installed in high-rise buildings around the world since 2003, it is part of the Australian plumbing code the AS3500-2 standard since the early 2000's. The system has been fully researched and reviewed, and I recommend reading the "Swaffield, J.A. (2010). Transient airflow in building drainage systems. Spon Press, Oxon, UK" to understand the fluid mechanics of DWV systems for taller buildings. The following could be used for understanding to support the current wording changes or an addition to the section 917 (single stack)

Causes and behaviour of air pressure transients in building drainage systems: Air pressure transients generated within the building drainage system obey the same mechanisms that govern transient generation and propagation in any fluid carrying system. In general terms, pressure transients are generated as a consequence of changes to the flow conditions at some point within the system and are the means by which such changes are
communicated throughout the system (Swaffield, 2010). The Joukowsky expression provides the fundamental relationship between pressure rise, wave speed, fluid density and flow velocity:

$\Delta p=-pc\Delta V$

where Δp is pressure change, p is the fluid density, c is the wave speed and ΔV is flow velocity change. The significance of the negative sign means that pressure increases with a decrease of velocity, and vice versa.

Within the building drainage system, air pressure transients are generated due to changes in the entrained airflow as a consequence of changes to the annular water downflow initiated by the random discharge of system appliances. Increasing annular downflow generates an enhanced entrained airflow which reduces the system pressure. Slowing-down or stopping the airflow, due to some blockage of the passage of air caused by the formation of a water curtain by either wastewater flowing from a branch into the stack or by the change of flow direction at an offset or the stack base, generates positive air transients (Swaffield et al., 2004). Pressure fluctuations from external events, such as surcharging of the main sewer, can also generate transients within the system. These low-amplitude air
pressure transients, whose magnitude are dependent upon the rate of change of system conditions,
are transmitted and or reflected at all boundaries within the system including open terminations, connections to the sewer, appliance trap seals, and pipe junctions. An openended pipe, such an open stack termination, has a reflection coefficient of -1, while a closedended pipe, such as an appliance trap seal, has a reflection coefficient of +1. Changes in the system characteristics, such as a change in diameter or the inclusion of a pipe junction, will
alter the transmitted wave and induce a reflection.

What portion of the transient is reflected and transmitted, is dictated by both the pipe material (which affects wave speed) and pipe diameter. The time taken for a transient to travel to a reflecting boundary and return to its source is known as the pipe period and is given by the expression: pipe period=2L/c

where L is the pipe length and c is the wave speed. For most stack to branch situations this relates the division of a pressure transient to the ratio of pipe cross sectional areas, however when a positive pressure reduction devices (PPRDs) is included in the design
the division is much greater since the positive pressure reduction devices (PPRDs) also operates on the wave speed (c in equation 2-4 above). This is means that in a fully vented system using traditional pipe junctions a parallel vent pipe of at least 200 mm and a length of 100 m would be required to achieve the same reduction in positive air pressure transient. Consequences of air pressure transients in building drainage systems:

While the air pressure transients generated within the building drainage system are of low amplitude, they are, however, responsible for compromising system integrity and enabling cross-contamination of habitable space through the destruction of water trap seals. Negative air pressure transients are capable of depleting the water trap seal by either induced or self-siphonage by creating a suction pressure within the pipe adjacent to the trap. Positive air pressure transients are capable of displacing the water trap seal upwards towards the appliance which will either force air through the water seal into the appliance, or if of sufficient magnitude, cause the water seal to be completely displaced into the appliance, leaving the trap wither wholly or partially depleted. A depleted trap seal permits airflow both into and out of the drainage system, thus allowing foul air to exit the system and enter habitable space.

Control and suppression of air pressure transients Air pressure transients are an unwanted consequence of normal system operation and, although unavoidable, it is possible to protect water trap seal integrity through the correct alleviation of any pressure fluctuations. Traditionally, this has been approached through passive solutions which rely on the provision of cross connections and vertical stacks vented to atmosphere. However, this approach, while both proven and traditional, has inherent limitations (Swaffield, 2006). The key to maintaining a balance of pressure within the building drainage system is to provide pressure relief as close to the source as possible; long pipe runs and remote vent terminations lead to delays in the arrival of relieving reflections and therefore compromise system integrity. More recently, active solutions to the control and suppression of air pressure transients have been developed providing necessary localised relief.

Negative air pressure transients, which communicate the need for more air and represents a suction force, can be alleviated by air admittance valves (AAVs) which, responding directly to the local pressure conditions, opens as the pressure falls to allow inward relief

airflow, hence limiting the pressure excursions experienced by the water trap seal. To avoid compromising system integrity by allowing foul sewer gases to enter the building, the AAV is designed with a fail-safe mechanism which ensures that it remains closed when not in use or when the local pressure exceeds atmospheric. AAVs can be installed locally to the water trap seal or at the stack termination to avoid the need for a roof penetration

Positive air pressure transients, which communicate the need to reduce the airflow and represents a pushing force, can be alleviated by variable volume containment attenuators (positive pressure reduction devices (PPRDs)) which absorb the airflow driven by positive air pressure transients. The positive pressure reduction devices (PPRDs), consisting of a variable volume bag that expands under the influence of a positive pressure transient, is capable of reducing the magnitude of a positive air pressure transient by up to 90% (Swaffield et al., 2005a, 2005b) by providing an alternative route which diverts and attenuates the system airflows gradually due to the significantly reduced wave speed within the positive pressure reduction devices (PPRDs). due to the properties of its elastic pipe construction. Designed as a collapsible reservoir, the variable volume bag provides an additional volume unseen by the system when the pressure regime at that point is sub-atmospheric, which absorbs the extra air induced by the positive air pressure transient.

Each positive pressure reduction devices (PPRDs) must meet the testing requirements of ASSE 1030

Base of stack.

The base of the stack is the most likely place for a blockage in the airflow to occur. As the distance between the base of the stack and the top stack termination is the maximum distance possible within the system, then a blockage at this location will lead to the greatest possible pressure rise. It is therefore recommended to use two PPRDs in series at the base of the stack. The devices should be located below the first branch connected to the stack. Note that is it still recommend that branches in the lower part of the stack be connected directly to the horizontal drainage and not to the main stack.
Offsets within the vertical stack, which in the past were wrongfully thought to “slow down” the water flow in tall buildings, can also be the cause of significant positive pressure

~~For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 gallon per minute = 3.785 L/m.~~

Add new text as follows:

1106.2.2 Sizing. Storm drain pipe sizing shall be sized in accordance with one of the following:

1. Pipe sizing tables or equations in accordance with Section 1106.2.3 and 1106.2.4
2. The sizing tables included in a listed piping system's manufacturer's installation instructions
3. Engineering methods.

1106.2.3 Sizing tables and equations. This section applies to horizontal drainage systems using building gravity. Where the drainage system material is known, Tables 1106.2.3(1), 1106.2.3(2) and 1106.2.3(3) shall be used to size drainage piping.
Where Equation 11-1 is used to determine the expected flow rate seen at a roof drain, or building drain.

Where Equations 11-2, 11-3 and 11-4 are used to size drainage piping based on the drainage pipe material used.

1. The rainfall rate falling on a roof surface shall be converted to a gallon per minute (L/m) flow rate in accordance with Equation 11-1, The Rational Method.$Q = C \times R \times A \times 0.0104$ (Equation 11-1)
   Where: C = Discharge Coefficient, *the roughness of the roof's surface.* Use 1.0 unless permitted by the local authority to factor in roof roughness for primary storm drainage. Secondary drainage shall use 1.0 in all cases.
   Q = Flow rate in gallons per minute (L/m)
   R= Rainfall intensity in inches (mm) per hour.
   A = Projected roof area in square feet (m^2)
2. The flow rates for horizontal sloped drains shall be calculated by use of the Flow Rate Equation and the Manning Equation based on full flow for pipe diameters of a given material, or coefficient of roughness.

   The Flow Rate Equation, Equation 11-2
   $Q = A \times V$ (Equation 11-2)

   Where: Q = Flow rate in gallons per minute (L/m)
   A = Cross-sectional area of the full flow

   V = Velocity of flow, feet per second (L/s)

   The Manning Equation, Equation 11-3
   $V = (k/n) \times R^{2/3} \times S^{1/2}$ (Equation 11-3)
   Where: V = Velocity of flow, feet per second (m/s)

   k = unit conversion factor, 1.486 in English units

   n = roughness (Manning) coefficient

   R = hydraulic radius of pipe, ft (m); for full flow pipe, use radius of the pipe

   S = slope of pressure gradient

   The modified Flow Rate Equation, Equation 11-4
   $Q = A \times (k/n) \times R^{2/3} \times S^{1/2}$ (Equation 11-4)

TABLE 1106.2.3 ROUGHNESS COEFFICIENT, n, FOR USE IN EQUATION 11-4

12	3,270
15	5,540

For SI: 1 inch = 25.4 mm, 1 foot = 304.8 mm, 1 gallon per minute = 3.785 L/m

Reason: If a building using cast iron storm drain pipe built from the model 2015, 2018, 2021 or 2024 codes were to have roof issues in the future; there is risk to the ICC because of faulty information in sizing storm drains. This proposal aims to fix that so engineers can follow a more complete model code.

As engineers, we have an ethical contract to not impose a hazard onto the occupants of the buildings we design. In its current form, the storm piping code imposes a hazard onto the occupants of the buildings we design. If we follow the current storm drain sizing criteria in 1106 and cast iron pipe is used, then the pipes would undersized between 20-50%, pending the size and slope of the installed pipe. Undersizing roof drain pipes increasing the possibility of the primary drains being overloaded and water ponding on the roof greater than the assumptions made by the structural engineer. The printed Tables in the 2015, 2018, 2021 and 2024 codes are assuming PVC pipe. The printed Tables in the IPC 2012 and earlier editions assumed aged cast iron. We must change this code immediately for the safety of the public and for the engineer's awareness in sizing pipes for a proper working system. This proposed change is a large overhaul from prior storm drainage sections, a code and commentary could be provided, but I didn't submit the context for that here. The layout and wording used was mimicked from the International Fuel Gas Code for gas pipe sizing (section 402), with obvious differences, so that the ICC reads similarly.

Use of roughness coefficients for tall/thick green roofs is viable, which is why mention of the complete Rational Method is shared. It would be fantastic if plumbing engineers use the same formulas as our Civil friends. It is true, storm piping within a building would have gravitational influence to drain faster if there is ponding at the roof drain, but this level of complexity does not appear warranted.

The manipulation of units can be seen/tested in the excels attached. PDFs are also included. I trusted the Manning's Roughness Coefficients from engineering toolbox, and have included them as a reference. The aged cast iron value for "n" was reverse engineered from the legacy storm tables. See documents "Manning Formula_proving code is based on Manning.pdf" and "Storm Rationale Method_04-Storm Drainage Calc.pdf" to see how accurate use of Manning Equation is to the legacy storm tables, so 0.0152 was proposed for the 2027 code to give homage to all storm tables of the last 20 years. PDFs and excel justifying the proposed tables are attached to answer questions about how the numbers were generated, and the excel can be used to see how the proposed Equations can be used should a less common pipe material be used.

Bibliography: For pipe roughness coefficients:

https://www.engineeringtoolbox.com/mannings-roughness-d_799.html

The layout and wording used was mimicked from the International Fuel Gas Code for gas pipe sizing (section 402), with obvious differences

The Rational Method and Manning Equation were sourced from my college fluid dynamics book. But they are readily available formulae that need not be sourced, right? I can provide more information as needed.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

$20 / foot of storm pipe.

Estimated Immediate Cost Impact Justification (methodology and variables):

The potential cost increase would only be for cast iron (metal) pipe. The current code edition reflects pipe sizes for PVC/plastic pipe, and those values in the charts remain the same.

The cost was calculated on a cost per linear foot of pipe basis.

I found list prices from a leading cast iron foundry showing costs for 10-foot sections of no hub cast iron pipes. Note that from the reasoning section, PVC pipes can carry ~20% more water when compared to the same size cast iron pipes because of a smoother interior. Here are the costs for convenience on how the number above was guesstimated:

- 2" x 10' pipe --> $174

- 3" x 10' --> $240

- 4" x 10' --> $312

- 5" x 10' --> $449

- 6" x 10' --> $536

- 8" x 10' --> $834

- 10" x 10' --> $1,417

- 12" x 10' --> $2,059

- 15" x 10' --> $3,010

Note that the proposed code change will not require a certain material to be used, but with the differentiation of sizes between PVC and cast iron, more engineers may opt to use PVC pipe as a cost savings measure. To which, this cost impact analysis would be useless as pipe material change adds a certain degree of complexity. If the engineer uses PVC in all storm drain systems, then there would not be a cost impact.

Estimated Life Cycle Cost Impact:

no change

P152-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The language is unenforceable and is more prescriptive that what is required. (14-0)

P152-24

Individual Consideration Agenda

Comment 1:

IPC: 1106.2, 1106.2.1, 1106.2.2, 1106.2.3, 1106.2.3.1 (New), 1106.2.3.2 (New), 1106.2.4

Proponents: Emily Lorenz, self (emilyblorenz@gmail.com); Christopher Winnie, self (chris.winnie@smithgroup.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Plumbing Code

Revise as follows:

1106.2 Size of storm drain piping. ~~The size of~~ Vertical and horizontal storm drain piping shall be sized in accordance with Sections 1106.2.1 through 1106.2.4, and shall be checked against the roof drain manufacturer's published flow rate for the specific roof drain model and size to verify that the selected roof drain will handle the anticipated flow. The horizontal sloped drains and vertical storm drain piping shall be sized to accommodate the volumetric flow rate of storm drainage, assuming all roof drains are at full capacity simultaneously.

1106.2.1 Maximum storm water demand. The rainfall rate falling on a roof surface shall be converted to a gallon per minute (L/m) volumetric flow rate (Q) in accordance with Equation 11-1.
Q = C x R x A x 0.0104 (Equation 11-1)
Where: C = Discharge Coefficient, the roughness of the roof's surface.

Q = Flow rate in gallons per minute (L/m)

R = Rainfall intensity in inches (mm) per hour.

A = Projected roof area in square feet (m)

The volumetric flow rate of storm drainage shall be the sum of the connected roof drain(s). The total connected load shall be used as the basis for pipe sizing, assuming all roof drains are at full capacity simultaneously.

1106.2.2 Sizing. Storm drain pipe sizing shall be sized in accordance with one of the following:

1. Horizontal p ~~P~~ipe sizing tables or equations in accordance with Section 1106.2.3 and vertical pipe sizing table in accordance with Section 1106.2.4
2. The sizing tables included in a listed piping system's manufacturer's installation instructions
3. Engineering methods.

1106.2.3 Horizontal s~~S~~izing tables and equations. This section applies to horizontal drainage systems using building gravity. Pipes for horizontal drainage systems shall be sized in accordance with Section 1106.2.3.1 or Section 1106.2.3.2. ~~Where the drainage system material is known, Tables 1106.2.3(1), 1106.2.3(2) and 1106.2.3(3) shall be used to size drainage piping.~~
~~Where Equation 11-1 is used to determine the expected flow rate seen at a roof drain, or building drain.~~

~~Where Equations 11-2, 11-3 and 11-4 are used to size drainage piping based on the drainage pipe material used.~~

1. ~~The rainfall rate falling on a roof surface shall be converted to a gallon per minute (L/m) flow rate in accordance with Equation 11-1, The Rational Method.Q = C x R x A x 0.0104 (Equation 11-1)~~
   ~~Where: C = Discharge Coefficient, *the roughness of the roof's surface*. Use 1.0 unless permitted by the local authority to factor in roof roughness for primary storm drainage. Secondary drainage shall use 1.0 in all cases.~~
   ~~Q = Flow rate in gallons per minute (L/m)~~
   ~~R= Rainfall intensity in inches (mm) per hour.~~
   ~~A = Projected roof area in square feet (m^2)~~
2. ~~The flow rates for horizontal sloped drains shall be calculated by use of the Flow Rate Equation and the Manning Equation based on full flow for pipe diameters of a given material, or coefficient of roughness.~~

   ~~The Flow Rate Equation, Equation 11-2~~
   ~~Q = A x V (Equation 11-2)~~

   ~~Where: Q = Flow rate in gallons per minute (L/m)~~
   ~~A = Cross-sectional area of the full flow~~

   ~~V = Velocity of flow, feet per second (L/s)~~

   ~~The Manning Equation, Equation 11-3~~
   ~~$V = (k/n) \times R^{2/3} \times S^{1/2}$ (Equation 11-3)~~
   ~~Where: V = Velocity of flow, feet per second (m/s)~~

   ~~k = unit conversion factor, 1.486 in English units~~

   ~~n = roughness (Manning) coefficient~~

   ~~R = hydraulic radius of pipe, ft (m); for full flow pipe, use radius of the pipe~~

   ~~S = slope of pressure gradient~~

   ~~The modified Flow Rate Equation, Equation 11-4~~
   ~~$Q = A \times (k/n) \times R^{2/3} \times S^{1/2}$ (Equation 11-4)~~

Add new text as follows:

1106.2.3.1 Horizontal sizing tables. Tables 1106.2.3(1), 1106.2.3(2) and 1106.2.3(3) shall be used to size horizontal drainage piping for the appropriate drainage pipe material.

1106.2.3.2 Horizontal sizing equations. Horizontal drainage piping shall be sized based on Equations 11-2, 11-3, and 11-4 and the drainage pipe material used.

The flow rates for horizontal sloped drains shall be calculated by use of the Flow Rate Equation and the Manning Equation based on full flow for pipe diameters of a given material, or coefficient of roughness.

The Flow Rate Equation, Equation 11-2

$Q = A \times V$ (Equation 11-2)

Where: Q = Flow rate in gallons per minute (L/m)

A = Cross-sectional area of the full flow

V = Velocity of flow, feet per second (L/s)

The Manning Equation, Equation 11-3

$V = (k/n) \times R^{2/3} \times S^{1/2}$ (Equation 11-3)

Where: V = Velocity of flow, feet per second (m/s)

k = unit conversion factor, 1.486 in English units

n = roughness (Manning) coefficient

R = hydraulic radius of pipe, ft (m); for full flow pipe, use radius of the pipe

S = slope of pressure gradient

The modified Flow Rate Equation, Equation 11-4

$Q = A \times (k/n) \times R^{2/3} \times S^{1/2}$ (Equation 11-4)

Revise as follows:

1106.2.4 Vertical sizing table. Vertical storm drain piping shall be sized for the expected volumetric flow rate through the roof drain(s). The volumetric flow rate, as calculated in accordance with Section 1106.2.~~2~~1, shall be checked against the roof drain manufacturer's published flow rate for the specific roof drain model and size to verify that the selected roof drain will handle the anticipated flow. The storm drain piping shall not exceed that specified in Table 1106.2.4.

Reason: Many of the changes proposed revert language in the original charging language to what is currently in the IPC. No changes were made to the tables in the original proposal, so those tables are not included within this code change. In response to the Committee's Reason for disapproval based on "language is unenforceable and is more prescriptive than what is required"

The proposed changes mirror those in the current edition of International Fuel Gas Code (IFGC) for sizing of natural gas and propane systems. The IFGC has used the same prescriptive formulas for multiple code cycles. For these reasons, we feel that the language is enforceable. However, I am open to specific modifications that the committee feels would improve the language. The provided Tables for PVC and new cast iron are included so engineers and inspectors can more quickly confirm appropriate pipe sizes, similar to how the IFGC is enforced.

It is important that the engineers, designers and other entities referring to the code have the most accurate data available. Friction plays a pivotal role in the flow/movement of mass including fluids, gasses, electric current or physical items. The formulas calculating the flow/movement of mass use pressure drop, voltage or force as a variable to define the amount of friction opposing the movement of the mass. There is no mass moving on Earth that is able to avoid friction losses. It is known that plastic pipes have a smoother interior than metallic pipes. There are known friction coefficients that we can use to calculate the impact of friction on the flow of storm water within a pipe. Not all Storm Drain systems use plastic (PVC/ABS) and not all systems use cast iron, so it would be of most use to the industry if the Tables in Chapter 11 for Storm Drain Pipe Sizing included sizing criteria for both plastic and metallic piping.

In the most recent edition of International Plumbing Code (2024), Table 1106.2 Storm Drain Pipe Sizing is the only table listed to size drain pipes within and below a building. IPC does not currently alter sizing criteria for the pipes based on friction. This code change assists the user in correcting pipe sizes for friction.

In referencing the “Manning Formula, proving code is based on Manning.pdf” in the original code-change proposal, we see the IPC (2015-2024) flow rates for horizontal storm piping highlighted in forest green. The Manning equation calculated flow rate for the same size horizontal storm pipes are highlighted in a lighter green. A simple comparison between the flow rates defined in code and my own calculated flow rates (assuming 0.010 for pipe friction; PVC) is highlighted in a light red color. It can be seen the accuracy between the code and my own calculations are more than 95% accurate. Use of different friction coefficients can be used to determine the appropriate maximum flow rate that a pipe of (any) size and (any) material can carry.

In May of 2024, a peer reviewed white paper, IAPMO/ASPE WHITE PAPER 2-2024 ‘Capacities of Stacks and Horizontal Drains in Storm Drainage Systems’, was released. The paper demonstrates a strong correlation between pipe material and draining flow rates. The adjusted equations in this code-change proposal agree with those presented in the peer-reviewed IAPMO/ASPE white paper.

In 2025, ASPE will open a task group to amend conflicts with the current ASPE Tables on storm drain pipe sizes and the conclusions found in the referenced white paper and the findings shared in this proposal.

Bibliography: See references in original code-change proposal.

In addition, the IAPMO/ASPE White Paper 2-2024, "Capacities of Stacks and Horizontal Drains in Storm Drainage Systems," is available through IAPMO.

Cost Impact: Increase

Estimated Immediate Cost Impact:

See original code-change proposal.

Estimated Immediate Cost Impact Justification (methodology and variables):

See original code-change proposal.

Comment (CAH2)# 39

Comment 2:

Proponents: Christopher Winnie, self (chris.winnie@smithgroup.com) requests As Submitted

Reason: In response to the Committee's Reason for disapproval based on "language is unenforceable and is more prescriptive than what is required"

The proposed changes mirror those in the current edition of International Fuel Gas Code (IFGC) for sizing of natural gas and propane systems. The IFGC has used the same prescriptive formulas for multiple code cycles. For these reasons, we feel that the language is enforceable. However, I am open to specific modifications that the committee feels would improve the language. The provided Tables for PVC and new cast iron are included so engineers and inspectors can more quickly confirm appropriate pipe sizes, similar to how the IFGC is enforced.

It is important that the engineers, designers and other entities referring to the code have the most accurate data available. Friction plays a pivotal role in the flow/movement of mass including fluids, gasses, electric current or physical items. The formulas calculating the flow/movement of mass use pressure drop, voltage or force as a variable to define the amount of friction opposing the movement of the mass. There is no mass moving on Earth that is able to avoid friction losses. It is known that plastic pipes have a smoother interior than metallic pipes. There are known friction coefficients that we can use to calculate the impact of friction on the flow of storm water within a pipe. Not all Storm Drain systems use plastic (PVC/ABS) and not all systems use cast iron, so it would be of most use to the industry if the Tables in Chapter 11 for Storm Drain Pipe Sizing included sizing criteria for both plastic and metallic piping.

In the most recent edition of International Plumbing Code (2024), Table 1106.2 Storm Drain Pipe Sizing is the only table listed to size drain pipes within and below a building. IPC does not currently alter sizing criteria for the pipes based on friction. This code change assists the user in correcting pipe sizes for friction.

In referencing the attached "Manning Formula, proving code is based on Manning.pdf", we see the IPC (2015-2024) flow rates for horizontal storm piping highlighted in forest green. The Manning equation calculated flow rate for the same size horizontal storm pipes are highlighted in a lighter green. A simple comparison between the flow rates defined in code and my own calculated flow rates (assuming 0.010 for pipe friction; PVC) is highlighted in a light red color. It can be seen the accuracy between the code and my own calculations are more than 95% accurate. Use of different friction coefficients can be used to determine the appropriate maximum flow rate that a pipe of (any) size and (any) material can carry.

In May of 2024, a peer reviewed white paper, IAPMO/ASPE WHITE PAPER 2-2024 'Capacities of Stacks and Horizontal Drains in Storm Drainage Systems', was released. The paper demonstrates a strong correlation between pipe material and draining flow rates. The adjusted equations in this code-change proposal agree with those presented in the peer-reviewed IAPMO/ASPE white paper.

In 2025, ASPE will open a task group to amend conflicts with the current ASPE Tables on storm drain pipe sizes and the conclusions found in the referenced white paper and the findings shared in this proposal.

BASED ON CHAPTER 1 OF ASPE VOLUME 2 2018-19

PROJECT NAME: Manning Formula

PROJECT NUMBER: xxxxx.xxx

Manning formula --> V = (k/n) * R^2/3 * S^1/2

Flow formula --> Q = A * V

where:

Q = quantity rate of flow; cubic feet per second

A = Cross-sectional area of flow, ft^2

V = velocity of flow, feet per second

R = hydraulic radius of pipe, ft

S = slope of pressure gradient

C = Hazen-Williams coefficient

n = manning coefficient, (varies with pipe roughness)

k = unit conversion factor, 1.486 in english units

2012 IPC (assumed cast iron 0.0151 and 1% slope)

pipe Ø (inches)	Pipe slope (inches per ft)	n	k
3.00	0.125	0.01510	1.486
4.00	0.125	0.01510	1.486

Comment (CAH2)# 461

P157-24 Part I

IPC: SECTION 202, SECTION 202 (New), CHAPTER 13, 1301.1, 1301.2, TABLE 1301.2(1) (New), TABLE 1301.2(2) (New), TABLE 1301.2(3) (New), 1301.2.1, 1301.2.2, 1301.3, 1301.4, 1301.5, 1301.6, 1301.7, 1301.8, 1301.9, 1301.9.1, 1301.9.2, 1301.9.3, 1301.9.3.1, 1301.9.3.2, 1301.9.4, 1301.9.5, 1301.9.6, 1301.9.7, 1301.9.8, 1301.9.9, 1301.9.10, 1301.10, 1301.10.1 (New), 1301.10.2 (New), 1301.10.3 (New), 1301.11, 1301.12, 1301.13 (New), SECTION 1302, 1302.1, 1302.2, 1302.2.1, 1302.4 (New), 1302.3, 1302.4, 1302.4.1, 1302.4.2, 1302.4.3, 1302.4.4, 1302.5, 1302.8 (New), 1302.6, 1302.6.1, 1302.7, 1302.7.1, 1302.7.2, 1302.8, 1302.8.1, 1302.8.2, 1302.9, 1302.10, 1302.11, 1302.11.1, 1302.11.2, 1302.11.3, 1302.12, 1302.12.1, 1302.12.2, 1302.12.3, 1302.12.4, 1302.12.5, 1302.12.6, 1302.14.7 (New), 1302.13, 1302.13.1, 1302.13.2, 1302.13.3, 1302.13.4, DOE (New), (New)

Proposed Change as Submitted

Proponents: Andrew Bevis, Chair, Plumbing, Mechanical and Fuel Gas Code Action Committee (pmgcac@iccsafe.org)

THIS IS A 2 PART CODE CHANGE. PART I WILL BE HEARD BY THE PLUMBING CODE COMMITTEE. PART II WILL BE HEARD BY THE IRC-MP CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Plumbing Code

SECTION 202
GENERAL DEFINITIONS

Add new definition as follows:

BLACKWATER. Wastewater that contains urine or fecal matter.

BLACKWATER CONTRIBUTION (BWC). The fraction equal to the quantity of blackwater divided by the sum of the quantities of raw and treated blackwater plus surface water, groundwater, and water from approved potable water systems.

LOG REDUCTION VALUE (LRV). The measure of the ability of a treatment process to remove or inactivate microorganisms such as bacteria, protozoa and viruses. LRV is the logarithm base 10 of the ratio of the levels of a pathogenic organism or other contaminant before and after treatment.

POTABLE REUSE. The practice of treating wastewater and utilizing it for potable applications.

REUSE WATER. Wastewater or rainwater treated to a level of quality suitable for reuse.

WASTEWATER. The water generated after use of freshwater, raw water, drinking water, or saline water in a deliberate application or process.

WATER REUSE SYSTEM. A system for the treatment, storage, distribution, and reuse of water including, but not limited to, wastewater and captured rainwater.

Revise as follows:

CHAPTER 13
~~NONPOTABLE~~ WATER REUSE SYSTEMS

1301.1 General. The provisions of Chapter 13 shall govern the materials, design, construction and installation of systems for the ~~collection~~ treatment, storage, ~~treatment~~ and distribution of ~~nonpotable~~ reuse water. ~~For nonpotable rainwater systems, the~~ The provisions of CSA B805/ICC 805 shall be an alternative for regulating the materials, design, construction and installation of systems for rainwater collection, storage, treatment and distribution ~~of nonpotable water~~. The application of water reuse systems shall comply with all applicable laws, rules, and ordinances of the jurisdiction. ~~The use and application of nonpotable water shall comply with laws, rules and ordinances applicable in the jurisdiction~~.

1301.2 ~~Water~~ Reuse water quality. ~~Nonpotable~~ Reuse water ~~for each end use application~~ quality shall meet the minimum ~~water quality~~ requirements as specified in Tables 1301.2(1), 1301.2(2), 1301.2(3), and as established for the intended application by ~~the~~ all applicable laws, rules and ordinances ~~applicable in~~of the jurisdiction. Where ~~nonpotable~~ water from ~~different~~multiple sources is combined ~~in a system~~, the system shall comply with the most stringent of the requirements of this code that are applicable to such sources.

Add new text as follows:

TABLE 1301.2(1) REQUIRED WATER QUALITY FOR REUSE APPLICATIONS

Use Category	Application	Exposure[a]	Quality Tier[b]
Direct Potable Reuse	Direct Potable Reuse	DC	4
Indirect Potable Reuse	Aquifer Recharge - Direct Injection	IC	2
(Treatment Follows Reuse Application)	Aquifer Recharge - Surface Application	IC	2
	Aquifer Storage and Recovery	IC	2
	Rapid Infiltration Basins	IC	2
	Infiltration/Percolation Lagoons	IC	2
	Raw Water Augmentation	IC	2
	Saltwater Intrusion Barrier	IC	2
	Surface Water Augmentation to a Supply Source	IC	2
Irrigation of Food Crops for Human Consumption (Spray/Drip)	Food crop with processing that destroys pathogens (Restricted Access)	LC	1
	Orchards and Vineyards	AC/LC	4/1
	Water contacts edible portion of food crop (Includes Root Crops)	AC	4
	Water doesn't contact edible portion of food crop (Restricted Access)	IC	2
Irrigation of Crops Not for Human Consumption (Spray/Drip)	Christmas Tree Farms	AC/LC	3/1
	Hemp Crops	AC/LC	3/1
	Fiber crops	AC/LC	3/1

	Snow Making (Storage)	AC	3
	Stack Scrubbing	LC	3
	Stream Flow Augmentation	LC	1
	Street, Sidewalk, Parking Lot Cleaning (Restricted Access)	LC	1
	Street, Sidewalk, Parking Lot Cleaning (Unrestricted Access)	AC	3
	Vehicle and equipment Washing	AC	3
	Wastewater Treatment (Process Uses)	LC	1
	Window Washing	AC	3

a. Where two Exposures and two Tiers are cited, the first refers to spray irrigation and the second refers to drip irrigation (or other subsurface irrigation).

b. Where the equipment manufacturer or the jurisdiction requires a level of free residual disinfectant that exceeds the requirement of the quality Tier indicated, such excess shall be provided.

DC (Quality Tier 4) = Direct Public Contact/Consumption Intended

AC (Quality Tier 3) = Aerosolization, or Accidental/Limited

Consumption Possible

IC (Quality Tier 2) = Indirect Public Consumption Intended or Possible

LC (Quality Tier 1) = Limited Contact / No Consumption Intended

TABLE 1301.2(2) WATER QUALITY FOR TIERS OF REUSE

Quality Tier	Minimun Design Water Quality
4	United States Environmental Protection Agency (USEPA) Primary and Secondary Drinking Water Quality Standards (40 CFR 141), plus 18/15/15 Log Removal of Enteric Viruses, Giardia, and Cryptosporidium
3	Compliant with all applicable laws, rules, ordinances and NSF 350
2	Compliant with all applicable laws, rules, ordinances, and end use fixture / equipment manufacturer requirements
1	Compliant with all applicable laws, rules, ordinances, and end use fixture / equipment manufacturer requirements

TABLE 1301.2(3) LOG REDUCTION (LRV) CREDITS APPLICALBLE TO DPR BASED ON SOURCE WATER

Source Water	Maximum LRV Credits for DPR
Blackwater	0/0/0
Blackwater blended with groundwater [a]	LRV credit [b] = negative log of BWC
Blackwater blended with surface water [a]	LRV credit [b] = negative log of BWC
Blackwater blended with groundwater and surface water [a]	LRV credit [b] = negative log of BWC
Graywater	Case by case basis
Stormwater	Case by case basis
Rainwater	Case by case basis
Industrial Water	Case by case basis
Process Water	Case by case basis

a. Groundwater and surface waters must be either an untreated source of drinking water approved by the jurisdiction or a treated drinking water approved by the jurisdiction.

b. LRV credit for all source waters containing blackwater shall not exceed 2.0.

Delete without substitution:

~~**1301.2.1 Residual disinfectants.** Where chlorine is used for disinfection, the nonpotable water shall contain not more than 4 ppm (4 mg/L) of chloramines or free chlorine when tested in accordance with ASTM D1253. Where ozone is used for disinfection, the nonpotable water shall not contain gas bubbles having elevated levels of ozone at the point of use. **Exception:** Reclaimed water sources shall not be required to comply with these requirements.~~

~~**1301.2.2 Filtration required.** Nonpotable water utilized for water closet and urinal flushing applications shall be filtered by a 100-micron (0.1 mm) or finer filter. **Exception:** Reclaimed water sources shall not be required to comply with these requirements.~~

Revise as follows:

1301.3 Signage required. ~~Nonpotable~~ Where nonpotable water is supplied to outlets such as hose connections, hydrants, open-ended pipes and faucets, each outlet shall be identified at the point of use ~~for each outlet~~ with signage that reads as follows: ~~"Nonpotable water is utilized for [application name].~~ CAUTION: NONPOTABLE WATER – DO NOT DRINK." The words shall be legibly and indelibly printed on a tag or sign constructed of corrosion-resistant waterproof material or shall be indelibly printed on the fixture. The letters of the words shall be not less than 0.5 inch (12.7 mm) in height and in colors in contrast to the background on which they are applied. In addition to the required ~~wordage~~ text, the pictograph shown in Figure 1301.3 shall appear on the signage required by this section.

1301.4 Permits. Permits shall be required for the construction, installation, operation, alteration and repair of ~~nonpotable~~ water reuse systems. Construction documents, engineering calculations, diagrams, operations and maintenence manuals,and other such data pertaining to the ~~nonpotable~~ water reuse systems shall be submitted with each permit application.

1301.5 Potable water connections. Where a potable system is connected to a nonpotable water system, the potable water supply shall be protected against backflow in accordance with Section 608.

Revise as follows:

1301.6 Components and materials. Piping, plumbing components and materials used in ~~collection and~~ conveyance and distibution systems shall be of material approved ~~by the manufacturer~~ for the intended application.

1301.7 Insect and vermin control. The system shall be protected to prevent the entrance of insects and vermin into process tanks and equipment, storage tanks and piping systems. Screen materials shall be compatible with contacting system components and shall not accelerate the corrosion of system components.

1301.8 Freeze protection. Where ~~sustained~~ freezing temperatures occur, provisions shall be made to keep storage tanks, process tanks and equipment and the related piping from freezing.

1301.9 ~~Nonpotable water storage~~ Water tanks. ~~Nonpotable w~~Water storage and process tanks shall comply with Sections 1301.9.1 through 1301.9.10.

1301.9.1 Location. Any storage tank, process tank and equipment
or portion thereof that is above grade shall be protected from direct exposure to sunlight by one of the following methods:

1. Tank construction using opaque, UV-resistant materials such as heavily tinted plastic, fiberglass, lined metal, concrete, ~~wood,~~ or painted to prevent algae growth.
2. Specially constructed sun barriers.
3. Installation in garages, crawl spaces or sheds.

1301.9.2 Materials. ~~Where collected on site,~~ Prior to treatment for reuse, water shall be collected in an *approved* tank constructed of durable, nonabsorbent and corrosion-resistant materials. The ~~storage~~ tank shall be constructed of materials compatible with ~~any~~ all disinfection systems used to treat water upstream of the tank and with ~~any~~all systems used to maintain water quality in the tank. ~~Wooden storage tanks that are not equipped with a makeup water source shall be provided with a flexible liner.~~

1301.9.3 Foundation and supports. ~~Storage~~ All tanks shall be supported on a firm base capable of withstanding the weight of the ~~storage~~ tank when filled to capacity. ~~Storage t~~Tanks shall be supported in accordance with the *International Building Code*.

1301.9.3.1 Ballast. Where the soil can become saturated, an underground ~~storage~~ tank shall be ballasted, or otherwise secured, to ~~prevent the tank from floating out of the ground~~ resist buoyant forces when empty. The combined weight of the empty tank and hold-down ballast shall ~~meet or~~ exceed the buoyancy force ~~of~~ applied to the tank. Where the installation requires a foundation, the foundation shall be flat and shall be designed to resist the maximum buoyant forces when the tank is empty, and to support the weight of the ~~storage~~ tank when full, consistent with the bearing capability of adjacent soil.

1301.9.3.2 Structural support. Where installed below grade, ~~storage~~ tank installations shall be designed to withstand earth and surface structural loads without damage and with minimal deformation when empty or filled with water.

1301.9.4 Makeup water. Where an uninterrupted supply is required for the intended application, ~~potable or reclaimed water shall be provided as a~~an additional source of makeup water shall be provided for the storage tank. ~~The~~ All makeup water supply~~y~~ies shall be protected against backflow in accordance with Section 608. A *full-open valve* located on the makeup water supply lines to the storage tank ~~shall be provided~~. ~~Inlets to~~ Flow into the storage tank shall be controlled by fill valves or other automatic supply valves installed to prevent the tank from overflowing and to prevent the water level from dropping below a predetermined point. ~~Where makeup water is provided,~~ tThe water level shall not be permitted to drop below the ~~source water inlet or the~~ intake of any ~~attached~~ pump supplying makeup water.

1301.9.5 Overflow. ~~The storage t~~Tanks shall be equipped with an overflow pipe having a diameter not less than that shown in Table ~~606.5.4~~ 606.5(4). The overflow pipe shall be protected from insects ~~or~~ and vermin and shall discharge in a manner consistent with all applicable laws, rules, and ordinances of the jurisdiction for storm water runoff requirements of the jurisdiction. The overflow pipe shall discharge at a sufficient distance from the tank to avoid damaging the tank foundation or the adjacent property. Drainage from overflow pipes shall be directed to prevent freezing on roof walkways, and on sidewalks, pavement, and other accessways subject to vehicular or pedestrian traffic. The overflow drain shall not be equipped with a shutoff valve. A cleanout shall be provided on each overflow pipe in accordance with Section 708.

1301.9.6 Access. Not less than one access opening shall be provided to allow inspection and cleaning of the tank interior. Access openings shall have an *approved* locking device or other *approved* method of securing access. Below-grade ~~storage~~ tanks, located outside of the building, shall be provided with ~~a manhole~~ an access opening either not less than 24 inches (610 mm) square or with an inside diameter not less than 24 inches (610 mm). ~~Manholes~~ Access opening shall extend not less than 4 inches (102 mm) above ground ~~or~~ and shall be designed to prevent water infiltration. ~~Finished~~ The finished grade shall be sloped away from the ~~manhole~~ maintenance hole to divert surface water. ~~Manhole~~ Access opening covers shall be secured to prevent unauthorized access. Service ports in ~~manhole~~ access opening covers shall be not less than 8 inches (203 mm) in diameter and shall be not less than 4 inches (102 mm) above the finished grade level. The service port shall be secured to prevent unauthorized access. Access locations to confined spaces shall be labeled “CONFINED SPACE.”

Exception: ~~Treated water storage t~~Tanks that are less than 800 gallons (3028 L) in volume and installed below grade shall not be required to be equipped with a manhole an access opening provided that the tank has a service port of not less than 8 inches (203 mm) in diameter.

1301.9.7 Venting. ~~Storage t~~Tanks that receive flow by gravity shall be provided with a vent sized in accordance with Chapter 9 and based on the aggregate diameter of all tank influent pipes. The reservoir vent shall not be connected to sanitary drainage system vents. Vents shall be protected from contamination by means of an *approved* cap or U-bend installed with the opening directed downward. Vent outlets shall extend not less than 4 inches (102 mm) above grade or as necessary to prevent surface water from entering the ~~storage~~ tank. Vent openings shall be protected against the entrance of vermin and insects in accordance with the requirements of Section 1301.7.

1301.9.8 Draining of tanks. Tanks shall be provided with a means of emptying the contents for the purpose of service or cleaning. Tanks shall be drained by using a pump or by a drain located at the lowest point in the tank. The tank drain pipe shall discharge as required for overflow pipes and shall not be smaller in size than specified in Table ~~606.5.7~~ 606.5(7). Not less than one cleanout shall be provided on each drain pipe in accordance with Section 708.

Revise as follows:

1301.9.9 Marking and signage. Each nonpotable water ~~storage~~ tank shall be labeled with its rated volumetric capacity. The contents of ~~storage~~ tanks shall be identified with the words “CAUTION: NONPOTABLE WATER – DO NOT DRINK.” Where an opening is provided that could allow the entry of personnel, the opening shall be marked with the words, “DANGER – CONFINED SPACE.” Markings shall be indelibly printed on the tank or on a tag or sign constructed of corrosion-resistant waterproof material that is mounted on the tank. The letters of the words shall be not less than 0.5 inch (12.7 mm) in height and shall be of a color in contrast with the background on which they are applied.

1301.9.10 ~~Storage t~~Tank tests. ~~Storage~~ Pressurized tanks shall be be certified in accordance with Section 303.4. Tanks that receive flow by gravity shall tested in accordance with the following: ~~Storage t~~Tanks shall be filled with water to the overflow line prior to and during inspection. Seams and joints shall be left exposed and the tank shall remain watertight without leakage for a period of 24 hours.

1. After 24 hours, supplemental water shall be introduced for a period of 15 minutes to verify proper drainage of the overflow system and that there are no leaks.
2. The tank drain shall be observed for proper operation.
3. The makeup water system shall be observed for proper operation and successful automatic shutoff of the system at the refill threshold shall be verified.

1301.10 System abandonment. If the owner of an on-site ~~nonpotable~~ water reuse system or ~~rainwater collection and conveyance system~~ components thereof, elects to cease use of, or fails to properly maintain such system, the system shall be abandoned and shall comply with ~~the following:~~ Sections 1301.10.1 through 1301.10.3.

1. ~~All system piping connecting to a utility-provided water system shall be removed or disabled.~~
2. ~~The distribution piping system shall be replaced with an *approved* potable water supply piping system. Where an existing potable pipe system is already in place, the fixtures shall be connected to the existing system.~~
3. ~~The storage tank shall be secured from accidental access by sealing or locking tank inlets and access points, or filling with sand or equivalent.~~

Add new text as follows:

1301.10.1 Utility-Connected Piping. All system piping connecting to a utility-provided water system shall be removed or disabled.

1301.10.2 Distribution Piping. The distribution piping system shall be removed or replaced with an approved potable water supply piping system. Where an existing potable pipe system is already in place, the fixtures shall be connected to the existing system.

1301.10.3 Tanks. Tanks shall be removed, or secured from accidental access by sealing or locking tank inlets and access points, or filling with sand or equivalent.

Revise as follows:

1301.11 Trenching requirements for nonpotable water piping. Nonpotable water ~~collection and~~ distribution ~~piping and reclaimed water~~ piping shall be separated from the *building sewer* and potable water piping underground by 5 feet (1524 mm) of undisturbed or compacted earth. Nonpotable water ~~collection and~~ distribution piping shall not be located in, under or above cesspools, septic tanks, septic tank drainage fields or seepage pits. Buried nonpotable water piping shall comply with the requirements of Section 306. **Exceptions:**

1. The required separation distance shall not apply where the bottom of the nonpotable water pipe within 5 feet (1524 mm) of the *sewer* is not less than 12 inches (305 mm) above the top of the highest point of the *sewer* and the pipe materials conform to Table 702.3.
2. The required separation distance shall not apply where the bottom of the potable water service pipe within 5 feet (1524 mm) of the nonpotable water pipe is not less than 12 inches (305 mm) above the top of the highest point of the nonpotable water pipe and the pipe materials comply with the requirements of Table 605.4.
3. Nonpotable water pipe is permitted to be located in the same trench with a *building sewer*, provided that such *sewer* is constructed of materials that comply with the requirements of Table 702.2.
4. The required separation distance shall not apply where a nonpotable water pipe crosses a *sewer* pipe, provided that the pipe is sleeved to not less than 5 feet (1524 mm) horizontally from the *sewer* pipe centerline on both sides of such crossing, with pipe materials that comply with Table 702.2.
5. The required separation distance shall not apply where a potable water service pipe crosses a nonpotable water pipe, provided that the potable water service pipe is sleeved for a distance of not less than 5 feet (1524 mm) horizontally from the centerline of the nonpotable pipe on both sides of such crossing, with pipe materials that comply with Table 702.2.
6. Irrigation piping located outside of a building and downstream of the backflow preventer is not required to meet the trenching requirements where nonpotable water is used for outdoor applications.

1301.12 Outdoor outlet access. Sill cocks, hose bibbs, wall hydrants, yard hydrants and other outdoor outlets supplied by nonpotable water shall be located in a locked vault or shall be operable only by means of a removable key and marked in accordance with Section 1301.3.

Add new text as follows:

1301.13 Operations and monitoring. The design, installation, and continued operation of water reuse systems shall be in accordance with an approved operating and monitoring program. The program shall be implemented by an individual or entity in accordance with the requirements of the *International Property Maintenance Code*.

Revise as follows:

SECTION 1302
~~ON-SITE NONPOTABLE~~ WATER REUSE SYSTEMS

1302.1 General. The provisions of ASTM E2635 and Section 1302 shall govern the construction, installation, alteration and repair of water reuse systems. ~~on-site nonpotable water reuse systems for the collection, storage, treatment and distribution of on-site sources of nonpotable water as permitted by the jurisdiction water reuse systems.~~.

1302.2 Graywater ~~S~~sources. ~~On-site nonpotable water~~ Graywater reuse systems shall collect waste discharge from only the following sources: bathtubs, showers, lavatories, clothes washers ~~and laundry trays~~ , laundry trays, condensate, and other domestic wastewaters that are not expected to contain urine, fecal matter, grease, or food wastes. ~~Where *approved* and as appropriate for the intended application, water from other nonpotable sources shall be collected for reuse by on-site nonpotable water reuse systems.~~.

1302.3 ~~1302.2.1 Prohibited~~ Blackwater sources. ~~Wastewater containing urine or fecal matter~~ Blackwater shall ~~not~~ be ~~diverted to on-site nonpotable water reuse systems and shall discharge~~ discharged to the sanitary drainage system ~~of the building or premises~~ in accordance with Chapter 7~~. Reverse osmosis system reject water, water softener discharge water, kitchen sink wastewater, dishwasher wastewater and wastewater discharged from wet hood scrubbers shall not be collected for reuse in an on-site nonpotable water~~or to an approved on-site blackwater reuse system.

Add new text as follows:

1302.4 Other sources.. Other sources including, but not limited to, condensate, reverse osmosis system reject water, water softener discharge water, and wastewater discharged from wet-hood scrubbers shall also be considered for use in a water reuse system.

Revise as follows:

1302.5 ~~1302.3~~ Traps. Traps serving fixtures and devices discharging ~~wastewater to on-site nonpotable~~ water to water reuse systems shall comply with Section 1002.4.

Delete without substitution:

~~**1302.4 Collection pipe.** On-site nonpotable water reuse systems shall utilize drainage piping *approved* for use in plumbing drainage systems to collect and convey untreated water for reuse. Vent piping *approved* for use in plumbing venting systems shall be utilized for vents in the graywater system. Collection and vent piping materials shall comply with Section 702.~~

~~**1302.4.1 Installation.** Collection piping conveying untreated water for reuse shall be installed in accordance with Section 704.~~

~~**1302.4.2 Joints.** Collection piping conveying untreated water for reuse shall utilize joints *approved* for use with the distribution piping and appropriate for the intended applications as specified in Section 705.~~

~~**1302.4.3 Size.** Collection piping conveying untreated water for reuse shall be sized in accordance with drainage sizing requirements specified in Section 710.~~

Revise as follows:

1302.6 ~~1302.4.4~~ Pipe marking. Additional marking of collection piping conveying untreated water for reuse shall not be required beyond that required for sanitary drainage, waste and vent piping by Chapter 7.

1302.7 ~~1302.5~~ ~~Filtration~~ Treatment. ~~Untreated w~~Water collected for reuse shall be ~~filtered as required for the intended end use. Filters shall be provided with *access* for inspection and maintenance. Filters shall utilize a pressure gauge or other *approved* method to provide indication when a filter requires servicing or replacement. Filters shall be installed with shutoff valves immediately upstream and downstream to allow for isolation during maintenance.~~treated to meet the quality standards required in Tables 1301.2(1) and 1301.2(2).

Add new text as follows:

1302.8 Treatment systems.. Treatment systems shall be installed to allow access for inspection and maintenance. All treatment equipment shall utilize pressure gauges, level sensors, intensity meters, or other approved methods to indicate when servicing or replacement is required. All treatment equipment shall be installed with shutoff valves immediately upstream and downstream to allow for isolation during maintenance.

Revise as follows:

1302.9 ~~1302.6~~ ~~Disinfection and treatment~~ Tanks. ~~Where the intended application for nonpotable water collected on-site for reuse requires disinfection or other treatment or both, it shall be disinfected as needed to ensure that the required water quality is delivered at the point of use. Nonpotable water collected on-site containing untreated graywater shall be retained in collection reservoirs for not longer than 24 hours.~~ Nopotable tanks utilized in water reuse systems shall comply with Sections 1301.9, 1302.8.1 and 1302.8.2.

Delete without substitution:

~~**1302.6.1 Graywater used for fixture flushing.** Graywater used for flushing water closets and urinals shall be disinfected and treated by an on-site water reuse treatment system complying with NSF 350.~~

~~**1302.7 Storage tanks.** Storage tanks utilized in on-site nonpotable water reuse systems shall comply with Sections 1301.9, 1302.7.1 and 1302.7.2.~~

Revise as follows:

1302.9.1 ~~1302.7.1~~ Location. ~~Storage t~~Tanks shall be located with a minimum horizontal distance between various elements as indicated in Table ~~1302.7.1~~ 1302.7(1).

1302.9.2 ~~1302.7.2~~ Outlets. Outlets shall be located not less than 4 inches (102 mm) above the bottom of the ~~storage~~ tank and shall not skim water from the surface.

1302.10 ~~1302.8~~ Valves. Valves shall be ~~supplied~~ installed on ~~on-site nonpotable~~ the collection of the water reuse systems in accordance with Sections 1302.~~8~~ 9.1 and 1302.~~8~~ 9.2.

1302.10.1 ~~1302.8.1~~ Bypass valve. One three-way diverter valve listed and labeled to NSF 50 or other *approved* device shall be installed on collection piping upstream of each storage tank, ~~or drain field,~~ as applicable, to divert untreated on-site reuse sources to the sanitary *sewer* or approved receiving tank to allow servicing and inspection of the system. Bypass valves shall be installed downstream of fixture traps and vent connections. Bypass valves shall be marked to indicate the direction of flow~~, connection and storage tank or drainfield connection~~. Bypass valves shall be provided with *access* that allows for removal. Two shutoff valves shall not be installed to serve as a bypass valve.

1302.10.2 ~~1302.8.2~~ Backwater valve. One or more backwater valves shall be installed on each overflow and tank drain pipe. Backwater valves shall be installed in accordance with Section 714.

1302.11 ~~1302.9~~ Pumping and control system. Mechanical equipment including pumps, valves and ~~filters~~ treatment units shall have

access ~~and be removable~~ in order to ~~perform~~ to replace, repair, ~~maintenance~~ maintain and clean~~ing~~. The minimum flow rate and flow pressure delivered by the pumping system shall be appropriate for the application and in accordance with Section 604.

1302.12 ~~1302.10~~ Water pressure-reducing valve or regulator. Where the water pressure supplied by the pumping system exceeds 80 psi (552 kPa) static, a pressure-reducing valve shall be installed to reduce the pressure in the ~~nonpotable~~ water distribution system piping to 80 psi (552 kPa) static or less. Pressure-reducing valves shall be specified and installed in accordance with Section 604.8.

1302.13 ~~1302.11~~ Distribution piping. Distribution piping utilized in ~~on-site nonpotable~~ water reuse systems shall comply with Sections ~~1302.11.1~~ 1302.12.1 through ~~1302.11.3~~ 1302.12.3. **Exception:** Irrigation piping located outside of the building and downstream of a backflow preventer.

~~1302.11.1~~ 1302.13.1 Materials, joints and connections. Distribution piping shall conform to the standards and requirements specified in Section 605.

~~1302.11.2~~ 1302.13.2 Design. ~~On-site nonpotable w~~Water reuse distribution piping systems shall be designed and sized in accordance with Section 604 for the intended application.

~~1302.11.3~~ 1302.13.3 Labeling and marking. ~~On-site n~~Nonpotable water distribution piping labeling and marking shall comply with Section 608.9.

1302.14 ~~1302.12~~ Tests and inspections. Tests and inspections shall be witnessed by the designer and performed in accordance with Sections 1302.12 14.1 through 1302.12 14.6.

1302.14.1 ~~1302.12.1~~ Collection pipe and vent test. Drain, waste and vent piping used for on-site water reuse systems shall be tested in accordance with Section 312.

1302.14.2 ~~1302.12.2~~ ~~Storage t~~Tank tests. ~~Storage t~~Tanks shall be tested in accordance with Section 1301.9.10.

1302.14.3 ~~1302.12.3~~ Water supply system test. The testing of makeup water supply piping and distribution piping shall be conducted in accordance with Section 312.6.

1302.14.4 ~~1302.12.4~~ Inspection and testing of backflow prevention assemblies. The testing of backflow preventers and backwater valves shall be conducted in accordance with Section 312.11.

1302.14.5 ~~1302.12.5~~ Inspection of vermin and insect protection. Inlets and vents to the system shall be inspected to verify that each is protected to prevent the entrance of insects and vermin into the ~~storage~~ tank and piping systems in accordance with Section 1301.7.

1302.14.6 ~~1302.12.6~~ Initial ~~W~~water quality test. The quality of the water for the intended application shall be verified at the point of use in accordance with ~~the requirements~~ all applicable laws, rules, and ordinances of the jurisdiction.

Add new text as follows:

1302.14.7 Operational water quality testing.. The quality of the water for the intended application(s) shall be verified at the point of use in accordance with all applicable laws, rules, ordinances of the jurisdiction, and in accordance with the operation and maintenance manual, and where required, the operating permit.

Revise as follows:

1302.15 ~~1302.13~~ Operation and maintenance manuals. Operation and maintenance materials shall be supplied with nonpotable on-site water reuse systems in accordance with Sections 1302.13.1 through 1302.13.4~~.~~ and the maintenance program shall be implemented by an individual or entity in accordance with the requirements of the *International Property Maintenance Code*.

1302.15.1 ~~1302.13.1~~ Manual. A detailed operations and maintenance manual shall be supplied in hardcopy form with all systems.

1302.15.2 ~~1302.13.2~~ Schematics. The manual shall include a detailed system schematic, and the locations and a list of all system components, including manufacturer and model number.

1302.15.3 ~~1302.13.3~~ Maintenance procedures. The manual shall provide a schedule and procedures for all system components requiring periodic maintenance. Consumable parts, including filters, shall be noted along with part numbers.

1302.15.4 ~~1302.13.4~~ Operations procedures. The manual shall include system startup and shutdown procedures. The manual shall include detailed operating procedures for the system.

Add new text as follows:

Add new standard(s) as follows:

N/A. 40 CFR 141 United States Environmental Protection Agency (USEPA) Primary and Secondary Drinking Water Quality Standards

Reason: A version of this proposal was presented in 2020 and rejected. Feedback from the PMGCAC has been considered and addressed herein as follows:

The definitions of graywater, wastewater, and blackwater are unclear.

It is unclear how a code official would enforce odor controls.

Odors are addressed in this proposal by reference to 40 CFR 141, NSF 350, and required compliance with all applicable laws, rules, and ordinances. Furthermore, The designer is required to address odor control in the operation and monitoring program, if the code official has any concerns.

Wastewater reuse should be governed locally, not in ICC code.

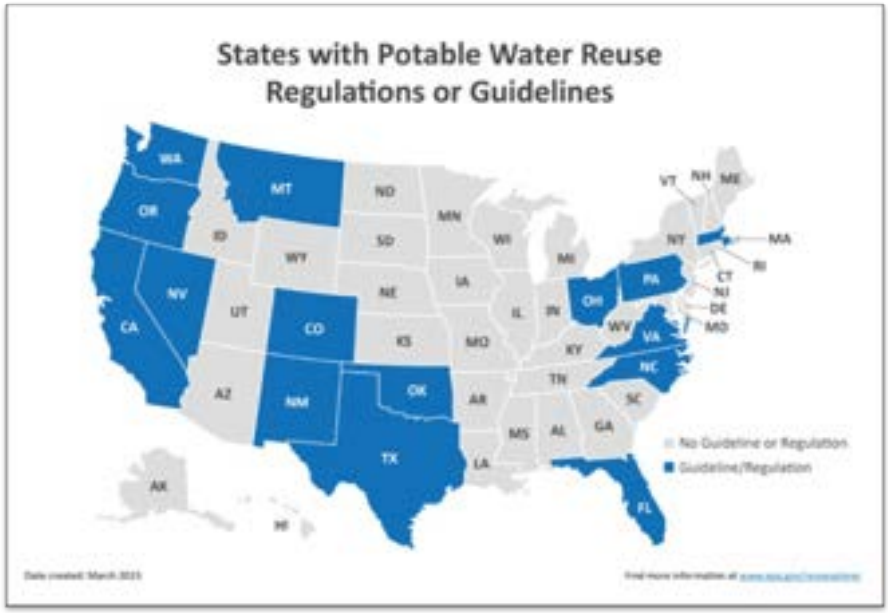
More detail is needed on blackwater reuse and related quality.

This proposal includes rigorous quality standards based on current science and focused on public safety.

Water reuse options should be expanded in the plumbing code not only because of the moral imperative to improve water efficiency and reduce consumption of valuable potable water for nonpotable purposes, but also because current technologies safely enable such practices. For example, by treating and reusing its own wastewater, a commercial office building can offset 100% of its toilet and urinal flushing demand, which can represent up to 70% of its total indoor potable water demands. In San Francisco, the San Francisco Public Utilities Commission headquarters building treats wastewater onsite for toilet and urinal flushing, reducing the use of potable water within the building by approximately 50%. In Sydney, Australia at 1 Bligh Street, a commercial high rise tower is offsetting 100% of the building's nonpotable water demands by reusing wastewater. In Portland, Oregon the Hassalo on Eighth eco-district, a cluster of residential, commercial, and mixed-use buildings is collecting its wastewater and reusing it for toilet flushing and irrigation. This system saves up to 7 million gallons of potable water per year. In New York City, the Solaire Building has successfully operated an onsite blackwater reuse system for two decades to meet the building's toilet flushing, cooling tower makeup, and irrigation demands. Similar to San Francisco, New York City has several buildings treating blackwater onsite for non-potable end uses. These are just a few examples of successfully operating nonpotable reuse systems with long histories.

Today, focus has shifted to Indirect Potable Reuse (IPR) and Direct Potable Reuse (DPR). IPR is when treated wastewater is supplied to a raw drinking water source such as an aquifer or reservoir. The naturally blended water is then withdrawn for treatment in a drinking water treatment facility prior to public consumption. DPR eliminates the environmental buffer and provides treated wastewater directly for public consumption.

According to the EPA, treated wastewater can be used for potable consumption in California, Colorado, Connecticut, Delaware, Florida, Massachusetts, Montana, Nevada, New Mexico, North Carolina, Oklahoma, Oregon, Pennsylvania, Texas, Virginia, and Washington. Some of these states also permit DPR. Still other states are in the process of developing DPR regulations, including Arizona where the practice is currently labeled "Advanced Water Purification" (AWP) instead of DPR.



Health & Safety. Standards such as NSF 350 exist to guide the implementation of onsite treatment and reuse systems. Water quality

standards are also evolving as public health regulators and utilities from across the country are adopting a health risk-based approach that applies to water sources including blackwater, graywater, and rainwater. This health risk- framework focuses on the removal of pathogens and ongoing monitoring to ensure water is treated appropriately based on the end use. Public health and safety is paramount. States including California and Washington are proceeding with establishing health risk-based frameworks for the treatment of onsite blackwater.

The quality defined for the sole Tier 4 application (DPR) is by necessity not only based on common drinking water quality standards (USEPA), but also on the recognition that additional biological barriers are appropriate, given the source water's origin. Extensive studies have been conducted in the past few decades to determine the level of treatment required to ensure public health and safety.

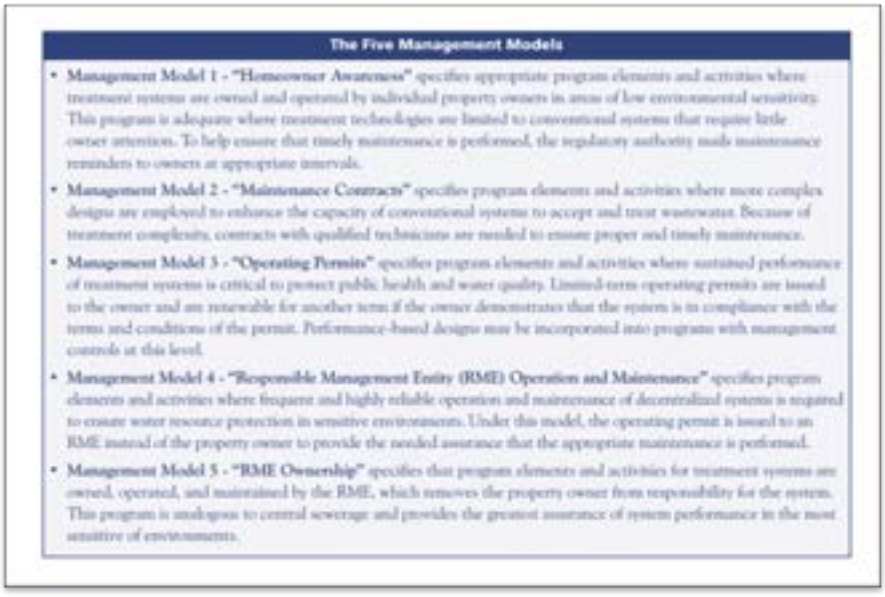
Log removals of Enteric Viruses, Giardia, and Cryptosporidium (18/15/15, respectively) are based on the National Water Research Institute's "DPR Criteria Expert Panel: Preliminary Findings and Recommendations", Fountain Valley, California, June 23, 2023

These log reductions, mean that enteric viruses are reduced by 99.9999999999999999% (18 nines), that giardia and cryptosporidium oocysts are each reduced by 99.9999999999999% (15 nines)

Engineering process design is expected to be based on treatment technique log removal values (LRVs), as published by generally accepted industry leaders and institutions (e.g., United States Environmental Protection Agency, Water Environment & Research Foundation, World Health Organization, etc.). Treatment verification is expected to be demonstrated by periodic challenge tests, as described by generally accepted industry leaders and institutions (see above). Due to the rapid evolution and variety of treatment techniques and challenge test protocols, neither are further specified herein although they may be in the future. Additionally, periodic challenge testing may not be required where treatment process surrogates are monitored to ensure ongoing performance within a credited window. At this time, flexibility is needed to promote water conservation and to empower decision makers.

This proposal does not seek to specifically define water quality requirements for Tier 1 and 2 applications. It is recognized that such standards may be highly dependent on source water quality,and should remain flexible to empower decision makers.

Public health and safety are further assured by requiring competent management of all water reuse systems. Section 1302.14 specifies Management Model 4 or Management Model 5 of USEPA's Management Guidelines for Decentralized Wastewater Management (EPA 832-B-03-001, March 2003)



SAMPLE LRV CREDIT CALCULATION REGARDING IPC TABLE 1301.2(3) and IRC Table P3401.2(3):

10,000 gpd of Blackwater

70,000 gpd of groundwater

20,000 gpd of surface water

BWC = 10,000 / (10,000 + 70,000 + 20,000)

BWC = 0.10

LRV Credit = -log (BWC)

LRV Credit = -log (0.10)

LRV Credit = 1.0

This proposal is submitted by the ICC Plumbing Mechanical Gas Code Action Committee (PMGCAC) PMGCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 PMGCAC has held 26 virtual meetings open to any interested party. In addition, there were several virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the PMGCAC website at PMGCAC.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposal to expand implementation of onsite wastewater reuse will not increase the cost of construction. The proposal is allowing for onsite wastewater reuse systems as an option, but not mandating installation. Buildings that choose to install a system would experience increased construction costs to install tanks, treatment, and distribution piping. However, buildings can also realize cost savings on water and sewer bills by reusing wastewater onsite. As a result, the building would consume less potable water and send less wastewater to the sewer.

An analysis was conducted to evaluate the amount of wastewater that could be treated and reused onsite in proposed mixed-use development in San Francisco. Using the water utility's rate schedule to estimate the financial savings, the analysis showed installing an onsite wastewater reuse system could result in savings of about $50,000 annually based on reduced potable consumption alone. As the cost of potable water increases, so would such savings.

Staff Analysis: A review of the standard proposed for inclusion in the code, DOE 40 CFR 141 *United States Environmental Protection Agency (USEPA) Primary and Secondary Drinking Water Quality Standards* , with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

P157-24 Part I

Public Hearing Results (CAH1)

Committee Action: **As Submitted**

Committee Reason: This is a big leap forward for water reuse. This will encourage more technology to be developed. There is already overseas widespread use of all waters for applications. (10-4)

P157-24 Part I

Individual Consideration Agenda

Comment 1:

IPC: TABLE 1301.2(1)

Proponents: Andrew Bevis, Chair, Plumbing, Mechanical and Fuel Gas Code Action Committee (pmgcac@iccsafe.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Plumbing Code

Revise as follows:

TABLE 1301.2(1) REQUIRED WATER QUALITY FOR REUSE APPLICATIONS

Portions of table not shown remain unchanged.

Use Category	Application	Exposure[a]	Quality Tier[b]
Process Water	Agricultural Cleaning (Animal Washing & Animal Pens)	AC	3
	Aquaculture	LC	1
	Boiler Feed	LC	1
	Building Washing	AC	3
	Chemical Mixing (Herbicides, Pesticides, Fertilizers)	LC	1
	Commercial Car Washes	AC	1
	Commercial Laundries	AC	3
	Cooling Power Equipment	LC	3
	Cooling systems with aerosolization	AC	1
	Cooling systems with no aerosolization	LC	1
	Dust Control (Roads and Streets)	LC	1
	Flushing Sanitary Sewers	LC	1
	Flushing Toilets and Urinals	AC	3
	Bidets and personal hygiene devices	DC	4
	Frost Protection	LC	1
	Gas Pipeline Testing	LC	1
	Hydro Seeding	AC	3
	Impoundments at Fish Hatcheries	LC	1
	Industrial Oil and Gas Operations	LC	1
Process Water	Industrial Process Water (Possibility of Human Contact or Evaporative)	AC	1
	Industrial Washwater applications	AC	3
	Livestock Drinking Water (Milk Producing)	AC	3
	Livestock Drinking Water (Non-Milk Producing)	AC	3
	Parts Cleaning	LC	1
	Pool Water Makeup	~~AC~~ DC	~~3~~ 4
	Pressure Washing	AC	3
	Priming Drainage Traps	LC	1
	Road Milling	LC	1
	Ship Ballasting	LC	1
	Snow Making (Commercial / Recreational Use)	AC	3
	Snow Making (Storage)	AC	3
	Stack Scrubbing	LC	3
	Stream Flow Augmentation	LC	1
	Street, Sidewalk, Parking Lot Cleaning (Restricted Access)	LC	1
	Street, Sidewalk, Parking Lot Cleaning (Unrestricted Access)	AC	3
	Vehicle and equipment Washing	AC	3
	Wastewater Treatment (Process Uses)	LC	1
	Window Washing	AC	3

a. Where two Exposures and two Tiers are cited, the first refers to spray irrigation and the second refers to drip irrigation (or other subsurface irrigation).

b. Where the equipment manufacturer or the jurisdiction requires a level of free residual disinfectant that exceeds the requirement of the quality Tier indicated, such excess shall be provided.

DC (Quality Tier 4) = Direct Public Contact/Consumption Intended

AC (Quality Tier 3) = Aerosolization, or Accidental/Limited

Consumption Possible

IC (Quality Tier 2) = Indirect Public Consumption Intended or Possible

LC (Quality Tier 1) = Limited Contact / No Consumption Intended

Reason: Swimming pools and spas require potable water for startup and makeup water because water chemistry is extremely important for the safety of the users (bathers.)

PMGCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 PMGCAC has held 33 virtual meetings open to any interested party. In addition, there were several virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the PMGCAC website at PMGCAC.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

Potable water is almost always readily available at the site location where pools and spas are constructed and used. As no treatment is needed for a potable water supply, the cost of potable water will likely be less than if lesser quality waters needed extensive treatment to make potable water.

Comment (CAH2)# 144

Comment 2:

IPC: 1301.2

Proponents: Kyle Thompson, Technical Director, Plumbing Manufacturers International (kthompson@safeplumbing.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Plumbing Code

Revise as follows:

1301.2 Reuse water quality. Reuse water quality shall meet the minimum requirements as specified in Tables 1301.2(1), 1301.2(2), 1301.2(3), and as established for the intended application by all applicable laws, rules and ordinances of the jurisdiction. Where water from multiple sources is combined , the system shall comply with the most stringent of the requirements of this code that are applicable to such sources. For Group R occupancies, where an alternate nonpotable water source for use in toilet flushing is installed, a potable water distribution line rough-in, sized in accordance with Section 604,that includes a shutoff valve located where the line originates, shall be provided at each toilet.

Reason: See CAH1 Proposal P155-24 for extended substantiation supporting the need for potable water use in smart toilets and personal hygiene devices. This proposed change only applies to buildings that chose to plumb non-potable water indoors specifically for toilet flushing. It would require a potable water supply line to be roughed in when the non-potable water supply line is installed to address smart toilets and personal hygiene devices. Smart toilets (See Figure 1) are those which include an integrated bidet feature and personal hygiene devices (See Figure 2) are an add on or toilet seat incorporating a bidet feature. When a residential building is plumbed with a non-potable water supply line to the toilet, residents opting for a smart toilet or personal hygiene device must connect to the available non-potable water supply or re-pipe with a potable water supply line for proper installation. This can be expensive after move-in but can be economically addressed during initial construction. Personal hygiene devices and smart toilets are crucial for many Americans with medical conditions, special needs or limited mobility. An allowance in the existing code to include provisions for these products is important to ensuring public health and safety. The water quality used with smart toilets and personal hygiene devices must be free of any pathogens that could cause infection or disease and, therefore, must be treated at a minimum in accordance with regulations for potable water.
Figure 1: Smart Toilet

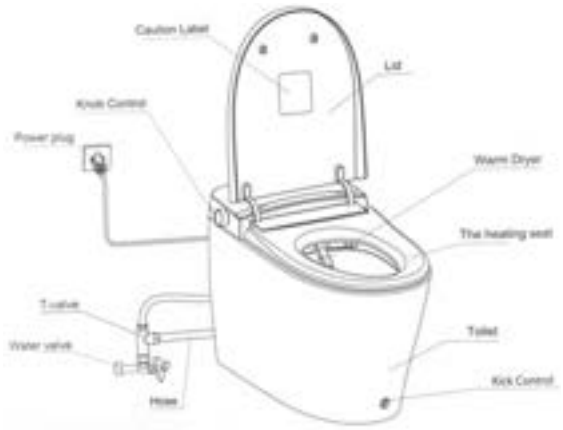

Figure 2: Personal Hygiene Device Connection

Cost Impact: Increase

Estimated Immediate Cost Impact:

Increase cost of $215 for rough in of potable water supply line.

Estimated Immediate Cost Impact Justification (methodology and variables):

a. Rough-in of potable water line that is dry until in use:

i. Parts: 2 shutoff valves ($40 ea.), 20 ft copper pipe ($60),

ii. Plumbing Labor: 0.5-hour labor @$150/hr ($75).

iii. Total $215

Estimated Life Cycle Cost Impact:

Savings of $735 for re piping when compared with the cost of rough in of potable supply pipe.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

i. Construction

1. Parts: Estimate Drywall $2.50/sq ft., Tile $10/sq ft.
2. Construction Labor: $100/hr.
3. Construction Subtotal: Remove and restore 20sq ft of drywall and tile. 2 hr labor plus parts (Sub Total $450)

ii. Plumbing

1. Parts: Shutoff valve ($40), 20 ft copper pipe ($60),
2. Plumbing Labor: $150/hr
3. Plumbing Subtotal: Reframe for new plumbing, pipe and fitting installation. 2 hr labor plus parts (Sub Total: $400)

iii. Permit: $100

iv. Total $950 for re-pipe after construction.

Comment (CAH2)# 215

P157-24 Part II

IRC: SECTION R202, SECTION 202 (New), SECTION P2910, P2910.1, P2910.2, P2910.2.1, P2910.2.2, P2910.3, FIGURE P2910.3, P2910.4, P2910.5, P2910.6, P2910.7, P2910.8, P2910.9, P2910.9.1, P2910.9.2, P2910.9.3, P2910.9.4, P2910.9.4.1, P2910.9.4.2, P2910.9.5, P2910.9.5.1, P2910.9.6, TABLE P2910.9.6, P2910.9.7, P2910.9.8, SECTION P2911, P2910.9.9, P2910.10, P2910.11, P2910.12, P2910.13, P2910.14, P2911.1, P2911.2, P2911.2.1, P2911.3, P2911.4, P2911.4.1, P2911.4.2, P2911.4.3, P2911.4.4, P2911.5, P2911.6, P2911.6.1, P2911.7, P2911.7.1, TABLE P2911.7.1, P2911.7.2, P2911.7.3, P2911.8, P2911.8.1, P2911.8.2, P2911.9, P2911.10, P2911.11, P2911.11.1, P2911.11.2, P2911.11.3, P2911.12, P2911.12.1, P2911.12.2, P2911.12.3, P2911.12.4, P2911.12.5, P2911.12.6, P2911.13, P2911.13.1, P2911.13.2, P2911.13.3, P2911.13.4, SECTION P2912, P2912.1, P2912.2, P2912.3, P2912.4, P2912.5, P2912.5.1, P2912.5.2, P2912.6, P2912.7, P2912.7.4, P2912.7.2, P2912.7.3, P2912.7.1, P2912.8, P2912.9, P2912.10, P2912.10.1, TABLE P2912.10.1, P2912.10.2, P2912.10.3, P2912.11, P2912.11.1, P2912.11.2, P2912.12, P2912.13, P2912.14, P2912.14.1, P2912.14.2, P2912.14.3, P2912.15, P2912.15.1, P2912.15.2, P2912.15.3, P2912.15.4, P2912.15.5, P2912.15.6, P2912.15.7, P2912.15.8, P2912.16, P2912.16.1, P2912.16.2, P2912.16.3, P2912.16.4, SECTION P2913, P2913.1, P2913.2, P2913.3, P2913.3.1, P2913.3.1.1, P2913.3.1.2, P2913.3.1.3, P2913.4, P2913.4.1, P2913.4.2, CHAPTER 34 (New), SECTION 3401 (New), P3401.1 (New), P3401.2 (New), TABLE P3401.2(1) (New), TABLE P3401.2(3) (New), TABLE P3401.2.2(2) (New), P3401.3 (New), FIGURE P3401.3 (New), P3401.4 (New), P3401.5 (New), P3401.6 (New), P3401.7 (New), P3401.8 (New), P3401.9 (New), P3401.9.1 (New), P3401.9.2 (New), P3401.9.3 (New), P3401.9.3.1 (New), P3401.9.3.2 (New), P3401.9.4 (New), P3401.9.5 (New), TABLE P3401.9.5 (New), P3401.9.6 (New), P3401.9.7 (New), P3401.9.8 (New), P3401.9.9 (New), P3401.9.10 (New), P3401.10 (New), P3401.10.1 (New), P3401.10.2 (New), P3401.10.3 (New), P3401.11 (New), P3401.12 (New), P3401.13 (New), SECTION P3402 (New), P3402.1 (New), 3402.2 (New), P3402.3 (New), P3402.4 (New), P3402.5 (New), P3402.6 (New), P3402.7 (New), P3402.8 (New), P3402.9 (New), P3402.9.1 (New), TABLE P3402.9.1 (New), P3402.9.2 (New), P3402.10 (New), P3402.10.1 (New), P3402.10.2 (New), P3402.11 (New), P3402.12 (New), P3402.13 (New), P3402.13.1 (New), P3402.13.2 (New), P3402.13.3 (New), P3402.14 (New), P3402.14.1 (New), P3402.14.2 (New), P3402.14.3 (New), P3402.14.4 (New), P3402.14.5 (New), P3402.14.6 (New), P3402.14.7 (New), P3402.15 (New), P3402.15.1 (New), P3402.15.2 (New), P3402.15.3 (New), P3402.15.4 (New), SECTION 3403 (New), P3403.1 (New), P3403.2 (New), P3403.3 (New), P3403.4 (New), P3403.5 (New), P3403.5.1 (New), P3403.5.2 (New), P3403.6 (New), P3403.7 (New), P3403.7.1 (New), P3403.7.2 (New), P3403.7.3 (New), P3403.7.4 (New), P3403.8 (New), P3403.9 (New), P3403.10 (New), P3403.10.1 (New), TABLE P3403.10.1 (New), P3403.10.2 (New), P3403.10.3 (New), P3403.11 (New), P3403.11.1 (New), P3403.11.2 (New), P3403.12 (New), P3403.13 (New), P3403.14 (New), P3403.14.1 (New), P3403.14.2 (New), P3403.14.3 (New), P3403.15 (New), P3403.15.1 (New), P3403.15.2 (New), P3403.15.3 (New), P3403.15.4 (New), P3403.15.5 (New), P3403.15.6 (New), P3403.15.7 (New), P3403.15.8 (New), >P3403.16 (New), P3403.16.1 (New), P3403.16.2 (New), P3403.16.3 (New), P3403.16.4 (New), SECTION P3404 (New), P3404.1 (New), P3404.2 (New), P3404.3 (New), P3404.3.1 (New), P3404.3.1.1 (New), P3404.3.1.2 (New), P3404.3.1.3 (New), P3404.4 (New), P3404.4.1 (New), P3404.4.2 (New), 44 DOE, (New)

Proposed Change as Submitted

2024 International Residential Code

SECTION R202
DEFINITIONS

Add new definition as follows:

BLACKWATER. Wastewater that contains urine or fecal matter.

BLACKWATER CONTRIBUTION (BWC). The fraction equal to the quantity of blackwater divided by the sum of the quantities of raw and treated blackwater plus surface water, groundwater, and water from approved potable water systems.

LOG REDUCTION VALUE (LRV). The measure of the ability of a treatment process to remove or inactivate microorganisms such as bacteria, protozoa and viruses. LRV is the logarithm base 10 of the ratio of the levels of a pathogenic organism or other contaminant before and after treatment.

POTABLE REUSE. The practice of treating *wastewater* and utilizing it for potable applications.

REUSE WATER. Wastewater or rainwater treated to a level of quality suitable for reuse.

WASTEWATER. The water generated after use of freshwater, raw water, drinking water, or saline water in a deliberate application or process.

WATER REUSE SYSTEM. A system for the treatment, storage, distribution, and reuse of water including, but not limited to, wastewater and captured rainwater.

Delete without substitution:

~~SECTION P2910~~
~~NONPOTABLE WATER SYSTEMS~~

~~**P2910.1 Scope.** The provisions of this section shall govern the materials, design, construction and installation of systems for the collection, storage, treatment and distribution of nonpotable water. The use and application of nonpotable water shall comply with laws, rules and ordinances applicable in the *jurisdiction*.~~

~~**P2910.2 Water quality.** Nonpotable water for each end use application shall meet the minimum water quality requirements as established for the intended application by the laws, rules and ordinances applicable in the *jurisdiction*. Where nonpotable water from different sources is combined in a system, the system shall comply with the most stringent requirements of this code applicable to such sources.~~

~~**P2910.2.1 Residual disinfectants.** Where chlorine is used for disinfection, the nonpotable water shall contain not more than 4 ppm (4 mg/L) of chloramines or free chlorine. Where ozone is used for disinfection, the nonpotable water shall not contain gas bubbles having elevated levels of ozone at the point of use. **Exception:** Reclaimed water sources shall not be required to comply with the requirements of this section.~~

~~**P2910.2.2 Filtration required.** Nonpotable water utilized for water closet and urinal flushing applications shall be filtered by a 100 micron or finer filter. **Exception:** Reclaimed water sources shall not be required to comply with the requirements of this section.~~

~~**P2910.3 Signage required.** Nonpotable water outlets such as hose connections, open-ended pipes and faucets shall be identified at the point of use for each outlet with signage that reads, "Nonpotable water is utilized for [application name]. CAUTION: NONPOTABLE WATER. DO NOT DRINK." The words shall be legibly and indelibly printed on a tag or sign constructed of corrosion-resistant, waterproof material or shall be indelibly printed on the fixture. The letters of the words shall be not less than 0.5 inches (12.7 mm) in height and in colors contrasting the background on which they are applied. In addition to the required wordage, the pictograph shown in Figure P2910.3 shall appear on the signage required by this section.~~

~~**FIGURE P2910.3 PICTOGRAPH—DO NOT DRINK**~~

~~**P2910.4 Permits.** *Permits* shall be required for the construction, installation, *alteration* and *repair* of nonpotable water systems. *Construction documents*, engineering calculations, diagrams and other such data pertaining to the nonpotable water system shall be submitted with each *permit* application.~~

P2910.5 Potable water connections. Where a potable system is connected to a nonpotable water system, the potable water supply shall be protected against backflow in accordance with Section P2902.

P2910.6 Approved components and materials. Piping, plumbing components and materials used in collection and conveyance systems shall be manufactured of material *approved* for the intended application and compatible with any disinfection and treatment systems used.

P2910.7 Insect and vermin control. The system shall be protected to prevent the entrance of insects and vermin into storage tanks and piping systems. Screen materials shall be compatible with contacting system components and shall not accelerate the corrosion of system components.

P2910.8 Freeze protection. Where sustained freezing temperatures occur, provisions shall be made to keep storage tanks and the related piping from freezing.

P2910.9 Nonpotable water storage tanks. Nonpotable water storage tanks shall comply with Sections P2910.9.1 through P2910.9.11.

P2910.9.1 Sizing. The holding capacity of the storage tank shall be sized in accordance with the anticipated demand.

P2910.9.2 Location. Storage tanks shall be installed above or below grade. Above-grade storage tanks shall be protected from direct sunlight and shall be constructed using opaque, UV-resistant materials such as, but not limited to, heavily tinted plastic, lined metal, concrete and wood; or painted to prevent algae growth; or shall have specially constructed sun barriers including, but not limited to, installation in garages, *crawl spaces* or sheds. Storage tanks and their manholes shall not be located directly under any soil piping, waste piping or any source of contamination.

P2910.9.3 Materials. Where collected on site, water shall be collected in an *approved* tank constructed of durable, nonabsorbent and corrosion-resistant materials. The storage tank shall be constructed of materials compatible with any disinfection systems used to treat water upstream of the tank and with any systems used to maintain water quality within the tank. Wooden storage tanks that are not equipped with a makeup water source shall be provided with a flexible liner.

P2910.9.4 Foundation and supports. Storage tanks shall be supported on a firm base capable of withstanding the weight of the storage tank when filled to capacity. Storage tanks shall be supported in accordance with this code.

P2910.9.4.1 Ballast. Where the soil can become saturated, an underground storage tank shall be ballasted or otherwise secured to prevent the tank from floating out of the ground when empty. The combined weight of the tank and hold-down ballast shall meet or exceed the buoyancy force of the tank. Where the installation requires a foundation, the foundation shall be flat and shall be designed to support the storage tank weight when full, consistent with the bearing capability of adjacent soil.

P2910.9.4.2 Structural support. Where installed below grade, storage tank installations shall be designed to withstand earth and surface structural loads without damage and with minimal deformation when empty or filled with water.

P2910.9.5 Makeup water. Where an uninterrupted nonpotable water supply is required for the intended application, potable or reclaimed water shall be provided as a source of makeup water for the storage tank. The makeup water supply shall be protected against backflow by means of an *air gap* not less than 4 inches (102 mm) above the overflow or an *approved* backflow device in accordance with Section P2902. A *full-open valve* located on the makeup water supply line to the storage tank shall be provided. Inlets to the storage tank shall be controlled by fill valves or other automatic supply valves installed to prevent the tank from overflowing and to prevent the water level from dropping below a predetermined point. Where makeup water is provided, the water level shall be prohibited from dropping below the source water inlet or the intake of any attached pump.

P2910.9.5.1 Inlet control valve alarm. Makeup water systems shall be fitted with a warning mechanism that alerts the user to a failure of the inlet control valve to close correctly. The alarm shall activate before the water within the storage tank begins to discharge into the overflow system.

P2910.9.6 Overflow. The storage tank shall be equipped with an overflow pipe having a diameter not less than that shown in Table P2910.9.6. The overflow outlet shall discharge at a point not less than 6 inches (152 mm) above the roof or roof drain; floor or *floor drain*; or over an open water-supplied fixture. The overflow outlet shall be covered with a corrosion-resistant screen of not less than 16 by 20 mesh per inch (630 by 787 mesh per m) and by $^{1}/_{4}$-inch (6.4 mm) hardware cloth or shall terminate in a horizontal angle seat check valve. Drainage from overflow pipes shall be directed to prevent freezing on roof walks. The overflow drain shall not be equipped with a shutoff valve. Not less than one cleanout shall be provided on each overflow pipe in accordance with Section P3005.2.

TABLE P2910.9.6 SIZE OF DRAIN PIPES FOR WATER TANKS

TANK CAPACITY (gallons)	DRAIN PIPE (inches)
Up to 750	1
751 to 1,500	$1^{1}/_{2}$
1,501 to 3,000	2
3,001 to 5,000	$2^{1}/_{2}$
5,001 to 7,500	3
Over 7,500	4

For SI: 1 gallon = 3.875 liters, 1 inch = 25.4 mm.

P2910.9.7 Access. Not less than one access opening shall be provided to allow inspection and cleaning of the tank interior. Access openings shall have an *approved* locking device or other *approved* method of securing access. Below-grade storage tanks, located outside of the *building*, shall be provided with a manhole either not less than 24 inches (610 mm) square or with an inside diameter not less than 24 inches (610 mm). Manholes shall extend not less than 4 inches (102 mm) above ground or shall be designed to prevent water infiltration. Finished grade shall be sloped away from the manhole to divert surface water. Manhole covers shall be secured to prevent unauthorized access. Service ports in manhole covers shall be not less than 8 inches (203 mm) in diameter and shall be not less than 4 inches (102 mm) above the finished grade level. The service port shall be secured to prevent unauthorized access. **Exception:** Storage tanks under 800 gallons (3028 L) in volume installed below grade shall not be required to be equipped with a manhole, but shall have a service port not less than 8 inches (203 mm) in diameter.

P2910.9.8 Venting. Storage tanks shall be provided with a vent sized in accordance with Chapter 31 and based on the aggregate diameter of all tank influent pipes. The reservoir vent shall not be connected to sanitary drainage system vents. Vents shall be protected from contamination by means of an *approved* cap or a U-bend installed with the opening directed downward. Vent outlets shall extend not less than 4 inches (102 mm) above grade, or as necessary to prevent surface water from entering the storage tank. Vent openings shall be protected against the entrance of vermin and insects in accordance with the requirements of Section P2910.7.

SECTION P2911
ON-SITE NONPOTABLE WATER REUSE SYSTEMS

P2910.9.9 Drain. A drain shall be located at the lowest point of the storage tank. The tank drain pipe shall discharge as required for overflow pipes and shall not be smaller in size than specified in Table P2910.9.6. Not less than one cleanout shall be provided on each drain pipe in accordance with Section P3005.2.

P2910.10 Marking and signage. Each nonpotable water storage tank shall be *labeled* with its rated capacity. The contents of storage tanks shall be identified with the words, "CAUTION: NONPOTABLE WATER. DO NOT DRINK." Where an opening is provided that could allow the entry of personnel, the opening shall be marked with the words, "DANGER—CONFINED SPACE." Markings shall be indelibly printed on the tank, or on a tag or sign constructed of corrosion-resistant waterproof material that is mounted on the tank. The letters of the words shall be not less than 0.5 inches (12.7 mm) in height and shall be of a color in contrast with the background on which they are applied.

P2910.11 Storage tank tests. Storage tanks shall be tested in accordance with the following:

1. Storage tanks shall be filled with water to the overflow line prior to and during inspection. Seams and joints shall be left exposed and the tank shall remain watertight without leakage for a period of 24 hours.
2. After 24 hours, supplemental water shall be introduced for a period of 15 minutes to verify proper drainage of the overflow system and leaks do not exist.
3. Following a successful test of the overflow, the water level in the tank shall be reduced to a level that is 2 inches (51 mm) below the makeup water trigger point by using the tank drain. The tank drain shall be observed for proper operation. The makeup water system shall be observed for proper operation, and successful automatic shutoff of the system at the refill threshold shall be verified. Water shall not be drained from the overflow at any time during the refill test.

P2910.12 System abandonment. If the *owner* of an on-site nonpotable water reuse system or rainwater collection and conveyance system elects to cease use of or fails to properly maintain such system, the system shall be abandoned and shall comply with the following:

1. System piping connecting to a utility-provided water system shall be removed or disabled.
2. The distribution piping system shall be replaced with an *approved* potable water supply piping system. Where an existing potable water pipe system is already in place, the fixtures shall be connected to the existing system.
3. The storage tank shall be secured from accidental access by sealing or locking tank inlets and access points, or filled with sand or equivalent.

P2910.13 Separation requirements for nonpotable water piping. Nonpotable water collection and distribution piping and reclaimed water piping shall be separated from the *building sewer* and potable water piping underground by 5 feet (1524 mm) of undisturbed or compacted earth. Nonpotable water collection and distribution piping shall not be located in, under or above cesspools, septic tanks, septic tank drainage fields or seepage pits. Buried nonpotable water piping shall comply with the requirements of Section P2604.

Exceptions:

1. The required separation distance shall not apply where the bottom of the nonpotable water pipe within 5 feet (1524 mm) of the sewer is not less than 12 inches (305 mm) above the top of the highest point of the sewer and the pipe materials conforms to Table P3002.2.
2. The required separation distance shall not apply where the bottom of the potable water service pipe within 5 feet (1524 mm) of the nonpotable water pipe is not less than 12 inches (305 mm) above the top of the highest point of the nonpotable water pipe and the pipe materials comply with the requirements of Table P2906.5.
3. The required separation distance shall not apply where a nonpotable water pipe is located in the same trench with a *building sewer* that is constructed of materials that comply with the requirements of Table P3002.2.
4. The required separation distance shall not apply where a nonpotable water pipe crosses a sewer pipe provided that the nonpotable water pipe is sleeved to not less than 5 feet (1524 mm) horizontally from the sewer pipe centerline on both sides of such crossing, with pipe materials that comply with Table P3002.2.
5. The required separation distance shall not apply where a potable water service pipe crosses a nonpotable water pipe, provided that the potable water service pipe is sleeved for a distance of not less than 5 feet (1524 mm) horizontally from the centerline of the nonpotable pipe on both sides of such crossing, with pipe materials that comply with Table P3002.2.
6. The required separation distance shall not apply to irrigation piping located outside of a building and downstream of the backflow preventer where nonpotable water is used for outdoor applications.

P2910.14 Outdoor outlet access. Sillcocks, hose bibbs, wall hydrants, yard hydrants and other outdoor outlets supplied by nonpotable

water shall be located in a locked vault or shall be operable only by means of a removable key.

P2911.1 General. The provisions of this section shall govern the construction, installation, *alteration* and *repair* of *on-site nonpotable water reuse systems* for the collection, storage, treatment and distribution of on-site sources of nonpotable water as permitted by the *jurisdiction*.

P2911.2 Sources. *On-site nonpotable water reuse systems* shall collect waste discharge only from the following sources: bathtubs, showers, lavatories, clothes washers and laundry trays. Water from other *approved* nonpotable sources including swimming pool backwash operations, air conditioner condensate, rainwater, foundation drain water, fluid cooler discharge water and fire pump test water shall be permitted to be collected for reuse by *on-site nonpotable water reuse systems*, as *approved* by the *building official* and as appropriate for the intended application.

P2911.2.1 Prohibited sources. Reverse osmosis system reject water, water softener backwash water, *kitchen* sink wastewater, dishwasher wastewater and wastewater containing urine or fecal matter shall not be collected for reuse within an on-site nonpotable water reuse system.

P2911.3 Traps. Traps serving fixtures and devices discharging wastewater to *on-site nonpotable water reuse systems* shall comply with the Section P3201.2.

P2911.4 Collection pipe. *On-site nonpotable water reuse systems* shall utilize drainage piping *approved* for use within plumbing drainage systems to collect and convey untreated water for reuse. Vent piping *approved* for use within plumbing venting systems shall be utilized for vents within the *graywater* system. Collection and vent piping materials shall comply with Section P3002.

P2911.4.1 Installation. Collection piping conveying untreated water for reuse shall be installed in accordance with Section P3005.

P2911.4.2 Joints. Collection piping conveying untreated water for reuse shall utilize joints *approved* for use with the distribution piping and appropriate for the intended applications as specified in Section P3002.

P2911.4.3 Size. Collection piping conveying untreated water for reuse shall be sized in accordance with drainage sizing requirements specified in Section P3005.4.

P2911.4.4 Marking. Additional marking of collection piping conveying untreated water for reuse shall not be required beyond that required for sanitary drainage, waste and vent piping by Chapter 30.

P2911.5 Filtration. Untreated water collected for reuse shall be filtered as required for the intended end use. Filters shall be accessible for inspection and maintenance. Filters shall utilize a pressure gauge or other *approved* method to provide indication when a filter requires servicing or replacement. Filters shall be installed with shutoff valves immediately upstream and downstream to allow for isolation during maintenance.

P2911.6 Disinfection. Nonpotable water collected on site for reuse shall be disinfected, treated or both to provide the quality of water needed for the intended end-use application. Where the intended end-use application does not have requirements for the quality of water, disinfection and treatment of water collected on site for reuse shall not be required. Nonpotable water collected on site containing untreated *graywater* shall be retained in collection reservoirs for not more than 24 hours.

P2911.6.1 Graywater used for fixture flushing. *Graywater* used for flushing water closets and urinals shall be disinfected and treated by an on-site water reuse treatment system complying with NSF 350.

P2911.7 Storage tanks. Storage tanks utilized in *on-site nonpotable water reuse systems* shall comply with Section P2910.9 and Sections P2911.7.1 through P2911.7.3.

P2911.7.1 Location. Storage tanks shall be located with a minimum horizontal distance between various elements as indicated in Table P2911.7.1.

TABLE P2911.7.1 LOCATION OF NONPOTABLE WATER REUSE STORAGE TANKS

ELEMENT	MINIMUM HORIZONTAL DISTANCE FROM STORAGE TANK (feet)
Critical root zone (CRZ) of protected trees	2
Lot line adjoining private lots	5
Public water main	10
Seepage pits	5
Septic tanks	5
Streams and lakes	50
Water service	5
Water wells	50

For SI: 1 foot = 304.8 mm.

P2911.7.2 Inlets. Storage tank inlets shall be designed to introduce water into the tank with minimum turbulence, and shall be located and designed to avoid agitating the contents of the storage tank.

P2911.7.3 Outlets. Outlets shall be located not less than 4 inches (102 mm) above the bottom of the storage tank, and shall not skim water from the surface.

P2911.8 Valves. Valves shall be supplied on *on-site nonpotable water reuse systems* in accordance with Sections P2911.8.1 and P2911.8.2.

P2911.8.1 Bypass valve. One three-way diverter valve certified to NSF 50 or other *approved* device shall be installed on collection piping upstream of each storage tank, or drainfield, as applicable, to divert untreated on-site reuse sources to the sanitary sewer to allow servicing and inspection of the system. Bypass valves shall be installed downstream of fixture traps and vent connections. Bypass valves shall be *labeled* to indicate the direction of flow, connection and storage tank or drainfield connection. Bypass valves shall be installed in accessible locations. Two shutoff valves shall not be installed to serve as a bypass valve.

P2911.8.2 Backwater valve. Backwater valves shall be installed on each overflow and tank drain pipe. Backwater valves shall be in accordance with Section P3008.

P2911.9 Pumping and control system. Mechanical equipment including pumps, valves and filters shall be accessible and removable in order to perform *repair*, maintenance and cleaning. The minimum flow rate and *flow pressure* delivered by the pumping system shall be appropriate for the application and in accordance with Section P2903.

P2911.10 Water pressure-reducing valve or regulator. Where the water pressure supplied by the pumping system exceeds 80 psi (552 kPa) static, a pressure-reducing valve shall be installed to reduce the pressure in the nonpotable water distribution system piping to 80 psi (552 kPa) static or less. Pressure-reducing valves shall be specified and installed in accordance with Section P2903.3.2.

P2911.11 Distribution pipe. Distribution piping utilized in *on-site nonpotable water reuse systems* shall comply with Sections P2911.11.1 through P2911.11.3. **Exception:** Irrigation piping located outside of the *building* and downstream of a backflow preventer.

P2911.11.1 Materials, joints and connections. Distribution piping shall conform to the standards and requirements specified in Section P2906 for nonpotable water.

P2911.11.2 Design. On-site nonpotable water reuse distribution piping systems shall be designed and sized in accordance with Section P2903 for the intended application.

Delete without substitution:

P2911.11.3 Marking. On-site nonpotable water distribution piping labeling and marking shall comply with Section P2901.2.

P2911.12 Tests and inspections. Tests and inspections shall be performed in accordance with Sections P2911.12.1 through P2911.12.6.

P2911.12.1 Collection pipe and vent test. Drain, waste and vent piping used for on-site water reuse systems shall be tested in accordance with Section P2503.

P2911.12.2 Storage tank test. Storage tanks shall be tested in accordance with Section P2910.11.

P2911.12.3 Water supply system test. The testing of makeup water supply piping and distribution piping shall be conducted in accordance with Section P2503.7.

P2911.12.4 Inspection and testing of backflow prevention assemblies. The testing of backflow preventers and backwater valves shall be conducted in accordance with Section P2503.8.

P2911.12.5 Inspection of vermin and insect protection. Inlets and vents to the system shall be inspected to verify that each is protected to prevent the entrance of insects and vermin into the storage tank and piping systems in accordance with Section P2910.7.

P2911.12.6 Water quality test. The quality of the water for the intended application shall be verified at the point of use in accordance with the requirements of the *jurisdiction*.

P2911.13 Operation and maintenance manuals. Operation and maintenance materials shall be supplied with nonpotable on-site water reuse systems in accordance with Sections P2911.13.1 through P2911.13.4.

P2911.13.1 Manual. A detailed operations and maintenance manual shall be supplied in hard-copy form for each system.

P2911.13.2 Schematics. The manual shall include a detailed system schematic, the location of system components and a list of system components that includes the manufacturers and model numbers of the components.

P2911.13.3 Maintenance procedures. The manual shall provide a schedule and procedures for system components requiring periodic maintenance. Consumable parts including filters shall be noted along with part numbers.

P2911.13.4 Operations procedures. The manual shall include system startup and shutdown procedures. The manual shall include detailed operating procedures for the system.

SECTION P2912
NONPOTABLE RAINWATER COLLECTION AND DISTRIBUTION SYSTEMS

P2912.1 General. The provisions of this section shall govern the construction, installation, *alteration* and *repair* of rainwater collection and conveyance systems for the collection, storage, treatment and distribution of rainwater for nonpotable applications. For nonpotable rainwater systems, the provisions of CSA B805/ICC 805 shall be an alternative for regulating the materials, design, construction and installation of systems for rainwater collection, storage, treatment and distribution of nonpotable water. The use and application of nonpotable water shall comply with laws, rules and ordinances applicable in the *jurisdiction*.

P2912.2 Collection surface. Rainwater shall be collected only from above-ground impervious roofing surfaces constructed from *approved* materials. Collection of water from vehicular parking or pedestrian walkway surfaces shall be prohibited except where the water is used exclusively for landscape irrigation. Overflow and bleed-off pipes from roof-mounted *appliances* including, but not limited to, evaporative coolers, water heaters and solar water heaters shall not discharge onto rainwater collection surfaces.

P2912.3 Debris excluders. Downspouts and leaders shall be connected to a roof washer and shall be equipped with a debris excluder

~~or equivalent device to prevent the contamination of collected rainwater with leaves, sticks, pine needles and similar material. Debris excluders and equivalent devices shall be self-cleaning.~~

~~**P2912.4 Roof washer.** An amount of rainwater shall be diverted at the beginning of each rain event, and not allowed to enter the storage tank, to wash accumulated debris from the collection surface. The amount of rainfall to be diverted shall be field-adjustable as necessary to minimize storage tank water contamination. The roof washer shall not rely on manually operated valves or devices and shall operate automatically. Diverted rainwater shall not be drained to the roof surface and shall be discharged in a manner consistent with the stormwater runoff requirements of the *jurisdiction*. Roof washers shall be accessible for maintenance and service.~~

~~**P2912.5 Roof gutters and downspouts.** Gutters and downspouts shall be constructed of materials that are compatible with the collection surface and the rainwater quality for the desired end use. Joints shall be watertight.~~

~~**P2912.5.1 Slope.** Roof gutters, leaders and rainwater collection piping shall slope continuously toward collection inlets and shall be free of leaks. Gutters and downspouts shall have a slope of not less than 1/8 inch per foot (10.4 mm/m) along their entire length. Gutters and downspouts shall be installed so that water does not pool at any point.~~

~~**P2912.5.2 Cleanouts.** Cleanouts shall be provided in the water conveyance system to allow *access to* filters, flushes, pipes and downspouts.~~

~~**P2912.6 Drainage.** Water drained from the roof washer or debris excluder shall not be drained to the sanitary sewer. Such water shall be diverted from the storage tank and shall discharge to a location that will not cause erosion or damage to property. Roof washers and debris excluders shall be provided with an automatic means of self-draining between rain events and shall not drain onto roof surfaces.~~

~~**P2912.7 Collection pipe.** Rainwater collection and conveyance systems shall utilize drainage piping *approved* for use within plumbing drainage systems to collect and convey captured rainwater. Vent piping *approved* for use within plumbing venting systems shall be utilized for vents within the rainwater system. Collection and vent piping materials shall comply with Section P3002.~~

~~**P2912.7.4 Marking.** Additional marking of collection piping conveying captured rainwater for reuse shall not be required beyond that required for sanitary drainage, waste, and vent piping by Chapter 30.~~

~~**P2912.7.2 Joints.** Collection piping conveying captured rainwater shall utilize joints *approved* for use with the distribution piping and appropriate for the intended applications as specified in Section P3003.~~

~~**P2912.7.3 Size.** Collection piping conveying captured rainwater shall be sized in accordance with drainage sizing requirements specified in Section P3005.4.~~

~~**P2912.7.1 Installation.** Collection piping conveying captured rainwater shall be installed in accordance with Section P3005.3.~~

~~**P2912.8 Filtration.** Collected rainwater shall be filtered as required for the intended end use. Filters shall be accessible for inspection and maintenance. Filters shall utilize a pressure gauge or other *approved* method to provide indication when a filter requires servicing or replacement. Filters shall be installed with shutoff valves installed immediately upstream and downstream to allow for isolation during maintenance.~~

~~**P2912.9 Disinfection.** Where the intended application for rainwater requires disinfection or other treatment or both, it shall be disinfected as needed to ensure that the required water quality is delivered at the point of use.~~

~~**P2912.10 Storage tanks.** Storage tanks utilized in nonpotable rainwater collection and conveyance systems shall comply with Section P2910.9 and Sections P2912.10.1 through P2912.10.3.~~

~~**P2912.10.1 Location.** Storage tanks shall be located with a minimum horizontal distance between various elements as indicated in Table P2912.10.1.~~

TABLE P2912.10.1 LOCATION OF RAINWATER STORAGE TANKS

ELEMENT	MINIMUM HORIZONTAL DISTANCE FROM STORAGE TANK (feet)
Critical root zone (CRZ) of protected trees	2
Lot line adjoining private lots	5
Seepage pits	5
Septic tanks	5

For SI: 1 foot = 304.8 mm

P2912.10.2 Inlets. Storage tank inlets shall be designed to introduce collected rainwater into the tank with minimum turbulence, and shall be located and designed to avoid agitating the contents of the storage tank.

P2912.10.3 Outlets. Outlets shall be located not less than 4 inches (102 mm) above the bottom of the storage tank and shall not skim water from the surface.

P2912.11 Valves. Valves shall be supplied on rainwater collection and conveyance systems in accordance with Sections P2912.11.1 and P2912.11.2.

P2912.11.1 Influent diversion. A means shall be provided to divert storage tank influent to allow for maintenance and repair of the storage tank system.

P2912.11.2 Backwater valve. Backwater valves shall be installed on each overflow and tank drain pipe. Backwater valves shall be in accordance with Section P3008.

P2912.12 Pumping and control system. Mechanical equipment including pumps, valves and filters shall be easily accessible and removable in order to perform repair, maintenance and cleaning. The minimum flow rate and *flow pressure* delivered by the pumping system shall be appropriate for the application and in accordance with Section P2903.

P2912.13 Water pressure-reducing valve or regulator. Where the water pressure supplied by the pumping system exceeds 80 psi (552 kPa) static, a pressure-reducing valve shall be installed to reduce the pressure in the rainwater distribution system piping to 80 psi (552 kPa) static or less. Pressure-reducing valves shall be specified and installed in accordance with Section P2903.3.2.

P2912.14 Distribution pipe. Distribution piping utilized in rainwater collection and conveyance systems shall comply with Sections P2912.14.1 through P2912.14.3. **Exception:** Irrigation piping located outside of the *building* and downstream of a backflow preventer.

P2912.14.1 Materials, joints and connections. Distribution piping shall conform to the standards and requirements specified in Section P2906 for nonpotable water.

P2912.14.2 Design. Distribution piping systems shall be designed and sized in accordance with Section P2903 for the intended application.

P2912.14.3 Labeling and marking. Nonpotable rainwater distribution piping labeling and marking shall comply with Section P2901.2.

P2912.15 Tests and inspections. Tests and inspections shall be performed in accordance with Sections P2912.15.1 through P2912.15.8.

P2912.15.1 Roof gutter inspection and test. Roof gutters shall be inspected to verify that the installation and slope is in accordance with Section P2912.5.1. Gutters shall be tested by pouring not less than 1 gallon of water (3.8 L) into the end of the gutter opposite the

collection point. The gutter being tested shall not leak and shall not retain standing water.

P2912.15.2 Roofwasher test. Roofwashers shall be tested by introducing water into the gutters. Proper diversion of the first quantity of water in accordance with the requirements of Section P2912.4 shall be verified.

P2912.15.3 Collection pipe and vent test. Drain, waste and vent piping used for rainwater collection and conveyance systems shall be tested in accordance with Section P2503.

P2912.15.4 Storage tank test. Storage tanks shall be tested in accordance with Section P2910.11.

P2912.15.5 Water supply system test. The testing of makeup water supply piping and distribution piping shall be conducted in accordance with Section P2503.7.

P2912.15.6 Inspection and testing of backflow prevention assemblies. The testing of backflow preventers and backwater valves shall be conducted in accordance with Section P2503.8.

P2912.15.7 Inspection of vermin and insect protection. Inlets and vents to the system shall be inspected to verify that each is protected to prevent the entrance of insects and vermin into the storage tank and piping systems in accordance with Section P2910.7.

P2912.15.8 Water quality test. The quality of the water for the intended application shall be verified at the point of use in accordance with the requirements of the *jurisdiction*.

P2912.16 Operation and maintenance manuals. Operation and maintenance manuals shall be supplied with rainwater collection and conveyance systems in accordance with Sections P2912.16.1 through P2912.16.4.

P2912.16.1 Manual. A detailed operations and maintenance manual shall be supplied in hard copy form for each system.

P2912.16.2 Schematics. The manual shall include a detailed system schematic, the location of system components and a list of system components that includes the manufacturers and model numbers of the components.

P2912.16.3 Maintenance procedures. The manual shall provide a maintenance schedule and procedures for system components requiring periodic maintenance. Consumable parts, including filters, shall be noted along with part numbers.

P2912.16.4 Operations procedures. The manual shall include system startup and shutdown procedures, and detailed operating procedures.

SECTION P2913
RECLAIMED WATER SYSTEMS

P2913.1 General. The provisions of this section shall govern the construction, installation, *alteration* and *repair* of systems supplying nonpotable reclaimed water.

P2913.2 Water pressure-reducing valve or regulator. Where the reclaimed water pressure supplied to the *building* exceeds 80 psi (552 kPa) static, a pressure-reducing valve shall be installed to reduce the pressure in the reclaimed water distribution system piping to 80 psi (552 kPa) static or less. Pressure-reducing valves shall be specified and installed in accordance with Section P2903.3.2.

P2913.3 Reclaimed water systems. The design of the reclaimed water systems shall conform to accepted engineering practice.

P2913.3.1 Distribution pipe. Distribution piping shall comply with Sections P2913.3.1.1 through P2913.3.1.3. **Exception:** Irrigation piping located outside of the *building* and downstream of a backflow preventer.

~~**P2913.3.1.1 Materials, joints and connections.** Distribution piping conveying reclaimed water shall conform to standards and requirements specified in Section P2906 for nonpotable water.~~

~~**P2913.3.1.2 Design.** Distribution piping systems shall be designed and sized in accordance with Section P2903 for the intended application.~~

~~**P2913.3.1.3 Labeling and marking.** Nonpotable rainwater distribution piping labeling and marking shall comply with Section P2901.2.~~

~~**P2913.4 Tests and inspections.** Tests and inspections shall be performed in accordance with Sections P2913.4.1 and P2913.4.2.~~

~~**P2913.4.1 Water supply system test.** The testing of makeup water supply piping and reclaimed water distribution piping shall be conducted in accordance with Section P2503.7.~~

~~**P2913.4.2 Inspection and testing of backflow prevention assemblies.** The testing of backflow preventers shall be conducted in accordance with Section P2503.8.~~

Add new text as follows:

CHAPTER 34
WATER REUSE SYSTEMS

SECTION 3401
GENERAL

P3401.1 General. The provisions of this chapter shall govern the materials, design, construction, and installation of systems for the treatment, storage, and distribution of *reuse water*. The provisions of CSA B805/ICC 805 shall be an alternative for regulating the materials, design, construction and installation of systems for rainwater collection, storage, treatment, and distribution. The application of water reuse systems shall comply with all applicable laws, rules, and ordinances of the jurisdiction.

P3401.2 Reuse water quality. Reuse water quality shall meet the minimum requirements as specified in Tables P3401.2(1), P3401.2(2), P3401.2(3), and as established for the intended application by all applicable laws, rules, and ordinances of the jurisdiction. Where water from multiple sources is combined, the system shall comply with the most stringent of the requirements of this code that are applicable to such sources.

TABLE P3401.2(1) REQUIRED WATER QUALITY FOR REUSE APPLICATIONS

Use Category	Application	Exposure[a]	Quality Tier[b]
Direct Potable Reuse	Direct Potable Reuse	DC	4
Indirect Potable Reuse	Aquifer Recharge - Direct Injection	IC	2
	Aquifer Recharge - Surface Application	IC	2
(Treatment Follows Reuse Application)	Aquifer Storage and Recovery	IC	2
	Rapid Infiltration Basins	IC	2
	Infiltration/Percolation Lagoons	IC	2
	Raw Water Augmentation	IC	2
	Saltwater Intrusion Barrier	IC	2
	Surface Water Augmentation to a Supply Source	IC	2
-	Food crop w/ processing that destroys pathogens (Restricted Access)	LC	1
-	Orchards and Vineyards	AC/LC	4/1
-	Water contacts edible portion of food crop (Includes Root Crops)	AC	4
Irrigation of Food Crops for Human Consumption (Spray/Drip)			

	Water doesn't contact edible portion of food crop (Restricted Access)	IC	2
	Christmas Tree Farms	AC/LC	3/1
	Hemp Crops	AC/LC	3/1
Irrigation of Crops Not for Human Consumption	Fiber crops	AC/LC	3/1
	Fodder /Feed Crop/ Forage Crops	AC/LC	3/1
(Spray/Drip)	Ornamental nursery stock	AC/LC	3/1
	Silviculture / Tree Farms	AC/LC	3/1
	Sod/Turf Crops	AC/LC	3/1
	Tobacco	AC/LC	3/1
	Athletic Fields	AC/LC	3/1
Landscape Irrigation	Cemeteries	AC/LC	3/1
	College and University Campuses	AC/LC	3/1
(Spray/Drip)	Commercial Campuses	AC/LC	3/1
	Golf Courses (Restricted Access)	LC	1
	Golf Courses (Unrestricted Access)	AC/LC	3/1
	Highway/Freeway Medians/ Roadside Vegetation	AC/LC	3/1
	Open Access Land Irrigation	AC/LC	3/1
	Pasture for Milk Producing Animals (Restricted Access)	LC	1
	Pasture for Non-Milk Producing Animals (Restricted Access)	LC	1
	Parks	AC/LC	3/1
	Playgrounds	AC/LC	3/1
	Residential Irrigation	AC/LC	3/1
	Landscape Irrigation (Restricted Access)	LC	1
	Urban Landscaping	AC/LC	3/1
	Schoolyards	AC/LC	3/1
Water Features	Decorative Fountains	AC	3
	Landscape Impoundments (With Fountain(s))	AC	3
	Landscape Impoundments (Without Fountain(s))	LC	1
	Ponds and Lagoons	LC	1
	Recreational Impoundments (Restricted Access)	LC	1
	Recreational Impoundments (Unrestricted Access)	AC	3
	Reservoir Augmentation (Recreational)	AC	3
	Wetland Creation	LC	1
	Wetland Discharge / Application	LC	1
Life Safety	Fire Fighting Via Plane	AC	3
	Fire Hydrant Water Supply	AC	3
	Fire Protection systems	AC	3
	Non Structural Fire Fighting	AC	3
	Structural Fire Fighting	AC	3
Construction	Concrete and Cement mixing	LC	1
	Dust Control	LC	1
	Equipment Operation (Ex. Cooling Power Equipment)	LC	1
	Material Washing and Sieving	LC	1
	Soil Compaction and Consolidation	LC	1
	Agricultural Cleaning (Animal Washing & Animal Pens)	AC	3
Process Water	Aquaculture	LC	1
	Boiler Feed	LC	1
	Building Washing	AC	3
	Chemical Mixing (Herbicides, Pesticides, Fertilizers)	LC	1
	Commercial Car Washes	AC	3
	Commercial Laundries	AC	3
	Cooling Power Equipment	LC	1
	Cooling systems with aerosolization	AC	3
	Cooling systems with no aerosolization	LC	1
	Dust Control (Roads and Streets)	LC	1
	Flushing Sanitary Sewers	LC	1
	Flushing Toilets and Urinals	AC	3
	Bidets and personal hygiene devices	DC	4
	Frost Protection	LC	1
	Gas Pipeline Testing	LC	1
	Hydro Seeding	AC	3
	Impoundments at Fish Hatcheries	LC	1
	Industrial Oil and Gas Operations	LC	1
	Industrial Process Water (No Possibility of Human Contact)	LC	1
Process Water	Industrial Process Water (Possibility of Human Contact or Evaporative)	AC	3
	Industrial Washwater applications	AC	3
	Livestock Drinking Water (Milk Producing)	AC	3
	Livestock Drinking Water (Non-Milk Producing)	AC	3
	Parts Cleaning	LC	1
	Pool Water Makeup	AC	3

Pressure Washing	AC	3
Priming Drainage Traps	LC	1
Road Milling	LC	1
Ship Ballasting	LC	1
Snow Making (Commercial / Recreational Use)	AC	3
Snow Making (Storage)	AC	3
Stack Scrubbing	AC	3
Stream Flow Augmentation	LC	1
Street, Sidewalk, Parking Lot Cleaning (Restricted Access)	LC	1
Street, Sidewalk, Parking Lot Cleaning (Unrestricted Access)	AC	3
Vehicle and equipment Washing	AC	3
Wastewater Treatment (Process Uses)	LC	1
Window Washing	AC	3

a. Where two Exposures and two Tiers are cited, the first refers to spray irrigation and the second refers to drip irrigation (or other subsurface irrigation).

b. Where the equipment manufacturer or the jurisdiction requires a level of free residual disinfectant that exceeds the requirement of the quality Tier indicated, such excess shall be provided.

DC (Quality Tier 4) = Direct Public Contact/Consumption Intended

AC (Quality Tier 3) = Aerosolization, or Accidental/Limited Consumption Possible

IC (Quality Tier 2) = Indirect Public Consumption Intended or Possible

LC (Quality Tier 1) = Limited Contact / No Consumption Intended

TABLE P3401.2(3) LOG REDUCTION (LRV) CREDITS APPLICABLE TO DPR BASED ON SOURCE WATER

Source Water	Maximum LRV Credits for DPR
Blackwater	0/0/0
Blackwater blended with ground water [a]	*LRV* credit [b] = negative log of *BWC*
Blackwater blended with surface water [a]	LRV credit [b] = negative log of BWC
Blackwater blended with groundwater and surface water [a]	*LRV* credit [b] = negative log of *BWC*
Graywater	Case by case basis
Stormwater	Case by case basis
Rainwater	Case by case basis
Industrial Water	Case by case basis
Process water	Case by case basis

a. Groundwater and surface waters must be either an untreated source of drinking water approved by the jurisdiction or a treated drinking water approved by the jurisdiction.

b. LRV credit for all source waters containing blackwater shall not exceed 2.0.

TABLE P3401.2.2(2) WATER QUALITY FOR TIERS OF REUSE

Quality Tier	Minimum Design Water Quality
4	United States Environmental Protection Agency (USEPA) Primary and Secondary Drinking Water Quality Standards (40 CFR 141), plus 18/15/15 Log Removal of Enteric Viruses, Giardia, and Cryptosporidium
3	Compliant with all applicable laws, rules, ordinances, and NSF/ANSI 350

2	Compliant with all applicable laws, rules, ordinances, and	end use fixture / equipment manufacturer requirements
1	Compliant with all applicable laws, rules, ordinances, and	end use fixture / equipment manufacturer requirements

P3401.3 Signage required. Where nonpotable water is supplied to outlets such as hose connections, hydrants, open-ended pipes and faucets each outlet shall be identified at the point of use with signage that reads as follows: "CAUTION: NONPOTABLE WATER – DO NOT DRINK." The words shall be legibly and indelibly printed on a tag or sign constructed of corrosion-resistant waterproof material or shall be indelibly printed on the fixture. The letters of the words shall be not less than 0.5 inch (12.7 mm) in height and in colors in contrast to the background on which they are applied. In addition to the required text, the pictograph shown in Figure P3401.3 shall appear on the signage required by this section.

FIGURE P3401.3 PICTOGRAPH—DO NOT DRINK

P3401.4 Permits. Permits shall be required for the construction, installation, operation, alteration and repair of water reuse systems. Construction documents, engineering calculations, diagrams, operation and maintenance manuals, and other such data pertaining to the water reuse system shall be submitted with each permit application.

P3401.5 Potable water connections. Where a potable system is connected to a nonpotable water system, the potable water supply shall be protected against backflow in accordance with Section P2902.

P3401.6 Components and materials. Piping, plumbing components, and materials used in conveyance and distribution systems shall be of material *approved* for the intended application.

P3401.7 Insect and vermin control. The system shall be protected to prevent the entrance of insects and vermin into process tanks and equipment, storage tanks and piping systems. Screen materials shall be compatible with contacting system components and shall not accelerate the corrosion of system components.

P3401.8 Freeze protection. Where freezing temperatures occur, provisions shall be made to keep storage tanks, process tanks and equipment, and the related piping from freezing.

P3401.9 Water tanks. Water storage and process tanks shall comply with Sections P3401.9.1 through P3401.9.10.

P3401.9.1 Location. Any storage tank, process tank and equipment, or portion thereof that is above grade shall be protected from direct exposure to sunlight by one of the following methods:

1. Tank construction using opaque, UV-resistant materials such as heavily tinted plastic, fiberglass, lined metal, concrete, or painted to prevent algae growth.
2. Specially constructed sun barriers.
3. Installation in garages, crawl spaces or sheds.

P3401.9.2 Materials. Prior to treatment for reuse, water shall be collected in an *approved* tank constructed of durable, nonabsorbent and corrosion-resistant materials. The tank shall be constructed of materials compatible with all disinfection systems used to treat water upstream of the tank and with all systems used to maintain water quality in the tank.

P3401.9.3 Foundation and supports.. All tanks shall be supported on a firm base capable of withstanding the weight of the tank when filled to capacity. Tanks shall be supported in accordance with the *International Building Code*.

P3401.9.3.1 Ballast. Where the soil can become saturated, an underground tank shall be ballasted, or otherwise secured, to resist buoyant forces when empty. The combined weight of the empty tank and hold-down ballast shall exceed the buoyancy force applied to the tank. Where the installation requires a foundation, the foundation shall be flat and shall be designed to resist the maximum buoyant forces when the tank is empty, and to support the weight of the tank when full, consistent with the bearing capability of adjacent soil.

P3401.9.3.2 Structural support. Where installed below grade, tank installations shall be designed to withstand earth and surface structural loads without damage and with minimal deformation when empty or filled with water.

P3401.9.4 Makeup water. Where an uninterrupted supply is required for the intended application, an additional source of makeup water shall be provided for the storage tank. All makeup water supplies shall be protected against backflow in accordance with Section P2902. A *full-open valve* located on the makeup water supply lines to the storage tank shall be provided. Flow into the storage tank shall be controlled by fill valves or other automatic supply valves installed to prevent the tank from overflowing and to prevent the water level from dropping below a predetermined point. The water level shall not be permitted to drop below the intake of any pump supplying makeup water.

P3401.9.5 Overflow. Tanks shall be equipped with an overflow pipe having a diameter not less than that shown in Table P3401.9.5. The overflow pipe shall be protected from insects and vermin and shall discharge in a manner consistent with all applicable laws, rules, and ordinances of the jurisdiction for storm water runoff requirements. The overflow pipe shall discharge at a sufficient distance from the tank to avoid damaging the tank foundation or the adjacent property. Drainage from overflow pipes shall be directed to prevent freezing on roof walkways, and on sidewalks, pavement, and other accessways subject to vehicular or pedestrian traffic. The overflow drain shall not be equipped with a shutoff valve. A cleanout shall be provided on each overflow pipe in accordance with Section P3005.2.

TABLE P3401.9.5 SIZE OF DRAIN PIPES FOR WATER TANKS

TANK CAPACITY (gallons)	DRAIN PIPE (inches)
Up to 750	1
751 to 1,500	1 1/2
1,501 to 3,000	2
3,001 to 3,000	2 1/2
5,001 to 7,500	3
Over 7,500	4

For SI: 1 gallon = 3.875 liters, 1 inch = 25.4 mm.

P3401.9.6 Access. Not less than one access opening shall be provided to allow inspection and cleaning of the tank interior. Access openings shall have an *approved* locking device or other *approved* method of securing access. Below-grade tanks, located outside of the building, shall be provided with an access opening either not less than 24 inches (610 mm) square or with an inside diameter not less than 24 inches (610 mm). An access opening shall extend not less than 4 inches (102 mm) above ground and shall be designed to prevent water infiltration. The finished grade shall be sloped away from the maintenance hole to divert surface water. Access opening covers shall be secured to prevent unauthorized access. Service ports in an access opening shall be not less than 8 inches (203 mm) in diameter and shall be not less than 4 inches (102 mm) above the finished grade level. The service port shall be secured to prevent unauthorized access. Access locations to confined spaces shall be labeled “CONFINED SPACE.” **Exception:** Tanks that are less than 800 gallons (3028 L) in volume and installed below grade shall not be required to be equipped with an access opening provided that the tank has a service port of not less than 8 inches (203mm) in diameter.

P3401.9.7 Venting. Tanks that receive flow by gravity shall be provided with a vent sized in accordance with Chapter 31 and based on the aggregate diameter of all tank influent pipes. The reservoir vent shall not be connected to sanitary drainage system vents. Vents shall be protected from contamination by means of an approved cap or U-bend installed with the opening directed downward. Vent outlets shall extend not less than 4 inches (102 mm) above grade or as necessary to prevent surface water from entering the tank. Vent openings shall be protected against the entrance of vermin and insects in accordance with the requirements of Section P3401.7.

P3401.9.8 Draining of tanks. Tanks shall be provided with a means of emptying the contents for the purpose of service or cleaning. Tanks shall be drained by using a pump or by a drain located at the lowest point in the tank. The tank drain pipe shall discharge as required for overflow pipes and shall not be smaller in size than specified in Table P3401.9.5.Not less than one cleanout shall be provided on each drain pipe in accordance with Section P3005.2.

P3401.9.9 Marking and signage. Each nonpotable water tank shall be labeled with its rated volumetric capacity. The contents of tanks shall be identified with the words “CAUTION: NONPOTABLE WATER – DO NOT DRINK.” Where an opening is provided that could allow the entry of personnel, the opening shall be marked with the words, “DANGER – CONFINED SPACE.” Markings shall be indelibly printed on the tank or on a tag or sign constructed of corrosion-resistant waterproof material that is mounted on the tank. The letters of the words shall be not less than 0.5 inch (12.7 mm) in height and shall be of a color in contrast with the background on which they are applied

P3401.9.10 Tank tests. Pressurized tanks shall be certified in accordance with Section P2609.4. Tanks that receive flow by gravity shall be tested in accordance with the following:
Tanks shall be filled with water to the overflow line prior to and during inspection. Seams and joints shall be left exposed and the tank shall remain watertight without leakage for a period of 24 hours.

1. After 24 hours, supplemental water shall be introduced for a period of 15 minutes to verify proper drainage of the overflow system and that there are no leaks.
2. The tank drain shall be observed for proper operation.
3. The makeup water system shall be observed for proper operation, and successful automatic shutoff of the system at the refill threshold shall be verified.

P3401.10 System abandonment. If the owner of an on-site *water reuse system* or components thereof elects to cease use of, or fails to properly maintain such system, the system shall be abandoned and shall comply with Sections P3401.10.1 through P3401.10.3.

P3401.10.1 Utility-connected piping. All system piping connecting to a utility-provided water system shall be removed or disabled.

P3401.10.2 Distribution piping. The distribution piping system shall be removed or replaced with an approved potable water supply piping system. Where an existing potable pipe system is already in place, the fixtures shall be connected to the existing system.

P3401.10.3 Tanks. Tank(s) shall be removed, or secured from accidental access by sealing or locking tank inlets and access points, or filling with sand or equivalent.

P3401.11 Trenching requirements for nonpotable water piping. Nonpotable water distribution piping shall be separated from the *building sewer* and potable water piping underground by 5 feet (1524 mm) of undisturbed or compacted earth. Nonpotable water distribution piping shall not be located in, under or above cesspools, septic tanks, septic tank drainage fields or seepage pits. Buried nonpotable water piping shall comply with the requirements of Section P2604. **Exceptions:**

1. The required separation distance shall not apply where the bottom of the nonpotable water pipe within 5 feet (1524 mm) of the sewer is not less than 12 inches (305 mm) above the top of the highest point of the *sewer* and the pipe materials conform to Table P3002.2.

2. The required separation distance shall not apply where the bottom of the potable water service pipe within 5 feet (1524 mm) of the nonpotable water pipe is not less than 12 inches (305 mm) above the top of the highest point of the nonpotable water pipe and the pipe materials comply with the requirements of Table P2906.5
3. Nonpotable water pipe is permitted to be located in the same trench as a *building sewer*, provided that such sewer is constructed of materials that comply with the requirements of Table P3002.1(2).
4. The required separation distance shall not apply where a nonpotable water pipe crosses a sewer pipe, provided that the pipe is sleeved to not less than 5 feet (1524 mm) horizontally from the sewer pipe centerline on both sides of such crossing, with pipe materials that comply with Table P3002.1(2).
5. The required separation distance shall not apply where a potable water service pipe crosses a nonpotable water pipe, provided that the potable water service pipe is sleeved for a distance of not less than 5 feet (1524 mm) horizontally from the centerline of the nonpotable pipe on both sides of such crossing, with pipe materials that comply with Table P3002.1(2).
6. Irrigation piping located outside of a building and downstream of the backflow preventer is not required to meet the trenching requirements where nonpotable water is used for outdoor applications.

P3401.12 Outdoor outlet access. Sillcocks, hose bibbs, wall hydrants, yard hydrants and other outdoor outlets supplied by nonpotable water shall be located in a locked vault or shall be operable only by means of a removable key and marked in accordance with Section P3401.3.

P3401.13 Operation and Monitoring. The design, installation and continued operation of water reuse systems shall be in accordance with an approved operating and monitoring program. The program shall be implemented by an individual or entity in accordance with the requirements of the *International Property Maintenance Code*.

SECTION P3402
GRAYWATER AND BLACKWATER REUSE

P3402.1 General. The provisions of ASTM E2635 and Section P3402 shall govern the construction, installation, alteration and repair of water reuse systems.

3402.2 Graywater sources. Graywater reuse systems shall collect waste discharge from only the following sources: bathtubs, showers, lavatories, clothes washers, laundry trays, condensate and other domestic wastewaters that are not expected to contain urine, fecal matter, grease or food wastes.

P3402.3 Blackwater sources. Blackwater shall be discharged to the sanitary drainage system in accordance with Chapter 30 or to an approved on-site blackwater reuse system.

P3402.4 Other sources. Other sources including, but not limited to, condensate, reverse osmosis system reject water and water softener discharge water shall also be considered for use in a water reuse system.

P3402.5 Traps. Traps serving fixtures and devices discharging water to water reuse systems shall comply with Section P3201.2.

P3402.6 Pipe marking. Additional marking of collection piping conveying untreated water for reuse shall not be required beyond that required for sanitary drainage, waste and vent piping by Chapter 30.

P3402.7 Treatment. Water collected for reuse shall be treated to meet the quality standards required in Tables P3401.2(1) and P3401.2(2).

P3402.8 Treatment systems. Treatment systems shall be installed to allowaccess for inspection and maintenance. All treatment equipment shall utilize pressure gauges, level sensors, intensity meters or other approved methods to indicate when servicing or

replacement is required. All treatment equipment shall be installed with shutoff valves immediately upstream and downstream to allow for isolation during maintenance.

P3402.9 Tanks. Nonpotabletanksutilized in water reuse systems shall comply with Sections P3401.9, P3402.9.1 and P3402.9.2.

P3402.9.1 Location. Tanks shall be located with a minimum horizontal distance between various elements as indicated in Table P3402.9.1.

TABLE P3402.9.1 LOCATION OF NONPOTABLE WATER REUSE TANKS

ELEMENT	MINIMUM HORIZONTAL DISTANCE FROM TANK (feet)
Critical root zone (CRZ) of protected trees	2
Lot line adjoining private lots	5
Public water main	10
Seepage pits	5
Septic tanks	5
Streams and lakes	50
Water service	5
Water wells	50

1 foot = 304.8 mm.

P3402.9.2 Outlets. Outlets shall be located not less than 4 inches (102 mm) above the bottom of the tank and shall not skim water from the surface.

P3402.10 Valves. Valves shall be installed on the collection piping of the *water reuse system*s in accordance with Sections P3402.10.1 and P3402.10.2.

P3402.10.1 Bypass valve. One three-way diverter valve listed and labeled to NSF 50 or other *approved* device shall be installed on collection piping upstream of each storage tank, as applicable, to divert untreated on-site reuse sources to the sanitary sewer or approved receiving tank to allow servicing and inspection of the system. Bypass valves shall be installed downstream of fixture traps and vent connections. Bypass valves shall be marked to indicate the direction of flow. Bypass valves shall be provided with access that allows for removal. Two shutoff valves shall not be installed to serve as a bypass valve.

P3402.10.2 Backwater valve. One or more backwater valves shall be installed on each overflow and tank drain pipe. Backwater valves shall be installed in accordance with Section P3008.

P3402.11 Pumping and control system. Mechanical equipment including pumps, valves, and treatment units shall have *access* in order to replace, repair, maintain and clean. The minimum flow rate and flow pressure delivered by the pumping system shall be appropriate for the application and in accordance with Section P2903.

P3402.12 Water pressure-reducing valve or regulator. Where the water pressure supplied by the pumping system exceeds 80 psi (552 kPa) static, a pressure-reducing valve shall be installed to reduce the pressure in the water distribution system piping to 80 psi (552 kPa) static or less. Pressure-reducing valves shall be specified and installed in accordance with Section P2903.3.2.

P3402.13 Distribution piping. Distribution piping utilized in water reuse systems shall comply with Sections P3402.13.1 through P3402.13.3. **Exception:** Irrigation piping located outside of the building and downstream of a backflow preventer.

P3402.13.1 Materials, joints and connections. Distribution piping shall conform to the standards and requirements specified in Section P2906.

P3402.13.2 Design. Water reuse distribution piping systems shall be designed and sized in accordance with Section P2903 for the intended application.

P3402.13.3 Labeling and marking. Nonpotable water distribution piping labeling and marking shall comply with Section P2901.2.

P3402.14 Tests and Inspections. Tests and inspections shall be witnessed by the designer and performed in accordance with Sections P3402.14.1 through P3402.14.7.

P3402.14.1 Collection pipe and vent test. Drain, waste and vent piping used for on-site water reuse systems shall be tested in accordance with Section P2503.5.

P3402.14.2 Tank test. Tanks shall be tested in accordance with Section P3401.9.10.

P3402.14.3 Water supply system test. The testing of makeup water supply piping and distribution piping shall be conducted in accordance with Section P2503.7.

P3402.14.4 Inspection and testing of backflow prevention assemblies. The testing of backflow preventers and backwater valves shall be conducted in accordance with Section P2503.8.

P3402.14.5 Inspection of vermin and insect protection. Inlets and vents to the system shall be inspected to verify that each is protected to prevent the entrance of insects and vermin into the tank and piping systems in accordance with Section P3401.7.

P3402.14.6 Initial water quality test. The quality of the water for the intended application shall be verified at the point of use in accordance with all applicable laws, rules and ordinances of the jurisdiction.

P3402.14.7 Operational water quality testing. The quality of the water for the intended application(s) shall be verified at the point of use in accordance with all applicable laws, rules, ordinances of the jurisdiction, and in accordance with the operation and maintenance manual, and where required, the operating permit.

P3402.15 Operation and maintenance manuals. Operation and maintenance materials shall be supplied with nonpotable on-site*water reuse system*s in accordance with Sections P3402.15.1 through P3402.15.4 and the maintenance program shall be implemented by an individual or entity in accordance with the requirements of the *International Property Maintenance Code*.

P3402.15.1 Manual. A detailed operations and maintenance manual shall be supplied in hardcopy form with all systems.

P3402.15.2 Schematics. The manual shall include a detailed system schematic, and the locations and a list of all system components, including manufacturer and model number.

P3402.15.3 Maintenance procedures. The manual shall provide a schedule and procedures for all system components requiring periodic maintenance. Consumable parts, including filters, shall be noted along with part numbers.

P3402.15.4 Operations procedures. The manual shall include system startup and shutdown procedures. The manual shall include detailed operating procedures for the system.

SECTION 3403
NONPOTABLE RAINWATER COLLECTION SYSTEMS

P3403.1 General. The provisions of this section shall govern the construction, installation, alteration and repair of rainwater collection and conveyance systems for the collection, storage, treatment and distribution of rainwater for nonpotable applications. For nonpotable rainwater systems, the provisions of CSA B805/ICC 805 shall be an alternative for regulating the materials, design, construction and installation of systems for rainwater collection, storage, treatment and distribution of nonpotable water. The use and application of

nonpotable water shall comply with laws, rules and ordinances applicable in the jurisdiction.

P3403.2 Collection surface. Rainwater shall be collected only from above-ground impervious roofing surfaces constructed from approved materials. Collection of water from vehicular parking or pedestrian walkway surfaces shall be prohibited except where the water is used exclusively for landscape irrigation. Overflow and bleed-off pipes from roof-mounted appliances including, but not limited to, evaporative coolers, water heaters and solar water heaters shall not discharge onto rainwater collection surfaces.

P3403.3 Debris excluders. Downspouts and leaders shall be connected to a roof washer and shall be equipped with a debris excluder or equivalent device to prevent the contamination of collected rainwater with leaves, sticks, pine needles and similar material. Debris excluders and equivalent devices shall be self-cleaning.

P3403.4 Roof washer. An amount of rainwater shall be diverted at the beginning of each rain event, and not allowed to enter the storage tank, to wash accumulated debris from the collection surface. The amount of rainfall to be diverted shall be field adjustable as necessary to minimize storage tank water contamination. The roof washer shall not rely on manually operated valves or devices, and shall operate automatically. Diverted rainwater shall not be drained to the roof surface, and shall be discharged in a manner consistent with the stormwater runoff requirements of the jurisdiction. Roof washers shall be accessible for maintenance and service.

P3403.5 Roof gutters and downspouts . Gutters and downspouts shall be constructed of materials that are compatible with the collection surface and the rainwater quality for the desired end use. Joints shall be watertight.

P3403.5.1 Slope. Roof gutters, leaders and rainwater collection piping shall slope continuously toward collection inlets and shall be free of leaks. Gutters and downspouts shall have a slope of not less than $^1/_8$ inch per foot (10.4 mm/m) along their entire length. Gutters and downspouts shall be installed so that water does not pool at any point.

P3403.5.2 Cleanouts. Cleanouts shall be provided in the water conveyance system to allow access to filters, flushes, pipes and downspout

P3403.6 Drainage. Water drained from the roof washer or debris excluder shall not be drained to the sanitary sewer. Such water shall be diverted from the storage tank and shall discharge to a location that will not cause erosion or damage to property. Roof washers and debris excluders shall be provided with an automatic means of self-draining between rain events and shall not drain onto roof surfaces.

P3403.7 Collection pipe. Rainwater collection and conveyance systems shall utilize drainage piping approved for use within plumbing drainage systems to collect and convey captured rainwater. Vent piping approved for use within plumbing venting systems shall be utilized for vents within the rainwater system. Collection and vent piping materials shall comply with Section P3002.

P3403.7.1 Installation. Collection piping conveying captured rainwater shall be installed in accordance with Section P3005.3.

P3403.7.2 Joints. Collection piping conveying captured rainwater shall utilize joints approved for use with the distribution piping and appropriate for the intended applications as specified in Section P3003.

P3403.7.3 Size. Collection piping conveying captured rainwater shall be sized in accordance with drainage-sizing requirements specified in Section P3005.4

P3403.7.4 Marking. Additional marking of collection piping conveying captured rainwater for reuse shall not be required beyond that required for sanitary drainage, waste, and vent piping by Chapter 30.

P3403.8 Filtration. Collected rainwater shall be filtered as required for the intended end use. Filters shall be accessible for inspection and maintenance. Filters shall utilize a pressure gauge or other approved method to provide indication when a filter requires servicing or replacement. Filters shall be installed with shutoff valves installed immediately upstream and downstream to allow for isolation during maintenance.

P3403.9 Disinfection. Where the intended application for rainwater requires disinfection or other treatment or both, it shall be disinfected

as needed to ensure that the required water quality is delivered at the point of use.

P3403.10 Storage tanks. Storage tanks utilized in nonpotable rainwater collection and conveyance systems shall comply with Section P3401.9 and Sections P3403.10.1 through P3403.10.3.

P3403.10.1 Location. Storage tanks shall be located with a minimum horizontal distance between various elements as indicated in Table P3403.10.1.

TABLE P3403.10.1 LOCATION OF RAINWATER STORAGE TANKS

ELEMENT	MINIMUM HORIZONTAL DISTANCE (feet)
Critical root zone	2
Lot line adjoining private lots	5
Seepage pits	5
Septic tanks	5

For SI: 1 foot = 304.8 mm

P3403.10.2 Inlets. Storage tank inlets shall be designed to introduce collected rainwater into the tank with minimum turbulence, and shall be located and designed to avoid agitating the contents of the storage tank.

P3403.10.3 Outlets. Outlets shall be located not less than 4 inches (102 mm) above the bottom of the storage tank and shall not skim water from the surface.

P3403.11 Valves. Valves shall be supplied on rainwater collection and conveyance systems in accordance with Sections P3403.11.1 and P3403.11.2.

P3403.11.1 Influent diversion. A means shall be provided to divert storage tank influent to allow for maintenance and repair of the storage tank system.

P3403.11.2 Backwater valve. Backwater valves shall be installed on each overflow and tank drain pipe. Backwater valves shall be in accordance with Section P3008.

P3403.12 Pumping and control system.. Mechanical equipment including pumps, valves and filters shall be easily accessible and removable in order to perform repair, maintenance and cleaning. The minimum flow rate and flow pressure delivered by the pumping system shall appropriate for the application and in accordance with Section P2903.

P3403.13 Water pressure-reducing valve or regulator. Where the water pressure supplied by the pumping system exceeds 80 psi (552 kPa) static, a pressure-reducing valve shall be installed to reduce the pressure in the rainwater distribution system piping to 80 psi (552 kPa) static or less. Pressure-reducing valves shall be specified and installed in accordance with Section P2903.3.2.

P3403.14 Distribution pipe. Distribution piping utilized in rainwater collection and conveyance systems shall comply with Sections P3403.14.1 through P3403.14.3. **Exception:** Irrigation piping located outside of the building and downstream of a backflow preventerrigation piping located outside of the building and downstream of a backflow preventer.

P3403.14.1 Materials, joints and connections. Distribution piping shall conform to the standards and requirementsspecified in Section

P2906 for nonpotable water.

P3403.14.2 Design. Distribution piping systems shall be designed and sized in accordance with the Section P2903 for the intended application.

P3403.14.3 Labeling and marking. Nonpotable rainwater distribution piping labeling and marking shall comply with Section P2901.2.

P3403.15 Tests and inspections. Tests and inspections shall be performed in accordance with Sections P3403.15.1 through P3403.15.8.

P3403.15.1 Roof gutter inspection and test. Roof gutters shall be inspected to verify that the installation and slope is in accordance with Section P3403.5.1. Gutters shall be tested by pouring not less than 1 gallon of water (3.8 L) into the end of the gutter opposite the collection point. The gutter being tested shall not leak and shall not retain standing water.

P3403.15.2 Roofwasher test.. Roofwashers shall be tested by introducing water into the gutters. Proper diversion of the first quantity of water in accordance with the requirements of Section P3403.4 shall be verified.

P3403.15.3 Collection pipe and vent test. Drain, waste and vent piping used for rainwater collection and conveyance systems shall be tested in accordance with Section P2503.5.

P3403.15.4 Storage tank test . Storage tanks shall be tested in accordance with the Section P3401.9.10.

P3403.15.5 Water supply system test. The testing of makeup water supply piping and distribution piping shall be conducted in accordance with Section P2503.7.

P3403.15.6 Inspection and testing of backflow prevention assemblies. The testing of backflow preventers and backwater valves shall be conducted in accordance with Section P2503.8.

P3403.15.7 Inspection of vermin and insect protection. Inlets and vents to the system shall be inspected to verify that each is protected to prevent the entrance of insects and vermin into the storage tank and piping systems in accordance with Section P3401.7.

P3403.15.8 Water quality test. The quality of the water for the intended application shall be verified at the point of use in accordance with the requirements of the jurisdiction.

>P3403.16 Operation and maintenance manuals.. Operation and maintenance manuals shall be supplied with rainwater collection and conveyance systems in accordance with Sections P3403.16.1 through P3403.16.4.

P3403.16.1 Manual.. A detailed operations and maintenance manual shall be supplied in hard-copy form for each system.

P3403.16.2 Schematics. The manual shall include a detailed system schematic, the location of system components and a list of system components that includes the manufacturers and model numbers of the components.

P3403.16.3 Maintenance procedures. The manual shall provide a maintenance schedule and procedures for system components requiring periodic maintenance. Consumable parts, including filters, shall be noted along with part numbers.

P3403.16.4 Operations procedures. The manual shall include system startup and shutdown procedures, and detailed operating procedures.

SECTION P3404
RECLAIMED WATER SYSTEMS

P3404.1 General. The provisions of this section shall govern the construction, installation, alteration and repair of systems supplying nonpotable reclaimed water.

P3404.2 Water pressure-reducing valve or regulator. Where the reclaimed water pressure supplied to the building exceeds 80 psi (552 kPa) static, a pressure-reducing valve shall be installed to reduce the pressure in the reclaimed water distribution system piping to 80 psi (552 kPa) static or less. Pressure-reducing valves shall be specified and installed in accordance with Section P2903.3.2.

P3404.3 Reclaimed water systems. The design of the reclaimed water systems shall conform to accepted engineering practice.

P3404.3.1 Distribution pipe. Distribution piping shall comply with Sections P3404.3.1.1 through P3404.3.1.3. **Exception:** Irrigation piping located outside of the building and downstream of a backflow preventer.

P3404.3.1.1 Materials, joints and connections. . Distribution piping conveying reclaimed water shall conform to standards and requirements specified in Section P2906 for nonpotable water.

P3404.3.1.2 Design. Distribution piping systems shall be designed and sized in accordance with Section P2903 for the intended application.

P3404.3.1.3 Labeling and marking. Nonpotable rainwater distribution piping labeling and marking shall comply with Section P3401.3.

P3404.4 Tests and inspections.. Tests and inspections shall be performed in accordance with Sections P3404.4.1 and P3404.4.2.

P3404.4.1 Water supply system test. The testing of makeup water supply piping and reclaimed water distribution piping shall be conducted in accordance with Section P2503.7.

P3404.4.2 Inspection and testing of backflow prevention assemblies. . The testing of backflow preventers shall be conducted in accordance with Section P2503.8.

Add new standard(s) as follows:

N/A. 40 CFR 141 United States Environmental Protection Agency (USEPA) Primary and Secondary Drinking Water Quality Standards

Reason: A version of this proposal was presented in 2020 and rejected. Feedback from the PMGCAC has been considered and addressed herein as follows:

The definitions of graywater, wastewater, and blackwater are unclear.

It is unclear how a code official would enforce odor controls.

Odors are addressed in this proposal by reference to 40 CFR 141, NSF 350, and required compliance with all applicable laws, rules, and ordinances. Furthermore, The designer is required to address odor control in the operation and monitoring program, if the code official has any concerns.

Wastewater reuse should be governed locally, not in ICC code.

More detail is needed on blackwater reuse and related quality.

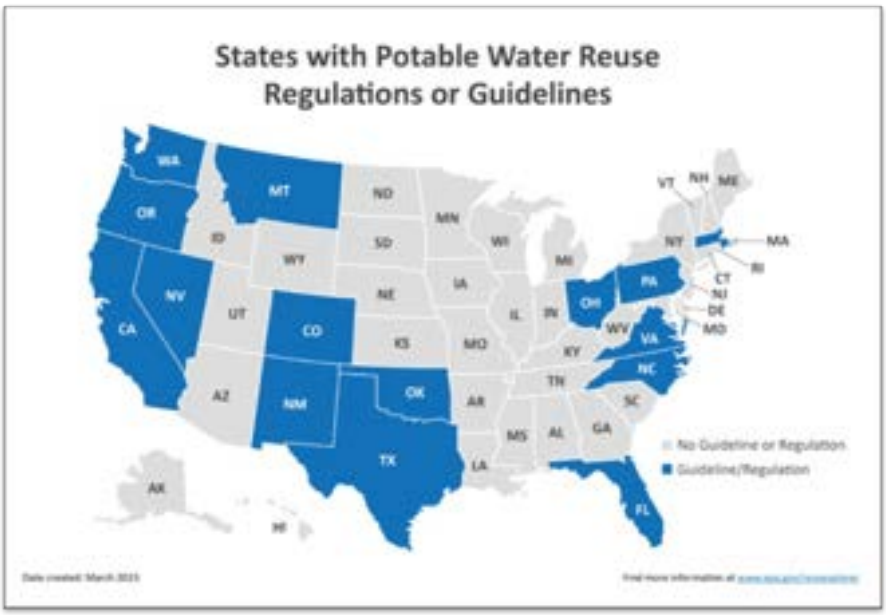
This proposal includes rigorous quality standards based on current science and focused on public safety.

Water reuse options should be expanded in the plumbing code not only because of the moral imperative to improve water efficiency and reduce consumption of valuable potable water for nonpotable purposes, but also because current technologies safely enable such practices. For example, by treating and reusing its own wastewater, a commercial office building can offset 100% of its toilet and urinal flushing demand, which can represent up to 70% of its total indoor potable water demands. In San Francisco, the San Francisco Public Utilities Commission headquarters building treats wastewater onsite for toilet and urinal flushing, reducing the use of potable water within the building by approximately 50%. In Sydney, Australia at 1 Bligh Street, a commercial high rise tower is offsetting 100% of the

building's nonpotable water demands by reusing wastewater. In Portland, Oregon the Hassalo on Eighth eco-district, a cluster of residential, commercial, and mixed-use buildings is collecting its wastewater and reusing it for toilet flushing and irrigation. This system saves up to 7 million gallons of potable water per year. In New York City, the Solaire Building has successfully operated an onsite blackwater reuse system for two decades to meet the building's toilet flushing, cooling tower makeup, and irrigation demands. Similar to San Francisco, New York City has several buildings treating blackwater onsite for non-potable end uses. These are just a few examples of successfully operating nonpotable reuse systems with long histories.

Today, focus has shifted to Indirect Potable Reuse (IPR) and Direct Potable Reuse (DPR). IPR is when treated wastewater is supplied to a raw drinking water source such as an aquifer or reservoir. The naturally blended water is then withdrawn for treatment in a drinking water treatment facility prior to public consumption. DPR eliminates the environmental buffer and provides treated wastewater directly for public consumption.

According to the EPA, treated wastewater can be used for potable consumption in California, Colorado, Connecticut, Delaware, Florida, Massachusetts, Montana, Nevada, New Mexico, North Carolina, Oklahoma, Oregon, Pennsylvania, Texas, Virginia, and Washington. Some of these states also permit DPR. Still other states are in the process of developing DPR regulations, including Arizona where the practice is currently labeled "Advanced Water Purification" (AWP) instead of DPR.



Health & Safety. Standards such as NSF 350 exist to guide the implementation of onsite treatment and reuse systems. Water quality standards are also evolving as public health regulators and utilities from across the country are adopting a health risk-based approach that applies to water sources including blackwater, graywater, and rainwater. This health risk- framework focuses on the removal of pathogens and ongoing monitoring to ensure water is treated appropriately based on the end use. Public health and safety is paramount. States including California and Washington are proceeding with establishing health risk-based frameworks for the treatment of onsite blackwater.

The quality defined for the sole Tier 4 application (DPR) is by necessity not only based on common drinking water quality standards (USEPA), but also on the recognition that additional biological barriers are appropriate, given the source water's origin. Extensive studies have been conducted in the past few decades to determine the level of treatment required to ensure public health and safety.

Log removals of Enteric Viruses, Giardia, and Cryptosporidium (18/15/15, respectively) are based on the National Water Research Institute's "DPR Criteria Expert Panel: Preliminary Findings and Recommendations", Fountain Valley, California, June 23, 2023

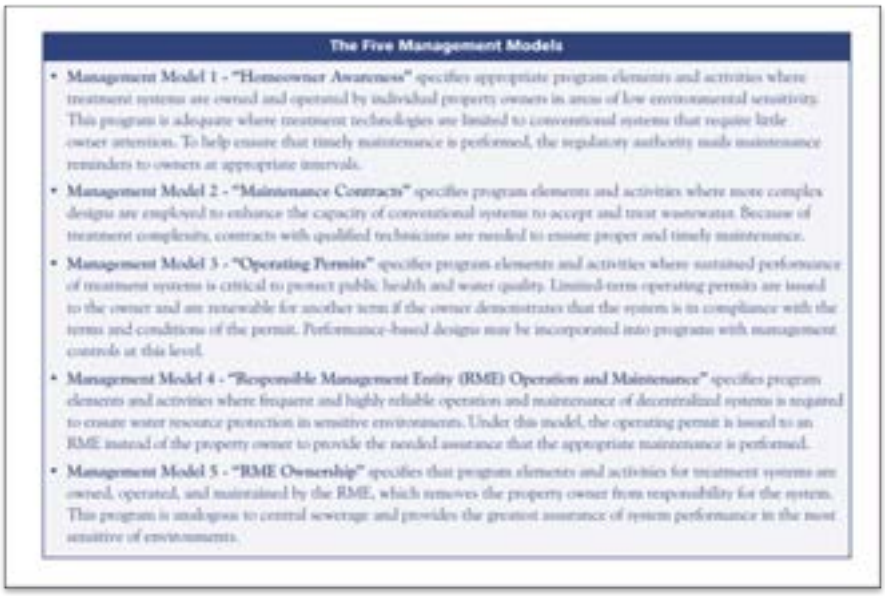
These log reductions, mean that enteric viruses are reduced by 99.9999999999999999% (18 nines), that giardia and cryptosporidium oocysts are each reduced by 99.9999999999999% (15 nines)

Engineering process design is expected to be based on treatment technique log removal values (LRVs), as published by generally accepted industry leaders and institutions (e.g., United States Environmental Protection Agency, Water Environment & Research Foundation, World Health Organization, etc.). Treatment verification is expected to be demonstrated by periodic challenge tests, as described by generally accepted industry leaders and institutions (see above). Due to the rapid evolution and variety of treatment

techniques and challenge test protocols, neither are further specified herein although they may be in the future. Additionally, periodic challenge testing may not be required where treatment process surrogates are monitored to ensure ongoing performance within a credited window. At this time, flexibility is needed to promote water conservation and to empower decision makers.

This proposal does not seek to specifically define water quality requirements for Tier 1 and 2 applications. It is recognized that such standards may be highly dependent on source water quality,and should remain flexible to empower decision makers.

Public health and safety are further assured by requiring competent management of all water reuse systems. Section 1302.14 specifies Management Model 4 or Management Model 5 of USEPA's Management Guidelines for Decentralized Wastewater Management (EPA 832-B-03-001, March 2003)



The Five Management Models

- **Management Model 1 - "Homeowner Awareness"** specifies appropriate program elements and activities where treatment systems are owned and operated by individual property owners in areas of low environmental sensitivity. This program is adequate where treatment technologies are limited to conventional systems that require little owner attention. To help ensure that timely maintenance is performed, the regulatory authority mails maintenance reminders to owners at appropriate intervals.
- **Management Model 2 - "Maintenance Contracts"** specifies program elements and activities where more complex designs are employed to enhance the capacity of conventional systems to accept and treat wastewater. Because of treatment complexity, contracts with qualified technicians are needed to ensure proper and timely maintenance.
- **Management Model 3 - "Operating Permits"** specifies program elements and activities where sustained performance of treatment systems is critical to protect public health and water quality. Limited-term operating permits are issued to the owner and are renewable for another term if the owner demonstrates that the system is in compliance with the terms and conditions of the permit. Performance-based designs may be incorporated into programs with management controls at this level.
- **Management Model 4 - "Responsible Management Entity (RME) Operation and Maintenance"** specifies program elements and activities where frequent and highly reliable operation and maintenance of decentralized systems is required to ensure water resource protection in sensitive environments. Under this model, the operating permit is issued to an RME instead of the property owner to provide the needed assurance that the appropriate maintenance is performed.
- **Management Model 5 - "RME Ownership"** specifies that program elements and activities for treatment systems are owned, operated, and maintained by the RME, which removes the property owner from responsibility for the system. This program is analogous to central sewerage and provides the greatest assurance of system performance in the most sensitive of environments.

SAMPLE LRV CREDIT CALCULATION REGARDING IPC TABLE 1301.2(3) and IRC Table P3401.2(3):

10,000 gpd of Blackwater

70,000 gpd of groundwater

20,000 gpd of surface water

BWC = 10,000 / (10,000 + 70,000 + 20,000)

BWC = 0.10

LRV Credit = -log (BWC)

LRV Credit = -log (0.10)

LRV Credit = 1.0

This proposal is submitted by the ICC Plumbing Mechanical Gas Code Action Committee (PMGCAC) PMGCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 PMGCAC has held 26 virtual meetings open to any interested party. In addition, there were several virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the PMGCAC website at PMGCAC.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposal to expand implementation of onsite wastewater reuse will not increase the cost of construction. The proposal is allowing for onsite wastewater reuse systems as an option, but not mandating installation. Buildings that choose to install a system would experience increased construction costs to install tanks, treatment, and distribution piping. However, buildings can also realize cost savings on water and sewer bills by reusing wastewater onsite. As a result, the building would consume less potable water and send less wastewater to the sewer.

An analysis was conducted to evaluate the amount of wastewater that could be treated and reused onsite in proposed mixed-use development in San Francisco. Using the water utility's rate schedule to estimate the financial savings, the analysis showed installing an onsite wastewater reuse system could result in savings of about $50,000 annually based on reduced potable consumption alone. As the cost of potable water increases, so would such savings.

Staff Analysis: A review of the standard proposed for inclusion in the code, DOE 40 CFR 141 *United States Environmental Protection*

Agency (USEPA) Primary and Secondary Drinking Water Quality Standards , with regard to some of the key ICC criteria for referenced standards (Section 4.6 of CP#28) will be posted on the ICC website on or before March 18, 2024.

Public Hearing Results (CAH1)

Errata: This proposal includes published errata Errata: The notes were missing from the table. See the Consolidated Monograph Updates document; https://www.iccsafe.org/wp-content/uploads/2024-Group-A-Consolidated-Monograph-Updates.pdf

Committee Action: **As Modified by Committee**

Committee Modification: TABLE P3401.2(1)REQUIRED WATER QUALITY FOR REUSE APPLICATION

Use Category	Application	Exposure[a]	Quality Tier[b]
Process Water	Industrial Process Water (Possibility of Human Contact or Evaporative)	AC	3
	Industrial Washwater applications	AC	3
	Livestock Drinking Water (Milk Producing)	AC	3
	Livestock Drinking Water (Non-Milk Producing)	AC	3
	Parts Cleaning	LC	1
	Pool Water Makeup	~~AC~~DC	~~3~~4
	Pressure Washing	AC	3

Committee Reason: For the modification: This corrects makeup water for pools to be suitable for Direct Contact Tier 4. (8-2)
For the proposal as modified: The Committee agreed with the published reason statement. (8-2)

P157-24 Part II

Individual Consideration Agenda

Comment 1:

IRC: P3401.2

Proponents: Kyle Thompson, Technical Director, Plumbing Manufacturers International (kthompson@safeplumbing.org) requests As Modified by Committee (AMC2)

Further modify as follows:

2024 International Residential Code

Revise as follows:

P3401.2 Reuse water quality. Reuse water quality shall meet the minimum requirements as specified in Tables P3401.2(1), P3401.2(2), P3401.2(3), and as established for the intended application by all applicable laws, rules, and ordinances of the jurisdiction. Where water from multiple sources is combined, the system shall comply with the most stringent of the requirements of this code that are applicable to such sources. Where an alternate non-potable water source for use in toilet flushing is installed, a potable water distribution line rough-

in, sized in accordance with Section P2903, that includes a shutoff valve located where the line originates, shall be provided at each toilet.

Reason: See CAH1 Proposal P155-24 for extended substantiation supporting the need for potable water use in smart toilets and personal hygiene devices.

This proposed change only applies to buildings that chose to plumb non-potable water indoors specifically for toilet flushing. It would require a potable water supply line to be roughed in when the non-potable water supply line is installed to address smart toilets and personal hygiene devices. Smart toilets (See Figure 1) are those which include an integrated bidet feature and personal hygiene devices (See Figure 2) are an add on or toilet seat incorporating a bidet feature.

When a residential building is plumbed with a non-potable water supply line to the toilet, residents opting for a smart toilet or personal hygiene device must connect to the available non-potable water supply or re-pipe with a potable water supply line for proper installation. This can be expensive after move-in but can be economically addressed during initial construction.

Personal hygiene devices and smart toilets are crucial for many Americans with medical conditions, special needs or limited mobility. An allowance in the existing code to include provisions for these products is important to ensuring public health and safety. The water quality used with smart toilets and personal hygiene devices must be free of any pathogens that could cause infection or disease and, therefore, must be treated at a minimum in accordance with regulations for potable water.

Figure 1: Smart Toilet

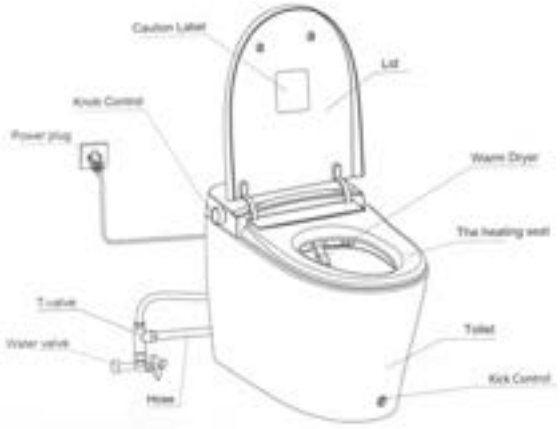

Figure 2: Personal Hygiene Device Connection

Cost Impact: Increase

Estimated Immediate Cost Impact:

Increase cost of $215 for rough in of potable water supply line.

Estimated Immediate Cost Impact Justification (methodology and variables):

a. Rough-in of potable water line:

   i. Parts: 2 shutoff valves ($40 ea.), 20 ft copper pipe ($60),

   ii. Plumbing Labor: 0.5-hour labor @$150/hr ($75).

   iii. Total $215

Estimated Life Cycle Cost Impact:

Savings of $735 for re piping when compared with the cost of rough in of potable supply pipe.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

a. Re-pipe for potable water supply line after construction:

i. Construction

1. Parts: Estimate Drywall $2.50/sq ft., Tile $10/sq ft.
2. Construction Labor: $100/hr.
3. Construction Subtotal: Remove and restore 20sq ft of drywall and tile. 2 hr labor plus parts (Sub Total $450)

ii. Plumbing

1. Parts: Shutoff valve ($40), 20 ft copper pipe ($60),
2. Plumbing Labor: $150/hr
3. Plumbing Subtotal: Reframe for new plumbing, pipe and fitting installation. 2 hr labor plus parts (Sub Total: $400)

iii. Permit: $100

iv. Total $950 for re-pipe after construction.

Proposed Change as Submitted

Proponents: Andrew Bevis, Chair, Plumbing, Mechanical and Fuel Gas Code Action Committee (pmgcac@iccsafe.org)

2024 International Plumbing Code

Add new text as follows:

APPENDIX G
Calculation and Labeling of the Water Use Performance of One- and Two-Family Dwellings

SECTION G101
GENERAL

G101.1 Purpose. The provisions of this appendix establish a uniform methodology for evaluating, rating and labeling the water use performance of one and two-family dwellings.

G101.2 Scope. This appendix shall provide a uniform methodology for evaluating, rating and labeling the indoor and outdoor water use performance of one- and two-family dwellings. Such evaluations, rating and labeling shall be in accordance with this appendix and RESNET/ICC-850.

SECTION G201
DEFINITIONS

G201.1 Definitions. The following terms and acronyms have specific meanings as used in this Appendix. In the event that definitions given here differ from definitions given elsewhere, the definitions given here shall govern.

Add new definition as follows:

APPROVED RATING PROVIDER. An approved entity responsible for the certification of home water efficiency raters working under its auspices and who is responsible for the quality assurance of such Certified Raters and for the quality assurance of water efficiency

ratings produced by such home water efficiency raters.

APPROVED SOFTWARE RATING TOOL. A computerized procedure that is approved for the purpose of conducting home water efficiency ratings and calculating the annual water consumption, annual water costs and a Water Rating Index for a home.

AUTOMATIC IRRIGATION SYSTEM. An irrigation system that is initiated by a clock timer, irrigation controller, or other method that does not require human intervention to initiate an irrigation event.

BEDROOM. A room or space 70 square feet of floor area or greater, with egress window and closet, used or intended to be used for sleeping. A "den," "library," "home office" with a closet, egress window, and 70 square feet of floor area or greater or other similar rooms shall count as a Bedroom, but living rooms and foyers shall not.

IRRIGATED AREA. The portion of a lot that receives supplemental water for irrigation.

LOT SIZE. The area of a single parcel of land on which the Rated Home is located.

OTHER WATER USE. Water use associated with leaks, minor draws, and other end uses not specified in the Reference Home or Rated Home.

OUTDOOR WATER USE. Water use that occurs outside of the exterior walls of a dwelling unit.

RATED HOME. The specific real property that is evaluated using the water use performance rating procedures specified by this Appendix.

REFERENCE HOME. A hypothetical home configured in accordance with the specifications set forth in Section G301.3 of this code and the basis of comparison for the purpose of calculating the Water Rating Index of a Rated Home.

RESIDENTIAL IRRIGATION CAPACITY INDEX (RICI). The intensity with which an automatic irrigation system applies water calculated in accordance with Section G301.6.3.

WATER RATING INDEX (WRI). An integer representing the relative water use of a Rated Home as compared with the water use of the Reference Home and where an Index value of 100 represents the water use of the Reference Home and each integer reduction represents a one percent improvement in water use efficiency.

Add new text as follows:

SECTION G301
HOME WATER RATING CALCULATION PROCEDURE

G301.1 Determining the Water Rating Index. The Water Rating Index (WRI) shall be determined in accordance with Sections G301.2 through G301.6. The Reference Home shall be configured in accordance with Sections G301.3 and G301.4, and the Rated Home shall be configured in accordance with Section G301.5 and G301.6 .

G301.2 Calculating the Water Rating Index. . A Water Rating Index shall be calculated as follows:

$$WRI = \frac{\text{indoor and outdoor daily water use for the Rated Home}}{\text{indoor and outdoor daily water use for the Reference Home}} \times 100$$

Equation G301.2-1

G301.3 Determining the Daily Indoor Water Use for the Reference Home. The indoor daily water use for the Reference Home shall be calculated as follows:

refingpd = refFgpd + refWgpd + refDWgpd + refCWgpd +
refTgpd + refSofgpd + refOther

(Equation G301.3-1)

Where:

refFgpd = daily fixture water use for the Reference Home

refWgpd = daily water use wasted from hot water outlets for the Reference Home

refDWgpd = daily dishwasher water use for the Reference Home

refCWgpd = daily clothes washer water use for the Reference Home

refTgpd = daily toilet water use for the Reference Home

refSofgpd = daily water softener water use for the Reference Home

refOther = daily total other/unidentified water use for the Reference Home

G301.3.1 Determining Daily Reference Home Fixture Water Use. Reference Home daily fixture water use shall be calculated as follows:

$refFgpd = 14.6 + 10 \times Nbr$ **(Equation G301.3.1-1)**

Where:

Nbr = number of bedrooms in the Rated Home

G301.3.2 Determining Daily Reference Home Hot Water Waste. Reference Home daily hot water waste shall be calculated as follows:

$refWgpd = 9.8 \times Nbr^{0.43}$ **(Equation G301.3.2-1)**

Where:

Nbr = number of bedrooms

G301.3.3 Determining Daily Reference Home Dishwasher Water Use. Reference Home dishwasher water use shall be calculated as follows:

$$refDWgpd = \frac{(88.4 + 34.9 \times Nbr) \times 8.16}{365}$$

(Equation G301.3.3-1)

Which simplifies to:

refWgpd = 1.97 + 0.7802 × *Nbr*

Where:

Nbr = number of bedrooms

(88.4 + 34.9 × *Nbr*) = best fit regression equation for dishwasher cycles per year using data from the 2005 Residential Energy Consumption Survey

8.16 = gallons per cycle from the DOE Technical Support Document from the NAECA standard in effect in 2006

This value is determined in accordance with ANSI/RESNET/ICC 301 Addendum A.

G301.3.4 Determining Daily Reference Home Clothes Washer Water Use. Reference Home daily clothes washer water use shall be calculated as follows:

$$refCWgpd = \frac{(3.0 \times 11.4 \times ACY)}{365}$$

(Equation G301.3.4-1)

Where:

3.0 = reference washer capacity (*CAPw*) in ft3

11.4 = reference integrated water factor (IWF) in (gal/cyc) per ft3

ACY = Adjusted Cycles per Year = (164 + 46.5 × *Nbr*)

Nbr = number of bedrooms

G301.3.5 Determining Daily Reference Home Toilet Water Use. Reference Home daily toilet water use shall be calculated as follows:

refTgpd = *refFPO* × *refGPF* × *Occ* **(Equation G301.3.5-1)**

Where:

RefFPO = the Reference Home flushes per person per day = 5.05

RefGPF = the Reference Home gallons per flush for toilets = 1.6

Occ = the number of occupants = 1.09 + 0.54 × *Nbr*

Nbr = number of bedrooms

G301.3.6 Determining Daily Reference Home Water Softener Use. Where the Rated Home has a water softener and the water hardness at the Rated Home location is greater than or equal to 180 milligrams/liter, the Reference Home water softener daily water use shall be calculated as follows:

refSofgpd = $\frac{\text{grains of hardness}}{\text{gallon of water}}$ × sum of indoor water uses in the Reference Home × $\frac{5 \text{ gallons used}}{1{,}000 \text{ grains removed}}$ **(Equation G301.3.6-1)**

Where the Rated Home does not meet these conditions, the *refSofgpd* = 0.

G301.3.7 Determining Daily Reference Home Other Water Use. Reference Home daily other water use shall be determined as follows:

refOther = 5.93 × *Nbr* **(Equation G301.3.7-1)**

Where:

Nbr = the number of bedrooms in the Rated Home

G301.4 Determining the Reference Home Outdoor Water Use. The reference home outdoor annual water use (in thousands of gallons per year) shall be calculated using the following two equations:

If the rated home has a netET of less than 12 inches/year OR the rated home has an automatic irrigation system, use Equation G301.4-1.

$$\left[\frac{Exp(A)}{1+Exp(A)}\right] \times 1.18086 \times [2.0341 \times netET^{0.7154} \times Ref\_Irr\_Area^{0.6227} + 0.5756 \times ind\_Pool \times netET]$$

(Equation G301.4-1)

If the rated home has a netET of greater than 12 inches/year AND the rated home does NOT have an automatic irrigation system, use Equation G301.4-2.

[

$\left[\frac{Exp(B)}{1+Exp(B)}\right]$

× 1.22257 × [1.4233 + 0.6311 × *netET* + 0.9376 × *Ref_Irr_Area*]]+ *ref_Pool*(Equation G301.4-2)

Either equation shall be constrained as follows:

IF

Rat_Irr_Area < Ref_Irr_Area

THEN

Ref_Out = Equation G301.4-1 or G301.4-2

$$\frac{\text{Equation 1 (Using Rat\_Irr\_Area and ind\_Pool = 0)}}{\text{Equation 1 (with Ref\_Irr\_Area and ind\_Pool = 0)}}$$

AND

Outdoor Reference Home Annual Water Use shall never be lower than Equation G301.4-2

Where:

Exp(A) = exponent of [1.4416 + 0.5069 × (*Irr_Area*/1,000)]

Exp(B) = exponent of [0.6911 + 0.00301 × *netET* × (*Irr_Area*/1,000)]

Ref_Irr_Area = the size of the irrigated area in the Reference Home, calculated in accordance with Section G301.4.1

Rat_Irr_Area = the size of the irrigated area in the Rated Home

NetET = the annual historic sum of mean reference evapotranspiration minus the mean precipitation for all months that evapotranspiration exceeds precipitation

ind_Pool = indicator representing the presence or absence of a swimming pool in the Rated Home

ref_Pool = Equation G301.4-1 (using *ind_Pool* = 1) – Equation G301.4-1 (using *ind_Pool* = 0)

G301.4.1 Determining Outdoor Daily Water Use for the Reference Home. Reference Home daily outdoor water use shall be determined by multiplying the result of either Equation G301.4-1 or Equation G301.4-2, as appropriate, by 1,000 and dividing the product

by 365.

G301.4.2 Determining Irrigated Area for the Reference Home. Reference Home Irrigated Area shall be calculated as follows:
Where the lot size of the Rated Home is less than 7,000 ft2, the Irrigated Area of the Reference Home shall be calculated as follows:

$$Ref\_Irr\_Area = Lot\_Area \times (0.002479 \times Lot\_Area^{0.6157}) \quad \text{(Equation G301.4.2-1)}$$

Where the Lot Size of the Rated Home is greater than or equal to 7,000 ft2, the Irrigated Area of the Reference Home shall be calculated as follows:

$$Ref\_Irr\_Area = Lot\_Area \times 0.577 \quad \textbf{(Equation G301.4.2-2)}$$

Where:

Ref_Irr_Area = the size of the landscape that receives supplemental water in the Reference Home

Lot_Area = the size of the lot on which the Rated Home is being constructed

G301.5 Determining Daily Indoor Water Use of the Rated Home. The daily Indoor Water Use of the Rated Home shall be calculated as follows:

$$Indoor_{gpd} = Shower_{gpd} + KitchF_{gpd} + LavF_{gpd} + Waste_{gpd} + CW_{gpd} + DW_{gpd} + Toilets_{gpd} + Soft_{gpd} + Other + EP_{gpd} \quad \textbf{(Equation G301.5-1)}$$

Where:

Showergpd = daily shower water use for the Rated Home

KitchFgpd = daily kitchen faucet water use for the Rated Home

LavFgpd = daily lavatory water use for the Rated Home

Wastegpd = daily water use wasted for the Rated Home

CWgpd = daily clothes washer water use for the Rated Home

DWgpd = daily dishwasher water use for the Rated Home

Toiletsgpd = daily toilet water use for the Rated Home

Softgpd = daily water softener water use for the Rated Home

Othergpd = daily other/unidentified water use for the Rated Home

EPgpd = daily excess pressure adjustment

G301.5.1 Determining Daily Shower Water Use for the Rated Home. Rated Home daily shower water use shall be calculated as follows:

Showergpd = FixtureTot × showerpc × SHeff **(Equation G301.5.1-1)**

Where:*FixtureTot* = determined in accordance with ANSI/RESNET/ICC 301, Addendum A = $\frac{adjFmix}{Fmix}$ *× refFgpd*

Shower pc = percent of fixture water use consumed by showers = 54%

SHeff = the ratio of the average rated flow rate of showerheads to the reference home flow rate

$= \frac{\text{average flow rate of showerheads in the Rated Hame}}{2.5}$

G301.5.2 Determining Daily Kitchen Faucet Water Use for the Rated Home. Rated Home daily kitchen faucet water use shall be calculated as follows:

KitchFgpd = FixtureTot × faucetpc × KitchFeff × kitch **(Equation 301.5.2-1)**

Where:

FixtureTot = determined in accordance with ANSI/RESNET/ICC 301 Addendum A =

$\frac{adjFmix}{Fmix}$ *× refFgpd*

faucetpc = percent of fixture water use consumed by faucets = 46%

KitchFeff = the ratio of the average rated flow rate of kitchen faucets to the Reference Home flow rate

$= \frac{\text{average flow rate of kitchen faucets in the Rated Hame}}{2.2}$

Kitch = the percentage of faucet use that is attributed to kitchen faucets = 69%

G301.5.3 Determining Daily Lavatory Faucet Water Use for the Rated Home. Rated Home daily lavatory faucet use shall be calculated as follows:*LavFgpd* = FixtureTot × faucetpc × LavFeff × Lav (Equation G301.5.3-1)
Where:

Lav = the percentage of faucet use that is attributed to lavatory faucets= 31%

FixtureTot = determined in accordance with ANSI/RESNET/ICC 301 Addendum A =

$$\frac{adjFmix}{Fmix} \times refFgpd$$

faucet_pc = percent of fixture water use consumed by faucets = 46%

LavFeff = the ratio of the average rated flow rate of lavatory faucets to the Water Rating Reference Home flow rate = 1 for standard faucets and 0.95 for high-efficiency faucets

G301.5.4 Determining Daily Hot Water Waste for the Rated Home. Rated Home daily hot water waste shall be calculated as follows: *Wastegpd = Feff* × (*oWgpd + sWgpd* × *WDeff*) **(Equation G301.5.4-1)**

Where:

Feff = fixture efficiency of showerheads, kitchen faucets, and lavatory faucets weighted by contribution to total fixture use = daily standard operating condition hot water wasted quantity as determined by ANSI/RESNET/ICC 301 Addendum A

sWgpd = daily structural hot water wasted quantity as determined by ANSI/RESNET/ICC 301 Addendum A

WDeff = distribution system water use effectiveness from Table 4.2.2.5.2.11(3) of ANSI/RESNET/ICC 301 Addendum A

This value is determined in accordance with ANSI/RESNET/ICC 301 Addendum A.

G301.5.5 Determining Daily Clothes Washer Water Use for the Rated Home. Rated Home daily clothes washer water use shall be calculated as follows:

$$CW_{gpd} = \frac{CAPw \times IWF \times ACY}{365}$$

(Equation G301.5.5-1)

Where:

CAPw = washer capacity in cubic feet = the manufacturer's data or the CEC database or the EPA Energy Star® website

IWF = Integrated Water Factor from manufacturer's data [(gal/cyc)/ft3]

ACY = Adjusted cycles per year

Determining ACY:

ACY = (164 + 46.5 × *Nbr*)

×

$$\frac{(3.0 \times 2.08 + 1.59)}{(CAPw \times 2.08 + 1.59)}$$

Where:*CAPw* = the capacity of the clothes washer in ft3

(164 + 46.5 × *Nbr*) = standard cycles per year based on 2005 Residential Energy Consumption Survey data

$$\frac{(3.0 \times 2.08 + 1.59)}{(CAPw \times 2.08 + 1.59)}$$

= best fit regression equation to adjust the standard cycles per year to account for occupancy and size of clothes washer; based on 2005 Residential Energy Consumption Survey data

G301.5.6 Determining Daily Dishwasher Water Use for the Rated Home. Rated Home daily dishwasher water use shall be calculated as follows:

DWgpd = [(88.4 + 34.9 × *Nbr*) × (12/*dWcap*) × gal/cycle/365 **(Equation G301.5.6-1)**

Where:

Nbr = number of bedrooms in the Rated Home

DWcap = capacity of the dishwasher in the Rated Home (in place settings) as included in the manufacturer's data (88.4 + 34.9 × *Nbr*) = best fit regression equation for dishwasher cycles per year using data from the 2005 Residential Energy Consumption Survey gal/cycle can be entered either directly or as listed on:

a. The ENERGY STAR product finder database.
b. The California Energy Commission (CEC) Modernized Appliance Efficiency Database.
c. The Department of Energy (DOE) Compliance Certification Management System (CCMS).

OR gal/cycle can be calculated from the Energy Guide label as follows (developed using the equations from 10 CFR 430, Subpart B, Appendix C and values on the Energy Guide label) to isolate the energy used by the appliance from the energy used in water heating):
gal/cycle = h2o_kWh × elec_h2o

h2o_kWh = LER-Appl_kWh

LER = Labeled Energy Rating in kWh per year per the dishwasher Energy Guide label

Appl_kWh = dishwasher appliance annual electric energy use = (GHWC × gas_h2o/$_therm-LER × $_kWh × elec_h2o/per_kWh) / ($_kWh × gas_h2o/$_therm-elec_h2o)

Where:

$_kWh = the cost of one kWh per the dishwasher Energy Guide label

$_therm = the cost of one therm per the dishwasher Energy Guide label

GHWC = Gas Hot Water Cost per the dishwasher Energy Guide label

elec_h2o = gallons of hot water use per cycle per unit of annual electricity use in gal × y/kWh × cyc = 1/(80 × 0.0024 × 208) = 0.02504

gas_h2o = gallons of hot water use per cycle per unit of annual gas use in gal × y/therm × cyc = 1/(80 × 8.2/0.75 × 208/100,000) = 0.5497

80 = the average hot water heater temperature rise per 10 CFR 430, Subpart B, Appendix C

0.0024 = specific heat of water in kWh/gal × F per 10 CFR 430, Subpart B, Appendix C

8.2 = specific heat of water in Btu/gal × F per 10 CFR 430, Subpart B, Appendix C

0.75 = recovery efficiency of gas hot water heater per 10 CFR 430, Subpart B, Appendix C

208 = cycles per year

This value is determined in accordance with ANSI/RESNET/ICC 301 Addendum A.

G301.5.7 Determining Daily Toilet Water Use for the Rated Home. Rated Home daily toilet water use shall be calculated as follows:
Toiletgpd = refFPO × gpf × Occ
Where:

RefFPO = the reference flushes per person per day = 5.05

gpf = the average gallons per flush of all toilets installed in the Rated Home; for tank-type dual-flush toilets, use the effective flush

volume per flush based on EPA Water Sense specification for Tank-Type Toilets

Occ = the number of predicted occupants in the Rated Home = 1.09 + 0.54 × *Nbr*

Nbr = the number of bedrooms in the Rated Home

G301.5.8 Determining Daily Water Softener Water Use for the Rated Home. Rated Home daily water softener water use shall be calculated as follows:

Softgpd = $\frac{\text{grains of hardness}}{\text{gallon of water}}$ × [sum of softened water uses in the Rated Home] × [gallons used per 1,000 grains of hardness]

(Equation G301.5.8-1)

Where:

softened water = water conditioned by a water softener

G301.5.9 Determining Daily Other Water Use for the Rated Home. Rated Home daily other water use shall be calculated as follows:*Othergpd* = 5.93 × *Nbr* **(Equation G301.5.9-1)**

Where:

Nbr = the number of bedrooms in the rated home

G301.5.10 Determining Daily Excess Pressure Adjustment Water Use for the Rated Home. Where a Rated Home does not have a pressure-reducing valve or pressure tank, additional water use attributed to excess water pressure shall be calculated as follows:*EPgpd* = MAX {[(*Showergpd* + (0.5 × (*LavFgpd* + *KitchFgpd* + *Othergpd*))) × 0.006 × (*PR* – 90)],0} **(Equation G301.5.10-1)**

Where:

PR = static water pressure (in psi) measured at the indoor fixture outlet on the lowest floor and (if more than one) closest to the water service entry to the house

Shower and lavatory faucets controlled by integral or accessory pressure-compensating devices shall be permitted to be excluded from this equation.

G301.6 Determining Outdoor Water Use for the Rated Home. The Rated Home outdoor water use shall be calculated as follows: Where the Rated Home has an automatic irrigation system, outdoor water use shall be calculated as follows:

$\left[\frac{Exp(A)}{1+Exp(A)}\right]$ × 1.18086 × [2.0341 × netET0.7154 × *Rat_Irr_Area*0.6227 + 0.5756 × *ind_Pool* × *netET*] **(Equation G301.6-1)**Where the Rated Home does not have an automatic irrigation system, outdoor water use shall be calculated as follows:

[$\left[\frac{Exp(B)}{1+Exp(B)}\right]$ × 1.22257 × [1.4233 + 0.6311 × *netET* + 0.9376 × *Rat_Irr_Area*]] + *Pool_use* **(Equation G301.6-2)**

The outdoor water use for the Rated Home shall never be less than the result of the following calculation:

$\left[\frac{Exp(B)}{1+Exp(B)}\right]$ × 1.22257 × [1.4233 + 0.6311 × *netET* + 0.9376 × *Rat_Irr_Area*] **(Equation G301.6-3)**

Where:

Exp(A) = exponent of [1.4416 + 0.5069 × (*Rat_Irr_Area*/1,000)]

Exp(B) = exponent of [0.6911 + 0.00301 × netET * (*Rat_Irr_Area*/1,000)]

Rat_Irr_Area = the size of the landscape that might receive supplemental water in the Rated Home

NetET = the annual historic sum of mean reference evapotranspiration minus the mean precipitation for all months that evapotranspiration exceeds precipitation

ind_Pool = indicator representing the presence or absence of a swimming pool

Pool_use = Equation G301.6-1 (using *ind_Pool* = 1) – Equation G301.6-1 (using *ind_Pool* = 0)

G301.6.1 Determining Outdoor Daily Water Use for the Rated Home. Rated Home daily outdoor water use shall be determined by multiplying the result of either Equation G301.6-1 or Equation G301.6-2, as appropriate, as such result may be further modified pursuant to Sections G301.6.1 through G301.6.4, by 1,000 and dividing the product by 365.

G301.6.2 Weather-based Controllers. Sensor- and weather- based irrigation controllers that are certified by the US EPA WaterSense program shall decrease the portion of predicted Rated Home outdoor water use associated with irrigation (less the water use associated with pools) by 15% in homes that have automatic irrigation system.

G301.6.3 Commissioning of an Automatic Irrigation System. In Rated Homes with an automatic irrigation system, where documentation is provided, the water use associated with irrigation shall be decreased by 5% where a certified professional, as identified

by a WaterSense labeled certification, has inspected the irrigation system according to the protocols identified in ASABE S626 and verified as follows:

1. Average distribution uniformity of at least 65% on turf areas.
2. Sprinklers are operating at the manufacturer's recommended water pressure +/- 10%.
3. The system operates without leaks
4. The system prevents runoff and overspray from leaving the property (checked during the audit).
5. Two seasonal water schedules (initial grow-in period and established landscape) are posted at the controller.

G301.6.4 Residential Irrigation Capacity Index (RICI). In a Rated Home with an automatic irrigation system, where documentation is provided, a RICI shall be calculated as follows:

$$RICI_{rat} = \frac{\text{sum of flow (gpm) of all irrigation valves}}{\text{square feet irrigated area}} \times 1{,}000$$

(Equation G301.6.4-1)

G301.6.4.1 Applying RICI. A Rated Home, where documentation for a RICI is provided, may adjust the volume of water use associated with irrigation (less the water use associated with pools) in the outdoor water use of the Rated Home by 10% for every point from a baseline RICI (RICI_ref) of 5.

G301.6.5 Applying Adjustments to the Outdoor Water Use of Rated Homes. Because the Water Rating Index model includes a number of percent adjustments for the outdoor water use of the Rated Home, the order of application becomes important. The correct order in which to apply these adjustments is as indicated in Table G301.6.5.

TABLE G301.6.5 APPLYING ADJUSTMENTS TO OUTDOOR WATER USE OF THE RATED HOME

STEP	SECTION	DETERMINED BY
1	G301.6.2 —Weather-based Controllers	Shall be determined by the presence or absence of a smart controller in the installed portion of the landscape.
2	G301.6.3 — Commissioning of an Automatic Irrigation System	Shall be determined by the presence or absence of commissioning in the installed portion of the landscape.
3	CI301.6.4 —Residential Irrigation Capacity Index (RICI)	Shall be calculated in accordance with Section G301.6.4 and adjusted in partially finished landscapes to be calculated as: $\frac{RICI_{rat}}{\text{(Predicted } Back\_irr \text{ is defined in Section G401.5.)}}$

SECTION G401
MINIMUM RATED FEATURES

G401.1 N/A MINIMUM RATED FEATURES TABLE. The estimated annual indoor and outdoor water use shall be determined using the minimum rated features set forth in Table G401.1.

TABLE G401.1 MINIMUM RATED FEATURES

Building Element	Minimum Rated Feature
Toilet	Flush volume for each toilet as measured on-site or from manufacturer's data.
Shower/Bath	As imprinted on the product, stated by manufacturer in product documentation, or tested via flow rate test in the field.
Bathroom Faucet	As imprinted on the product, stated by manufacturer in product documentation, or tested via flow rate test in the field.
Kitchen Faucet	As imprinted on the product, stated by manufacturer in product documentation, or tested via flow rate test in the field.
Clothes Washer	Washer capacity (cubic feet) from manufacturer's data or the CEC Appliance Efficiency Database or the EPA ENERGY STAR website for all clothes washers located within the Rated Home.
Dishwasher	Capacity of the dishwasher (in place settings) as included in the manufacturer's data, labeled energy factor (cycles/kWh) for all dishwashers located within the Rated Home.
Water Softener	Gallons of water used per 1,000 grains of hardness removed.
Hot Water Distribution	Insulation *R*-value of pipe insulation, type of recirculation system, length of pipe.
Outdoor Water Use	Irrigation system type (automatic or manual), lot size, irrigated area (square feet).
Pool/Spa	Indicate presence or absence of a pool or spa.
Service Water Pressure	Service pressure of water being supplied to the home, as established by the setting of an installed pressure-reducing valve OR the setting of an installed pressure tank OR written documentation from the water supplier that service pressure to the site is 90 psi OR an on-site static pressure test.

G401.2 Data Sources. Data required for the calculation of indoor and outdoor daily water use in the Rated and Reference Homes shall be determined by the location of the Rated Home and using data as set forth in Sections G401.2.1 and G401.2.2.

G401.2.1 Net Evapotranspiration. Data for net evapotranspiration shall be determined for the location of the Rated Home using the World Water and Climate Atlas.

G401.2.2 Hardness of Water. Data for the hardness of water shall be determined by the location of the Rated Home and one of the following:

1. US Geological Survey Concentrations of Hardness as Calcium Carbonate Map.
2. Data provided by the local water supplier.
3. A hardness test of water collected in the home using an EPA-approved method for determination of hardness.

G401.3 Default Values. Values that are not available in accordance with Table G401.1 or are absent from the home at the time of the rating shall use default values in accordance with Table G401.3. Values for building elements that are not specified in Table G401.3 are required for a rating to be issued.

TABLE G401.3 DEFAULT VALUES

Building Element	Default
Water Softeners	Can be entered as 0 if they are absent from a Rated Home. If they are present and no documentation is available, they may be assumed to use 5 gallons/1,000 grains removed for cation water softeners if information is unavailable.

Clothes Washer	Same as Reference Home.
Dishwasher	Determined by ANSI/RESNET/ICC 301. A Rated Home without either a dishwasher or an undercounter cavity for placement of a dishwasher shall be assigned a Daily Dishwasher Water Use of 0.
Hot Water Distribution	Determined by ANSI/RESNET/ICC 301 Addendum A.
Outdoor Water Use	Must be done in accordance with Section G301.4.

G401.4 Incomplete Outdoor Area. To receive a rating, a home must (at a minimum) have the front yard landscape completed. Homes that do not have landscaping completed in the back yard shall be determined in accordance with Section G301.6 with the portion of landscaping that is done determining the presence or absence of an automatic irrigation system. The following steps shall be followed in determining irrigated area in this instance:
Rater must determine a line between the front and back area (*Front_area* + *Back_area* must = *Total_available_area*)

Lot_Area – Pad Footprint = Total_available_area

(Back_area/*Total_available_area*) × *Ref_Irr_Area* = *Predicted Back_irr*

Irr_Area = Predicted Back_irr + Front_irr

Where:

Pad Footprint = the portion of the lot area covered by the dwelling unit and any attached or detached garage

Total_available_area = the portion of the lot excluding the pad of the house that is available for landscaping or other design features (hardscape, softscape, etc.)

Front_area = the area (ft2) of the total available area that is located primarily in front of the house

Back_area = the area (ft2) of the total available area that is located primarily behind the house

Front_irr = the area located primarily in front of the house that receives supplemental water for irrigation at the time of the rating

Predicted Back_irr = the portion of the area located primarily behind the house that can be predicted to receive supplemental water for irrigation in the future

SECTION G501
CERTIFICATION AND LABELING

G501.1 STANDARD FOR CERTIFICATION AND LABELING. This section establishes minimum uniform standards for certifying and labeling home water use performance using the Water Rating Index. These include minimum requirements of the home water use rating process, standard methods for estimating water use, minimum reporting requirements, and specification of the types of ratings that are performed in accordance with this code.

G501.2 Rating Requirements. .

G501.2.1 General. The rating for a home shall be determined in accordance with Sections G501.2.1.1 through G501.2.1. 2 .

G501.2.1.1 EXISTING HOMES. For an existing home, required data shall be collected on-site.

G501.2.1.1.1 NEW HOMES. For a new, to-be-built home, the procedures of Section G401 shall be used to collect required data.

G501.2.1.2 ESTIMATED ANNUAL WATER CONSUMPTION. The collected data shall be used to estimate the annual water consumption for indoor and outdoor water use for both the Rated Home and the Reference Home as specified by Section G301.

G501.2.2 Cost Savings Estimates. Where determined, cost savings estimates for water and wastewater (sanitary sewer) service for the Rated Home shall be calculated in accordance with Sections G501.2.2.1 through G501.2.2.1.3 .

G501.2.2.1 Water Cost Savings.

501.2.2.1.1 Water Prices. Water cost savings for homes receiving potable water service from a water supplier shall be based on the schedule of rates and charges adopted by the water supplier serving the Rated Home.

G501.2.2.1.2 Relevant Rates and Charges. Water cost savings shall be calculated from the volumetric portion of the schedule of rates and charges, sometimes referred to as the commodity charge. Fixed or flat charges that do not vary with the volume of water delivered to the home, sometimes referred to as the meter charge or service charge, shall not contribute to the cost savings estimate.

G501.2.2.1.3 Water Cost Savings Calculations. .

G501.2.2.1.3.1 Average Billed Indoor Volume of the Reference Home. Convert the total annual volume of indoor water use by the Reference Home to an increment of indoor use during a water billing period by dividing the annual indoor volume by the number of bills per year generated by the water supplier (e.g., for monthly billing divide by 12 and for quarterly billing divide by 4). Convert the units of consumption of the Reference Home as necessary to match the units of the rate schedule (e.g., 1,000 gallons, 100 cubic feet) to yield the average billed indoor volume of the Reference Home.

G501.2.2.1.3.2 Determine Outdoor Water Use for a Billing Period. Convert the total annual volume of outdoor water use in the Reference Home to an increment of outdoor use during a water billing period using one of two methods, based on prevailing practice at the location of the Rated Home.

G501.2.2.1.3.2.1 Peak Season Irrigation. Divide the annual outdoor volume by the number of bills generated by the water supplier during the irrigation season (e.g., for a 6-month irrigation season with monthly billing, divide by 6; for a 6-month irrigation season with quarterly billing, divide by 2). Convert the units of consumption of the Reference Home as necessary to match the units of the rate schedule (e.g., 1,000 gallons, 100 cubic feet) to yield the average billed outdoor volume of the Reference Home.

G501.2.2.1.3.2.1.2 Year-Round Irrigation. Divide the annual outdoor volume by the number of bills generated by the water supplier during a full year (e.g., for monthly billing, divide by 12 and for quarterly billing, divide by 4). Convert the units of consumption of the Reference Home as necessary to match the units of the rate schedule (e.g., 1,000 gallons, 100 cubic feet) to yield the average billed outdoor volume of the Reference Home.

G501.2.2.1.3.3 Combine Indoor and Outdoor Water Use Charges. For each billing period in a year, calculate the billed water volume by combining the average billed indoor volume with any average billed outdoor volume applicable to such billing period. Note that where

peak season irrigation has been calculated, the billed water volume for the billing period outside of the irrigation season will consist entirely of the average billed indoor volume. Apply the volumetric portion of the rate schedule to the billed volume for each billing period, accounting for any rate blocks or seasonal variations in the rate schedule, to produce the billed volume charge (in dollars) for each billing period. Combine the billed volume charge for each billing period to yield the annual water volume charge of the Reference Home.

G501.2.2.1.3.4 Determine Water Use Cost for the Rated Home. Repeat the process described in Sections G501.2.2.1.3 through G501.2.2.1.3.3 for the Rated Home to calculate the annual water volume charge of the Rated Home.

G501.2.2.1.3.5 Total Estimated Water Cost Savings. Estimated water cost savings shall be the difference between the estimated annual water volume charge of the Reference Home and the estimated annual water volume charge of the Rated Home.

G501.2.2.2 Sanitary Sewer Service Cost Saving. .

G501.2.2.2.1 Sewer Service Prices. Sanitary sewer service cost savings for homes with a permanent connection to sanitary collection and treatment works shall be based on the schedule of rates and charges adopted by the sanitary sewer service provider serving the Rated Home. Note that collection and treatment of sanitary discharges may be performed by separate entities, and that billing to the Rated Home by such entities may be combined or separate.

G501.2.2.2.2 Relevant Rates and Charges. Sanitary sewer service cost savings shall be calculated from the volumetric portion of the schedule of rates and charges. Fixed or flat charges that do not vary with the volume of water delivered to the home shall not contribute to the cost savings estimate.

G501.2.2.2.3 Sewer Cost Savings Calculations. .

G501.2.2.2.3.1 Average Billed Indoor Volume of the Reference Home. Convert the total annual volume of indoor water use by the Reference Home to an increment of indoor use during a sewer billing period by dividing the annual indoor volume by the number of bills per year generated by the sewer service provider (e.g., for monthly billing, divide by 12 and for semi-annual billing, divide by 2). Convert the units of consumption of the Reference Home as necessary to match the units of the rate schedule (e.g., 1,000 gallons, 100 cubic feet) to yield the average billed indoor volume of the Reference Home.

G501.2.2.2.3.2 Annual Sewer Volume Charge for the Reference Home. Apply the volumetric portion of the sewer rate schedule to the average billed indoor volume for each billing period, accounting for any rate blocks or seasonal variations in the rate schedule, to produce the billed volume charge (in dollars) for each billing period. Combine the billed volume charge for each billing period to yield the annual sewer volume charge of the Reference Home.

G501.2.2.2.4 Determine Annual Sewer charge for the Rated Home. Repeat the process described in Section CI501.2.2.2.3 for the Rated Home to calculate the annual sewer volume charge of the Rated Home.

G501.2.2.2.5 Estimated Sewer Cost Savings. Estimated sewer cost savings shall be the difference between the estimated annual sewer volume charge of the Reference Home and the estimated annual sewer volume charge of the Rated Home.

G501.2.2.2.6 Combined Presentation of Cost Savings. Estimated water cost savings and estimated sewer cost savings may be presented as a total estimated cost savings when designated as “water and sewer” savings.

G501.2.2.3 Other Cost Savings. Performance attributes of the Rated Home may influence other types of charges, depending on the fee structure in the jurisdiction of the Rated Home. While less common, these savings may be significant. Any determinations for cost savings associated with the following charges shall be submitted for individual review and approval by the body providing quality assurance for the rating service provider of the Rated Home.

1. Water service connection charges, also known as tap fees.
2. Sanitary sewer service connection charges, also known as capacity charges.

3. Stormwater fees.

G501.2.3 Reports. All reports generated by an Approved Software Rating Tool shall, at a minimum, contain the information specified by Sections G501.2.3.1 through G501.2.3.6

G501.2.3.1 Location. The property location, including city, state, zip code and either the street address or the Community Name and Plan Name for the Rating.

G501.2.3.2 Name of rater. The name of the certified rater conducting the Rating.

G501.2.3 Name of provider. The name of the Approved Rating Provider under whose auspices the rater is certified.

G501.2.3.4 DATE. The date the Rating was conducted.

G501.2.3.5 TOOL NAME AND VERSION. The name and version number of the Approved Software Rating Tool used to determine the Rating.

G501.2.3.6 DISCLOSURE. The following statement in not less than 10-point font: “The Home Water Rating Standard Disclosure for this home is available from the Rating Provider.” At a minimum, this statement shall also include the Rating Provider’s mailing address and phone number.

G501.2.4 Rating Types. There shall be three Rating Types in accordance with Sections G501.2.4.1 through G501.2.4.3.

G501.2.4.1 Confirmed Rating. A Rating Type that encompasses one individual dwelling and is conducted in accordance with Sections G501.2.4.1.1 through G501.2.4.1.3.

G501.2.4.1.1 Field verified. All Minimum Rated Features of the Rated Home shall be field-verified through inspection and testing in accordance with Section G401.

G501.2.4.1.2 Entry into tool. All field-verified Minimum Rated Features of the Rated Home shall be entered into the Approved Software Rating Tool that generates the home water rating. The home water rating shall report the Water Rating Index that comports with these inputs.

G501.2.4.1.3 Quality Assurance. Confirmed Ratings shall be subjected to Quality Assurance requirements equivalent to Section 900 of the Mortgage Industry National Home Energy Rating Systems Standard.

G501.2.4.2 Sampled Ratings. A Rating Type that encompasses a set of dwellings and is conducted in accordance with Sections G501.2.4.2.1 through G501.2.4.2.3.

G501.2.4.2.1 Set of rated homes. For the set of Rated Homes, all Minimum Rated Features shall be field verified through inspection and testing of a single home in the set, or distributed across multiple homes in the set, in accordance with the requirements equivalent to Section 600 of the Mortgage Industry National Home Energy Rating Systems Standard.

G501.2.4.2.2 Worst case analysis. The threshold specifications from the Worst-Case Analysis for the Minimum Rated Features of the set of Rated Homes shall be entered into the Approved Software Rating Tool that generates the home water use rating. The home water use rating shall report the Water Rating Index that comports with these inputs.

G501.2.4.2.3 QUALITY ASSURANCE. Sampled Ratings shall be subjected to Quality Assurance requirements equivalent to Section 900 of the Mortgage Industry National Home Energy Rating Systems Standard.

G501.2.4.3 Projected Ratings. A Rating Type that encompasses one individual dwelling and is conducted in accordance with Sections G501.2.4.3.1 through G501.2.4.3.3.

G501.2.4.3.1 Minimum rated features. All Minimum Rated Features of the Rated Home shall be determined from architectural drawings, threshold specifications, and the planned location for a new home or from a site audit and threshold specifications for an existing home that is to be improved.

G501.2.4.3.2 Unknown values. Unknown values shall be determined in accordance with Section G401.3.

G501.2.4.3.3 Text required. The Projected Rating Report shall contain the following text in not less than 14-point font at the top of the first page of the report: "Projected Rating Based on Plans—Field Confirmation Required."

G501.3 Innovative Design Requests. .

G501.3.1 Petition. Water Rating providers can petition for adjustment to the Water Rating Index for a Rated Home with features or technologies not addressed by Approved Software Rating Tools or this Standard. Innovative Design Requests (IDRs) shall be submitted to an Approved IDR authority and shall include, at a minimum, the following:

G501.3.1.1 Features required. A Rating generated from an Approved Software Rating Tool for the Rated Home without feature(s) that cannot be modeled in the software tool.

G501.3.1.2 Features not included. Written description of feature(s) not included in the Rating generated from software.

G501.3.1.3 Manufacturer's specifications. Manufacturer's technical and/or performance specifications for feature(s) not included in the Rating generated from the Approved Software Rating Tool.

G501.3.1.4 Estimated water use impact. Calculations or simulation results estimating the water use impact of feature(s) not included in the Rating generated from an Approved Software Rating Tool and documentation to support the calculation methodology and/or describe the modeling approach used.

G501.3.1.5 Estimated adjustment. Estimated adjustment to the Water Rating Index. Calculations shall follow the procedures of Sections G301.1 and G301.2.

G501.3.2 Approval. IDRs shall be approved on a case by case basis. The Approved IDR review authority shall accept or reject the IDR as submitted, or request additional information. The Approved IDR review authority shall assign a unique identifier to each IDR and maintain a database of IDRs. If the IDR is approved, the Water Rating provider is authorized to issue a supplemental report that adjusts the Water Rating Index, as approved.

SECTION G601
REFERENCE STANDARD

G601.1 General. See Table G601.1 for standards that are referenced in various section of this appendix. Standards are listed by the standard identification with the effective date, the standard title, and the section or sections of this appendix that reference this standard.

TABLE G601.1 REFERENCED STANDARDS

STANDARD ACRONYM	STANDARD NAME	SECTIONS HEREIN REFERENCED
ANSI/RESNET/ICC-301-2022	Standard for the Calculation and Labeling of the Energy Performance of Dwelling and Sleeping Units using an Energy Rating Index.	

RESNET/ICC-850-2020	Calculation and Labeling of the Water Use Performance of One-and Two-Family Dwellings Using the Water Rating Index
ANSI/ASABE S626 SEP2016 (R2020)	Landscape Irrigation System Uniformity and Application Rate Testing
--	CEC appliance database
--	EPA Energy Star Website
--	ENERGY STAR product finder database
--	California Energy Commission (CEC) Modernized Appliance Efficiency Database
--	Department of Energy (DOE) Compliance Certification Management System (CCMS).
--	EPA Water Sense specification for Tank-Type Toilets
--	US Geological Survey Concentrations of Hardness as Calcium Carbonate Map
--	Mortgage Industry National Home Energy Rating Systems Standard.

Reason: In response to water resources becoming increasingly strained throughout the country and water prices rising fast due to aging infrastructure and water utility rate structures, ANSI/RESNET/ICC 850-2020 was developed to provide a consistent, uniform methodology for evaluating, quantifying, and labeling the water use performance of one- and two-family dwellings and to serve as the basis for RESNET's residential water efficiency rating system (known as HERS$_{H2O}$®).

Drought, new development and aging water infrastructure can all put a strain on local water resources. In some instances this has caused local officials to put a moratorium on new permits for fear the water utility could not meet the increased demand, as described in a New York Times article. ANSI/RESNET/ICC 850 provides a much-needed resource for states, municipalities and builders to not only evaluate a home's water efficiency but to estimate their annual water use. This estimate of annual water use can serve as an important tool for anticipating the water needs of new development.

For user convenience and to provide a resource for builders to measure the water efficiency of the homes they build, ANSI/RESNET/ICC 850 should be added in its entirety as a new appendix in both the International Plumbing Code and International Residential Code since both are adopted for use in residential construction.

This proposal is submitted by the ICC Plumbing Mechanical Gas Code Action Committee (PMGCAC)

PMGCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 PMGCAC has held 26 virtual meetings open to any interested party. In addition, there were several virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the PMGCAC website at PMGCAC.

Bibliography: RESNET's Water Efficiency Rating System HERS$_{H2O}$® - https://www.resnet.us/about/hersh2o/

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The proposed language is being recommended for inclusion into the code(s) as a voluntary appendix.

APPENDIX G Calculation and Labeling of the Water Use Performance of One- and Two-Family Dwellings

SECTION G101
GENERAL

G101.1 Purpose. The provisions of this appendix establish a uniform methodology for evaluating and rating the water use performance of one-and two-family dwellings.

G101.2 Scope. This appendix shall provide a uniform methodology for evaluating and rating the indoor and outdoor water use performance of one-and two-family dwellings.

G101.3 Evaluation and rating. All evaluations and rating shall be performed in accordance with the RESNET/ICC-850 or other approved rating methodology

SECTION G201
REFERENCE STANDARDS

G201.1 General. See Table G201.1 for standards that are referenced in various section of this appendix. Standards are listed by the standard identification with the effective date, the standard title, and the section or sections of this appendix that reference this standard.

TABLE G201.1 REFERENCED STANDARDS

STANDARD ACRONYM	STANDARD NAME	SECTIONS HEREIN REFERENCED

Reason: This comment replaces the original proposal to provide a simplified approach of directly referencing the RESNET/ICC 850 standard. The language recognizes that there may be other rating methodologies that could be approved by the code official. The term labeling was removed from the proposed language to avoid any misunderstanding with respect to the defined term "labeled".

This proposal is needed for those jurisdictions where water is a precious commodity. The design of buildings has significant impact on water use efficiency. Evaluation and rating methodologies are needed to be able to compare building designs.

The committee should note that although this proposal adds subject matter pertaining only to one- and two family dwellings (not typically within the scope of the IPC), IPC Section 101.2 Scope states the following (underlined added):

> "The provisions of this code shall apply to the erection, installation, alteration, repairs, relocation, replacement, addition to, use, or maintenance of plumbing systems within this jurisdiction. This code shall regulate nonflammable medical gas, inhalation anesthetic, vacuum piping, nonmedical oxygen systems, and sanitary and condensate vacuum collection systems. The installation of fuel gas distribution piping and equipment, fuel-gas-fired water heaters, and water heater venting systems shall be regulated by the *International Fuel Gas Code*.
>
> **Exception:** Detached one- and two-family dwellings and townhouses not more than three stories above grade plane in height with a separate means of egress, and their accessory structures not more than three stories above grade plane in height, shall comply with this code or the *International Residential Code*."

In other words, there are some jurisdictions where the IRC Plumbing Chapters are not used for one and two family dwellings but instead, the IPC is used for all buildings, including one- and two family dwellings. Therefore, this proposed appendix will be useful in the IPC under these jurisdictional circumstances.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This appendix is intended to be nonmandatory for the model I-codes and as such, there is no cost impact to the IPC. However, where a jurisdiction wishes to adopt this appendix, there would be a cost associated with having an evaluation and rating performed for a building. As stated in the original proposal, such services cost approximately $50 to $300 per home. This estimate of cost comes from a small survey of what third party home rating firms currently charge for completing the water efficiency rating for various sizes of typical homes. Larger homes may cost more than small homes and builders with more homes may receive volume discounts. The costs also vary based on geographic location of the home rating companies.

Proposed Change as Submitted

Proponents: Andrew Bevis, Chair, Plumbing, Mechanical and Fuel Gas Code Action Committee (pmgcac@iccsafe.org)

2024 International Residential Code

Add new text as follows:

APPENDIX CI
Calculation and Labeling of the Water Use Performance of One- and Two-Family Dwellings

SECTION CI101
GENERAL

CI101.1 Purpose. The provisions of this appendix establish a uniform methodology for evaluating, rating and labeling the water use performance of one and two-family dwellings.

CI101.2 Scope. This appendix shall provide a uniform methodology for evaluating, rating and labeling the indoor and outdoor water use performance of one- and two-family dwellings. Such evaluations, rating and labeling shall be in accordance with this appendix and RESNET/ICC-850.

Add new definition as follows:

CI201
DEFINITIONS

Add new text as follows:

CI201.1 Definitions. The following terms and acronyms have specific meanings as used in this Appendix. In the event that definitions given here differ from definitions given elsewhere, the definitions given here shall govern.

Add new definition as follows:

Approved Rating Provider. An approved entity responsible for the certification of home water efficiency raters working under its auspices and who is responsible for the quality assurance of such Certified Raters and for the quality assurance of water efficiency ratings produced by such home water efficiency raters.

Approved Software Rating Tool. A computerized procedure that is approved for the purpose of conducting home water efficiency ratings and calculating the annual water consumption, annual water costs and a Water Rating Index for a home.

Automatic Irrigation System. An irrigation system that is initiated by a clock timer, irrigation controller, or other method that does not require human intervention to initiate an irrigation event.

Bedroom. A room or space 70 square feet of floor area or greater, with egress window and closet, used or intended to be used for sleeping. A “den,” “library,” “home office” with a closet, egress window, and 70 square feet of floor area or greater or other similar rooms shall count as a Bedroom, but living rooms and foyers shall not.

Irrigated Area. The portion of a lot that receives supplemental water for irrigation.

Lot Size. The area of a single parcel of land on which the Rated Home is located.

Other Water Use. Water use associated with leaks, minor draws, and other end uses not specified in the Reference Home or Rated Home.

Outdoor Water Use. Water use that occurs outside of the exterior walls of a dwelling unit.

Rated Home. The specific real property that is evaluated using the water use performance rating procedures specified by this Appendix.

Reference Home. A hypothetical home configured in accordance with the specifications set forth in Section CI301.3of this code andthe basis of comparison for the purpose of calculating the Water Rating Index of a Rated Home.

Residential Irrigation Capacity Index (RICI). The intensity with which an automatic irrigation system applies water calculated in accordance with Section **CI301.6.3.**

Water Rating Index (WRI). An integer representing the relative water use of a Rated Home as compared with the water use of the Reference Home and where an Index value of 100 represents the water use of the Reference Home and each integer reduction represents a one percent improvement in water use efficiency.

Add new text as follows:

SECTION CI301
HOME WATER RATING CALCULATION PROCEDURES

CI301.1 Determining the Water Rating Index. The Water Rating Index (WRI) shall be determined in accordance with Sections CI301.2 through CI301.6. The Reference Home shall be configured in accordance with Sections CI301.3 and CI301.4, and the Rated Home shall be configured in accordance with Section CI301.5 and CI301.6 .

CI301.2 Determining the Daily Indoor Water Use for the Reference Home. The indoor daily water use for the Reference Home shall be calculated as follows:

$$WRI = \frac{\text{indoor and outdoor daily water use for the Rated Home}}{\text{indoor and outdoor daily water use for the Reference Home}} \times 100$$

(Equation CI301.2-1)

CI301.3 Determining the Daily Indoor Water Use for the Reference Home.. The indoor daily water use for the Reference Home shall be calculated as follows:**refingpd = refFgpd + refWgpd + refDWgpd + refCWgpd +refTgpd + refSofgpd + refOther(Equation CI301.3-1)**

where:$refF_{gpd}$ = daily fixture water use for the Reference Home

refWgpd = daily water use wasted from hot water outlets for the Reference Home

refDWgpd = daily dishwasher water use for the Reference Home

refCWgpd = daily clothes washer water use for the Reference Home

refTgpd = daily toilet water use for the Reference Home

refSofgpd = daily water softener water use for the Reference Home

refOther = daily total other/unidentified water use for the Reference Home

CI301.3.1 Determining Daily Reference Home Fixture Water Use. Reference Home daily fixture water use shall be calculated as follows: $refFgpd = 14.6 + 10 \times Nbr$ **(Equation CI301.3.1-1)**

where:

Nbr = number of bedrooms in the Rated Home

CI301.3.2 Determining Daily Reference Home Hot Water Waste. Reference Home daily hot water waste shall be calculated as follows: $refWgpd = 9.8 \times Nbr^{0.43}$ **(Equation CI301.3.2-1)**

where:

Nbr = number of bedrooms

CI301.3.3 Determining Daily Reference Home Dishwasher Water Use. Reference Home dishwasher water use shall be calculated as follows:*refDWgpd* =

$$\frac{(88.4 + 34.9 \times Nbr) \times 8.16}{365}$$

(Equation CI301.3.3-1)

Which simplifies to:

$refWgpd = 1.97 + 0.7802 \times Nbr$

Where:

Nbr = number of bedrooms

(88.4 + 34.9 × *Nbr*) = best fit regression equation for dishwasher cycles per year using data from the 2005 Residential Energy Consumption Survey

8.16 = gallons per cycle from the DOE Technical Support Document from the NAECA standard in effect in 2006

This value is determined in accordance with ANSI/RESNET/ICC 301 Addendum A.

CI301.3.4 Determining Daily Reference Home Clothes Washer Water Use. Reference Home daily clothes washer water use shall be calculated as follows:*refCWgpd* =

$$\frac{(3.0 \times 11.4 \times ACY)}{365}$$

(Equation CI301.3.4-1)

Where:

3.0 = reference washer capacity (*CAPw*) in ft3

11.4 = reference integrated water factor (IWF) in (gal/cyc) per ft3

ACY = Adjusted Cycles per Year = (164 + 46.5 × *Nbr*)

Nbr = number of bedrooms

CI301.3.5 Determining Daily Reference Home Toilet Water Use. *refTgpd= refFPO* × *refGPF* × *Occ* **(Equation CI301.3.5-1)**

where:

refFPO = the Reference Home flushes per person per day = 5.05

refGPF = the Reference Home gallons per flush for toilets = 1.6

Occ = the number of occupants = 1.09 + 0.54 ×*Nbr*

Nbr = number of bedrooms

CI301.3.6 Determining Daily Reference Home Water Softener Use.. Where the Rated Home has a water softener and the water hardness at the Rated Home location is greater than or equal to 180 milligrams/liter, the Reference Home water softener daily water use shall be calculated as follows:*refSofgpd* =

$$\frac{\text{grains of hardness}}{\text{gallon of water}}$$

× sum of indoor water uses in the Reference Home ×

$$\frac{5 \text{ gallons used}}{1{,}000 \text{ grains removed}}$$

(Equation CI301.3.6-1)

Where the Rated Home does not meet these conditions, the *refSofgpd* = 0.

CI301.3.7 Determining Daily Reference Home Other Water Use. . Reference Home daily other water use shall be determined as follows:*refOther* = 5.93 × *Nbr* **(Equation CI301.3.7-1)**

where:

Nbr = the number of bedrooms in the Rated Home

CI301.4 Determining the Reference Home Outdoor Water Use. The reference home outdoor annual water use (in thousands of gallons per year) shall be calculated using the following two equations:

If the rated home has a netET of less than 12 inches/year OR the rated home has an automatic irrigation system, use Equation **CI301.4-1**.

$$\left[\frac{Exp(A)}{1 + Exp(A)}\right]$$

× 1.18086 × [2.0341 × *netET*0.7154 × *Ref_Irr_Area*0.6227 + 0.5756 × *ind_Pool* × *netET]* **(Equation CI301.4-1)**

If the rated home has a netET of greater than 12 inches/year AND the rated home does NOT have an automatic irrigation system, use **Equation CI301.4-2**.

$$\left[\frac{Exp(B)}{1+Exp(B)}\right]$$

× 1.22257 × [1.4233 + 0.6311 × *netET* +

0.9376 × *Ref_Irr_Area*]]+ *ref_Pool* (Equation **CI301.4-2**)*Either equation shall be constrained as follows:*

IF

Rat_Irr_Area < *Ref_Irr_Area* ***THEN*** *Ref_Out* = Equation **CI301.4-1** or **CI301.4-2**

Equation 1 (Using Rat_Irr_Area and ind_Pool = 0)
Equation 1 (with Ref_Irr_Area and ind_Pool = 0)

(Equation **CI301.4-3**)

AND

Outdoor Reference Home Annual Water
Use shall never be lower than Equation **CI301.4-2**

Where:

Exp(A) = exponent of [1.4416 + 0.5069 × (*Irr_Area*/1,000)]

Exp(B) = exponent of [0.6911 + 0.00301 × *netET* × (*Irr_Area*/1,000)]

Ref_Irr_Area = the size of the irrigated area in the Reference Home, calculated in accordance with Section **CI301.4.1**

Rat_Irr_Area = the size of the irrigated area in the Rated Home

netET = the annual historic sum of mean reference evapotranspiration minus the mean precipitation for all months that evapotranspiration exceeds precipitation

ind_Pool = indicator representing the presence or absence of a swimming pool in the Rated Home

ref_Pool = Equation **CI301.4-1** (using *ind_Pool* = 1) – Equation **CI301.4-1** (using *ind_Pool* = 0)

CI301.4.1 Determining Outdoor Daily Water Use for the Reference Home. . Reference Home daily outdoor water use shall be determined by multiplying the result of either Equation **CI301.4-1** or Equation **CI301.4-2**, as appropriate, by 1,000 and dividing the product by 365.

CI301.4.2 Determining Irrigated Area for the Reference Home. Reference Home Irrigated Area shall be calculated as follows:
Where the lot size of the Rated Home is less than 7,000 ft2, the Irrigated Area of the Reference Home shall be calculated as follows:

Ref_Irr_Area = *Lot_Area* × (0.002479 × *Lot_Area*0.6157) **(Equation CI301.4.2-1)**
wherethe Lot Size of the Rated Home is greater than or equal to 7,000 ft2, the Irrigated Area of the Reference Home shall be calculated as follows:
Ref_Irr_Area = *Lot_Area* × 0.577Equation **CI301.4.2-2**)

Where:

Ref_Irr_Area = the size of the landscape that receives supplemental water in the Reference Home

Lot_Area = the size of the lot on which the Rated Home is being constructed

CI301.5 Determining Daily Indoor Water Use of the Rated Home.. The daily Indoor Water Use of the Rated Home shall be calculated as follows:*Indoorgpd = Showergpd + KitchFgpd + LavFgpd + Wastegpd + CWgpd + DWgpd + Toiletsgpd + Softgpd + Other + EPgpd* **(Equation CI301.5-1)**

where:

Where:

Showergpd = daily shower water use for the Rated Home

KitchFgpd = daily kitchen faucet water use for the Rated Home

LavFgpd = daily lavatory water use for the Rated Home

Wastegpd = daily water use wasted for the Rated Home

CWgpd = daily clothes washer water use for the Rated Home

DWgpd = daily dishwasher water use for the Rated Home

Toiletsgpd = daily toilet water use for the Rated Home

Softgpd = daily water softener water use for the Rated Home

Othergpd = daily other/unidentified water use for the Rated Home

EPgpd = daily excess pressure adjustment

CI301.5.1 Determining Daily Shower Water Use for the Rated Home. Rated Home daily shower water use shall be calculated as follows:*Showergpd = FixtureTot × showerpc × SHeff* **(Equation CI301.5.1-1)**

where:

FixtureTot = determined in accordance with ANSI/RESNET/ICC 301, Addendum A =

$$\frac{adjFmix}{Fmix}$$

x *refFgpd*

Shower_pc = percent of fixture water use consumed by showers = 54%

SHeff = the ratio of the average rated flow rate of showerheads to the reference home flow rate

$$= \frac{\text{average flow rate of showerheads in the Rated Hame}}{2.5}$$

CI301.5.2 Determining Daily Kitchen Faucet Water Use for the Rated Home. Rated Home daily kitchen faucet water use shall be calculated as follows: $KitchFgpd = FixtureTot \times faucetpc \times KitchFeff \times kitch$ **(Equation CI301.5.2-1)**

where:

FixtureTot = determined in accordance with ANSI/RESNET/ICC 301 Addendum A =

$$\frac{adjFmix}{Fmix}$$

× *refFgpdfaucetpc* = percent of fixture water use consumed by faucets = 46%

KitchFeff = the ratio of the average rated flow rate of kitchen faucets to the Reference Home flow rate

average flow rate of kitchen faucets in rated home

2.2

Kitch = the percentage of faucet use that is attributed to kitchen faucets = 69%

CI301.5.3 Determining Daily Lavatory Faucet Water Use for the Rated Home. . Rated Home daily lavatory faucet use shall be calculated as follows: $LavFgpd = FixtureTot \times faucetpc \times LavFeff \times Lav$ **(Equation CI301.5.3-1)**

where:

Lav = the percentage of faucet use that is attributed to lavatory faucets= 31% *FixtureTot* = determined in accordance with ANSI/RESNET/ICC 301 Addendum A =

$$\frac{adjFmix}{Fmix}$$

x *refFgpdfaucet_pc* = percent of fixture water use consumed by faucets = 46%

LavFeff = the ratio of the average rated flow rate of lavatory faucets to the Water Rating Reference Home flow rate = 1 for standard faucets and 0.95 for high-efficiency faucets

CI301.5.4 Determining Daily Hot Water Waste for the Rated Home. Rated Home daily hot water waste shall be calculated as follows:

$Wastegpd = Feff \times (oWgpd + sWgpd \times WDeff)$ **(Equation CI301.5.4-1)**

where:

Feff = fixture efficiency of showerheads, kitchen faucets, and lavatory faucets weighted by contribution to total fixture use (by volume)

oWgpd = daily standard operating condition hot water wasted quantity as determined by ANSI/RESNET/ICC 301 Addendum A

sWgpd = daily structural hot water wasted quantity as determined by ANSI/RESNET/ICC 301 Addendum A

WDeff = distribution system water use effectiveness from Table 4.2.2.5.2.11(3) of ANSI/RESNET/ICC 301 Addendum A

This value is determined in accordance with ANSI/RESNET/ICC 301 Addendum A.

CI301.5.5 Determining Daily Clothes Washer Water Use for the Rated Home. Rated Home daily clothes washer water use shall be calculated as follows:

$$CW_{gpd} = \frac{CAPw \times IWF \times ACY}{365}$$

(Equation CI301.5.5-1)

where:

CAPw = washer capacity in cubic feet = the manufacturer's data or the CEC database or the EPA Energy Star® website

IWF = Integrated Water Factor from manufacturer's data [(gal/cyc)/ft3]

ACY = Adjusted cycles per year

Determining ACY:

ACY = (164 + 46.5 × *Nbr*)
x

$$\frac{(3.0 \times 2.08 + 1.59)}{(CAPw \times 2.08 + 1.59)}$$

=
best fit regression equation to adjust the standard cycles per year to account for occupancy and size of clothes washer; based on 2005 Residential Energy Consumption Survey data

Where:

CAPw = the capacity of the clothes washer in ft3(164 + 46.5 × *Nbr*) = standard cycles per year based on 2005 Residential Energy Consumption Survey data

$$\frac{(3.0 \times 2.08 + 1.59)}{(CAPw \times 2.08 + 1.59)}$$

CI301.5.6 Determining Daily Dishwasher Water Use for the Rated Home. . Rated Home daily dishwasher water use shall be calculated as follows:

DWgpd = [(88.4 + 34.9 × *Nbr*) × (12/*dWcap*) × gal/cycle/365 **(Equation CI301.5.6-1)**

where:

Nbr = number of bedrooms in the Rated Home

dWcap = capacity of the dishwasher in the Rated Home (in place settings) as included in the manufacturer's data (88.4 + 34.9 × *Nbr*) = best fit regression equation for dishwasher cycles per year using data from the 2005 Residential Energy Consumption Survey gal/cycle can be entered either directly or as listed on:

a. The ENERGY STAR product finder database.

b. The California Energy Commission (CEC) Modernized Appliance Efficiency Database.

c. The Department of Energy (DOE) Compliance Certification Management System (CCMS).

OR gal/cycle can be calculated from the Energy Guide label as follows (developed using the equations from 10 CFR 430, Subpart B, Appendix C and values on the Energy Guide label) to isolate the energy used by the appliance from the energy used in water heating):gal/cycle = h2o_kWh × elec_h2o
h2o_kWh = LER-Appl_kWh

LER = Labeled Energy Rating in kWh per year per the dishwasher Energy Guide label

Appl_kWh = dishwasher appliance annual electric energy use = (GHWC × gas_h2o/$_therm-LER × $_kWh × elec_h2o/per_kWh) / ($_kWh × gas_h2o/$_therm-elec_h2o)

Where:

$_kWh = the cost of one kWh per the dishwasher Energy Guide label

$_therm = the cost of one therm per the dishwasher Energy Guide label

GHWC = Gas Hot Water Cost per the dishwasher Energy Guide label

elec_h2o = gallons of hot water use per cycle per unit of annual electricity use in gal × y/kWh × cyc = 1/(80 × 0.0024 × 208) = 0.02504gas_h2o = gallons of hot water use per cycle per unit of annual gas use in gal × y/therm × cyc = 1/(80 × 8.2/0.75 × 208/100,000) = 0.5497

80 = the average hot water heater temperature rise per 10 CFR 430, Subpart B, Appendix C

0.0024 = specific heat of water in kWh/gal × F per 10 CFR 430, Subpart B, Appendix C

8.2 = specific heat of water in Btu/gal × F per 10 CFR 430, Subpart B, Appendix C

0.75 = recovery efficiency of gas hot water heater per 10 CFR 430, Subpart B, Appendix C

208 = cycles per year

This value is determined in accordance with ANSI/RESNET/ICC 301 Addendum A.

CI301.5.7 Determining Daily Toilet Water Use for the Rated Home. Rated Home daily toilet water use shall be calculated as follows:

$Toiletgpd = refFPO \times gpf \times Occ$

Where:

refFPO = the reference flushes per person per day = 5.05

gpf = the average gallons per flush of all toilets installed in the Rated Home; for tank-type dual-flush toilets, use the effective flush volume per flush based on EPA Water Sense specification for Tank-Type Toilets

Occ = the number of predicted occupants in the Rated Home = $1.09 + 0.54 \times Nbr$

Nbr = the number of bedrooms in the Rated Home

CI301.5.8 Determining Daily Water Softener Water Use for the Rated Home. . Rated Home daily water softener water use shall be calculated as follows:*Softgpd* =

$$\frac{\text{grains of hardness}}{\text{gallon of water}} \times [\text{sum of softened water uses in the Rated Home}] \times [\text{gallons used per 1,000 grains of hardness}]$$

(Equation CI301.5.8-1)

where:

softened water = water conditioned by a water softener

CI301.5.9 Determining Daily Other Water Use for the Rated Home. . Rated Home daily other water use shall be calculated as follows:

$Othergpd = 5.93 \times Nbr$ **(Equation CI301.5.9-1)**

where:

Where:

Nbr = the number of bedrooms in the rated home

CI301.5.10 Determining Daily Excess Pressure Adjustment Water Use for the Rated Home.. Where a Rated Home does not have a pressure-reducing valve or pressure tank, additional water use attributed to excess water pressure shall be calculated as follows:

$EPgpd = MAX\{[(Showergpd + (0.5 \times (LavFgpd + KitchFgpd + Othergpd))) \times 0.006 \times (PR - 90)],0\}$ **(Equation CI301.5.10-1)**

where:

Where:

PR = static water pressure (in psi) measured at the indoor fixture outlet on the lowest floor and (if more than one) closest to the water service entry to the house

Shower and lavatory faucets controlled by integral or accessory pressure-compensating devices shall be permitted to be excluded from this equation.

CI301.6 Determining Outdoor Water Use for the Rated Home. The Rated Home outdoor water use shall be calculated as follows: Where the Rated Home has an automatic irrigation system, outdoor water use shall be calculated as follows:

$$\left[\frac{Exp(A)}{1+Exp(A)}\right] \times 1.18086 \times [2.0341 \times netET^{0.7154} \times Rat\_Irr\_Area^{0.6227} + 0.5756 \times ind\_Pool \times netET] \quad \textbf{(Equation CI301.6-1)}$$

Where the Rated Home does not have an automatic irrigation system, outdoor water use shall be calculated as follows:

$$\left[\frac{Exp(B)}{1+Exp(B)}\right] \times 1.22257 \times [1.4233 + 0.6311 \times netET + 0.9376 \times Rat\_Irr\_Area]] + Pool\_use \quad \text{(Equation } \textbf{CI301.6-2}\text{)}$$

The outdoor water use for the Rated Home shall never be less than the result of the following calculation:

$$\left[\frac{Exp(B)}{1+Exp(B)}\right] \times 1.22257 \times [1.4233 + 0.6311 \times netET + 0.9376 \times Rat\_Irr\_Area] \quad \text{(Equation } \textbf{CI301.6-3}\text{)}$$

Where:

Exp(A) = exponent of [1.4416 + 0.5069 × (*Rat_Irr_Area*/1,000)]

Exp(B) = exponent of [0.6911 + 0.00301 × netET * (*Rat_Irr_Area*/1,000)]

Rat_Irr_Area = the size of the landscape that might receive supplemental water in the Rated Home

netET = the annual historic sum of mean reference evapotranspiration minus the mean precipitation for all months that evapotranspiration exceeds precipitation

ind_Pool = indicator representing the presence or absence of a swimming pool

Pool_use = Equation **CI301.6-1** (using *ind_Pool* = 1) – Equation **CI301.6-1** (using *ind_Pool* = 0)

CI301.6.1 Determining Outdoor Daily Water Use for the Rated Home. Rated Home daily outdoor water use shall be determined by multiplying the result of either Equation CI301.6-1 or Equation CI301.6-2 as appropriate, as such result may be further modified pursuant to Sections CI301.6.1 through CI301.6.4 , by 1,000 and dividing the product by 365.

CI301.6.2 Weather-based Controllers. . Sensor- and weather- based irrigation controllers that are certified by the US EPA WaterSense program shall decrease the portion of predicted Rated Home outdoor water use associated with irrigation, less the water use associated

with pools, by 15% in homes that have automatic irrigation system.

CI301.6.3 Commissioning of an Automatic Irrigation System. In Rated Homes with an automatic irrigation system, where documentation is provided, the water use associated with irrigation shall be decreased by 5% where a certified professional, as identified by a WaterSense labeled certification, has inspected the irrigation system according to the protocols identified in ASABE S626 and verified as follows:

1. Average distribution uniformity of at least 65% on turf areas.
2. Sprinklers are operating at the manufacturer's recommended water pressure +/- 10%.
3. The system operates without leaks
4. The system prevents runoff and overspray from leaving the property (checked during the audit).
5. Two seasonal water schedules (initial grow-in period and established landscape) are posted at the controller.

CI301.6.4 Residential Irrigation Capacity Index (RICI). In a Rated Home with an automatic irrigation system, where documentation is provided, a RICI shall be calculated as follows:

$$RICI_{rat} = \frac{\text{sum of flow (gpm) of all irrigation valves}}{\text{square feet irrigated area}} \times 1{,}000$$

(Equation CI301.6.4-1

CI301.6.4.1 Applying RICI. . A Rated Home, where documentation for a RICI is provided, may adjust the volume of water use associated with irrigation (less the water use associated with pools) in the outdoor water use of the Rated Home by 10% for every point from a baseline RICI (RICI_ref) of 5.

CI301.6.5 Applying Adjustments to the Outdoor Water Use of Rated Homes. . Because the Water Rating Index model includes a number of percent adjustments for the outdoor water use of the Rated Home, the order of application becomes important. The correct order in which to apply these adjustments is as indicated in Table **CI301.6.5.**

TABLE CI301.6.5 APPLYING ADJUSTMENTS TO OUTDOOR WATER USE OF THE RATED HOME

STEP	SECTION	DETERMINED BY
1	**CI301.6.2** —Weather-based Controllers	Shall be determined by the presence or absence of a smart controller in the installed portion of the landscape.
2	**CI301.6.3** — Commissioning of an Automatic Irrigation System	Shall be determined by the presence or absence of commissioning in the installed portion of the landscape.
3	**CI301.6.4**—Residential Irrigation Capacity Index (RICI)	Shall be calculated in accordance with Section **CI301.6.4** and adjusted in partially finished landscapes to be calculated as: *RICI rat* (Predicted *Back irr* is defined in Section **CI401.5**)

SECTION CI401
MINIMUM RATED FEATURES

CI401.1 MINIMUM RATED FEATURES TABLE. The estimated annual indoor and outdoor water use shall be determined using the minimum rated features set forth in Table **CI401.1**

TABLE CI401.1 MINIMUM RATED FEATURES

Building Element	Minimum Rated Feature
Toilet	Flush volume for each toilet as measured on-site or from manufacturer's data.
Shower/Bath	As imprinted on the product, stated by manufacturer in product documentation, or tested via flow rate test in the field.
Bathroom Faucet	As imprinted on the product, stated by manufacturer in product documentation, or tested via flow rate test in the field.
Kitchen Faucet	As imprinted on the product, stated by manufacturer in product documentation, or tested via flow rate test in the field.
Clothes Washer	Washer capacity (cubic feet) from manufacturer's data or the CEC Appliance Efficiency Database or the EPA ENERGY STAR website for all clothes washers located within the Rated Home.
Dishwasher	Capacity of the dishwasher (in place settings) as included in the manufacturer's data, labeled energy factor (cycles/kWh) for all dishwashers located within the Rated Home.
Water Softener	Gallons of water used per 1,000 grains of hardness removed.
Hot Water Distribution	Insulation *R*-value of pipe insulation, type of recirculation system, length of pipe.
Outdoor Water Use	Irrigation system type (automatic or manual), lot size, irrigated area (square feet).
Pool/Spa	Indicate presence or absence of a pool or spa.
Service Water Pressure	Service pressure of water being supplied to the home, as established by the setting of an installed pressure-reducing valve OR the setting of an installed pressure tank OR written documentation from the water supplier that service pressure to the site is 90 psi OR an on-site static pressure test.

CI401.2 Data Sources. Data required for the calculation of indoor and outdoor daily water use in the Rated and Reference Homes shall be determined by the location of the Rated Home and using data as set forth in Sections **CI401.2**.1 and **CI401.2**.2.

CI401.2.1 Net Evapotranspiration. Data for net evapotranspiration shall be determined for the location of the Rated Home using the World Water and Climate Atlas.

CI401.2.2 Hardness of Water. Data for the hardness of water shall be determined by the location of the Rated Home and one of the following:

1. US Geological Survey Concentrations of Hardness as Calcium Carbonate Map.
2. Data provided by the local water supplier.
3. A hardness test of water collected in the home using an EPA-approved method for determination of hardness.

CI401.3 Default Values. Values that are not available in accordance with Table CI401.1 5.0 or are absent from the home at the time of the rating shall use default values in accordance with Table **CI401.3** . Values for building elements that are not specified in Table **CI401.3** are required for a rating to be issued.

TABLE CI401.3 DEFAULT VALUES

Building Element	Default
Water Softeners	Can be entered as 0 if they are absent from a Rated Home. If they are present and no documentation is available, they may be assumed to use 5 gallons/1,000 grains removed for cation water softeners if information is unavailable.
Clothes Washer	Same as Reference Home.
Dishwasher	Determined by ANSI/RESNET/ICC 301. A Rated Home without either a dishwasher or an undercounter cavity for placement of a dishwasher shall be assigned a Daily Dishwasher Water Use of 0.
Hot Water Distribution	Determined by ANSI/RESNET/ICC 301 Addendum A.
Outdoor Water Use	Must be done in accordance with Section CI301.4

CI401.4 Incomplete Outdoor Area. To receive a rating, a home must (at a minimum) have the front yard landscape completed. Homes that do not have landscaping completed in the back yard shall be determined in accordance with Section **CI301.6** with the portion of landscaping that is done determining the presence or absence of an automatic irrigation system. The following steps shall be followed in determining irrigated area in this instance:

Rater must determine a line between the front and back area (*Front_area* + *Back_area* must = *Total_available_area*)

Lot_Area – Pad Footprint = Total_available_area

(Back_area/*Total_available_area*) × *Ref_Irr_Area* = *Predicted Back_irr*

Irr_Area = Predicted Back_irr + Front_irr

Where:

Pad Footprint = the portion of the lot area covered by the dwelling unit and any attached or detached garage

Total_available_area = the portion of the lot excluding the pad of the house that is available for landscaping or other design features (hardscape, softscape, etc.)

Front_area = the area (ft2) of the total available area that is located primarily in front of the house

Back_area = the area (ft2) of the total available area that is located primarily behind the house

Front_irr = the area located primarily in front of the house that receives supplemental water for irrigation at the time of the rating

Predicted Back_irr = the portion of the area located primarily behind the house that can be predicted to receive supplemental water for irrigation in the future

CI501
CERTIFICATION AND LABELING

CI501.1 STANDARD FOR CERTIFICATION AND LABELING. This section establishes minimum uniform standards for certifying and labeling home water use performance using the Water Rating Index. These include minimum requirements of the home water use rating process, standard methods for estimating water use, minimum reporting requirements, and specification of the types of ratings that are performed in accordance with this code.

CI501.2 Rating Requirements. .

CI501.2.1 General. The rating for a home shall be determined in accordance with Sections CI501.2.1.1through CI501.2.1. 2.

CI501.2.1.1 EXISTING HOMES. For an existing home, required data shall be collected on-site.

CI501.2.1.1.1 NEW HOMES. For a new, to-be-built home, the procedures of Section CI401 shall be used to collect required data.

CI501.2.1.2 ESTIMATED ANNUAL WATER CONSUMPTION. The collected data shall be used to estimate the annual water

consumption for indoor and outdoor water use for both the Rated Home and the Reference Home as specified by Section CI301

CI501.2.2 Cost Savings Estimates. Where determined, cost savings estimates for water and wastewater (sanitary sewer) service for the Rated Home shall be calculated in accordance with Sections CI501.2.2.1 through CI501.2.2.1.3

CI501.2.2.1 Water Cost Savings. .

CI501.2.2.1.1 Water Prices. Water cost savings for homes receiving potable water service from a water supplier shall be based on the schedule of rates and charges adopted by the water supplier serving the Rated Home.

CI501.2.2.1.2 Relevant Rates and Charges. Water cost savings shall be calculated from the volumetric portion of the schedule of rates and charges, sometimes referred to as the commodity charge. Fixed or flat charges that do not vary with the volume of water delivered to the home, sometimes referred to as the meter charge or service charge, shall not contribute to the cost savings estimate.

CI501.2.2.1.3 Water Cost Savings Calculations. .

CI501.2.2.1.3.1 Average Billed Indoor Volume of the Reference Home. Convert the total annual volume of indoor water use by the Reference Home to an increment of indoor use during a water billing period by dividing the annual indoor volume by the number of bills per year generated by the water supplier (e.g., for monthly billing divide by 12 and for quarterly billing divide by 4). Convert the units of consumption of the Reference Home as necessary to match the units of the rate schedule (e.g., 1,000 gallons, 100 cubic feet) to yield the average billed indoor volume of the Reference Home.

CI501.2.2.1.3.2 Determine Outdoor Water Use for a Billing Period. Convert the total annual volume of outdoor water use in the Reference Home to an increment of outdoor use during a water billing period using one of two methods, based on prevailing practice at the location of the Rated Home.

CI501.2.2.1.3.2.1 Peak Season Irrigation. Divide the annual outdoor volume by the number of bills generated by the water supplier during the irrigation season (e.g., for a 6-month irrigation season with monthly billing, divide by 6; for a 6-month irrigation season with quarterly billing, divide by 2). Convert the units of consumption of the Reference Home as necessary to match the units of the rate schedule (e.g., 1,000 gallons, 100 cubic feet) to yield the average billed outdoor volume of the Reference Home.

CI501.2.2.1.3.2.1.2 Year-Round Irrigation. Divide the annual outdoor volume by the number of bills generated by the water supplier during a full year (e.g., for monthly billing, divide by 12 and for quarterly billing, divide by 4). Convert the units of consumption of the Reference Home as necessary to match the units of the rate schedule (e.g., 1,000 gallons, 100 cubic feet) to yield the average billed outdoor volume of the Reference Home.

CI501.2.2.1.3.3 Combine Indoor and Outdoor Water Use Charges. For each billing period in a year, calculate the billed water volume by combining the average billed indoor volume with any average billed outdoor volume applicable to such billing period. Note that where peak season irrigation has been calculated, the billed water volume for the billing period outside of the irrigation season will consist entirely of the average billed indoor volume. Apply the volumetric portion of the rate schedule to the billed volume for each billing period, accounting for any rate blocks or seasonal variations in the rate schedule, to produce the billed volume charge (in dollars) for each billing period. Combine the billed volume charge for each billing period to yield the annual water volume charge of the Reference Home.

CI501.2.2.1.3.4 Determine Water Use Cost for the Rated Home. Repeat the process described in Sections CI501.2.2.1.3 through CI501.2.2.1.3.3 for the Rated Home to calculate the annual water volume charge of the Rated Home.

CI501.2.2.1.3.5 Total Estimated Water Cost Savings. Estimated water cost savings shall be the difference between the estimated annual water volume charge of the Reference Home and the estimated annual water volume charge of the Rated Home.

CI501.2.2.2 Sanitary Sewer Service Cost Savings. .

CI501.2.2.2.1 Sewer Service Prices. Sanitary sewer service cost savings for homes with a permanent connection to sanitary collection

and treatment works shall be based on the schedule of rates and charges adopted by the sanitary sewer service provider serving the Rated Home. Note that collection and treatment of sanitary discharges may be performed by separate entities, and that billing to the Rated Home by such entities may be combined or separate.

CI501.2.2.2.2 Relevant Rates and Charges. Sanitary sewer service cost savings shall be calculated from the volumetric portion of the schedule of rates and charges. Fixed or flat charges that do not vary with the volume of water delivered to the home shall not contribute to the cost savings estimate.

CI501.2.2.2.3 Sewer Cost Savings Calculations. .

CI501.2.2.2.3.1 Average Billed Indoor Volume of the Reference Home. Convert the total annual volume of indoor water use by the Reference Home to an increment of indoor use during a sewer billing period by dividing the annual indoor volume by the number of bills per year generated by the sewer service provider (e.g., for monthly billing, divide by 12 and for semi-annual billing, divide by 2). Convert the units of consumption of the Reference Home as necessary to match the units of the rate schedule (e.g., 1,000 gallons, 100 cubic feet) to yield the average billed indoor volume of the Reference Home.

CI501.2.2.2.3.2 Annual Sewer Volume Charge for the Reference Home. Apply the volumetric portion of the sewer rate schedule to the average billed indoor volume for each billing period, accounting for any rate blocks or seasonal variations in the rate schedule, to produce the billed volume charge (in dollars) for each billing period. Combine the billed volume charge for each billing period to yield the annual sewer volume charge of the Reference Home.

CI501.2.2.2.4 Determine Annual Sewer charge for the Rated Home. . Repeat the process described in Section CI501.2.2.2.3 for the Rated Home to calculate the annual sewer volume charge of the Rated Home.

CI501.2.2.2.5 Estimated Sewer Cost Savings. . Estimated sewer cost savings shall be the difference between the estimated annual sewer volume charge of the Reference Home and the estimated annual sewer volume charge of the Rated Home.

CI501.2.2.2.6 Combined Presentation of Cost Savings. . Estimated water cost savings and estimated sewer cost savings may be presented as a total estimated cost savings when designated as “water and sewer” savings.

CI501.2.2.3 Other Cost Savings. Performance attributes of the Rated Home may influence other types of charges, depending on the fee structure in the jurisdiction of the Rated Home. While less common, these savings may be significant. Any determinations for cost savings associated with the following charges shall be submitted for individual review and approval by the body providing quality assurance for the rating service provider of the Rated Home.

1. Water service connection charges, also known as tap fees.
2. Sanitary sewer service connection charges, also known as capacity charges.
3. Stormwater fees.

CI501.2.3 Reports. All reports generated by an Approved Software Rating Tool shall, at a minimum, contain the information specified by Sections CI501.2.3.1 through CI501.2.3.6.

CI501.2.3.1 LOCATION. The property location, including city, state, zip code and either the street address or the Community Name and Plan Name for the Rating.

CI501.2.3.2 NAME OF RATER. The name of the certified rater conducting the Rating.

CI501.2.3.2 NAME OF Provider. The name of the Approved Rating Provider under whose auspices the rater is certified.

CI501.2.3.4 DATE. The date the Rating was conducted.

CI501.2.3.5 TOOL NAME AND VERSION. The name and version number of the Approved Software Rating Tool used to determine the Rating.

CI501.2.3.6 DISCLOSURE. The following statement in not less than 10-point font: "The Home Water Rating Standard Disclosure for this home is available from the Rating Provider." At a minimum, this statement shall also include the Rating Provider's mailing address and phone number.

CI501.2.4 Rating Types. . There shall be three Rating Types in accordance with Sections CI501.2.4.1through CI501.2.4.3.

CI501.2.4.1 Confirmed Rating. . A Rating Type that encompasses one individual dwelling and is conducted in accordance with Sections CI501.2.4.1.1 through CI501.2.4.1.3 .

CI501.2.4.1.1 Field verified. All Minimum Rated Features of the Rated Home shall be field-verified through inspection and testing in accordance with Section CI401 .

CI501.2.4.1.2 Entry into tool. All field-verified Minimum Rated Features of the Rated Home shall be entered into the Approved Software Rating Tool that generates the home water rating. The home water rating shall report the Water Rating Index that comports with these inputs.

CI501.2.4.1.3 Quality Assurance. Confirmed Ratings shall be subjected to Quality Assurance requirements equivalent to Section 900 of the Mortgage Industry National Home Energy Rating Systems Standard.

CI501.2.4.2 Sampled Ratings. . A Rating Type that encompasses a set of dwellings and is conducted in accordance with Sections CI501.2.4.2.1 through CI501.2.4.2.3.

CI501.2.4.2.1 Set of rated homes. For the set of Rated Homes, all Minimum Rated Features shall be field verified through inspection and testing of a single home in the set, or distributed across multiple homes in the set, in accordance with the requirements equivalent to Section 600 of the Mortgage Industry National Home Energy Rating Systems Standard.

CI501.2.4.2.2 Worst case analysis. The threshold specifications from the Worst-Case Analysis for the Minimum Rated Features of the set of Rated Homes shall be entered into the Approved Software Rating Tool that generates the home water use rating. The home water use rating shall report the Water Rating Index that comports with these inputs.

CI501.2.4.2.3 QUALITY ASSURANCE. Sampled Ratings shall be subjected to Quality Assurance requirements equivalent to Section 900 of the Mortgage Industry National Home Energy Rating Systems Standard.

CI501.2.4.3 Projected Ratings. . A Rating Type that encompasses one individual dwelling and is conducted in accordance with Sections CI501.2.4.3.1 through CI501.2.4.3.3 .

CI501.2.4.3.1 Minimum rated features. All Minimum Rated Features of the Rated Home shall be determined from architectural drawings, threshold specifications, and the planned location for a new home or from a site audit and threshold specifications for an existing home that is to be improved.

CI501.2.4.3.2 Unknown values. Unknown values shall be determined in accordance with Section CI401.3 5.2.

CI501.2.4.3.3 Text required. The Projected Rating Report shall contain the following text in not less than 14-point font at the top of the first page of the report: "Projected Rating Based on Plans—Field Confirmation Required."

CI501.3 Innovative Design Requests. .

CI501.3.1 Petition. Water Rating providers can petition for adjustment to the Water Rating Index for a Rated Home with features or technologies not addressed by Approved Software Rating Tools or this Standard. Innovative Design Requests (IDRs) shall be submitted

to an Approved IDR authority and shall include, at a minimum, the following:

CI501.3.1.1 Features required. A Rating generated from an Approved Software Rating Tool for the Rated Home without feature(s) that cannot be modeled in the software tool.

CI501.3.1.2 Features not included. Written description of feature(s) not included in the Rating generated from software.

CI501.3.1.3 Manufacturer's specifications. Manufacturer's technical and/or performance specifications for feature(s) not included in the Rating generated from the Approved Software Rating Tool.

CI501.3.1.4 Estimated water use impact. Calculations or simulation results estimating the water use impact of feature(s) not included in the Rating generated from an Approved Software Rating Tool and documentation to support the calculation methodology and/or describe the modeling approach used.

CI501.3.1.5 Estimated adjustment. Estimated adjustment to the Water Rating Index. Calculations shall follow the procedures of Sections CI301.1 and CI301.2 .

CI501.3.2 Approval.. IDRs shall be approved on a case by case basis. The Approved IDR review authority shall accept or reject the IDR as submitted, or request additional information. The Approved IDR review authority shall assign a unique identifier to each IDR and maintain a database of IDRs. If the IDR is approved, the Water Rating provider is authorized to issue a supplemental report that adjusts the Water Rating Index, as approved.

CI601
REFERENCE STANDARDS

CI601.1 General. See Table CI601.1 for standards that are referenced in various section of this appendix. Standards are listed by the standard identification with the effective date, the standard title, and the section or sections of this appendix that reference this standard.

TABLE CI601.1 REFERENCED STANDARDS

STANDARD ACRONYM	STANDARD NAME	SECTIONS HEREIN REFERENCED
ANSI/RESNET/ICC-301-2022	Standard for the Calculation and Labeling of the Energy Performance of Dwelling and Sleeping Units using an Energy Rating Index.	
RESNET/ICC-850-2020	Calculation and Labeling of the Water Use Performance of One-and Two-Family Dwellings Using the Water Rating Index	
ANSI/ASABE S626 SEP2016 (R2020)	Landscape Irrigation System Uniformity and Application Rate Testing	
--	CEC appliance database	
--	EPA Energy Star Website	
--	ENERGY STAR product finder database	
--	California Energy Commission (CEC) Modernized Appliance Efficiency Database	
--	Department of Energy (DOE) Compliance Certification Management System (CCMS).	
--	EPA Water Sense specification for Tank-Type Toilets	
--	US Geological Survey Concentrations of Hardness as Calcium Carbonate Map	
--	Mortgage Industry National Home Energy Rating Systems Standard.	

Reason: In response to water resources becoming increasingly strained throughout the country and water prices rising fast due to aging infrastructure and water utility rate structures, ANSI/RESNET/ICC 850-2020 was developed to provide a consistent, uniform methodology for evaluating, quantifying, and labeling the water use performance of one- and two-family dwellings and to serve as the basis for RESNET's residential water efficiency rating system (known as HERS$_{H2O}$®).

Drought, new development and aging water infrastructure can all put a strain on local water resources. In some instances this has caused local officials to put a moratorium on new permits for fear the water utility could not meet the increased demand, as described in a New York Times article. ANSI/RESNET/ICC 850 provides a much-needed resource for states, municipalities and builders to not only evaluate a home's water efficiency but to estimate their annual water use. This estimate of annual water use can serve as an important

tool for anticipating the water needs of new development.

For user convenience and to provide a resource for builders to measure the water efficiency of the homes they build, ANSI/RESNET/ICC 850 should be added in its entirety as a new appendix in both the International Plumbing Code and International Residential Code since both are adopted for use in residential construction.

This proposal is submitted by the ICC Plumbing Mechanical Gas Code Action Committee (PMGCAC) PMGCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 PMGCAC has held 26 virtual meetings open to any interested party. In addition, there were several virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the PMGCAC website at PMGCAC.

Bibliography: RESNET's Water Efficiency Rating System HERS$_{H2O}$® - https://www.resnet.us/about/hersh2o/

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

$50 to $300 per home

Estimated Immediate Cost Impact Justification (methodology and variables):

This cost comes from a small survey of what third party home rating firms currently charge for completing the water efficiency rating for various sizes of typical homes. Larger homes may cost more than small homes and builders with more homes may receive volume discounts. The costs also vary based on geographic location of the home rating companies.

Estimated Life Cycle Cost Impact:

N/A

Estimated Life Cycle Cost Impact Justification (methodology and variables):

N/A

P162-24 Part II

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: These calculation tools are in their infancy. This was disapproved in the IPC. (9-1)

Individual Consideration Agenda

Comment 1:

IRC: APPENDIX CI (New), SECTION CI101 (New), CI101.1 (New), CI101.2 (New), CI101.3 (New), SECTION CI201 (New), CI201.1 (New), TABLE CI201.1 (New)

Proponents: Andrew Bevis, Chair, Plumbing, Mechanical and Fuel Gas Code Action Committee (pmgcac@iccsafe.org) requests As Modified by Committee (AMC2)

Replace as follows:

2024 International Residential Code

Add new text as follows:

APPENDIX CI
Calculation and Labeling of the Water Use Performance of One- and Two-Family Dwellings

SECTION CI101
GENERAL

CI101.1 Purpose. The provisions of this appendix establish a uniform methodology for evaluating and rating the water use performance of one-and two-family dwellings.

CI101.2 Scope. This appendix shall provide a uniform methodology for evaluating and rating the indoor and outdoor water use performance of one-and two-family dwellings.

CI101.3 Evaluation and rating. All evaluations and rating shall be performed in accordance with the RESNET/ICC-850 or other approved rating methodology

SECTION CI201
REFERENCE STANDARDS

CI201.1 General. See Table CI201.1 for standards that are referenced in various section of this appendix. Standards are listed by the standard identification with the effective date, the standard title, and the section or sections of this appendix that reference this standard.

TABLE CI201.1 REFERENCED STANDARDS

STANDARD ACRONYM	STANDARD NAME	SECTIONS HEREIN REFERENCED
ANSI/RESNET/ICC-850-2020	Calculation and Labeling of the Water Use Performance of One-and Two-Family Dwellings Using the Water Rating Index	CI101.3

Reason: This comment replaces the original proposal to provide a simplified approach of directly referencing the RESNET/ICC 850 standard. The language recognizes that there may be other rating methodologies that could be approved by the code official. The term labeling was removed from the proposed language to avoid any misunderstanding with respect to the defined term "labeled".

This proposal is needed for those jurisdictions where water is a precious commodity. The design of buildings has significant impact on water use efficiency. Evaluation and rating methodologies are needed to be able to compare building designs.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This appendix is intended to be nonmandatory for the IRC and as such, there is no cost impact including this in the IRC. However, where a jurisdiction wishes to adopt this appendix, there would be a cost associated with having an evaluation and rating performed for a building. As stated in the original proposal, such

services cost approximately $50 to $300 per home. This estimate of cost comes from a small survey of what third party home rating firms currently charge for completing the water efficiency rating for various sizes of typical homes. Larger homes may cost more than small homes and builders with more homes may receive volume discounts. The costs also vary based on geographic location of the home rating companies.

Proponents: Ryan Meres, RESNET, RESNET (ryan@resnet.us) requests As Modified by Committee (AMC2)

Replace as follows:

2024 International Residential Code

Add new text as follows:

APPENDIX CI
Water Use Performance Requirements for One- and Two-Family Dwellings and Townhouses

SECTION CI101
GENERAL

CI101.1 Purpose. The provisions of this appendix establish a uniform methodology for quantifying the water use performance of new one and two-family dwellings and townhouses, for use by jurisdictions seeking to adopt incentives or requirements pertaining to the water efficiency of new homes.

CI101.2 Scope. This appendix incorporates the methodology for quantifying the efficiency of the indoor and outdoor water use performance of one- and two-family dwellings and townhouses in the as-built condition. Such evaluations shall be in accordance with this appendix and ANSI/RESNET/ICC-850.

SECTION CI102
DEFINITIONS

Add new definition as follows:

Approved Rating Provider. An approved entity responsible for the certification of home water efficiency raters working under its auspices and who is responsible for the quality assurance of such certified raters and for the quality assurance of water efficiency ratings produced by such home water efficiency raters.

Approved Software Rating Tool. A computerized procedure that is approved for the purpose of conducting home water efficiency ratings and calculating the annual water consumption, annual water costs and a Water Rating Index for a home.

RATED HOME. The specific real property that is evaluated using the water use performance rating procedures specified by ANSI/RESNET/ICC-850.

REFERENCE HOME. A hypothetical home configured in accordance with the specifications set forth in Section 4.3 of ANSI/RESNET/ICC-850 and the basis of comparison for the purpose of calculating the Water Rating Index of a rated home.

WATER RATING INDEX (WRI). An integer representing the relative water use of a rated home as compared with the water use of the reference home and where an Index value of 100 represents the water use of the reference home and each integer reduction represents a one percent improvement in water use efficiency.

Add new text as follows:

SECTION CI103
WATER USE PERFORMANCE

CI103.1 Compliance. The rated home shall not exceed the maximum water rating index score of [an integer between 1 and 100 selected by the adopting jurisdiction] as calculated in accordance with ANSI/RESNET/ICC 850 using an approved software rating tool.

CI103.2 Verification. Verification of the water rating index shall be by a report provided by an approved rating provider.

Add new standard(s) as follows:

CI104
REFERENCED STANDARDS

Add new text as follows:

TABLE CI104.1 REFERENCED STANDARDS

STANDARD ACRONYM	STANDARD NAME	SECTIONS HEREIN REFERENCED
ANSI/RESNET/ICC-850-2020	Calculation and Labeling of the Water Use Performance of One-and Two-Family Dwellings Using the Water Rating Index	CI101.2 CI103.1

Reason: The IRC Committee disapproved of P162-24 Part II in part due to the disapproval of Part I of this proposal by the IPC Committee on the previous day. The proponent is not commenting on Part I, but will respond to points raised by both technical committees. The IPC Committee stated that the proposal was not a code requirement and thus did not need to be in the code and could be found elsewhere. The IPC Committee was correct. As originally submitted, the proposal was simply a restatement of ANSI/RESNET/ICC 850-2020. As revised by this public comment, however, the proposal now is framed as a code requirement for jurisdictions that choose to adopt an enforceable performance requirement for the water efficiency of new homes. The proposal is greatly simplified by incorporating Standard 850 by reference, rather than restating it verbatim.The IRC Committee, in addition to citing the disapproval by the IPC Committee, stated that the calculation tools for quantifying the water efficiency of new homes “are in their infancy”. In actuality, Standard 850 was first adopted in 2020, and since that time over 10,000 new homes have received a rating. In 2021, Standard 850 received approval from the Environmental Protection Agency as a WaterSense Approved Certification Methodology for the WaterSense Labeled Homes Program, Version 2.0. There are currently two approved Home Certification Organizations using Standard 850 to certify homes for the WaterSense Program. The methodology in the current standard is sound and robust, and while a draft revision of Standard 850 is now out for public comment, the primary import of the forthcoming revision will be to expand its application to multifamily dwellings, rather than to correct major flaws in the methodology.
This appendix provides the means for states and local jurisdictions to set performance-based requirements for the water efficiency of new one- and two-family dwellings and townhouses. The appendix gives the adopting entity the authority to set the required maximum water rating index score. Similar to the energy rating index compliance path option for energy efficiency, the water rating index is based on a

scale from zero to 100, where each one-point reduction on the index scale equates to a one percent reduction in annual water use. The reference home represents a score of 100 on the index scale and reflects a home built in compliance with 2006 codes and standards.

According to the World Resources Institute, 25 of 50 states are in areas of medium-high to extremely high-water stress. Putting even more pressure on already-strained water resources is that as of June 2024, 41 of the top 50 new construction markets[1] were in these areas. In response to water resources becoming increasingly strained throughout the country and water prices rising fast due to aging infrastructure and water utility rate structures, ANSI/RESNET/ICC 850-2020 was developed to provide a consistent, uniform methodology for evaluating, quantifying, and labeling the water use performance of one- and two-family dwellings and townhouses and to serve as the basis for RESNET's residential water efficiency rating system (known as HERS$_{H2O}$®).

Drought, new development and aging water infrastructure can all put a strain on local water resources. In some instances, this has caused local officials to put a moratorium on new permits for fear the water utility could not meet the increased demand, as described in an August 3, 2021 *New York Times* article[2] about Oakley, UT. ANSI/RESNET/ICC 850 provides a much-needed resource for states, municipalities and builders to not only evaluate a home's water efficiency but to estimate its annual water use. This estimate of annual water use can serve as an important tool for anticipating the water needs of new development.

Dozens of counties, cities, towns and water utilities are working on ordinances to create their own water efficiency requirements. This will create a patchwork of different construction requirements for builders to deal with. This appendix offers a whole-house (indoor and outdoor) performance-based approach that jurisdictions can adopt, rather than creating their own, often very prescriptive and restrictive, requirements.

Bibliography: RESNET's Water Efficiency Rating System HERS ® - https://www.resnet.us/about/hersh2o/

Cost Impact: Increase

Estimated Immediate Cost Impact:

$50 to $300 per home

Estimated Immediate Cost Impact Justification (methodology and variables):

The methodology for quantifying the water efficiency of new homes under Standard 850 has no prescriptive requirements. Thus, since the rating system is entirely performance-based, it offers a builder broad flexibility in design and material choices to achieve the Water Rating Index score that may be required by the adopting local jurisdiction. Some of these options, such as compact design of domestic hot water distribution systems, actually reduce construction costs.

The cost impact presented here for this proposal is the cost of carrying out the assessment and rating of the home by a certified rating service provider. The cost estimate is drawn from a small survey conducted by RESNET in 2023 of what third-party home rating firms currently charge for completing the water efficiency rating for various sizes of typical homes. Larger homes may cost more than small homes and builders with more homes may receive volume discounts. The costs also vary based on geographic location of the home rating companies.

Estimated Life Cycle Cost Impact:

N/A

Estimated Life Cycle Cost Impact Justification (methodology and variables):

N/A

ADM1-24

IFGC: 101.2.2.1 (New), 107.1.1 (New)

Proposed Change as Submitted

Proponents: Andrew Bevis, Chair, Plumbing, Mechanical and Fuel Gas Code Action Committee (pmgcac@iccsafe.org)

THIS PROPOSAL WILL BE HEARD BY THE IFGC CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

2024 International Fuel Gas Code

Add new text as follows:

101.2.2.1 Systems where hydrogen admixtures greater than 5-percent are supplied. Fuel gas, where hydrogen admixtures are delivered, shall meet the requirements of Chapters 3, 4, 5, and 6 for the supplier-defined hydrogen admixture limits, expressed in volume concentration of gaseous hydrogen for service up to the defined hydrogen admixture limits.

107.1.1 Fuel gases. Where hydrogen admixtures are supplied, the code official shall be provided with compositional description of the fuel gas.

Reason: Section 101.2.2.1

This is one of several revisions that address the potential for hydrogen admixtures. This language confirms that systems delivering hydrogen admixtures to end use appliances and equipment must conform with requirements already in effect for natural gas including installation locations, clearances, and other installation conditions (Chapter 3), gas piping requirements (Chapter 4), appliance and equipment chimneys and vents (Chapter 5), and appliance-specific installation requirements (Chapter 6). This section is applicable to the IRC Chapter 24 as well as the IFGC. Hydrogen admixtures above 5% have a range of >5% - <95% due to the requirements found in Chapter 7 which are exclusively for Gaseous Hydrogen Systems which are defined as having at least 95% hydrogen gas by volume and not more than 1 percent oxygen by volume.

[F] GASEOUS HYDROGEN SYSTEM.

An assembly of *piping*, devices and apparatus designed to generate, store, contain, distribute or transport a nontoxic, gaseous hydrogen containing mixture having at least 95-percent hydrogen gas by volume and not more than 1-percent oxygen by volume. Gaseous hydrogen systems consist of items such as compressed gas containers, reactors and appurtenances, including pressure regulators, pressure relief devices, manifolds, pumps, compressors and interconnecting *piping* and tubing and controls.

Section 107.1.1

Due to the introduction of Hydrogen Admixtures in Natural Gas supplies, this proposed revision provides the requirement the code official be provided with the compositional description of the fuel gas to ensure appliances and equipment and piping systems are listed for use with the correct fuel gas and admixtures for the type of fuel supplied in accordance with section 301.3 Listed and labeled.

301.3 Listed and labeled.

Appliances regulated by this code shall be *listed* and *labeled* for the application in which they are used unless otherwise *approved* in accordance with Section 105. The approval of unlisted appliances in accordance with Section 105 shall be based on *approved* engineering evaluation.

This proposal is submitted by the ICC Plumbing Mechanical Gas Code Action Committee (PMGCAC)

PMGCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 PMGCAC has held 26 virtual meetings open to any interested party. In addition, there were several virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the PMGCAC website at PMGCAC.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The two new sections merely define what is fuel gas as opposed to a hydrogen admixture. The sections do not require any technical change and thus there will not be any labor or material expended as a result of the inclusion of these two sections in the code.

ADM1-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee voted 10-0 and agrees that the way the proposal is written is problematic. The consensus is that the proposal should be revisited with a modification to the proposed code language. There are still a lot of questions regarding higher limits, and there are currently no standards to support or list the code language as submitted for this proposal.

ADM1-24

Individual Consideration Agenda

Comment 1:

IFGC: 101.2.2.1, 107.1.1

Proponents: Andrew Bevis, Chair, Plumbing, Mechanical and Fuel Gas Code Action Committee (pmgcac@iccsafe.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Fuel Gas Code

Delete and substitute as follows:

~~**101.2.2.1 Systems where hydrogen admixtures greater than 5-percent are supplied.** Fuel gas, where hydrogen admixtures are delivered, shall meet the requirements of Chapters 3, 4, 5, and 6 for the supplier-defined hydrogen admixture limits, expressed in volume concentration of gaseous hydrogen for service up to the defined hydrogen admixture limits.~~

101.2.2.1 Hydrogen admixture gas supply. Supply systems in which hydrogen is blended into admixtures greater than 5% and not exceeding 20% hydrogen by volume.

Revise as follows:

107.1.1 ~~Fuel gases~~ Gas composition. Where hydrogen admixtures are supplied, the code official shall be provided with compositional

description of the ~~fuel~~ gas.

Reason: This As Modified proposal is submitted in concert with FG 11. The addition of hydrogen admixtures is outside the scope of the IFGC and therefore a change in scope is necessary to incorporate this new technology. This additional item in the scoping Section 102.2.1 was needed to incorporate coverage of hydrogen admixtures by definition. Admixtures are not a "fuel gas" because they are greater than 5% hydrogen but they are not "hydrogen" because they are not greater than 95% hydrogen composite make up.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The two new sections merely define what is fuel gas as opposed to a hydrogen admixture. The sections do not require any technical change and thus there will not be any labor or material expended as a result of the inclusion of these two sections in the code.

Comment (CAH2)# 328

Comment 2:

IFGC: 101.2.2.1, 107.1.1

Proponents: Ted Williams, Natural Gas Direct, LLC, Natural Gas Direct, LLC (ngdllc@outlook.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Fuel Gas Code

[A] 101.2.2 Gaseous hydrogen systems. *Gaseous hydrogen systems* shall be regulated by Chapter 7.

101.2.2.1 ~~Systems where hydrogen admixtures greater than 5-percent are supplied~~ Hydrogen Admixtures. ~~Fuel gas, where hydrogen admixtures are delivered, shall meet the requirements of Chapters 3, 4, 5, and 6 for the supplier-defined hydrogen admixture limits, expressed in volume concentration of gaseous hydrogen for service up to the defined hydrogen admixture limits.~~Admixtures of natural gas blended with hydrogen exceeding 5% hydrogen by volume and not exceed 20% hydrogen by volume shall be regulated by this code.

[A] 107.1 Approval. After the prescribed tests and inspections indicate that the work complies in all respects with this code, a notice of approval shall be issued by the *code official*.

Revise as follows:

107.1.1 ~~Fuel gases~~ Hydrogen admixtures in natural gas supply systems. ~~Where hydrogen admixtures are supplied, the code official shall be provided with compositional description of the fuel gas.~~Where hydrogen admixtures are supplied, the code official shall be provided with information by the natural gas supplier on the maximum percentage hydrogen by volume that is added to the natural gas.

Reason: The current state of knowledge represented by testing and analysis supports use of hydrogen admixtures in natural gas up to and including 20% without additional appliance approval testing or revision of fuel gas distribution requirements and specifications. This state of knowledge also supports an admixture limit of 20% by volume as compatible with appliances and equipment already approved for use with natural gas without additional testing or approvals. Revision for standards for safety for natural gas appliances is currently assessing using the admixture limit of 20% hydrogen by volume as the basis for approval of new appliances and equipment designs by revising the standards for safety "table of test gases" to include a hydrogen admixture of 20% by volume in natural gas listed appliances. As research and analysis continues to address admixture thresholds for natural gas appliances, future actions on standards for safety may justify a higher threshold than the 20% hydrogen by volume for natural gas appliances, but promulgation of requirements that allow

greater than 20% by volume are not justified at this time. The requirement proposed under the newly proposed Section 101.2.2.1 for hydrogen admixture percentages accomplish this and are consistent with other North American codes and standards proposals under active technical consideration by consensus standards and code body activities.
As standards for safety for natural gas appliances and equipment move forward in approving operation on hydrogen admixtures in natural gas up to and including 20% by volume (covered in the proposed Section 101.2.2.1 requirements), authorities having jurisdiction (AHJ) over approval of natural gas systems need to have information on the upper limits of hydrogen in the natural gas supply in the jurisdiction in order to approve of installations that have appliances and equipment that are fully compatible between the natural gas supply and the upper admixture limit relevant to that local jurisdiction. Again, the current state of knowledge supports an admixture limit of 20% by volume as compatible with appliances and equipment already approved for use with natural gas without additional testing or approvals, but new approvals of natural gas appliances and equipment that are listed and labeled for hydrogen admixture limits must be in agreement with the supplied natural gases. Without information from gas suppliers on hydrogen content of natural gas, the AHJ cannot determine the compatibility of proposed appliances and equipment with potential local gas supplies and might approve of installations in which aberrant appliance function and potential safety hazards might emerge as a significant risk. For example, new natural gas appliances not approved for operation on hydrogen admixture natural gases, or for hydrogen admixtures of lower-than-supply-system limits, may present such heightened risks of safe combustion behavior, but without supply information on hydrogen admixture limits, the AHJ cannot provide reliable approvals for installation of such equipment. The requirement proposed as a new Section 107.1.1 helps implement consistent treatment of added hydrogen fractions to natural gas without imposing excessively burdensome alternatives such as documentation of full natural gas compositional descriptions.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

No new technical requirements are proposed via this comment and, therefore, no change in the cost of construction would be caused.

Comment (CAH2)# 546

NOTE: G1-24 PART I DID NOT RECEIVE A COMMENT (CAH2) AND IS REPRODUCED FOR INFORMATIONAL PURPOSES ONLY

G1-24 Part I

IBC: 701.1, SECTION 801, 801.1, 901.1, 1401.1, 2601.1

Proposed Change as Submitted

Proponents: Steven Orlowski, Sundowne Building Code Consultants, LLC, Self (sorlowski@sbcc.codes); Robert Marshall, FCAC, FCAC (fcac@iccsafe.org); Jeff Grove, Chair, Building Code Action Committee (BCAC) (bcac@iccsafe.org); Andrew Bevis, Chair, Plumbing, Mechanical and Fuel Gas Code Action Committee (pmgcac@iccsafe.org)

THIS IS AN 8 PART CODE CHANGE.

PART I WILL BE HEARD BY THE IBC-FIRE SAFETY CODE COMMITTEE.

PART II WILL BE HEARD BY THE IBC-EGRESS CODE COMMITTEE.

PART III WILL BE HEARD BY THE IRC PLUMBING & MECHANICAL CODE COMMITTEE.

PART V WILL BE HEARD BY THE SWIMMING POOL AND SPA CODE COMMITTEE.

PART IV AND VI WILL BE HEARD BY THE PLUMBING CODE COMMITTEE.

PART VII WILL BE HEARD BY THE MECHANICAL CODE COMMITTEE.

PART VIII WILL BE HEARD BY THE FIRE CODE COMMITTEE.

SEE THE TENTATIVE HEARING SCHEDULE FOR THESE COMMITTEES.

2024 International Building Code

CHAPTER 7
FIRE AND SMOKE PROTECTION FEATURES

SECTION 701
GENERAL

Revise as follows:

701.1 Scope. ~~The provisions of this chapter shall govern the materials~~ Materials, systems and assemblies used for structural *fire resistance* and fire-resistance-rated construction separation of adjacent spaces to safeguard against the spread of fire and smoke within a *building* and the spread of fire to or from *buildings.* Design, installation, and construction of fire and smoke protection features shall comply with this chapter.

CHAPTER 8
INTERIOR FINISHES

Revise as follows:

SECTION 801

~~SCOPE~~GENERAL

801.1 Scope. ~~The provisions of this chapter shall govern the use of materials.~~ Materials used as *interior finishes*, *trim* and *decorative materials shall comply with this chapter.*.

CHAPTER 9
FIRE PROTECTION AND LIFE SAFETY SYSTEMS

SECTION 901
GENERAL

Revise as follows:

901.1 Scope. ~~The provisions of this chapter shall specify where~~ Where fire protection and *life safety systems* are required by this chapter, ~~and shall apply to~~ the design, installation and operation of *fire protection* and *life safety systems* shall comply with this chapter.

CHAPTER 14
EXTERIOR WALLS

SECTION 1401
GENERAL

Revise as follows:

1401.1 Scope. ~~The provisions of this chapter shall establish the minimum requirements for *exterior*~~ *Exterior walls*, exterior wall assemblies, *exterior wall coverings*, *exterior wall* openings, exterior windows and doors, exterior soffits and fascias, and architectural *trim shall comply with this chapter*.

CHAPTER 26
PLASTIC

SECTION 2601
GENERAL

Revise as follows:

2601.1 Scope. ~~These provisions shall govern the materials~~Materials, design, application, construction and installation of foam plastic, *foam plastic insulation*, plastic *veneer*, interior plastic finish and *trim*, light-transmitting plastics and plastic composites, including *plastic lumber* shall comply with this chapter.

Reason:

Currently, there is inconsistency among all the I-Codes in how the scoping sections are written at the beginning of each chapter. The Code Correlation Committee requested a task group be formed to review the scoping section in all the I-Codes and determine if there would be a way to harmonize both the language and style across the model codes. The Scoping Task Group was formed and consisted of several members from the various Code Action Committees and interested parties (some with no client interest). The task group reviewed each chapter of the I-codes and after careful consideration, developed a format that could be incorporated and repeated for all

the I-Codes.

As you will see in the proposed changes above, most of the chapters began with a style and format that was already consistent and was only slightly changed to give the scoping a more authoritative infliction. Where the chapter contained no scoping provisions, the task group added scoping language based on the content of the chapter. Where the existing scoping sections provided a laundry list of what is contained in the chapter, these list were reformatted into a list form to make it easier for users to see what information was contained. The Scoping Task group proposes that the recommended changes will improve the code by:

1. Create consistency in language used in the scope for all the I-Codes.
2. Creates a scoping section for chapters that did not have one before to clarify what is covered by the chapter.
3. Clarify the items covered and not covered in the chapter, using consistent format to send the user to different chapter(s) or code(s).
4. Remove redundant administrative language from existing scoping sections.
5. Where there were extensive number of items outlined in the scoping section, the items are now broken out into a list format to make it easier for the reader to indicate what is contained in the chapter.

To the best of the task groups knowledge the proposed changes are editorial in nature and no requirements not already addressed in the existing scoping or in the chapter being referenced were added. As these proposed changes are editorial, there is no cost impact on the cost of construction.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

As stated in our reason statement, these proposed changes are editorial, there is no cost impact on the cost of construction.

G1-24 Part I

Public Hearing Results (CAH1)

Committee Action: **As Submitted**

Committee Reason: The committee concluded that the proposal creates consistency in the language used in the scope and brings in proper terminologies (Vote: 11-0).

G1-24 Part I

NOTE: G1-24 PART II DID NOT RECEIVE A COMMENT (CAH2) AND IS REPRODUCED FOR INFORMATIONAL PURPOSES ONLY

G1-24 Part II

IBC: SECTION 1001, 1001.1, 1001.2, 1101.1

Proposed Change as Submitted

Proponents: Steven Orlowski, Sundowne Building Code Consultants, LLC, Self (sorlowski@sbcc.codes); Robert Marshall, FCAC, FCAC (fcac@iccsafe.org); Jeff Grove, Chair, Building Code Action Committee (BCAC) (bcac@iccsafe.org); Andrew Bevis, Chair, Plumbing, Mechanical and Fuel Gas Code Action Committee (pmgcac@iccsafe.org)

2024 International Building Code

CHAPTER 10
MEANS OF EGRESS

Revise as follows:

SECTION 1001
~~ADMINISTRATION~~GENERAL

1001.1 ~~General~~Scope. *Buildings* or portions thereof shall be provided with a *means of egress* system ~~as required by~~ and shall comply with this chapter. The provisions of this chapter shall control the design, construction and arrangement of *means of egress* components required to provide an *approved means of egress* from *structures* and portions thereof.

1001.2 ~~Minimum requirements~~General. It shall be unlawful to alter a *building* or *structure* in a manner that will reduce the number of *exits* or the minimum width or required capacity of the *means of egress* to less than required by this code.

CHAPTER 11
ACCESSIBILITY

SECTION 1101
GENERAL

Revise as follows:

1101.1 Scope. ~~The provisions of this chapter shall control the design~~ Design and construction of *facilities* for accessibility for individuals with disabilities shall comply with this chapter.

Reason:

Currently, there is inconsistency among all the I-Codes in how the scoping sections are written at the beginning of each chapter. The Code Correlation Committee requested a task group be formed to review the scoping section in all the I-Codes and determine if there would be a way to harmonize both the language and style across the model codes. The Scoping Task Group was formed and consisted of several members from the various Code Action Committees and interested parties (some with no client interest). The task group reviewed each chapter of the I-codes and after careful consideration, developed a format that could be incorporated and repeated for all the I-Codes.

As you will see in the proposed changes above, most of the chapters began with a style and format that was already consistent and was only slightly changed to give the scoping a more authoritative infliction. Where the chapter contained no scoping provisions, the task group added scoping language based on the content of the chapter. Where the existing scoping sections provided a laundry list of what is contained in the chapter, these list were reformatted into a list form to make it easier for users to see what information was contained. The Scoping Task group proposes that the recommended changes will improve the code by:

1. Create consistency in language used in the scope for all the I-Codes.
2. Creates a scoping section for chapters that did not have one before to clarify what is covered by the chapter.
3. Clarify the items covered and not covered in the chapter, using consistent format to send the user to different chapter(s) or code(s).
4. Remove redundant administrative language from existing scoping sections.
5. Where there were extensive number of items outlined in the scoping section, the items are now broken out into a list format to make it easier for the reader to indicate what is contained in the chapter.

To the best of the task groups knowledge the proposed changes are editorial in nature and no requirements not already addressed in the existing scoping or in the chapter being referenced were added. As these proposed changes are editorial, there is no cost impact on the cost of construction.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

As stated in our reason statement, these proposed changes are editorial, there is no cost impact on the cost of construction.

G1-24 Part II

Public Hearing Results (CAH1)

Committee Action: **As Submitted**

Committee Reason: The committee agreed that this change to the titles and scope of the first sections of the chapters would add consistency across the codes in the application of the chapters. (Vote 10-3)

2024 International Residential Code

CHAPTER 12
MECHANICAL ADMINISTRATION

SECTION M1201
GENERAL

Revise as follows:

M1201.1 Scope. The provisions of of this chapter shall establish the general administrative requirements applicable to mechanical systems and inspection requirements of this code.~~Chapters 12 through 24 shall regulate the design~~Design, installation, maintenance, *alteration* and inspection of *mechanical systems* that are permanently installed and used to control environmental conditions within *buildings*shall comply with Chapters 12 through 24 of this code. These chapters shall also regulate those *mechanical systems*, system components, *equipment* and *appliances* specifically addressed in this code.

CHAPTER 13
GENERAL MECHANICAL SYSTEM REQUIREMENTS

SECTION M1301
GENERAL

Revise as follows:

M1301.1 Scope. ~~The provisions of this chapter shall govern the installation~~ Installation of *mechanical systems* not specifically covered in other chapters applicable to *mechanical systems* shall comply with this chapter. Installations of mechanical *appliances, equipment* and systems not addressed by this code shall comply with the applicable provisions of the *International Fuel Gas Code* and the *International Mechanical Code* .

CHAPTER 14
HEATING AND COOLING EQUIPMENT AND APPLIANCES

SECTION M1401
GENERAL

Add new text as follows:

M1401.1 Scope. Heating and cooling equipment and appliances shall comply with this chapter.

CHAPTER 15
EXHAUST SYSTEMS

SECTION M1501
GENERAL

Add new text as follows:

M1501.1 Scope. Exhaust systems shall comply with this chapter.

CHAPTER 16
DUCT SYSTEMS

Add new text as follows:

M1601
GENERAL

M1601.1 Scope. Duct systems serving HVAC and exhaust shall comply with this chapter.

Revise as follows:

DUCT CONSTRUCTION

CHAPTER 17
COMBUSTION AIR

SECTION M1701
GENERAL

Add new text as follows:

M1701.1 Scope. For other than gas fired appliances regulated by Chapter 24, combustion air systems shall comply with this chapter.

Revise as follows:

~~M1701.1~~1701.2 ~~Scope~~General requirements. Solid fuel-burning *appliances* shall be provided with *combustion air* in accordance with

the *appliance* manufacturer's installation instructions. Oil-fired *appliances* shall be provided with *combustion air* in accordance with NFPA 31. The methods of providing *combustion air* in this chapter do not apply to fireplaces, fireplace stoves and direct-vent *appliances*. The requirements for combustion and dilution air for gas-fired *appliances* shall be in accordance with Chapter 24.

CHAPTER 18
CHIMNEYS AND VENTS

SECTION M1801
GENERAL

Add new text as follows:

M1801.1 Scope. For other than gas fired appliances regulated by Chapter 24, chimneys and vents shall comply with this chapter.

CHAPTER 19
SPECIAL APPLIANCES, EQUIPMENT AND SYSTEMS

Add new text as follows:

SECTION M1901
GENERAL

M1901.1 Scope. For other things fired appliances regulated by Chapter 24, appliances, systems, and equipment identified herein shall comply with this chapter.

Revise as follows:

SECTION ~~M1901~~ M1902
RANGES AND OVENS

CHAPTER 20
BOILERS AND WATER HEATERS

Add new text as follows:

SECTION M2001
GENERAL

M2001.1 Scope. Systems that heat water shall comply with this chapter.

Revise as follows:

SECTION ~~M2001~~ M2002
BOILERS

CHAPTER 21
HYDRONIC PIPING

Add new text as follows:

SECTION M2101
GENERAL

M2101.1 Scope. Hydronic piping shall comply with this chapter.

Revise as follows:

SECTION ~~M2101~~ M2102
HYDRONIC PIPING SYSTEMS INSTALLATION

CHAPTER 22
FUEL OIL STORAGE AND~~SPECIAL~~ PIPING ~~AND STORAGE~~ SYSTEMS

Add new text as follows:

SECTION M2201
GENERAL

M2201.1 SCOPE. Fuel oil storage and piping systems shall comply with this chapter.

Revise as follows:

SECTION ~~M2201~~ M2202
OIL TANKS

CHAPTER 23
SOLAR THERMAL ENERGY SYSTEMS

Revise as follows:

SECTION M2301
~~SOLAR THERMAL ENERGY SYSTEMS~~GENERAL

M2301.1 ~~General~~Scope. ~~This section provides for the design~~Design, construction, installation, *alteration* and *repair* of *equipment* and systems using solar thermal energy to provide space heating or cooling, *hot water* heating and swimming pool heating shall comply with this code.

CHAPTER 25
PLUMBING ADMINISTRATION

SECTION P2501
GENERAL

Revise as follows:

P2501.1 Scope. The provisions of this chapter shall establish the general administrative requirements applicable to plumbing systems and inspection requirements of this code. Design, installation, maintenance, alteration and inspection of plumbing systems that are permanently installed and used to control environmental conditions within buildings shall comply with Chapters 25 through 33 of this code. These chapters shall also regulate those plumbing systems, system components, equipment and appliances specifically addressed in this code.

CHAPTER 26
GENERAL PLUMBING REQUIREMENTS

SECTION P2601
GENERAL

Revise as follows:

P2601.1 Scope. ~~The provisions of this chapter shall govern the installation of plumbing not specifically covered in other chapters applicable to plumbing systems. The installation of plumbing, *appliances, equipment* and systems not addressed by this code shall comply with the applicable provisions of the *International Plumbing Code* .~~ Installation of plumbing, not specifically covered in other chapters applicable to plumbing systems, shall comply with this chapter.

CHAPTER 27
PLUMBING FIXTURES

Add new text as follows:

SECTION P2701
GENERAL

P2701.1 Scope. Design, Installation, and materials of plumbing fixtures, faucets and fixture fittings shall comply with this chapter.

Revise as follows:

SECTION ~~P2701~~ P2702
FIXTURES, FAUCETS AND FIXTURE FITTINGS

CHAPTER 28
WATER HEATERS

SECTION P2801
GENERAL

Add new text as follows:

P2801.1 Scope. Design, Installation, and materials of water heaters and hot water storage tanks shall comply with this chapter.

CHAPTER 29
WATER SUPPLY AND DISTRIBUTION

SECTION P2901
GENERAL

Add new text as follows:

P2901.1 Scope. Design, Installation, and materials of hot and cold water supply and distribution system, for utilization in connection with human occupancy and habitation, and individual water supply systems shall comply with this chapter.

CHAPTER 30
SANITARY DRAINAGE

SECTION P3001
GENERAL

Add new text as follows:

P3001.1 Scope. Design, Installation, construction, and materials of sanitary drainage systems shall comply with this chapter.

Revise as follows:

~~**P3001.1**~~ **P3001.2 General requirements~~Scope.~~** ~~The provisions of this chapter shall govern the materials, design, construction and installation of sanitary drainage systems. Plumbing materials shall conform to the requirements of this chapter.~~ The drainage, waste and vent (DWV) system shall consist of piping for conveying wastes from plumbing fixtures, *appliances* and appurtenances, including fixture traps; above-grade drainage piping; below-grade drains within the *building*, such as a *building drain*; below- and above-grade venting systems; and piping to the public sewer or private septic system.

CHAPTER 31
VENTS

Revise as follows:

SECTION P3101
~~VENT SYSTEMS~~GENERAL

P3101.1 ~~General~~ Scope. ~~This chapter shall govern the selection and installation of piping, tubing and fittings for vent systems. This chapter shall control the minimum diameter of vent pipes, circuit vents, branch vents and *individual vents*, and the size and length of vents and various aspects of vent stacks and stack vents. Additionally, this chapter regulates vent grades and connections, height above fixtures and relief vents for stacks and fixture traps, and the venting of sumps and sewers.~~ Design, installation, construction, and materials of vent systems shall comply with this chapter.

CHAPTER 32
TRAPS

Revise as follows:

SECTION P3201
~~FIXTURE TRAPS~~ GENERAL

Add new text as follows:

P3201.1 Scope. Design, installation, construction, and materials of fixture traps shall comply with this chapter.

CHAPTER 33
STORM DRAINAGE

SECTION P3301
GENERAL

Revise as follows:

P3301.1 Scope. ~~The provisions of this chapter shall govern the materials, design, construction and installation of storm drainage.~~Design, installation, construction, and materials of storm drainage systems shall comply with this chapter.

Reason:

Currently, there is inconsistency among all the I-Codes in how the scoping sections are written at the beginning of each chapter. The Code Correlation Committee requested a task group be formed to review the scoping section in all the I-Codes and determine if there would be a way to harmonize both the language and style across the model codes. The Scoping Task Group was formed and consisted of several members from the various Code Action Committees and interested parties (some with no client interest). The task group reviewed each chapter of the I-codes and after careful consideration, developed a format that could be incorporated and repeated for all the I-Codes.

As you will see in the proposed changes above, most of the chapters began with a style and format that was already consistent and was only slightly changed to give the scoping a more authoritative infliction. Where the chapter contained no scoping provisions, the task group added scoping language based on the content of the chapter. Where the existing scoping sections provided a laundry list of what is contained in the chapter, these list were reformatted into a list form to make it easier for users to see what information was contained. The Scoping Task group proposes that the recommended changes will improve the code by:

1. Create consistency in language used in the scope for all the I-Codes.
2. Creates a scoping section for chapters that did not have one before to clarify what is covered by the chapter.
3. Clarify the items covered and not covered in the chapter, using consistent format to send the user to different chapter(s) or code(s).
4. Remove redundant administrative language from existing scoping sections.
5. Where there were extensive number of items outlined in the scoping section, the items are now broken out into a list format to make it easier for the reader to indicate what is contained in the chapter.

To the best of the task groups knowledge the proposed changes are editorial in nature and no requirements not already addressed in the existing scoping or in the chapter being referenced were added. As these proposed changes are editorial, there is no cost impact on the cost of construction.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

As stated in our reason statement, these proposed changes are editorial, there is no cost impact on the cost of construction.

G1-24 Part III

Public Hearing Results (CAH1)

Committee Action: **As Submitted**

Committee Reason: This is a needed cleanup that will provide consistency across all the codes. (10-0)

2024 International Private Sewage Disposal Code

CHAPTER 3
GENERAL REGULATIONS

SECTION 301
GENERAL

Revise as follows:

301.1 Scope. ~~The provisions of this chapter shall govern the general regulations of *private*~~*Private sewage disposal systems*, including specific limitations and *flood hazard areas* shall comply with this chapter.

CHAPTER 4
SITE EVALUATION AND REQUIREMENTS

SECTION 401
GENERAL

Revise as follows:

401.1 Scope. ~~The provisions of this chapter shall govern the evaluation~~ Evaluation of private sewage disposal systems and requirements for ~~*private sewage disposal system*~~ sitesshall comply with this chapter.

SECTION 501
GENERAL

CHAPTER 5
MATERIALS

Revise as follows:

501.1 Scope. ~~The provisions of this chapter shall govern the requirements for materials~~ Materials for *private sewage disposal systems* shall comply with this chapter.

CHAPTER 6
SOIL ABSORPTION SYSTEMS

SECTION 601
GENERAL

Revise as follows:

601.1 Scope. ~~The provisions of this chapter shall govern the sizing~~ Sizing and installation of soil absorption systems shall comply with this chapter.

CHAPTER 7
PRESSURE DISTRIBUTION SYSTEMS

SECTION 701
GENERAL

Revise as follows:

701.1 Scope. ~~The provisions of this chapter shall govern the design~~ Design, and installation of *pressure distribution systems* shall comply with this chapter.

CHAPTER 8
TANKS

SECTION 801
GENERAL

Revise as follows:

801.1 Scope. ~~The provisions of this chapter shall govern the design~~ Design, installation, repair and maintenance of septic tanks, treatment tanks and holding tanks shall comply with this chapter.

CHAPTER 9
MOUND SYSTEMS

SECTION 901
GENERAL

Revise as follows:

901.1 Scope. ~~The provisions of this chapter shall govern the design~~ Design and installation of mound systems shall comply with this

chapter.

CHAPTER 10
CESSPOOLS

SECTION 1001
GENERAL

Revise as follows:

1001.1 Scope. ~~The provisions of this chapter shall govern the design~~ Design and installation of *cesspools* shall comply with this chapter.

CHAPTER 11
RESIDENTIAL WASTEWATER SYSTEMS

SECTION 1101
GENERAL

Revise as follows:

1101.1 Scope. ~~The provisions of this chapter shall govern residential~~ Residential wastewater systemsshall comply with this chapter.

CHAPTER 12
INSPECTIONS

SECTION 1201
GENERAL

Revise as follows:

1201.1 Scope. ~~The provisions of this chapter shall govern the inspection~~ Inspection of *private sewage disposal systems* shall comply with this chapter.

CHAPTER 13
NONLIQUID SATURATED TREATMENT SYSTEMS

SECTION 1301
GENERAL

Revise as follows:

1301.1 Scope. ~~The provisions of this chapter shall govern nonliquid~~ Nonliquid saturated treament systems shall comply with this chapter.

Reason:

Currently, there is inconsistency among all the I-Codes in how the scoping sections are written at the beginning of each chapter. The

Code Correlation Committee requested a task group be formed to review the scoping section in all the I-Codes and determine if there would be a way to harmonize both the language and style across the model codes. The Scoping Task Group was formed and consisted of several members from the various Code Action Committees and interested parties (some with no client interest). The task group reviewed each chapter of the I-codes and after careful consideration, developed a format that could be incorporated and repeated for all the I-Codes.

As you will see in the proposed changes above, most of the chapters began with a style and format that was already consistent and was only slightly changed to give the scoping a more authoritative infliction. Where the chapter contained no scoping provisions, the task group added scoping language based on the content of the chapter. Where the existing scoping sections provided a laundry list of what is contained in the chapter, these list were reformatted into a list form to make it easier for users to see what information was contained. The Scoping Task group proposes that the recommended changes will improve the code by:

1. Create consistency in language used in the scope for all the I-Codes.
2. Creates a scoping section for chapters that did not have one before to clarify what is covered by the chapter.
3. Clarify the items covered and not covered in the chapter, using consistent format to send the user to different chapter(s) or code(s).
4. Remove redundant administrative language from existing scoping sections.
5. Where there were extensive number of items outlined in the scoping section, the items are now broken out into a list format to make it easier for the reader to indicate what is contained in the chapter.

To the best of the task groups knowledge the proposed changes are editorial in nature and no requirements not already addressed in the existing scoping or in the chapter being referenced were added. As these proposed changes are editorial, there is no cost impact on the cost of construction.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

As stated in our reason statement, these proposed changes are editorial, there is no cost impact on the cost of construction.

2024 International Swimming Pool and Spa Code

CHAPTER 3
GENERAL COMPLIANCE

SECTION 301
GENERAL

Revise as follows:

301.1 Scope. ~~The provisions of this chapter shall govern the general~~ General design and construction of public and *residential* pools and spas and related piping, equipment, and materials shall comply with this chapter. ~~Provisions that are unique to a specific type of pool or spa are located in Chapters 4 through 10.~~

~~**301.1.1 Application of Chapters 4 through 10.** Where differences occur between the provisions of this chapter and the provisions of Chapters 4 through 10, the provisions of Chapters 4 through 10 shall apply.~~

CHAPTER 4
PUBLIC SWIMMING POOLS

SECTION 401
GENERAL

Revise as follows:

401.1 Scope. ~~The provisions of this chapter shall apply only to~~ Design, construction, installation, repair, and operation of Class A, Class B, Class C, Class E and Class F public swimming pools shall comply with this chapter.

~~**401.2 Intent.** The provisions in this chapter shall govern the design, equipment, operation, warning signs, installation, sanitation, new construction, and *alteration* specific to the types of public swimming pools indicated in Section 401.1.~~

~~**401.3 Chapter 3 compliance required.** In addition to the requirements of this chapter, public swimming pools shall comply with the requirements of Chapter 3.~~

CHAPTER 5
PUBLIC SPAS AND PUBLIC EXERCISE SPAS

SECTION 501
GENERAL

Revise as follows:

501.1 Scope. ~~This chapter shall govern the design~~Design, installation, construction and repair of public spas and exercise spas shall comply with this chapter ~~regardless of whether a fee is charged for use~~.

~~**501.2 General.** In addition to the requirements of this chapter, public spas and public exercise spas shall comply with the requirements of Chapter 3.~~

CHAPTER 6
AQUATIC RECREATION FACILITIES

SECTION 601
GENERAL

Revise as follows:

601.1 Scope. ~~This chapter covers public pools and water containment systems used for aquatic recreation. This chapter provides specifications for the design~~ Design, construction, installation, alteration, repair, and operation of Class D-1 through Class D-6 ~~equipment, operation, signs, installation, sanitation, new construction, and rehabilitation of~~ public swimming pools and water containment systems intended to be used for aquatic recreation facilities shall comply with this chapter ~~play. This chapter covers Class D-1 through Class D-6 public pools whether they are provided as stand-alone attractions or in various combinations in a composite attraction.~~

601.2 Combinations. Where combinations of Class D-1 through Class D-6 pools exist within an aquatic recreation ~~a~~ facility, each element ~~in the facility~~ shall comply with the applicable code sections as if the element functioned as a part of a freestanding public swimming pool of Class D-1 through Class D-6.

~~**601.3 General.** In addition to the requirements of this chapter, aquatic recreation facilities shall comply with the requirements of Chapter 3.~~

CHAPTER 7
ONGROUND STORABLE RESIDENTIAL SWIMMING POOLS

SECTION 701
GENERAL

Revise as follows:

701.1 Scope. ~~This chapter describes certain criteria for the design,~~ Design, manufacturing, and testing of *onground storable pools* intended for *residential* use shall comply with this chapter. ~~This includes portable pools with flexible or nonrigid side walls that achieve their structural integrity by means of uniform shape, support frame or a combination thereof, and that can be disassembled for storage or relocation. This chapter includes what has been commonly referred to in past standards or codes as onground or above-ground pools.~~

~~**701.1.1 Permanent inground residential swimming pool.** This chapter does not apply to permanent inground *residential* pools, as defined in Chapter 8.~~

~~**701.2 General.** In addition to the requirements of this chapter, onground storable *residential* swimming pools shall comply with the requirements of Chapter 3.~~

CHAPTER 8
PERMANENT INGROUND RESIDENTIAL SWIMMING POOLS

SECTION 801
GENERAL

Revise as follows:

801.1 Scope. ~~The provisions of this chapter shall govern permanent inground *residential* swimming pools. Permanent inground~~ Design, construction, installation, alteration, repair and operation of permament *residential* swimming pools ~~shall~~ which include pools that are inground, partially aboveground or entirely aboveground shall comply with this chapter ~~grade. This chapter does not cover pools that are specifically manufactured for above-ground use and that are capable of being disassembled and stored. This chapter covers new construction, modification and repair of inground *residential* swimming pools.~~

~~**801.2 General.** Permanent inground *residential* pools shall comply with the requirements of Chapter 3.~~

CHAPTER 9
PERMANENT RESIDENTIAL SPAS AND PERMANENT RESIDENTIAL EXERCISE SPAS

SECTION 901
GENERAL

Revise as follows:

901.1 Scope. ~~This chapter shall govern the design, installation,~~ Design, construction, installation, alteration, repair, and operation ~~and repair~~ of permanently installed *residential* spas and exercise spas intended for *residential* use, shall comply with this chapter and Sections 501 through 503 and 505 through 507..

~~**901.2 General.** Permanent *residential* spas and permanent *residential* exercise spas shall comply with Chapter 5 except that Sections 504.1, 504.1.1 and 508.1 shall not apply. Such spas shall comply with the requirements of Chapter 3.~~

CHAPTER 10
PORTABLE RESIDENTIAL SPAS AND PORTABLE RESIDENTIAL EXERCISE SPAS

SECTION 1001
GENERAL

Revise as follows:

1001.1 Scope. ~~This chapter shall govern the installation,~~ Installation, *alteration* and repair of portable *residential* spas and portable exercise spas intended for *residential* use shall comply with this chapter.

~~**1001.2 General.** In addition to the requirements of this chapter, portable *residential* spas and portable *residential* exercise spas shall comply with the requirements of Chapter 3.~~

Reason:

Currently, there is inconsistency among all the I-Codes in how the scoping sections are written at the beginning of each chapter. The Code Correlation Committee requested a task group be formed to review the scoping section in all the I-Codes and determine if there would be a way to harmonize both the language and style across the model codes. The Scoping Task Group was formed and consisted of several members from the various Code Action Committees and interested parties (some with no client interest). The task group reviewed each chapter of the I-codes and after careful consideration, developed a format that could be incorporated and repeated for all the I-Codes.

As you will see in the proposed changes above, most of the chapters began with a style and format that was already consistent and was only slightly changed to give the scoping a more authoritative infliction. Where the chapter contained no scoping provisions, the task group added scoping language based on the content of the chapter. Where the existing scoping sections provided a laundry list of what is contained in the chapter, these list were reformatted into a list form to make it easier for users to see what information was contained. The Scoping Task group proposes that the recommended changes will improve the code by:

1. Create consistency in language used in the scope for all the I-Codes.
2. Creates a scoping section for chapters that did not have one before to clarify what is covered by the chapter.
3. Clarify the items covered and not covered in the chapter, using consistent format to send the user to different chapter(s) or code(s).
4. Remove redundant administrative language from existing scoping sections.
5. Where there were extensive number of items outlined in the scoping section, the items are now broken out into a list format to make it easier for the reader to indicate what is contained in the chapter.

To the best of the task groups knowledge the proposed changes are editorial in nature and no requirements not already addressed in the existing scoping or in the chapter being referenced were added. As these proposed changes are editorial, there is no cost impact on the cost of construction.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

As stated in our reason statement, these proposed changes are editorial, there is no cost impact on the cost of construction.

2024 International Plumbing Code

CHAPTER 3
GENERAL REGULATIONS

SECTION 301
GENERAL

Revise as follows:

301.1 Scope. ~~The provisions of this chapter shall govern the general regulations regarding the installation of plumbing not specific to other chapters.~~ General installation of plumbing systems shall comply with this chapter.

CHAPTER 4
FIXTURES, FAUCETS AND FIXTURE FITTINGS

SECTION 401
GENERAL

Revise as follows:

401.1 Scope. ~~This chapter shall govern the materials, design and installation of plumbing fixtures, faucets and fixture fittings in accordance with the type of *occupancy*, and shall provide for the minimum number of fixtures for various types of *occupancies*.~~ Design, installation, and materials of plumbing fixtures, faucets and fixture fittings shall comply with this chapter.

CHAPTER 5
WATER HEATERS

SECTION 501
GENERAL

Revise as follows:

501.1 Scope. ~~The provisions of this chapter shall govern the materials, design and installation of water heaters and the related safety devices and appurtenances.~~Design, installation, and materials of hot water heaters and hot water storage tanks shall comply with this chapter.

CHAPTER 6
WATER SUPPLY AND DISTRIBUTION

SECTION 601
GENERAL

Revise as follows:

601.1 Scope. ~~This chapter shall govern the materials, design and installation~~Design, installation, and materials of hot and cold ~~of~~ water supply systems~~, both hot and cold,~~ for utilization in connection with human occupancy and habitation and ~~shall govern the installation~~ of individual water supply systems shall comply with this chapter.

CHAPTER 7
SANITARY DRAINAGE

SECTION 701
GENERAL

Revise as follows:

701.1 Scope. ~~The provisions of this chapter shall govern the materials, design, construction and installation of sanitary drainage systems.~~ Design, Installation, construction, and materials of sanitary drainage systems shall comply with this chapter.

CHAPTER 8
INDIRECT/SPECIAL WASTE

SECTION 801
GENERAL

Revise as follows:

801.1 Scope. ~~This chapter shall govern matters concerning indirect waste piping~~ Indirect and special wastes systems shall comply with this chapter. ~~This chapter shall further control matters concerning food-handling establishments, sterilizers, humidifiers, clear-water waste, swimming pools, methods of providing *air breaks* or *air gaps*, and neutralizing devices for corrosive wastes.~~

CHAPTER 9
VENTS

SECTION 901
GENERAL

Revise as follows:

901.1 Scope. ~~The provisions of this chapter shall govern the materials, design, construction and installation of vent systems.~~Design, installation, construction, and materials of vent systems shall comply with this chapter.

CHAPTER 10
TRAPS, INTERCEPTORS AND SEPARATORS

SECTION 1001
GENERAL

Revise as follows:

1001.1 Scope. ~~This chapter shall govern the material and installation of traps, interceptors and separators.~~Installation and materials of traps, interceptors, and separators shall comply with this chapter.

CHAPTER 11
STORM DRAINAGE

SECTION 1101
GENERAL

Revise as follows:

1101.1 Scope. ~~The provisions of this chapter shall govern the materials, design, construction and installation of storm drainage.~~Design, installation, construction, and materials of storm drainage systems shall comply with this chapter.

CHAPTER 12
SPECIAL PIPING AND STORAGE SYSTEMS

SECTION 1201
GENERAL

Revise as follows:

1201.1 Scope. ~~The provisions of this chapter shall govern the design~~ Design and installation of piping and storage systems for nonflammable medical gas systems and nonmedical oxygen systems shall comply with this chapter.
~~All maintenance and operations of such systems shall be in accordance with the *International Fire Code.*~~

Add new text as follows:

1201.2 Maintenance and operation. Maintenance and operations of of nonflammable medical gas systems and nonmedical oxygen systems shall be in accordance with the *International Fire Code*.

CHAPTER 13
NONPOTABLE WATER SYSTEMS

SECTION 1301
GENERAL

Revise as follows:

1301.1 General. ~~The provisions of Chapter 13 shall govern the materials, design, construction and installation~~ Design, installation, construction, and materials of systems for the collection, storage, treatment and distribution of nonpotable water shall comply with this chapter. ~~For nonpotable rainwater systems, the provisions of CSA B805/ICC 805 shall be an alternative for regulating the materials, design, construction and installation of systems for rainwater collection, storage, treatment and distribution of nonpotable water~~. The use and application of nonpotable water shall comply with laws, rules and ordinances applicable in the jurisdiction.

Add new text as follows:

1301.1.1 Nonpotable Rainwater Systems. The provisions of CSA B805/ICC 805 shall be an alternative for regulating the design, installation, construction, and materials of systems for rainwater collection, storage, treatment, and distribution of nonpotable water.

CHAPTER 14
SUBSURFACE GRAYWATER SOIL ABSORPTION SYSTEMS

SECTION 1401
GENERAL

Revise as follows:

1401.1 Scope. ~~The provisions of this chapter shall govern the materials, design, construction and installation~~Design, installation, construction, and materials of subsurface graywater soil absorption systems connected to nonpotable water from on-site water reuse systems shall comply with this chapter.

2024 International Building Code

CHAPTER 29
PLUMBING SYSTEMS

SECTION 2901
GENERAL

Revise as follows:

[P] 2901.1 Scope. ~~The provisions of this chapter and the *International Plumbing Code* shall govern the design,~~ Design, construction, erection and installation of plumbing components, appliances, equipment and systems used in *buildings* and *structures* covered by this code shall comply with this chapter and the *International Plumbing Code*. Toilet and bathing rooms shall be constructed in accordance with Section 1210. Private sewage disposal systems shall conform to the *International Private Sewage Disposal Code* . The *International Fire Code* , the *International Property Maintenance Code* and the *International Plumbing Code* shall govern the use and maintenance of plumbing components, appliances, equipment and systems. The *International Existing Building Code* and the *International Plumbing Code* shall govern the *alteration*, *repair*, relocation, replacement and addition of plumbing components, *appliances*, *equipment* and systems.

Reason:

Currently, there is inconsistency among all the I-Codes in how the scoping sections are written at the beginning of each chapter. The Code Correlation Committee requested a task group be formed to review the scoping section in all the I-Codes and determine if there would be a way to harmonize both the language and style across the model codes. The Scoping Task Group was formed and consisted of several members from the various Code Action Committees and interested parties (some with no client interest). The task group

reviewed each chapter of the I-codes and after careful consideration, developed a format that could be incorporated and repeated for all the I-Codes.

As you will see in the proposed changes above, most of the chapters began with a style and format that was already consistent and was only slightly changed to give the scoping a more authoritative infliction. Where the chapter contained no scoping provisions, the task group added scoping language based on the content of the chapter. Where the existing scoping sections provided a laundry list of what is contained in the chapter, these list were reformatted into a list form to make it easier for users to see what information was contained. The Scoping Task group proposes that the recommended changes will improve the code by:

1. Create consistency in language used in the scope for all the I-Codes.
2. Creates a scoping section for chapters that did not have one before to clarify what is covered by the chapter.
3. Clarify the items covered and not covered in the chapter, using consistent format to send the user to different chapter(s) or code(s).
4. Remove redundant administrative language from existing scoping sections.
5. Where there were extensive number of items outlined in the scoping section, the items are now broken out into a list format to make it easier for the reader to indicate what is contained in the chapter.

To the best of the task groups knowledge the proposed changes are editorial in nature and no requirements not already addressed in the existing scoping or in the chapter being referenced were added. As these proposed changes are editorial, there is no cost impact on the cost of construction.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

As stated in our reason statement, these proposed changes are editorial, there is no cost impact on the cost of construction.

G1-24 Part VI

Public Hearing Results (CAH1)

Committee Action: **As Submitted**

Committee Reason: This is good work to cleanup and coordinate all of the codes. (14-0)

G1-24 Part VI

Individual Consideration Agenda

Comment 1:

IPC: 501.1

Proponents: Steven Orlowski, Sundowne Building Code Consultants, LLC, Self (sorlowski@sbcc.codes); Robert Marshall, FCAC, FCAC (fcac@iccsafe.org); Jeff Grove, Chair, Building Code Action Committee (BCAC) (bcac@iccsafe.org); Andrew Bevis, Chair, Plumbing,

Mechanical and Fuel Gas Code Action Committee (pmgcac@iccsafe.org) requests As Modified by Committee (AMC2)

Further modify as follows:

2024 International Plumbing Code

501.1 Scope. Design, installation, and materials of ~~hot~~ water heaters and hot water storage tanks shall comply with this chapter.

Reason: During the hearings in Orlando, it was pointed out by a committee member the word "hot" should be removed before the words water heater in section 501.1. This Committee comment removes the term as requested by the committee member.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This committee comment is editorial and has no cost impact on construction.

Comment (CAH2)# 91

Comment 2:

IBC: CHAPTER 29, SECTION 2901, [P] 2901.1

Proponents: Steven Orlowski, Sundowne Building Code Consultants, LLC, Self (sorlowski@sbcc.codes) requests As Modified by Committee (AMC2)

Further modify as follows:

2024 International Building Code

CHAPTER 29
PLUMBING SYSTEMS

SECTION 2901
GENERAL

[P] 2901.1 Scope. Design, installation and construction of plumbing equipment and systems shall comply with this chapter, the International Plumbing Code, and the International Private Sewage Disposal Code. ~~The provisions of this chapter and the *International Plumbing Code* shall govern the design, construction, erection and installation of plumbing components, appliances, equipment and systems used in *buildings* and *structures* covered by this code. Toilet and bathing rooms shall be constructed in accordance with Section 1210. Private sewage disposal systems shall conform to the *International Private Sewage Disposal Code* . The *International Fire Code* , the *International Property Maintenance Code* and the *International Plumbing Code* shall govern the use and maintenance of plumbing components, appliances, equipment and systems. The *International Existing Building Code* and the *International Plumbing Code* shall govern the *alteration*, *repair*, relocation, replacement and addition of plumbing components, *appliances*, *equipment* and systems.~~

Reason: The Scoping work group has continued work on IBC for Group B. In order to correlate the scoping of Chapter 29, the work group is submitting this committee comment to address the need to revise the Chapter 29 scoping to match that of the other IBC chapters and the other I-codes as well. The committee will notice that the references pertaining to maintenance, repairs, alterations and the references to the other codes have been deleted, as pointed out are not covered under the scope of this chapter of the IBC and therefore should not be included. This is an editorial change in nature and does not make any technical changes to the IBC.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

As noted in the reason statement, this is an editorial change that has no economic impact on the cost of construction.

Comment (CAH2)# 427

G1-24 Part VII

IMC: 301.1, 401.1, CHAPTER 5, 501.1, CHAPTER 6, 601.1, 701.1, 701.2, 702.1(New), 702.2(New), 702.3(New), 901.1, 901.2, 1001.1, 1001.2(New), 1101.1, 1201.1, 1201.2(New), 1301.1, 1301.2, 1401.1; IBC: [M] 2801.1

Proposed Change as Submitted

Proponents: Steven Orlowski, Sundowne Building Code Consultants, LLC, Self (sorlowski@sbcc.codes); Robert Marshall, FCAC, FCAC (fcac@iccsafe.org); Jeff Grove, Chair, Building Code Action Committee (BCAC) (bcac@iccsafe.org); Andrew Bevis, Chair, Plumbing, Mechanical and Fuel Gas Code Action Committee (pmgcac@iccsafe.org)

2024 International Mechanical Code

CHAPTER 3
GENERAL REGULATIONS

SECTION 301
GENERAL

Revise as follows:

301.1 Scope. ~~This chapter shall govern the approval and installation~~Installation of all *equipment* and *appliances* that comprise parts of the *building* mechanical systems shall comply with this chapter. ~~regulated by this code in accordance with Section 101.2.~~

CHAPTER 4
VENTILATION

SECTION 401
GENERAL

Revise as follows:

401.1 Scope. ~~This chapter shall govern the ventilation~~ Ventilation of spaces within a *building* intended to be occupied, other than by systems regulated by Chapter 5, shall comply with this chapter. ~~Mechanical exhaust systems, including exhaust systems serving clothes dryers and cooking *appliances*; hazardous exhaust systems; dust, stock and refuse conveyor systems; subslab soil exhaust systems; smoke control systems; energy recovery ventilation systems and other systems specified in Section 502 shall comply with Chapter 5.~~

CHAPTER 5
EXHAUST SYSTEMS, SMOKE CONTROL SYSTEMS, AND ENERGY RECOVERY VENTILATION SYSTEMS

SECTION 501
GENERAL

Revise as follows:

501.1 Scope. ~~This chapter shall govern the design~~Design, construction and installation of ~~mechanical~~ exhaust systems, smoke control systems, and ~~including exhaust systems serving clothes dryers and cooking *appliances*; hazardous exhaust systems; dust, stock and~~

~~refuse conveyor systems; subslab soil exhaust systems; smoke control systems;~~ energy recovery ventilation systems shall comply with this chapter. ~~and other systems specified in Section 502.~~

CHAPTER 6
~~DUCT SYSTEMS~~AIR MOVEMENT

SECTION 601
GENERAL

Revise as follows:

601.1 Scope. ~~Duct systems used for the~~ Air movement for the purpose of ~~air in~~ air-conditioning, heating, ~~ventilating~~ and ventilation or exhaust systems ~~shall conform to the provisions of this chapter except as otherwise~~ other than specified in Chapters 5 and 7, shall comply with this chapter.

Exception: Ducts discharging combustible material directly into any *combustion* chamber shall conform to the requirements of NFPA 82.

CHAPTER 7
COMBUSTION AIR

SECTION 701
GENERAL

Revise as follows:

701.1 Scope. For other than fireplaces, fireplace stoves and direct-vent *appliances*, combustion air shall comply with this chapter.
~~Solid fuel-burning *appliances* shall be provided with *combustion air* in accordance with the *appliance* manufacturer's installation instructions.~~
~~Oil-fired *appliances* shall be provided with *combustion air* in accordance with NFPA 31. The methods of providing *combustion air* in this chapter do not apply to fireplaces, fireplace stoves and direct-vent *appliances*.~~
~~The requirements for combustion and dilution air for gas-fired *appliances* shall be in accordance with the *International Fuel Gas Code*.~~

Add new text as follows:

702.1 Solid fuel-burning appliances. Solid fuel-burning *appliances* shall be provided with *combustion air* in accordance with the *appliance* manufacturer's installation instructions.

702.2 Oil-fired appliances. Oil-fired *appliances* shall be provided with *combustion air* in accordance with NFPA 31.

702.3 Gas-fired appliances. Combustion and dilution air for gas-fired *appliances* shall be in accordance with the *International Fuel Gas Code.*

Revise as follows:

~~**701.2**~~**703.1 ~~Dampered openings~~Interlock.** Where *combustion air* openings are provided with volume, smoke or fire dampers, the dampers shall be interlocked with the firing cycle of the *appliances* served, so as to prevent operation of any *appliance* that draws *combustion air* from the room or space when any of the dampers are closed. Manual dampers shall not be installed in *combustion air* ducts. Ducts not provided with dampers and that pass through rated construction shall be enclosed in a shaft in accordance with the

International Building Code.

CHAPTER 9
SPECIFIC APPLIANCES, FIREPLACES AND SOLID FUEL-BURNING EQUIPMENT

SECTION 901
GENERAL

Revise as follows:

901.1 Scope. ~~This chapter shall govern the approval,~~ For other than gas-fired *appliances* regulated by the *International Fuel Gas Code*, the design, installation, construction, maintenance, *alteration* and repair of ~~the~~ *appliances*, systems, and *equipment* specifically identified herein shall comply with this chapter.~~and factory built fireplaces. The approval, design, installation, construction, maintenance, *alteration* and repair of gas fired *appliances* shall be regulated by the *International Fuel Gas Code*.~~

Delete without substitution:

~~**901.2 General.** The requirements of this chapter shall apply to the mechanical *equipment* and *appliances* regulated by this chapter, in addition to the other requirements of this code.~~

CHAPTER 10
BOILERS, WATER HEATERS AND PRESSURE VESSELS

SECTION 1001
GENERAL

Revise as follows:

1001.1 Scope. ~~This chapter shall govern the installation~~Installation, *alteration* and repair of boilers, water heaters and pressure vessels, other than those specified in section 1001.2, shall comply with this chapter.

~~**Exceptions:**~~

1. ~~Pressure vessels used for unheated water supply.~~
2. ~~Portable unfired pressure vessels and Interstate Commerce Commission containers.~~
3. ~~Containers for bulk oxygen and medical gas.~~
4. ~~Unfired pressure vessels having a volume of 5 cubic feet (0.14 m^3) or less operating at pressures not exceeding 250 pounds per square inch (psi) (1724 kPa) and located within *occupancies* of Groups B, F, H, M, R, S and U.~~
5. ~~Pressure vessels used in *refrigeration systems* that are regulated by Chapter 11 of this code.~~
6. ~~Pressure tanks used in conjunction with coaxial cables, telephone cables, power cables and other similar humidity control systems.~~
7. ~~Any boiler or pressure vessel subject to inspection by federal or state inspectors.~~
8. ~~Pressure vessels used in specific *appliances* and *equipment* that are regulated by Chapter 9 of this code.~~

Add new text as follows:

1001.2 Nonapplicability. This chapter shall not apply to the following:

1. Pressure vessels used for unheated water supply.
2. Portable unfired pressure vessels and Interstate Commerce Commission containers.
3. Containers for bulk oxygen and medical gas.
4. Unfired pressure vessels having a volume of 5 cubic feet (0.14 m^3) or less operating at pressures not exceeding 250 pounds per square inch (psi) (1724 kPa) and located within *occupancies* of Groups B, F, H, M, R, S and U.
5. Pressure vessels used in *refrigeration systems* that are regulated by Chapter 11 of this code.
6. Pressure tanks used in conjunction with coaxial cables, telephone cables, power cables and other similar humidity control systems.
7. Any boiler or pressure vessel subject to inspection by federal or state inspectors.
8. Pressure vessels used in specific *appliances* and *equipment* that are regulated by Chapter 9 of this code.

CHAPTER 11
REFRIGERATION

SECTION 1101
GENERAL

Revise as follows:

1101.1 Scope. ~~This chapter shall govern the design~~Design, installation, construction and repair of *refrigeration systems* shall comply with this chapter. ~~Permanently installed refrigerant storage systems and other components shall be considered as part of the *refrigeration system* to which they are attached.~~

CHAPTER 12
HYDRONIC PIPING

SECTION 1201
GENERAL

Revise as follows:

1201.1 Scope. ~~The provisions of this chapter shall govern the construction~~Construction, installation, *alteration* and repair of hydronic piping systems that are part of the heating, ventilation, and air-conditioning systems shall comply with this chapter. ~~This chapter shall apply to hydronic piping systems that are part of heating, ventilation and air-conditioning systems. Such piping systems shall include steam, hot water, radiant heating, radiant cooling , chilled water, steam condensate, ground source heat pump loop systems, and snow- and ice-melting. Potable cold and hot water distribution systems shall be installed in accordance with the *International Plumbing Code*.~~

Add new text as follows:

1201.2 System configuration. Hydronic piping systems shall include steam, hot water, radiant heating, radiant cooling , chilled water, steam condensate, ground source heat pump loop systems, and snow- and ice-melting. Potable cold and hot water distribution systems shall be installed in accordance with the *International Plumbing Code*.

CHAPTER 13

FUEL OIL PIPING AND STORAGE

SECTION 1301
GENERAL

Revise as follows:

1301.1 Scope. ~~This chapter shall govern the design~~Design, installation, construction and repair of fuel oil storage and piping systems shall comply with this chapter. ~~The storage of fuel oil and flammable and combustible liquids shall be in accordance with Chapters 6 and 57 of the International Fire Code.~~

1301.2 Storage ~~and piping systems~~. Fuel oil storage systems shall comply with Section 605.4 of the International Fire Code. ~~Fuel oil piping systems shall comply with the requirements of this code.~~ The storage of fuel oil and flammable and combustible liquids shall be in accordance with Chapter 57 of the *International Fire Code*.

CHAPTER 14
SOLAR THERMAL SYSTEMS

SECTION 1401
GENERAL

Revise as follows:

1401.1 Scope. ~~This chapter shall govern the design, construction,~~ Design, installation, construction *alteration* and repair of solar thermal systems, *equipment* and *appliances* intended to utilize solar energy for space heating or cooling, domestic hot water heating, swimming pool heating or process heating shall comply with this chapter.

2024 International Building Code

CHAPTER 28
MECHANICAL SYSTEMS

SECTION 2801
GENERAL

Revise as follows:

[M] 2801.1 Scope. ~~The provisions of this chapter, the *International Mechanical Code* and the *International Fuel Gas Code* shall govern the design,~~Design, construction, erection and installation of mechanical appliances, equipment and systems used in *buildings* and *structures* covered by this code shall comply with this chapter, the *International Mechanical Code* and the *International Fuel Gas Code*. Masonry chimneys, fireplaces and barbecues shall comply with the *International Mechanical Code* and Chapter 21 of this code. The *International Fire Code* , the *International Property Maintenance Code* , the *International Mechanical Code* and the *International Fuel Gas Code* shall govern the use and maintenance of mechanical components, appliances, equipment and systems. The *International Existing Building Code* , the *International Mechanical Code* and the *International Fuel Gas Code* shall govern the *alteration*, *repair*, relocation, replacement and addition of mechanical components, appliances, equipment and systems.

Reason:

Currently, there is inconsistency among all the I-Codes in how the scoping sections are written at the beginning of each chapter. The Code Correlation Committee requested a task group be formed to review the scoping section in all the I-Codes and determine if there would be a way to harmonize both the language and style across the model codes. The Scoping Task Group was formed and consisted of several members from the various Code Action Committees and interested parties (some with no client interest). The task group reviewed each chapter of the I-codes and after careful consideration, developed a format that could be incorporated and repeated for all the I-Codes.

As you will see in the proposed changes above, most of the chapters began with a style and format that was already consistent and was only slightly changed to give the scoping a more authoritative infliction. Where the chapter contained no scoping provisions, the task group added scoping language based on the content of the chapter. Where the existing scoping sections provided a laundry list of what is contained in the chapter, these list were reformatted into a list form to make it easier for users to see what information was contained. The Scoping Task group proposes that the recommended changes will improve the code by:

1. Create consistency in language used in the scope for all the I-Codes.
2. Creates a scoping section for chapters that did not have one before to clarify what is covered by the chapter.
3. Clarify the items covered and not covered in the chapter, using consistent format to send the user to different chapter(s) or code(s).
4. Remove redundant administrative language from existing scoping sections.
5. Where there were extensive number of items outlined in the scoping section, the items are now broken out into a list format to make it easier for the reader to indicate what is contained in the chapter.

To the best of the task groups knowledge the proposed changes are editorial in nature and no requirements not already addressed in the existing scoping or in the chapter being referenced were added. As these proposed changes are editorial, there is no cost impact on the cost of construction.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

As stated in our reason statement, these proposed changes are editorial, there is no cost impact on the cost of construction.

G1-24 Part VII

Public Hearing Results (CAH1)

Committee Action: **As Submitted**

Committee Reason: According to the proponent's justification, the committee voted 14-0 to approve the proposal as submitted. The proposal's proponent argues that scoping language should be added per the chapter's content. Where the existing scoping sections covered the chapter's content, the information was reorganized into a list form to standardize the language used in the scope for all I-Codes for those chapters that lacked one. This action will clarify the chapter's contents and eliminate superfluous administrative language from the existing scoping sections.

G1-24 Part VII

Individual Consideration Agenda

Comment 1:

IBC: CHAPTER 28, SECTION 2801, [M] 2801.1; IMC®: CHAPTER 7, SECTION 701, 701.1, SECTION 702 (New), 702.1, 702.2, 702.3, SECTION 703 (New), 703.1, CHAPTER 8, 801.1

Proponents: Steven Orlowski, Sundowne Building Code Consultants, LLC, Self (sorlowski@sbcc.codes) requests As Modified by Committee (AMC2)

Further modify as follows:

2024 International Building Code

CHAPTER 28
MECHANICAL SYSTEMS

SECTION 2801
GENERAL

[M] 2801.1 Scope. ~~The provisions of this chapter, the *International Mechanical Code* and the *International Fuel Gas Code* shall govern the design, construction, erection and installation of mechanical appliances,~~ Design, Installation, and construction of mechanical equipment and systems ~~used in *buildings* and *structures* covered by this code. Masonry chimneys, fireplaces and barbecues~~ shall comply with the *International Mechanical Code* ~~and Chapter 21 of this code. The~~, the *International Fire Code* ~~, the *International Property Maintenance Code* , the *International Mechanical Code*~~ and the *International Fuel Gas Code* ~~shall govern the use and maintenance of mechanical components, appliances, equipment and systems. The *International Existing Building Code* , the *International Mechanical Code* and the *International Fuel Gas Code* shall govern the *alteration*, *repair*, relocation, replacement and addition of mechanical components, appliances, equipment and systems~~.

2024 International Mechanical Code

CHAPTER 7
COMBUSTION AIR

SECTION 701
GENERAL

701.1 Scope. For other than fireplaces, fireplace stoves and direct-vent *appliances,* combustion air shall comply with this chapter.

Add new text as follows:

SECTION 702
FUEL-BURNING APPLIANCES

702.1 Solid fuel-burning appliances. Solid fuel-burning *appliances* shall be provided with *combustion air* in accordance with the *appliance* manufacturer's installation instructions.

702.2 Oil-fired appliances. Oil-fired *appliances* shall be provided with *combustion air* in accordance with NFPA 31.

702.3 Gas-fired appliances. Combustion and dilution air for gas-fired *appliances* shall be in accordance with the *International Fuel Gas Code*.

Add new text as follows:

SECTION 703
DAMPERS

703.1 ~~Interlock~~ Damper openings. Where *combustion air* openings are provided with volume, smoke or fire dampers, the dampers shall be interlocked with the firing cycle of the *appliances* served, so as to prevent operation of any *appliance* that draws *combustion air* from the room or space when any of the dampers are closed. Manual dampers shall not be installed in *combustion air* ducts. Ducts not provided with dampers and that pass through rated construction shall be enclosed in a shaft in accordance with the *International Building Code*.

CHAPTER 8
CHIMNEYS AND VENTS

801.1 Scope. ~~This chapter shall govern the installation~~ Installation, maintenance, and repair ~~and approval~~ of ~~factory-built~~ *chimneys*~~,~~ ~~*chimney* liners,~~ and vents ~~and connectors. This chapter shall govern the utilization of masonry *chimneys*~~ shall comply with this chapter. Gas-fired *appliances* shall be vented in accordance with the *International Fuel Gas Code*.

Reason: The Scoping work group has continued work on IBC for Group B. In order to correlate the scoping of Chapter 28, the work group is submitting this committee comment to address the need to revise the Chapter 28 scoping to match that of the other IBC chapters and the other I-codes as well. The committee will notice that the references pertaining to maintenance, repairs, alterations and the references to the other codes have been deleted, as pointed out are not covered under the scope of this chapter of the IBC and therefore should not be included. This is an editorial change in nature and does not make any technical changes to the IBC.

In the IMC, Chapter 8 was missed. In Chapter 7 the new section titles were missed. These revisions would be consistent with what was approved for the remainder of the IMC chapters.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

As noted in the reason statement, this is an editorial change that has no economic impact on the cost of construction.

Comment (CAH2)# 425

2024 International Fire Code

CHAPTER 3
GENERAL REQUIREMENTS

SECTION 301
GENERAL

Revise as follows:

301.1 Scope. ~~The provisions of this chapter shall govern the occupancy~~ Occupancy and maintenance of all structures and premises for precautions against fire and the spread of fire and general requirements of fire safety shall comply with this chapter.

CHAPTER 4
EMERGENCY PLANNING AND PREPAREDNESS

SECTION 401
GENERAL

Revise as follows:

401.1 Scope. Reporting of emergencies, coordination with emergency response forces, emergency plans and procedures for managing or responding to emergencies shall comply with ~~the provisions of this section~~ this chapter. **Exception:** Firms that have *approved* on-premises firefighting organizations and that are in compliance with *approved* procedures for fire reporting.

CHAPTER 6
BUILDING SERVICES AND SYSTEMS

SECTION 601
GENERAL

Revise as follows:

601.1 Scope. ~~The provisions of this chapter shall apply to the installation, operation, testing and maintenance of the~~ The following building services and systems~~shall comply with this chapter~~:

1. Electrical systems, equipment and wiring.
2. Information technology server rooms.
3. Elevator systems, emergency operation and recall.
4. Fuel-fired appliances, heating systems, chimneys and fuel oil storage.
5. Commercial cooking equipment and systems.
6. Commercial cooking oil storage.
7. Mechanical refrigeration systems.
8. Hyperbaric facilities.
9. Clothes dryer exhaust systems.

CHAPTER 7
FIRE AND SMOKE PROTECTION FEATURES

SECTION 701
GENERAL

Revise as follows:

701.1 Scope. ~~The provisions of this chapter shall govern the inspection~~ Inspection and maintenance of ~~the materials, systems and assemblies used for structural *fire resistance*, *fire resistance rated* construction separation of adjacent spaces and construction installed to resist the passage of smoke to safeguard against the spread of~~ fire and smoke protection features in ~~within a building and the spread of fire to or from~~ buildings shall comply with this chapter. ~~New buildings shall comply with the *International Building Code*.~~ .

CHAPTER 8
INTERIOR FINISH, DECORATIVE MATERIALS AND FURNISHINGS

SECTION 801
GENERAL

Revise as follows:

801.1 Scope. ~~The provisions of this chapter shall govern interior~~ Interior finish, interior trim, furniture, furnishings, decorative materials and decorative vegetation in buildings~~shall comply with this chapter~~. ~~Existing buildings shall comply with Sections 803 through 808. New buildings shall comply with Sections 804 through 808, and Section 803 of the International Building Code.~~

CHAPTER 9
FIRE PROTECTION AND LIFE SAFETY SYSTEMS

SECTION 901
GENERAL

Revise as follows:

901.1 Scope. ~~The provisions of this chapter shall specify where~~ Where *fire protection* and *life safety systems* are required by this chapter, ~~and shall apply to~~ the design, installation, inspection, operation, testing and maintenance of all *fire protection* and *life safety systems* shall comply with this chapter.

CHAPTER 10
MEANS OF EGRESS

Revise as follows:

SECTION 1001
~~ADMINISTRATION~~GENERAL

1001.1 ~~General~~ Scope. Buildings or portions thereof shall be provided with a *means of egress* system ~~as required by~~ and shall comply with this chapter. The provisions of this chapter shall control the design, construction, ~~and~~ arrangement and maintenance of *means of egress* components required to provide an *approved means of egress* from structures and portions thereof. ~~Sections 1003 through 1031 shall apply to new construction. Section 1032 shall apply to existing buildings.~~ **Exception:** Detached one- and two-family *dwellings* and *townhouses* not more than three stories above *grade plane* in height with a separate means of egress and their accessory structures shall comply with the *International Residential Code*.

[BE] 1001.2 ~~Minimum requirements~~General. It shall be unlawful to alter a building or structure in a manner that will reduce the number of *exits* or the capacity of the *means of egress* to less than required by this code.

CHAPTER 11
CONSTRUCTION REQUIREMENTS FOR EXISTING BUILDINGS

SECTION 1101
GENERAL

Revise as follows:

1101.1 Scope. ~~The provisions of this chapter shall apply to existing~~ Existing buildings constructed prior to the adoption of this code shall comply with this chapter.

CHAPTER 12
ENERGY SYSTEMS

SECTION 1201
GENERAL

Revise as follows:

1201.1 Scope. ~~The provisions of this chapter shall apply to the installation~~ Installation, operation, maintenance, repair, retrofitting, testing, commissioning and decommissioning of energy systems used for generating or storing energy, including but not limited to energy storage systems under the exclusive control of an electric utility or lawfully designated agency shall comply with this chapter. It shall not apply to equipment associated with the generation, control, transformation, transmission, or distribution of energy installations that is

under the exclusive control of an electric utility or lawfully designated agency. Energy storage systems regulated by Section 1207 shall comply with this chapter, as appropriate, and NFPA 855.

CHAPTER 20
AVIATION FACILITIES

SECTION 2001
GENERAL

Revise as follows:

2001.1 Scope. Airports, heliports, helistops and aircraft hangars shall comply ~~be in accordance~~ with this chapter.

CHAPTER 21
DRY CLEANING

SECTION 2101
GENERAL

Revise as follows:

2101.1 Scope. Dry cleaning plants and their operations shall comply with ~~the requirements of~~ this chapter.

CHAPTER 22
COMBUSTIBLE DUST-PRODUCING OPERATIONS

SECTION 2201
GENERAL

Revise as follows:

2201.1 Scope. The equipment, processes and operations involving dust explosion hazards and use or handling of *combustible dust* shall comply with ~~the provisions of~~ this chapter.

~~**Exceptions:**~~

1. ~~Storage and use of consumer materials in Group B or R occupancies.~~
2. ~~Storage and use of commercially packaged materials in Group M occupancies.~~
3. ~~Materials displayed in original packaging in Group M occupancies and intended as building materials or for personal or household use.~~
4. ~~Storage of sealed containers of *combustible dust* at facilities not associated with an operation that uses, handles or generates *combustible dust*.~~
5. ~~Materials stored or used in farm buildings or similar occupancies intended for on-premises agricultural purposes.~~

Add new text as follows:

2201.1.1 Non-applicability. This chapter shall not apply to any of the following:

1. Storage and use of consumer materials in Group B or R occupancies.
2. Storage and use of commercially packaged materials in Group M occupancies.
3. Materials displayed in original packaging in Group M occupancies and intended as building materials or for personal or household use.
4. Storage of sealed containers of *combustible dust* at facilities not associated with an operation that uses, handles or generates *combustible dust*.
5. Materials stored or used in farm buildings or similar occupancies intended for on-premises agricultural purposes.

CHAPTER 23
MOTOR FUEL-DISPENSING FACILITIES AND REPAIR GARAGES

SECTION 2301
GENERAL

Revise as follows:

2301.1 Scope. Public and private automotive ~~Automotive~~ motor fuel-dispensing facilities, marine motor fuel-dispensing facilities, fleet vehicle motor fuel-dispensing facilities, aircraft motor-vehicle fuel-dispensing facilities and repair garages shall comply ~~be in accordance~~ with this chapter ~~and the *International Building Code*, *International Fuel Gas Code* and *International Mechanical Code*. Such operations shall include both those that are open to the public and private operations~~.

CHAPTER 24
FLAMMABLE FINISHES

SECTION 2401
GENERAL

Revise as follows:

2401.1 Scope. ~~This chapter shall apply to locations or areas where any of the~~ The following activities shall comply with this chapter: ~~are conducted:~~

1. The application of flammable finishes to articles or materials by means of spray apparatus.
2. The application of flammable finishes by dipping or immersing articles or materials into the contents of tanks, vats or containers of *flammable* or *combustible liquids* for coating, finishing, treatment or similar processes.
3. The application of flammable finishes by applying combustible powders to articles or materials utilizing powder spray guns, electrostatic powder spray guns, fluidized beds or electrostatic fluidized beds.
4. Floor surfacing or finishing operations using Class I or II liquids in areas exceeding 350 square feet (32.5 m^2).
5. The application of flammable finishes consisting of dual-component coatings or Class I or II liquids where applied by brush or roller in quantities exceeding 1 gallon (4 L).

CHAPTER 25
FRUIT AND CROP RIPENING

SECTION 2501
GENERAL

Revise as follows:

2501.1 Scope. Ripening processes where ethylene gas is introduced into a room to promote the ripening of fruits, vegetables and other crops shall comply with this chapter.

~~**Exception:** Mixtures of ethylene and one or more inert gases in concentrations that prevent the gas from reaching greater than 25 percent of the lower explosive limit (LEL) when released to the atmosphere.~~

Add new text as follows:

2501.1.1 Non-applicability. This chapter shall not apply to mixtures of ethylene and one or more inert gases in concentrations that prevent the gas from reaching greater than 25 percent of the lower explosive limit (LEL) when released to the atmosphere.

CHAPTER 27
SEMICONDUCTOR FABRICATION FACILITIES

SECTION 2701
GENERAL

Revise as follows:

2701.1 Scope. Semiconductor fabrication facilities and comparable ~~research and development~~ areas classified as Group H-5 shall comply with this chapter. ~~and the *International Building Code*.~~ The use, storage and handling of hazardous materials in Group H-5 shall comply with this chapter~~,~~ and other applicable provisions of this code. ~~and the *International Building Code*.~~

CHAPTER 28
LUMBER YARDS AND AGRO-INDUSTRIAL, SOLID BIOMASS AND WOODWORKING FACILITIES

SECTION 2801
GENERAL

Revise as follows:

2801.1 Scope. The storage, manufacturing and processing of solid biomass feedstock, timber, lumber, plywood, veneers and agro-industrial byproducts shall ~~be in accordance~~ comply with this chapter.

CHAPTER 29
MANUFACTURE OF ORGANIC COATINGS

SECTION 2901
GENERAL

Revise as follows:

2901.1 Scope. Organic coating manufacturing processes shall comply with this chapter., ~~except that this chapter shall not apply to processes manufacturing nonflammable or water-thinned coatings or to operations applying coating materials.~~

Add new text as follows:

2901.1.1 Non-applicability.. This chapter shall not apply to processes manufacturing nonflammable or water-thinned coatings or to operations applying coating materials.

CHAPTER 30
INDUSTRIAL OVENS

SECTION 3001
GENERAL

Revise as follows:

3001.1 Scope. ~~This chapter shall apply to the installation~~ Installation and operation of industrial ovens and furnaces shall comply with this chapter, and applicable provisions of ~~the *International Fuel Gas Code*, the *International Mechanical Code*,~~ NFPA 86~~, and this chapter~~. The terms “ovens” and “furnaces” are used interchangeably in this chapter.

CHAPTER 31
TENTS, TEMPORARY SPECIAL EVENT STRUCTURES AND OTHER MEMBRANE STRUCTURES

SECTION 3101
GENERAL

Revise as follows:

3101.1 Scope. *Tents*, temporary special event structures and *membrane structures* shall comply with this chapter. ~~The provisions of Section 3103 are applicable only to temporary *tents* and *membrane structures*. The provisions of Sections 3104 and 3108 are applicable to temporary and permanent *tents* and *membrane structures*. The provisions of Section 3105 are applicable to temporary special event structures. The provisions of Section 3106 are applicable to inflatable amusement devices. The provisions of Section 3107are applicable to outdoor assembly events. Other temporary structures shall comply with the *International Building Code*.~~

Add new text as follows:

3101.1.1 Applicability. The following applies as follows:

1. The provisions of Section 3103 are applicable only to temporary *tents* and *membrane structures*.
2. The provisions of Sections 3104 and 3108 are applicable to temporary and permanent *tents* and *membrane structures*.
3. The provisions of Section 3105 are applicable to temporary special event structures.
4. The provisions of Section 3106 are applicable to inflatable amusement devices.
5. The provisions of Section 3107 are applicable to outdoor assembly events.
6. Other temporary structures not covered by this chapter shall comply with the *International Building Code*.

CHAPTER 32
HIGH-PILED COMBUSTIBLE STORAGE

SECTION 3201
GENERAL

Revise as follows:

3201.1 Scope. *High-piled combustible storage* shall ~~be in accordance~~ comply with this chapter. In addition to the requirements of this chapter, the following material-specific requirements shall apply:

1. Aerosols shall be in accordance with Chapter 51.
2. *Flammable* and *combustible liquids* shall be in accordance with Chapter 57.
3. Hazardous materials shall be in accordance with Chapter 50.
4. Storage of combustible paper records shall be in accordance with NFPA 13.
5. Storage of *combustible fibers* shall be in accordance with Chapter 37.
6. General storage of combustible material shall be in accordance with Chapter 3.

CHAPTER 33
FIRE SAFETY DURING CONSTRUCTION AND DEMOLITION

SECTION 3301
GENERAL

Revise as follows:

3301.1 Scope. ~~This chapter shall apply to structures~~ Structures in the course of construction, *alteration* or demolition, including those in underground locations shall comply with this chapter. Compliance with NFPA 241 is required for items not specifically addressed herein.

CHAPTER 34
TIRE REBUILDING AND TIRE STORAGE

SECTION 3401
GENERAL

Revise as follows:

3401.1 Scope. Tire rebuilding plants, tire storage and tire byproduct facilities shall comply with this chapter~~,~~ and other applicable requirements of this code ~~and NFPA 13. Tire storage in buildings shall also comply with Chapter 32.~~

Add new text as follows:

3401.1.1 Additional Requirements. The following shall also apply.

1. The rubber tire protection requirements of NFPA 13.
2. Storage of tires shall comply with Chapter 32.

CHAPTER 36
MARINAS

Revise as follows:

SECTION 3601
~~SCOPE~~GENERAL

3601.1 Scope. Marina facilities shall ~~be in accordance~~ comply with this chapter.

CHAPTER 37
COMBUSTIBLE FIBERS

SECTION 3701
GENERAL

Revise as follows:

3701.1 Scope. ~~The equipment~~Equipment, processes and operations involving *combustible fibers* shall comply with this chapter.

CHAPTER 38
HIGHER EDUCATION LABORATORIES

SECTION 3801
GENERAL

Revise as follows:

3801.1 Scope. Higher education laboratories ~~complying with the requirements of this chapter shall be permitted to exceed the maximum allowable quantities of hazardous materials in *control areas* set forth in Chapter 50 without requiring classification as a Group H occupancy~~ shall comply with this chapter. Except as specified in this chapter, such laboratories shall comply with all applicable provisions of this code.~~and the *International Building Code*.~~

3801.2 Application. The provisions of this chapter shall be applied as exceptions or additions to applicable requirements of this code. ~~Unless specifically modified by this chapter, the storage, use and handling of hazardous materials shall comply with the provisions in Chapters 50 through 67 and the *International Building Code* for quantities not exceeding the maximum allowable quantity.~~

Add new text as follows:

3801.2.1 Materials exceeding the Maximum Allowable Quantity. Occupancies complying with this chapter shall be permitted to exceed the maximum allowable quantities of hazardous materials in control areas set forth in Chapter 50 without requiring classification as a Group H occupancy

3801.2.2 Materials not exceeding the Maximum Allowable Quantity . Unless specifically modified by this chapter, the storage, use and handling of hazardous materials shall comply with the provisions of chapters 50 through 67 for quantities not exceeding the maximum allowable quantities.

CHAPTER 39
PROCESSING AND EXTRACTION FACILITIES

SECTION 3901
GENERAL

Revise as follows:

3901.1 Scope. Facilities where plant processing and solvent-based extraction are conducted, including but not limited to cultivation and related activities, pre-extraction or post-extraction, shall comply with this chapter and the *International Building Code*. The use, storage, transfilling and handling of hazardous materials in these facilities shall comply with this chapter, other applicable provisions of this code and the *International Building Code*. ~~**Exception:** Greenhouses in compliance with Section 3112 of the *International Building Code* not utilizing carbon dioxide enrichment.~~

Add new text as follows:

3901.1.1 Non-applicability. This chapter shall not apply to greenhouses in compliance with Section 3112 of the *International Building Code* not utilizing carbon dioxide enrichment.

CHAPTER 40
STORAGE OF DISTILLED SPIRITS AND WINES

SECTION 4001
GENERAL

Revise as follows:

4001.1 ~~General~~Scope. ~~The storage~~Storage of distilled spirits and wines in barrels and casks shall comply with this chapter. ~~in addition to other applicable requirements of this code.~~

CHAPTER 41
TEMPORARY HEATING AND COOKING OPERATIONS

SECTION 4101 GENERAL. Section 4101.5 relocated from before 3107.13

Revise as follows:

4101.1 ~~General~~Scope. ~~The provisions of this chapter shall apply to the use~~ Use, operation, testing and maintenance of mobile and portable equipment and devices used for temporary heating and cooking shall comply with this chapter. Temporary heating and cooking operations with open flames shall also comply with any additional applicable requirements in Section 308

.

~~**Exception:** Temporary heating devices used in the course of construction, alteration and demolition of structures shall comply with Section 3304.~~

Add new text as follows:

4101.1.1 Non-applicability. This chapter shall not apply to temporary heating devices used in the course of construction, alteration and demolition of structures complying with Section 3304.

CHAPTER 50
HAZARDOUS MATERIALS—GENERAL PROVISIONS

SECTION 5001
GENERAL

Revise as follows:

5001.1 Scope. Prevention, control and mitigation of dangerous conditions related to storage, dispensing, use and handling of hazardous materials shall ~~be in accordance~~ comply with this chapter.

This chapter shall apply to all hazardous materials, including those materials regulated elsewhere in this code, except that where specific requirements are provided in other chapters, those specific requirements shall apply in accordance with the applicable chapter. Where a material has multiple hazards, all hazards shall be addressed.

~~**Exceptions:**~~

1. ~~In retail or wholesale sales occupancies, medicines, foodstuff, cosmetics and commercial or institutional products containing not more than 50 percent by volume of water-miscible liquids and with the remainder of the solutions not being flammable, provided that such materials are packaged in individual containers not exceeding 1.3 gallons (5 L).~~
2. ~~Alcoholic beverages in retail or wholesale sales occupancies, provided that the liquids are packaged in individual containers not exceeding 1.3 gallons (5 L).~~
3. ~~Application and release of pesticide and agricultural products and materials intended for use in weed abatement, erosion control, soil amendment or similar applications where applied in accordance with the manufacturer's instructions and label directions.~~
4. ~~The off-site transportation of hazardous materials where in accordance with Department of Transportation (DOTn) regulations.~~
5. ~~Building materials not otherwise regulated by this code.~~
6. ~~Refrigeration systems (see Section 608).~~
7. ~~Stationary storage battery systems regulated by Section 1207.~~
8. ~~The display, storage, sale or use of fireworks and *explosives* in accordance with Chapter 56.~~
9. ~~*Corrosives* utilized in personal and household products in the manufacturer's original consumer packaging in Group M occupancies.~~
10. ~~The storage of beer, distilled spirits and wines in barrels and casks.~~
11. ~~The use, storage or both of dispensers containing alcohol-based hand rubs classified as Class I or II liquids where in accordance with Section 5705.5.~~
12. ~~Specific provisions for flammable liquids in motor fuel-dispensing facilities, repair garages, airports and marinas in Chapter 23.~~
13. ~~Storage and use of fuel oil in tanks and containers connected to oil-burning equipment. Such storage and use shall be in accordance with Section 605. For abandonment of fuel oil tanks, Chapter 57 applies.~~
14. ~~Storage and display of aerosol products complying with Chapter 51.~~
15. ~~Storage and use of *flammable* or *combustible liquids* that do not have a fire point when tested in accordance with ASTM D92, not otherwise regulated by this code.~~

~~16. *Flammable* or *combustible liquids* with a *flash point* greater than 95°F (35°C) in a water-miscible solution or dispersion with a water and inert (noncombustible) solids content of more than 80 percent by weight, which do not sustain combustion, not otherwise regulated by this code.~~

~~17. Commercial cooking oil storage tank systems located within a building and designed and installed in accordance with Section 607 and NFPA 30.~~

Add new text as follows:

5001.1.1 Non-applicability. This chapter shall not apply to any of the following:

1. Retail or wholesale sales occupancies containing medicines, foodstuff, cosmetics and commercial or institutional products containing not more than 50 percent by volume of water-miscible liquids and with the remainder of the solutions not being flammable, provided that such materials are packaged in individual containers not exceeding 1.3 gallons (5 L).
2. Alcoholic beverages in retail or wholesale sales occupancies, provided that the liquids are packaged in individual containers not exceeding 1.3 gallons (5 L).
3. Application and release of pesticide and agricultural products and materials intended for use in weed abatement, erosion control, soil amendment or similar applications where applied in accordance with the manufacturer's instructions and label directions.
4. The off-site transportation of hazardous materials complying with Department of Transportation (DOTn) regulations.
5. Building materials not otherwise regulated by this code.
6. Refrigeration systems complying with Section 608.
7. Stationary storage battery systems complying with Section 1207.
8. The display, storage, sale or use of fireworks and *explosives* complying with Chapter 56.
9. *Corrosives* utilized in personal and household products in the manufacturer's original consumer packaging in retail or wholesale occupancies.
10. The storage of beer, distilled spirits and wines in barrels and casks.
11. The use, storage or both of dispensers containing alcohol-based hand rubs classified as Class I or II liquids where in complying with Section 5705.5.
12. Specific provisions for flammable liquids in motor fuel-dispensing facilities, repair garages, airports and marinas complying with Chapter 23.
13. Storage and use of fuel oil in tanks and containers connected to oil-burning equipment complying with Section 605. Abandonment of fuel oil tanks shall comply with Chapter 57.
14. Storage and display of aerosol products complying with Chapter 51.
15. Storage and use of *flammable* or *combustible liquids* that do not have a fire point when tested in accordance with ASTM D92, not otherwise regulated by this code.
16. *Flammable* or *combustible liquids* with a *flash point* greater than 95°F (35°C) in a water-miscible solution or dispersion with a water and inert (noncombustible) solids content of more than 80 percent by weight, which do not sustain combustion, not otherwise regulated by this code.
17. Commercial cooking oil storage tank systems located within a building complying with Section 607 and NFPA 30.

Revise as follows:

5001.1.2 ~~500.1.1.1~~ Waiver. The provisions of this chapter are waived where the *fire code official* determines that such enforcement is

preempted by other codes, statutes or ordinances. The details of any action granting such a waiver shall be recorded and entered in the files of the code enforcement agency.

CHAPTER 51
AEROSOLS

SECTION 5101
GENERAL

Revise as follows:

5101.1 Scope. ~~The provisions of this chapter, the *International Building Code* and NFPA 30B shall apply to the~~ Manufacturing, storage and display of aerosol products, aerosol cooking spray products and plastic aerosol 3 products shall comply with this chapter, and NFPA 30B . Manufacturing of aerosol products, aerosol cooking spray products and plastic aerosol 3 products using hazardous materials shall also comply with Chapter 50.

CHAPTER 53
COMPRESSED GASES

SECTION 5301
GENERAL

Revise as follows:

5301.1 Scope. Storage, use and handling of *compressed gases* in *compressed gas* containers, cylinders, tanks and compressed gas systems shall comply with this chapter and NFPA 55., ~~including those gases regulated elsewhere in this code. Partially full *compressed gas* containers, cylinders or tanks containing residual gases shall be considered as full for the purposes of the controls required. Liquefied natural gas for use as a vehicular fuel shall also comply with NFPA 52 and NFPA 59A.~~

~~*Compressed gases* classified as hazardous materials shall also comply with Chapter 50 for general requirements and chapters addressing specific hazards, including Chapters 58 (Flammable Gases and Flammable *Cryogenic Fluids*), 60 (Highly Toxic and Toxic Materials), 63 (*Oxidizers*, Oxidizing Gases and Oxidizing *Cryogenic Fluids*) and 64 (*Pyrophoric* Materials).Compressed hydrogen (CH_2) shall also comply with the applicable portions of Chapters 23 and 58 of this code, the *International Fuel Gas Code* and NFPA 2.Cutting and welding gases shall also comply with Chapter 35.~~

~~**Exceptions:**~~

1. ~~Gases used as refrigerants in refrigeration systems (see Section 608).~~
2. ~~Compressed natural gas (CNG) for use as a vehicular fuel shall comply with Chapter 23, the *International Fuel Gas Code* and NFPA 52 .~~
3. ~~*Cryogenic fluids* shall comply with Chapter 55.~~
4. ~~LP-gas shall comply with Chapter 61 and the *International Fuel Gas Code*.~~

Add new text as follows:

5301.1.1 Non-applicability. This chapter shall not apply to any of the following:

1. Gases used as refrigerants in refrigeration systems complying with Section 608.

2. Compressed natural gas (CNG) for use as a vehicular fuel complying with Chapter 23 and NFPA 52.
3. *Cryogenic fluids* complying with Chapter 55.
4. LP-gas complying with Chapter 61.

5301.1.2 Additional Requirements. Compressed gasses shall also comply with the following:

1. Liquefied natural gas for use as a vehicular fuel shall comply with NFPA 52 and NFPA 59A.
2. Compressed gases classified as hazardous materials shall comply with Chapter 50 for general requirements and chapters addressing specific hazards, including Chapters 58 (Flammable Gases and Flammable Cryogenic Fluids), 60 (Highly Toxic and Toxic Materials), 63 (Oxidizers, Oxidizing Gases and Oxidizing Cryogenic Fluids) and 64 (Pyrophoric Materials).
3. Compressed hydrogen shall comply with the applicable portions of Chapters 23 and 58 of this code, and NFPA 2.
4. Cutting and welding gases shall comply with Chapter 35.

Revise as follows:

5303.1 ~~Containers, cylinders and tanks~~ Compressed gas containers. *Compressed gas containers*~~, cylinders and tanks~~ shall comply with this section. ~~*Compressed gas* containers, cylinders or tanks that are not designed for refillable use shall not be refilled after use of the original contents.~~

Add new text as follows:

5303.1.1 Partially filled compressed gas containers. Partially full compressed gas containers containing residual gasses shall be considered as full for the purposes of the controls required.

5303.1.2 Refillable Compressed Gas Containers. Compressed gas containers that are not designed for refillable use shall not be refilled after the use of the original contents.

CHAPTER 54
CORROSIVE MATERIALS

SECTION 5401
GENERAL

Revise as follows:

5401.1 Scope. ~~The storage~~ Storage and use of *corrosive* materials shall comply ~~be in accordance~~ with this chapter. *Compressed gases* shall also comply with Chapter 53. ~~**Exceptions:**~~

1. ~~Display and storage in Group M and storage in Group S occupancies complying with Section 5003.11.~~
2. ~~Stationary storage battery systems in accordance with Section 1207.~~
3. ~~This chapter shall not apply to R-717 (ammonia) where used as a refrigerant in a refrigeration system (see Section 608).~~

Add new text as follows:

5401.1.1 Non-applicability. This chapter shall not apply to any of the following:

1. Display and storage in Group M and storage in Group S occupancies complying with Section 5003.11.
2. Refrigeration systems complying with section 608.
3. Stationary Battery Storage systems complying with section 1207

CHAPTER 55
CRYOGENIC FLUIDS

SECTION 5501
GENERAL

Revise as follows:

5501.1 Scope. Storage, use and handling of *cryogenic fluids* shall comply with this chapter and NFPA 55. ~~*Cryogenic fluids* classified as hazardous materials shall also comply with the general requirements of Chapter 50. Partially full containers containing residual *cryogenic fluids* shall be considered as full for the purposes of the controls required.~~ ~~**Exceptions:**~~

1. ~~Fluids used as refrigerants in refrigeration systems (see Section 608).~~
2. ~~Liquefied natural gas (LNG), which shall comply with NFPA 59A.~~

~~Oxidizing *cryogenic fluids*, including oxygen, shall comply with Chapter 63, as applicable.~~
~~Flammable *cryogenic fluids*, including hydrogen, methane and carbon monoxide, shall comply with Chapters 23 and 58, as applicable.~~

~~Inert *cryogenic fluids*, including argon, helium and nitrogen, shall comply with ANSI/CGA P-18.~~

Add new text as follows:

5501.1.1 Non-applicability. This chapter shall not apply to any of the following:

1. Fluids used as refrigerants in refrigeration systems complying with Section 608.
2. Liquefied natural gas (LNG) complying with NFPA 59A.

5501.1.2 Additional Requirements. *In addition to the requirements of this chapter, the following shall also apply:*

1. *Cryogenic fluids* classified as hazardous materials shall comply with the general requirements of Chapter 50.
2. Partially full containers containing residual *cryogenic fluids* shall be considered as full for the purposes of the controls required.
3. Oxidizing *cryogenic fluids*, including oxygen, shall comply with Chapter 63.
4. Flammable *cryogenic fluids*, including hydrogen, methane and carbon monoxide, shall comply with Chapters 23 and 58.
5. Inert *cryogenic fluids*, including argon, helium and nitrogen, shall comply with ANSI/CGA P-18.

CHAPTER 56
EXPLOSIVES AND FIREWORKS

SECTION 5601
GENERAL

Revise as follows:

5601.1 Scope. ~~The provisions of this chapter shall govern the possession~~ Possession, manufacture, storage, handling, sale and use of *explosives*, *explosive materials*, fireworks and small arms ammunition shall comply with this chapter. ~~**Exceptions:**~~

1. ~~The Armed Forces of the United States, Coast Guard or National Guard.~~
2. ~~*Explosives* in forms prescribed by the official United States Pharmacopoeia.~~
3. ~~The possession, storage and use of small arms ammunition where packaged in accordance with DOTn packaging requirements.~~
4. ~~The possession, storage and use of not more than 1 pound (0.454 kg) of commercially manufactured sporting black powder, 20 pounds (9 kg) of smokeless powder and 10,000 small arms primers for hand loading of small arms ammunition for personal consumption.~~
5. ~~The use of *explosive materials* by federal, state and local regulatory, law enforcement and fire agencies acting in their official capacities.~~
6. ~~Special industrial *explosive* devices that in the aggregate contain less than 50 pounds (23 kg) of *explosive materials.*~~
7. ~~The possession, storage and use of blank industrial power load cartridges where packaged in accordance with DOTn packaging regulations.~~
8. ~~Transportation in accordance with DOTn 49 CFR Parts 100–185.~~
9. ~~Items preempted by federal regulations.~~

Delete and substitute as follows:

~~**5601.1.1 Explosive material standard.** In addition to the requirements of this chapter, NFPA 495 shall govern the manufacture, transportation, storage, sale, handling and use of *explosive materials* .~~

5601.1.1 Non-applicability. This chapter shall not apply to any of the following:

1. Where preempted by federal regulation, including use by the armed forces
2. Explosives in forms prescribed by the United States Pharmacopia.
3. Possession, storage and use of small arms ammunition and blank industrial-powerload cartridges where packaged in accordance with DOTn packaging requirements.
4. The possession, storage and use of not more than 1 pound (0.454 kg)of commercially manufactured sporting black powder, 20 pounds (9 KG)of smokeless powder and 10,000 small arms primers for hand loading of small arms ammunition for personal consumption.
5. The use of explosive materials by federal, state, and local regulatory law enforcement agencies acting in their official capacities
6. Special industrial explosive devices that in aggregate contain less than 50 pounds (23 KG) of explosive materials.
7. The off-site transportation of *explosive materials* where in accordance with Department of Transportation (DOTn) regulations.

~~**5601.1.2 Explosive material terminals.** In addition to the requirements of this chapter, the operation of *explosive material* terminals shall conform to the provisions of NFPA 498.~~

5601.1.2 Additional Requirements. In addition to the requirements of this chapter, the following shall also apply:

1. Operation of *explosive material* terminals shall comply with NFPA 498.

2. Manufacture, transportation, storage, sale, handling, and use of explosive materials shall comply with NFPA 495

CHAPTER 57
FLAMMABLE AND COMBUSTIBLE LIQUIDS

SECTION 5701
GENERAL

Revise as follows:

5701.1 Scope ~~and application.~~ Prevention, control and mitigation of dangerous conditions related to storage, use, dispensing, mixing and handling of *flammable* and *combustible liquids* shall comply with this chapter and ~~be in accordance with~~ Chapter 50 ~~and this chapter~~ .

5701.2 Nonapplicability. This chapter shall not apply to liquids as otherwise provided in other laws or regulations or chapters of this code, including:

1. Specific provisions for *flammable liquids* in motor fuel-dispensing facilities, repair garages, airports and marinas ~~in~~ complying with Chapter 23.
2. Medicines, foodstuffs, cosmetics and commercial or institutional products containing not more than 50 percent by volume of water-miscible liquids and with the remainder of the solution not being flammable, provided that such materials are packaged in individual containers not exceeding 1.3 gallons (5 L).
3. Quantities of alcoholic beverages in retail or wholesale sales or storage occupancies, provided that the liquids are packaged in individual containers not exceeding 1.3 gallons (5 L).
4. Storage and use of fuel oil in tanks and containers connected to oil-burning equipment~~. Such storage and use shall be in accordance~~ complying with Section 605. ~~For~~ Abandonment of fuel oil tanks~~,~~ shall comply with this chapter ~~applies~~.
5. Refrigeration systems complying with ~~(see~~ Section 608~~)~~.
6. Storage and display of aerosol products complying with Chapter 51.
7. Storage and use of liquids that do not have a fire point when tested in accordance with ASTM D92.
8. Liquids with a *flash point* greater than 95°F (35°C) in a water-miscible solution or dispersion with a water and inert (noncombustible) solids content of more than 80 percent by weight, which do not sustain combustion.
9. Liquids without *flash points* that can be flammable under some conditions, such as certain halogenated hydrocarbons and mixtures containing halogenated hydrocarbons.
10. The storage of beer, distilled spirits and wines in barrels and casks.
11. Commercial cooking oil storage tank systems located within a building and designed and installed in ~~accordance~~ compliance with Section 607 and NFPA 30.
12. Application and release of pesticide and agricultural products and materials intended for use in weed abatement, erosion control, soil amendment or similar applications where applied in accordance with the manufacturer's instructions and label directions.
13. The off-site transportation of *flammable* or *combustible liquids* where in accordance with Department of Transportation (DOTn) regulation.

CHAPTER 58
FLAMMABLE GASES AND FLAMMABLE CRYOGENIC FLUIDS

SECTION 5801
GENERAL

Revise as follows:

5801.1 Scope. ~~The storage~~Storage and use of flammable gases and flammable *cryogenic fluids* shall comply ~~be in accordance~~ with this chapter, NFPA 2 and NFPA 55. ~~*Compressed gases* shall also comply with Chapter 53 and *cryogenic fluids* shall also comply with Chapter 55. Flammable *cryogenic fluids* shall comply with Section 5806. Hydrogen motor fuel-dispensing stations and repair garages and their associated above-ground hydrogen storage systems shall also be designed, constructed and maintained in accordance with Chapter 23.~~ **~~Exceptions:~~**

1. ~~Gases used as refrigerants in refrigeration systems (see Section 608).~~
2. ~~Liquefied petroleum gases and natural gases regulated by Chapter 61.~~
3. ~~Fuel-gas systems and appliances regulated under the *International Fuel Gas Code* other than gaseous hydrogen systems and appliances.~~
4. ~~*Pyrophoric* gases in accordance with Chapter 64.~~

Add new text as follows:

5801.1.1 Non-applicability. This chapter shall not apply to any of the following:

1. Gases used as refrigerants in refrigeration systems complying with Section 608.
2. Liquefied petroleum gases and natural gases complying with Chapter 61.
3. Fuel-gas systems and appliances regulated under the *International Fuel Gas Code* other than gaseous hydrogen systems and appliances.
4. *Pyrophoric* gases complying with Chapter 64

5801.1.2 Additional requirements. In addition to the requirements of this chapter, the following shall also apply:

1. *Compressed gases* shall comply with Chapter 53.
2. *Cryogenic fluids* shall comply with Chapter 55.
3. Flammable *cryogenic fluids* shall comply with Section 5806.
4. Hydrogen motor fuel-dispensing stations and repair garages and their associated above-ground hydrogen storage systems shall be designed, constructed and maintained in accordance with Chapter 23.

CHAPTER 59
FLAMMABLE SOLIDS

SECTION 5901
GENERAL

Revise as follows:

5901.1 Scope. ~~The storage~~Storage and use of flammable solids shall comply ~~be in accordance~~ with this chapter.

CHAPTER 60
HIGHLY TOXIC AND TOXIC MATERIALS

SECTION 6001
GENERAL

Revise as follows:

6001.1 Scope. ~~The storage~~Storage and use of highly toxic and toxic materials shall comply with this chapter. *Compressed gases* shall also comply with Chapter 53. ~~**Exceptions:**~~

~~1. Display and storage in Group M and storage in Group S occupancies complying with Section 5003.11.~~

~~2. Conditions involving pesticides or agricultural products as follows:~~

~~2.1. Application and release of pesticide, agricultural products and materials intended for use in weed abatement, erosion control, soil amendment or similar applications when applied in accordance with the manufacturer's instruction and label directions.~~

~~2.2. Transportation of pesticides in compliance with the Federal Hazardous Materials Transportation Act and regulations thereunder.~~

~~2.3. Storage in *dwellings* or private garages of pesticides registered by the US Environmental Protection Agency to be utilized in and around the home, garden, pool, spa and patio.~~

Add new text as follows:

6001.1.1 Non-applicability. This chapter shall not apply to any of the following:

1. Display and storage in Group M and storage in Group S occupancies complying with Section 5003.11.
2. Conditions involving pesticides or agricultural products as follows:
   2.1. Application and release of pesticide, agricultural products and materials intended for use in weed abatement, erosion control, soil amendment or similar applications when applied in accordance with the manufacturer's instruction and label directions.
   2.2. Transportation of pesticides in compliance with the Federal Hazardous Materials Transportation Act and regulations there under.
   2.3. Storage in *dwellings* or private garages of pesticides registered by the US Environmental Protection Agency to be utilized in and around the home, garden, pool, spa and patio.

CHAPTER 62
ORGANIC PEROXIDES

SECTION 6201

GENERAL

Revise as follows:

6201.1 Scope. ~~The storage~~Storage and use of *organic peroxides* shall comply ~~be in accordance~~ with this chapter and Chapter 50. Unclassified detonable *organic peroxides* that are capable of *detonation* in their normal shipping containers under conditions of fire exposure shall be stored in accordance with Chapter 56.

CHAPTER 63
OXIDIZERS, OXIDIZING GASES AND OXIDIZING CRYOGENIC FLUIDS

SECTION 6301
GENERAL

Revise as follows:

6301.1 Scope. ~~The storage~~Storage and use of oxidizing materials shall comply ~~be in accordance~~ with this chapter and Chapter 50. ~~Oxidizing gases shall also comply with Chapter 53. Oxidizing *cryogenic fluids* shall also comply with Chapter 55.~~ ~~**Exceptions:**~~

1. ~~Display and storage in Group M and storage in Group S occupancies complying with Section 5003.11.~~
2. ~~Bulk oxygen systems at industrial and institutional consumer sites shall be in accordance with NFPA 55.~~
3. ~~Liquid oxygen stored or used in home health care in Group I-1, I-4 and R occupancies in accordance with Section 6306.~~

Add new text as follows:

6301.1.1 Non-applicability. This chapter shall not apply to any of the following:

1. Display and storage in Group M and storage in Group S occupancies complying with Section 5003.11.
2. Bulk oxygen systems at industrial and institutional consumer sites complying with NFPA 55.
3. Liquid oxygen stored or used in home health care in Group I-1, I-4 and R occupancies complying with Section 6306.

6301.1.2 Additional Requirements. In addition to the requirements of this chapter, the following shall also apply:

1. Oxidizing gases shall comply with Chapter 53.
2. Oxidizing *cryogenic fluids* shall comply with Chapter 55.

CHAPTER 64
PYROPHORIC MATERIALS

SECTION 6401
GENERAL

Revise as follows:

6401.1 Scope. ~~The storage~~Storage and use of *pyrophoric* materials shall comply ~~be in accordance~~ with this chapter. ~~*Compressed gases* shall also comply with Chapter 53.~~

Add new text as follows:

6401.1.1 Additional requirements. Compressed gases shall also comply with Chapter 53.

CHAPTER 65
PYROXYLIN (CELLULOSE NITRATE) PLASTICS

SECTION 6501
GENERAL

Revise as follows:

6501.1 Scope. ~~This chapter shall apply to the storage~~ Storage and handling of plastic substances, materials or compounds with cellulose nitrate (pyroxylin) as a base, by whatever name known, in the form of blocks, sheets, tubes or fabricated shapes shall comply with this chapter.
Cellulose nitrate (pyroxylin) motion picture film shall comply with the requirements of Section 306.

CHAPTER 66
UNSTABLE (REACTIVE) MATERIALS

SECTION 6601
GENERAL

Revise as follows:

6601.1 Scope. ~~The storage~~ Storage and use of unstable (reactive) materials shall comply ~~be in accordance~~ with this chapter. ~~*Compressed gases* shall also comply with Chapter 53.~~ ~~**Exceptions:**~~

1. ~~Display and storage in Group M and storage in Group S occupancies complying with Section 5003.11.~~
2. ~~Detonable unstable (reactive) materials shall be stored in accordance with Chapter 56.~~

Add new text as follows:

6601.1.1 Non-applicability. This chapter shall not apply to any of the following:

1. Display and storage in Group M and storage in Group S occupancies complying with Section 5003.11.
2. Detonable unstable (reactive) materials shall be stored in compliance with Chapter 56.

6601.1.2 Additional Requirement. *Compressed gases* shall also comply with Chapter 53.

CHAPTER 67
WATER-REACTIVE SOLIDS AND LIQUIDS

SECTION 6701
GENERAL

Revise as follows:

6701.1 Scope. ~~The storage~~ Storage and use of water-reactive solids and liquids shall comply ~~be in accordance~~ with this chapter.
~~**Exceptions:**~~

1. ~~Display and storage in Group M and storage in Group S occupancies complying with Section 5003.11.~~
2. ~~Detonable water-reactive solids and liquids shall be stored in accordance with Chapter 56.~~

Add new text as follows:

6701.1.1 Non-applicability. This chapter shall not apply to any of the following:

1. Display and storage in Group M and storage in Group S occupancies complying with Section 5003.11.
2. Detonable water-reactive solids and liquids stored in compliance with Chapter 56.

2024 International Wildland Urban Interface Code

CHAPTER 3
WILDLAND-URBAN INTERFACE AREAS

SECTION 301
GENERAL

Revise as follows:

301.1 Scope. ~~The provisions of this chapter provide methodology~~ Methodology for ~~to establish~~ establishing and ~~record~~ recording *wildland-urban interface areas* ~~based on the findings of fact~~ shall comply with this chapter..

CHAPTER 4
WILDLAND-URBAN INTERFACE AREA REQUIREMENTS

SECTION 401
GENERAL

Revise as follows:

401.1 Scope. The following items occurring in *Wildland-urban interface areas* shall comply with this chapter: ~~be provided with emergency vehicle access and water supply in accordance with this chapter.~~

1. Subdivisions
2. Fire Apparatus Access
3. Water Supply

4. Fire Protection Plans

401.3 General safety precautions. General safety precautions shall comply ~~be in accordance~~ with this chapter. ~~See also Appendix A.~~

CHAPTER 5
SPECIAL BUILDING CONSTRUCTION REGULATIONS

SECTION 501
GENERAL

Revise as follows:

501.1 Scope. Buildings and structures shall be constructed in compliance ~~accordance~~ with this chapter ~~the *International Building Code*~~ and ~~this code~~ applicable Building Code. ~~**Exceptions:**~~

1. ~~Accessory structures not exceeding 120 square feet (11 m^2) in floor area where located not less than 50 feet (15 240 mm) from buildings containing habitable spaces.~~
2. ~~Agricultural buildings not less than 50 feet (15 240 mm) from buildings containing habitable spaces.~~

Add new text as follows:

501.1.1 Additional Requirements. In addition to complying with the applicable building code, the following types of structures shall comply with this code:

1. Accessory Structures not exceeding 120 square feet (11 m^2) in floor area located less than 50 feet (15240 mm) from buildings containing habitable spaces.
2. Agricultural buildings less than 50 feet from buildings containing habitable spaces.

CHAPTER 6
FIRE PROTECTION REQUIREMENTS

SECTION 601
GENERAL

Revise as follows:

601.1 Scope. ~~The provisions of this chapter establish general requirements for new and existing buildings, structures and premises located within *wildland-urban interface areas.*~~
Mitigation of hazards from fire in wildland urban interface areas shall comply with this chapter.

Reason: Currently, there is inconsistency among all the I-Codes in how the scoping sections are written at the beginning of each chapter. The Code Correlation Committee requested a task group be formed to review the scoping section in all the I-Codes and determine if there would be a way to harmonize both the language and style across the model codes. The Scoping Task Group was formed and consisted of several members from the various Code Action Committees and interested parties (some with no client interest). The task group reviewed each chapter of the I-codes and after careful consideration, developed a format that could be incorporated and repeated for all the I-Codes.

As you will see in the proposed changes above, most of the chapters began with a style and format that was already consistent and was only slightly changed to give the scoping a more authoritative infliction. Where the chapter contained no scoping provisions, the task group added scoping language based on the content of the chapter. Where the existing scoping sections provided a laundry list of what is contained in the chapter, these list were reformatted into a list form to make it easier for users to see what information was contained. The Scoping Task group proposes that the recommended changes will improve the code by:

1. Create consistency in language used in the scope for all the I-Codes.
2. Creates a scoping section for chapters that did not have one before to clarify what is covered by the chapter.
3. Clarify the items covered and not covered in the chapter, using consistent format to send the user to different chapter(s) or code(s).
4. Remove redundant administrative language from existing scoping sections.
5. Where there were extensive number of items outlined in the scoping section, the items are now broken out into a list format to make it easier for the reader to indicate what is contained in the chapter.

To the best of the task groups knowledge the proposed changes are editorial in nature and no requirements not already addressed in the existing scoping or in the chapter being referenced were added. As these proposed changes are editorial, there is no cost impact on the cost of construction.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

As stated in the reason statement, these proposed changes are editorial, there is no cost impact on the cost of construction.

G1-24 Part VIII

Public Hearing Results (CAH1)

Committee Action: **As Submitted**

Committee Reason: This proposal makes the code more consistent throughout and eliminates laundry lists which have been problematic. (Vote 13-0)

G1-24 Part VIII

Individual Consideration Agenda

Comment 1:

IWUIC: CHAPTER 5, SECTION 501, 501.1, 501.1.1, CHAPTER 6, SECTION 601, 601.1

Proponents: Milad Shabanian, Insurance Institute for Buisness & Home Safety (mshabanian@ibhs.org); T. Eric Stafford, Insurance Institute for Business and Home Safety (testafford@charter.net) requests As Modified by Committee (AMC2)

Modify as follows:

CHAPTER 5
SPECIAL BUILDING CONSTRUCTION REGULATIONS

SECTION 501
GENERAL

Revise as follows:

501.1 Scope. Buildings and structures shall be constructed in compliance with this chapter and applicable Building Code.
Exceptions:

1. Accessory structures not exceeding 120 square feet (11 m^2) in floor area where located not less than 50 feet (15 240 mm) from buildings containing habitable spaces.
2. Agricultural buildings not less than 50 feet (15 240 mm) from buildings containing habitable spaces.

Delete without substitution:

~~**501.1.1 Additional Requirements.** In addition to complying with the applicable building code, the following types of structures shall comply with this code:~~

1. ~~Accessory Structures not exceeding 120 square feet (11 m^2) in floor area located less than 50 feet (15240 mm) from buildings containing habitable spaces.~~
2. ~~Agricultural buildings less than 50 feet from buildings containing habitable spaces.~~

CHAPTER 6
FIRE PROTECTION REQUIREMENTS

SECTION 601
GENERAL

Delete and substitute as follows:

~~**601.1 Scope.** -~~
~~Mitigation of hazards from fire in wildland urban interface areas shall comply with this chapter.~~

601.1 Scope. The provisions of this chapter establish general requirements for new and existing buildings, structures and premises located within wildland-urban interface areas.

Reason: While IBHS supports the efforts to make the scoping sections across the I-codes consistent, the proposed changes to the IWUIC are not editorial. These changes to the IWUIC significantly alter its scope and will considerably weaken the IWUIC provisions.

The exception to Section 501.1 currently exempts accessory structures not exceeding 120 square feet where located not less than 50 feet from buildings containing habitable spaces. The proposed new language states that accessory structures not exceeding 120 square feet and located less than 50 feet from a building containing habitable space have to comply with this code. So, an acccessory structure with a floor area exceeding 120 square feet located less than 50 feet from a building containing habitable space would not be required to comply with this code. This is nonsensical. If this proposal were approved, a larger accessory structure located within 50 feet of a

building with habitable space would be exempt from the IWUIC but smaller one would be required to comply.

Additionally, the changes proposed to Chapter 6 in IWUIC completely change its scope. The scope in the 2024 IWUIC makes it clear that it applies to new and existing buildings. The new language deletes the reference to existing buildings altogether.

This comment essentially changes the provisions of Sections 50.1 and 601.1 of the IWUIC back to the language that currently exists in the 2024 IWUIC.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

-

Comment (CAH2)# 719

G2-24

IBC: SECTION 202 (New); IFC: SECTION 202 (New)

Proposed Change as Submitted

Proponents: Jeff O'Neil, Chair, Committee on Healthcare (ahc@iccsafe.org)

THIS CODE CHANGE WILL BE HEARD BY THE IBC EGRESS COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

2024 International Building Code

Add new definition as follows:

CLINICAL NEED. A known care or welfare risk to care recipients that necessitates an enhanced level of safety or security.

2024 International Fire Code

Add new definition as follows:

CLINICAL NEED. A known care or welfare risk to care recipients that necessitates an enhanced level of safety or security.

Reason: Certain sections of the code allow certain conditions based the clinical needs of the occupants. However, there has not been an official definition for what “clinical need” means and it has been widely interpreted. This proposal seeks to clear up confusion and create a common ground of understanding.

The term Clinical Need is most often found in conjunction with Group I-1 and I-2 occupancies. Certain groups of occupants within these settings require different levels of protections. There are references to the term Clinical Need in several sections, primarily having reference to locking of doors: IBC/IFC (2021 section references) 1010.2.4, 1010.2.13.1 and 1010.2.14, IEBC Section 804.14.2 (2024 reference) and one mention in relation to smoking: IFC Section 310.2.

The purpose of this change is to establish the basis for what is known as clinical need. This is a relatively short definition, but speaks to the component of how a patient in a hospital, or resident of a nursing home or assisted living setting, often have a security need that presents itself more urgently than a life-safety/egress need.

The word “known” is purposefully used related to care, and can take many forms. Court orders are a primary example of the need to put a behavioral health patient in a locked unit, and this is known on admission. Doctor’s orders are also commonly issued, particularly for individuals suffering from cognitive issues, and need to be placed into specialty units with extra security to protect them from harm. These factors become known at the time of placement.

“Welfare risk” is also purposefully used phrasing. A primary example of a welfare risk to a care recipient would be a memory care/dementia unit, where wandering throughout or outside of the building could put that individual in grave risk because of not being fully aware if their surroundings. A closed, locked unit represents the safest environment for their condition.

Similarly, many elders in assisted living have balance and gait issues that make regular use of stairways dangerous. As stair towers are not regularly used or observed, if a resident gets into the stair and falls, this can be a fatal event. Locking these stair tower doors, during non-emergency conditions, is the only way to prevent this.

Another, very common welfare risk is in maternity and neo-natal intensive care units where child abduction is a continual threat. Having the ability to lock doors for stair towers and other exits is critical to preventing this.

“Necessitates” is a term used to set up the scope of the individual technical requirements of the code chapters. By formulating this wording, the working group from the Committee for Healthcare (CHC) took particular care not to bury code requirements in the definition, to avoid creating more confusion. The locations where “clinical need” is already used in the code were reviewed and discussed, and it was determined that the technical requirements around clinical need for the specific section (such as, door locking) was covered in a better way. It did not do the definition well to try and cover each and every technical requirement.

Due to patient privacy laws, specific orders relating to patient or resident care cannot be released as part of justification for the construction of an environment appropriate for care. However, the level of care needed can be provided by the design professional representing the owner/care provider specific to the known care or welfare risk to care recipients. It is reasonable for an AHJ to request a narrative or functional program from the Design team or Owner/care provider as part of the approval process.

This proposal is submitted by the ICC Committee for Healthcare (CHC).
The Committee on Healthcare (CHC) was established by the ICC Board of Directors in 2011 to pursue opportunities to study and develop effective and efficient provisions for Hospital, Nursing Homes, Assisted Living and Ambulatory Care Facilities. This committee was formed in cooperation with the American Society for Healthcare Engineering (ASHE). In July of 2017, the ICC Board made CHC a standing committee. In 2023 the CHC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the CHC website at CHC webpage.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The addition of this definition will not add or decrease any construction costs. Yes, the implementation of special locking provisions does add cost to the project. However, the code sections that refer to this definition are already in the code. This definition simply adds clarity.

G2-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The new definition was disapproved because the committee felt this was too broad and could be misused. While this is a term currently used in the medical field, it was not clear on who would determine if there was a need. (Vote 10-4)

G2-24

Individual Consideration Agenda

Comment 1:

IBC: SECTION 202; IFC: SECTION 202

Proponents: Jeff O'Neil, Chair, Committee on Healthcare (ahc@iccsafe.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

CLINICAL NEED. ~~A known care or welfare risk to care recipients that necessitates an enhanced level of safety or security.~~
An enhanced level of safety or security required to address care or welfare risks for care recipients.

2024 International Fire Code

CLINICAL NEED. ~~A known care or welfare risk to care recipients that necessitates an enhanced level of safety or security.~~
An enhanced level of safety or security required to address care or welfare risks for care recipients.

Reason: The language of the definition was revised to better describe the need, and to attempt to better address some of the Committee's concerns. This new definition is simply trying to provide additional guidance for a term that is already used in the code. The definition of clinical need provides owners, designers and regulatory officials with the ability to identify those care recipients that are subject to known care or welfare risk.

A question was raised by the Committee about who would make the determination of a "welfare or care risk". This was one reason why the definition was revised to remove the term "known risk", and to remove that obligation of judgement from the AHJ.

Because things like special locking arrangements need to be included into the construction documents, the determination of clinical needs, for certain areas of the building, is discussed between the Owner and the Design team during the design and documentation process. The Owner/Operator makes the clinical needs determination based on the care recipients they intend to serve. It would be reasonable for an AHJ to request a narrative or functional program from the design team and/or the Owner/Operator as part of the approval process. It would also be expected that the areas designated as having care recipients with these clinical needs, and the operations of doors, staff responsibilities and the like would be included in the Fire Safety and Evacuation plans, which are required by IFC Section 403.7

Most State and Federal regulatory agencies, like the Department of Health or CMS require care providers to provide written notification to Assisted Living and Nursing Home care recipients, or their families, that they will be placed in a secured unit for their safety and/or security. In this case, the care recipient, or their family, can choose not to move in if they do not agree to the added safety measures.

The Committee raised concerns that this definition "could be used in a negative way…to secure people", and "could be used to lock people down in a hospital". The allowance to "lock down people in a hospital" already exists in the code, with the appropriate safeguards. This definition does not change that, it simply defines an already used term in the code.

Existing IBC Section 1010.2.4 (2) already allows this provision: "Locks and latches shall be permitted to prevent operation of doors…In Group 1-1, Condition 2 and Group I-2 occupancies where the clinical needs of persons receiving care require containment or where persons receiving care pose a security threat, provided that all clinical staff can readily unlock doors at all times…" IBC Section 1010.2.13 also currently allows controlling egress doors with electrical locking.

Not all care recipients have special care or welfare risks. However, there are a number of clinical reasons why certain care recipients require special containment, in specific areas, on an ongoing basis. These are widely known and understood care and welfare risks in the care industry. Delayed Egress locking arrangements are not sufficient to contain determined care recipients. (They can easily read and follow the instructions on the signs, and they can be surprisingly fast!) These known care and welfare risks are a larger risk to care recipient's daily health and safety, than a much rarer fire or other emergency event. However, safeguards are already built into the Building and Fire Code to address life safety should a fire or other emergency occur.

These clinical settings, and care recipients with specifically known risks include, but are not limited to:

· Maternity, neo-natal and pediatric units to prevent abductions of children. This is a welfare risk. These units commonly incorporate an enhanced level of safety or security which includes a locking strategy leading in and out of those areas.

· Behavioral Health settings (psychiatric and substance abuse) to prevent care recipients from eloping, harming themselves or staff. This is a care risk. A care recipient may occasionally have a Court Order requiring them to be placed in a specially secured unit.

· Memory support/Dementia care units to prevent residents from eloping. This is both a care and a welfare risk.

· Stairways in Skilled Nursing or Assisted Living Buildings: Many elders in care settings have mobility, gait or balance issues that make the use of stairways dangerous. If a care recipient were to access the stairway and fall, it can result in serious injury or even death. Stairways in these care settings are generally not used, and are not observed by staff, which makes any fall more life-threatening. This is a welfare risk.

Please refer to our previous reason statement for additional background and reasoning.

The model codes and subsequent definitions are specific to building construction, occupancy and maintenance. Patient and resident care plans as well as patient and resident rights are not determined on the basis of the model building and fire codes. The model building and fire codes are established and continually evaluated and updated to align with patient and resident care plans as well as patient and resident rights.

Here are a couple of recent examples that made the news.

https://www.nbcnews.com/news/us-news/woman-posed-nurse-tried-steal-newborn-california-hospital-officials-sa-rcna39064
https://wsvn.com/news/local/florida/sheriff-florida-woman-steals-baby-from-nicu-stabs-hospital-staff-members-in-incident-at-palms-west-hospital/https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10381052/
https://www.ncbi.nlm.nih.gov/books/NBK305246/

https://pubmed.ncbi.nlm.nih.gov/15633945/

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The addition of this definition will not add or decrease any construction costs. Yes, the implementation of special locking provisions does add cost to the project. However, the code sections that refer to this definition are already in the code. This definition simply adds clarity to meaning of the term within the existing text.

Comment (CAH2)# 199

G3-24

IBC: SECTION 202; IFC: SECTION 202

Proposed Change as Submitted

Proponents: Gabriel Levy, incandescence life safety, inc, Colorado Chapter Code Development Committee (glevy@incandescencels.com)

THIS CODE CHANGE WILL BE HEARD BY THE IBC EGRESS COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

2024 International Building Code

[BE] EXIT ACCESS. That portion of a *means of egress* system that leads from any occupied portion of a *building* or *structure* to an *exit*.

Revise as follows:

[BE] EXIT ACCESS RAMP. ~~A~~ An interior or exterior *ramp* within the *exit access* portion of the *means of egress* system.

[BE] EXIT ACCESS STAIRWAY. ~~A~~ An interior or exterior *stairway* within the *exit access* portion of the *means of egress* system.

[BE] EXIT. That portion of a *means of egress* system between the *exit access* and the *exit discharge* or *public way*. Exit components include exterior exit doors at the *level of exit discharge*, *interior exit stairways* and *ramps*, *exit passageways*, exterior exit *stairways* and *ramps*, point identified by the r*egistered design professional* between an exterior *exit access stairway or ramp* and the *public way*, and *horizontal exits*.

2024 International Fire Code

[BE] EXIT ACCESS. That portion of a *means of egress* system that leads from any occupied portion of a building or structure to an *exit*.

Revise as follows:

[BE] EXIT ACCESS RAMP. ~~A~~ An interior or exterior *ramp* within the *exit access* portion of the *means of egress* system.

[BE] EXIT ACCESS STAIRWAY. ~~A~~ An interior or exterior *stairway* within the *exit access* portion of the *means of egress* system.

[BE] EXIT. That portion of a *means of egress* system between the *exit access* and the *exit discharge* or *public way*. Exit components include exterior exit doors at the *level of exit discharge*, *interior exit stairways* and *ramps*, *exit passageways*, exterior exit *stairways* and *ramps*, a point identified by the r*egistered design professional* between an exterior *exit access stairway or ramp* and the *public way*, and *horizontal exits*.

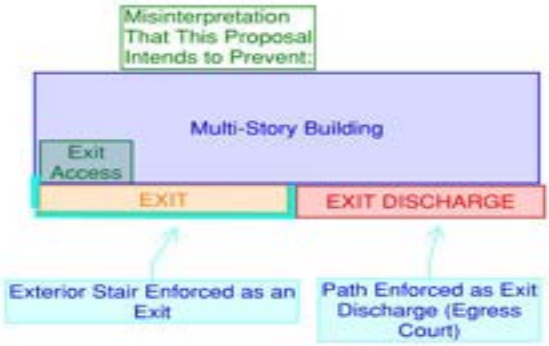
Reason: This proposal serves to resolve two ambiguities – clearly identifying that exit stairs are permitted to serve as exit access, and clarifying where the exit starts after an exterior exit access stair. An exit access stairway is permitted at the exterior of the building.

Code change E7-12/13 deleted the word “interior” from the definition of *exit access stairway and ramp* so that the provisions which allow an unenclosed exit access stair would be equally applicable to interior or exterior stairways. However, *exterior exit stairway* provisions of IBC 1027 can be mistakenly applied to *exit access stairways* located exterior to the building. Reviewers often see an exterior stair and enforce exterior exit requirements. However, if the stair is permitted to serve as exit access rather than as an exit, the exterior exit stairway requirements of 1027 are not required and often erroneously enforced. The proposed change intends to emphasize that an exit access stairway is permitted at the exterior.

Code change E7-12/13 did not provide an obvious *exit* component for the means of egress after an exterior *exit access stairway*. The definition of *exit* is amended to identify that the *exit* component exists after an exterior *exit access stairway*. While an easy solution would be to define the exit as the bottom of the exterior *exit access stair*, there are configurations where redundant protection would be required if the travel after an exterior *exit access stair* were defined as *exit* and *exit discharge*. For example, where an *exit access stair* ends along a path adjacent to an exterior wall, that path could require egress court protection. However, under the same logic as previous code change E7-12/13, if that path were interior to the building, it would not require separation from the building. Therefore, by defining that

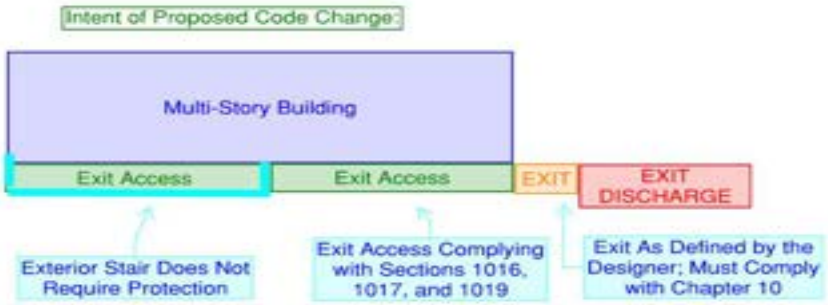
path as a continuation of exit access (rather than defining the bottom of the stair as an exit, thus the path as exit discharge), the exit access does not require rated protection. This change would allow a designer to propose any point after an exterior exit access stair as a the *exit*. That said, the defined *exit* must still meet all requirements of Chapter 10, such as travel distance and protection. Some figures below are provided for reference.

Example Configuration:
Multi-Story Building
Path of Travel, <10' Wide
Exterior Stair From Level 2 Which Provides Travel Down One Story



Misinterpretation That This Proposal Intends to Prevent:
Multi-Story Building
Exit Access
EXIT
EXIT DISCHARGE
Exterior Stair Enforced as an Exit
Path Enforced as Exit Discharge (Egress Court)

Issue with "easy solution" to define the exit as the bottom of the exterior exit access stair:
Multi-Story Building
Exit Access
EXIT
EXIT DISCHARGE
Exterior Stair Does Not Require Protection
Path Enforced as Exit Discharge (Egress Court)



Intent of Proposed Code Change:
Multi-Story Building
Exit Access
Exit Access
EXIT
EXIT DISCHARGE
Exterior Stair Does Not Require Protection
Exit Access Complying with Sections 1016, 1017, and 1019
Exit As Defined by the Designer; Must Comply with Chapter 10

Bibliography: https://www.iccsafe.org/wp-content/uploads/02_IBC-E1.pdf

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

Assuming a Type IIIA Group R-2 building utilizes this configuration, ICC estimates that the cost of constructing an unrated enclosure along the exit access path to be $177.77/sf.

Estimated Immediate Cost Impact Justification (methodology and variables):

Under the justification that this proposal is similar to E7 12/13, such that an equivalent interior space after an exit access stair would be permitted as unrated, this proposal saves the cost of that hypothetical construction.

G3-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: This proposal was disapproved because this issue should be addressed in the code text - this is not something that could be addressed by a change in definitions. Clearly addressing an exterior exit discharge stairway in the text might address some of the issues brought up in the testimony. Requirements should be clearly defined on what is going on on the outside of the building and the protection to address different associated hazards that are present on the exterior versus the interior exit or exit access stairways. Some buildings do not require "registered design professionals" in every state, so who would set this 'point'. (Vote 11-3)

G3-24

Individual Consideration Agenda

Comment 1:

IBC: SECTION 202; IFC: SECTION 202

Proponents: Gabriel Levy, incandescence life safety, inc, Colorado Chapter Code Development Committee (glevy@incandescencels.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

[BE] EXIT ACCESS RAMP. An interior or exterior *ramp* within the *exit access* portion of the *means of egress* system.

[BE] EXIT ACCESS STAIRWAY. An interior or exterior *stairway* within the *exit access* portion of the *means of egress* system.

[BE] EXIT. That portion of a *means of egress* system between the *exit access* and the *exit discharge* or *public way*. Exit components

include exterior exit doors at the *level of exit discharge*, *interior exit stairways* and *ramps*, *exit passageways*, exterior exit *stairways* and *ramps,* a point identified by the ~~registered~~ design professional between an exterior *exit access stairway or ramp* and the *public way*, and *horizontal exits*.

2024 International Fire Code

[BE] EXIT ACCESS RAMP. An interior or exterior *ramp* within the *exit access* portion of the *means of egress* system.

[BE] EXIT ACCESS STAIRWAY. An interior or exterior *stairway* within the *exit access* portion of the *means of egress* system.

[BE] EXIT. That portion of a *means of egress* system between the *exit access* and the *exit discharge* or *public way*. Exit components include exterior exit doors at the *level of exit discharge*, *interior exit stairways* and *ramps*, *exit passageways*, exterior exit *stairways* and *ramps,* a point identified by the ~~registered~~ design professional between an exterior *exit access stairway or ramp* and the *public way*, and *horizontal exits*.

Reason: Beyond the justification provided in the original code proposal, the following responds to comments and questions made by the committee during CAH1 testimony.

Committee Question: Have you considered the situation where the exterior portion [of exit access travel] is near a lot line? If the egress component is interior of the building, and the exterior wall is near a lot line, the code provides requirements for that wall to be rated. In your proposal, where the path is now outside the building, have you considered the situation where that path may be near a lot line?

Response: The hazard identified by this comment seems to only be applicable if an adjacent building is on fire. In that instance, flames or smoke from an adjacent building could potentially block usage of the exterior exit access path proposed by this code change. While this risk is legitimate, it is a hazard that is currently not addressed by code. An egress court or other exterior exit discharge path does not require separation from adjacent buildings. Why should an exterior exit access path? Especially considering that the code already allows for an exterior exit access stair to be along a lot line - there is no reason why the flat path after the exit access stair should require protection.

Committee Question: Would you be against striking the term "registered" from the defined design professional responsible for determining the point of exit?

Response: The committee identifies that some jurisdictions do not require a *registered design professional.* Therefore, the word "registered" has been deleted in this modification, such that design professional is used as an undefined term, which has an ordinarily accepted meaning such as the context implies, per IBC 201.4.

Committee Question: Have you considered the unintended consequence of requiring manual pull stations or exit signs exterior to the building at these locations?

Response: As the code is currently written, an exit must come after exit access. An exterior exit access stair is not an exit, so the code seemingly still requires an exterior exit sign after an exterior exit access stair. Although this amendment does not address the unintentional consequence of a possible exterior exit sign, that consequence has been in the code since E7-12/13 was approved. In my professional experience, I have not seen this oversight as an issue.

NFPA 72 Section 17.15.9.4 states that, "Manual fire alarm boxes shall be located within 5 ft (1.5 m) of each exit doorway on each floor." Given that this is a not an exit doorway, a fire alarm box is not required.

This code change resolves a big issue. I have seen projects require major design change because an official has interpreted the a 2-story exterior stair as an exit, and the following path as an exit discharge egress court. This triggers exterior wall ratings and opening protectives that should not be required - in such an instance, the cheaper solution is to put up a roof so that the path can be interior and thus better understood as Exit Access.

Cost Impact: Decrease

Estimated Immediate Cost Impact:

Assuming a Type IIIA building utilizes this configuration, ICC estimates that the cost of constructing an unrated enclosure along the exit access path to be $177.77/sf.

Estimated Immediate Cost Impact Justification (methodology and variables):

Under the justification that this proposal is similar to E7 12/13, such that an equivalent interior space after an exit access stair would be permitted as unrated, this proposal saves the cost of that hypothetical construction.

Proposed Change as Submitted

Proponents: Mike Fischer, Kellen, The Extruded Polystyrene Foam Association (mfischer@kellencompany.com); Jonathan Roberts, UL Solutions, UL Solutions (jonathan.roberts@ul.com)

THIS CODE CHANGE WILL BE HEARD BY THE IBC FIRE SAFETY COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

2024 International Building Code

Revise as follows:

[BF] FLAME SPREAD INDEX. A comparative measure, expressed as a dimensionless number, derived from visual measurements of the spread of flame versus time for a material tested in accordance with ASTM E84 or UL 723. Where ceiling and floor values are reported, the ceiling value is the *flame spread index*.

[BF] SMOKE-DEVELOPED INDEX. A comparative measure, expressed as a dimensionless number, derived from measurements of smoke obscuration versus time for a material tested in accordance with ASTM E84 or UL 723. Where ceiling and total smoke values are reported, the ceiling value is the *smoke-developed index*.

2024 International Fire Code

Revise as follows:

[BF] FLAME SPREAD INDEX. A comparative measure, expressed as a dimensionless number, derived from visual measurements of the spread of flame versus time for a material tested in accordance with ASTM E84 or UL 723. Where ceiling and floor values are reported, the ceiling value is the *flame spread index*.

[BF] SMOKE-DEVELOPED INDEX. A comparative measure, expressed as a dimensionless number, derived from measurements of smoke obscuration versus time for a material tested in accordance with ASTM E84 or UL 723. Where ceiling and total smoke values are reported, the ceiling value is the *smoke-developed index*.

2024 International Mechanical Code

Revise as follows:

[BF] FLAME SPREAD INDEX. ~~The numerical value assigned to a material tested in accordance with ASTM E84 or UL 723~~. A comparative measure, expressed as a dimensionless number, derived from visual measurements of the spread of flame versus time for a material tested in accordance with ASTM E84 or UL 723. Where ceiling and floor values are reported, the ceiling value is the *flame spread index*.

[BF] SMOKE-DEVELOPED INDEX. ~~A numerical value assigned to a material tested in accordance with ASTM E84.~~ A comparative measure, expressed as a dimensionless number, derived from measurements of smoke obscuration versus time for a material tested in accordance with ASTM E84 or UL 723. Where ceiling and total smoke values are reported, the ceiling value is the *smoke-developed index*.

2024 International Wildland Urban Interface Code

Revise as follows:

[BF] FLAME SPREAD INDEX. A comparative measure, expressed as a dimensionless number, derived from visual measurements of the spread of flame versus time for a material tested in accordance with ASTM E84 or UL 723. Where ceiling and floor values are reported, the ceiling value is the *flame spread index*.

Reason: Roberts (UL):

The revisions are as follows:

1) The purpose of the test is to determine the comparative burning characteristics of the material under test by evaluating the spread of flame over its surface and the density of the smoke developed when exposed to a test fire. These measurements are made as the test flame advances along the ceiling of the sample.

However, materials that melt and drip to the floor of the test chamber and continue burning, often have a second measurement reported, based upon the flame spread advancements of material burning along the floor of the furnace. For materials exhibiting these behaviors, both ceiling and floor measurements are reported for the flame spread, while ceiling and total smoke measurements are reported for the smoke developed.

The intent of the code requirement for these materials has been that when both the floor and ceiling measurements are reported, the ceiling measurement applies to the building code. This code change proposal clarifies that the ceiling measurement is applicable to avoid confusion when these two values are reported.

UL 723 contains specific direction in Section 7 (Classification) and Section 9 (Reporting) for the determination and reporting of ceiling and floor flame spread and ceiling and total smoke developed.

2) The International Mechanical Code (IMC) definitions are revised to match the IBC, IRC, IFC and IWUIC for consistency. Reference to UL 723 is the smoke-developed index is also added for consistency.

3) There is one other flame spread and smoke-developed index test standard besides ASTM E84 and UL 723. It is the CAN/ULC S102.2 test standard used for loose fill insulation, where the product is mounted and tested on the floor of the tunnel apparatus. Therefore, this test standard is listed as an exception in IBC Section 720.4 and IRC R302.10.

The clarification to the definitions regarding reporting of ASTM E84 and UL 723 values will not impact the reporting of CAN/ULC S102.2, which is currently limited to one product with one floor measurement.

Reason: Fischer (XPSA): While ASTM E84 and UL 723 contain the same requirements, there are a few minor differences in how data are captured and reported. This proposal will clarify how the test data from testing under either standard correlates to the FS and SD requirements in the code. It will also aid in code education efforts by improving the language.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This clarification reflects current practice and as such will neither increase or decrease the cost of construction.

G7-24

Public Hearing Results (CAH1)

Committee Action: **As Submitted**

Committee Reason: The committee stated that the reason for approval was that the proposal clarifies how the test data from testing under ASTM E84 and UL 723 standards correlates to the FS and SD requirements in the code. The committee agreed with the clarification added to the definitions regarding reporting of ASTM E84 and UL 723 values. The committee concluded that the code

change proposal clarifies that the ceiling value is applicable to avoid confusion when ceiling and floor values are reported (Vote: 11-0).

G7-24

Individual Consideration Agenda

Comment 1:

IBC: SECTION 202; IFC: SECTION 202; IMC®: SECTION 202; IWUIC: SECTION 202

Proponents: Richard Justin Koscher, Polyisocyanurate Insulation Manufacturers Association (jkoscher@pima.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

Revise as follows:

[BF] FLAME SPREAD INDEX. A comparative measure, expressed as a dimensionless number, derived from visual measurements of the spread of flame versus time for a material tested in accordance with ASTM E84 or UL 723. Where ceiling and floor values are reported, the ceiling value is the *flame spread index*. Testing of materials that melt, drip, or delaminate to such a degree that the continuity of the flame front is destroyed, results in low flame spread indices that do not relate directly to indices obtained by testing materials that remain in place.

2024 International Fire Code

Revise as follows:

[BF] FLAME SPREAD INDEX. A comparative measure, expressed as a dimensionless number, derived from visual measurements of the spread of flame versus time for a material tested in accordance with ASTM E84 or UL 723. Where ceiling and floor values are reported, the ceiling value is the *flame spread index*. Testing of materials that melt, drip, or delaminate to such a degree that the continuity of the flame front is destroyed, results in low flame spread indices that do not relate directly to indices obtained by testing materials that remain in place.

2024 International Mechanical Code

Revise as follows:

[BF] FLAME SPREAD INDEX. A comparative measure, expressed as a dimensionless number, derived from visual measurements of the spread of flame versus time for a material tested in accordance with ASTM E84 or UL 723. Where ceiling and floor values are reported, the ceiling value is the *flame spread index*. Testing of materials that melt, drip, or delaminate to such a degree that the continuity of the flame front is destroyed, results in low flame spread indices that do not relate directly to indices obtained by testing materials that remain in place.

2024 International Wildland Urban Interface Code

Revise as follows:

[BF] FLAME SPREAD INDEX. A comparative measure, expressed as a dimensionless number, derived from visual measurements of the spread of flame versus time for a material tested in accordance with ASTM E84 or UL 723. Where ceiling and floor values are reported, the ceiling value is the *flame spread index*. Testing of materials that melt, drip, or delaminate to such a degree that the continuity of the flame front is destroyed, results in low flame spread indices that do not relate directly to indices obtained by testing materials that remain in place.

Reason: PIMA is opposed to the proposed change that would use only the ceiling value for flame spread index when determining compliance with ASTM E84 and UL 723. However, the proposed change as approved by the Committee is misleading. The modified definition suggests that ceiling values for flame spread index are comparable for any material tested in accordance with ASTM E84 or UL 723. This is not true. As described in the scope of the ASTM E84 standard, ceiling values for materials that melt, drip, or delaminate during the test result in low flame spread indices and are not comparable to indices for materials that remain in place during the test. This public comment modifies the original proposal to include this clarification. The proposed clarification is verbatim from the ASTM E84 scope. While we oppose the proposed change, if approved by the Committee, the proposal should be clarified so that code officials and the public are not misled to believe that flame spread indices for all materials are comparable when only the ceiling values are used.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This public comment adds text to a definition and does not create any new requirements.

Comment (CAH2)# 622

Comment 2:

Proponents: Mike Fischer, Kellen, The Extruded Polystyrene Foam Association (mfischer@kellencompany.com); Marcelo Hirschler, GBH International, GBH International (mmh@gbhint.com) requests As Submitted

Reason: FISCHER: XPSA agrees with the committee recommendation for Approval As Submitted.

UL 723 and ASTM E84 are test methods used to evaluate the spread of flame and development of smoke of combustible building materials when exposed to fire in a controlled environment (the Steiner Tunnel). While the I-Codes recognize both standards as equivalent, there are differences in how the test reports are prepared and what information is shared in a listing. Most notably, for materials such as thermoplastics that exhibit dripping material that continues to burn in the floor of the tunnel. UL 723 test reports contain additional information about the flame spread and smoke development characteristics of the materials at the bottom of the chamber.

The ASTM E84 Test Method does not contain a requirement to report the floor conditions; a ballot is underway at ASTM to mirror the UL 723 reporting provisions in E84. It is uncertain at this time what the outcome of that balloting will be, but XPSA supports the ASTM E84 modification that provides more information to end-users about the fire properties of XPS insulation materials on the floor of the tunnel test.

Materials producers that utilize UL 723 have test reports and listings containing both the tunnel ceiling values, (used to demonstrate code compliance for flame spread and smoke developed indices), as well as the floor values. The UL 723 listings with both floor and ceiling values have been in place for decades with the understanding the ceiling values govern code compliance. XPSA has brought this proposal forward to avoid potential compliance confusion about that reporting when the floor values are listed in both ASTM E84 and UL 723 listings.

What this proposal does:

Clarifies the current code requirements that have been in place and interpreted and enforced for decades

Simplifies compliance with a clear and consistent definition of *Flame Spread Index* and *Smoke-Developed Index* throughout the I-Codes

Removes the likelihood for marketplace confusion as to whether ceiling or floor values apply for code compliance

Provides additional information on floor values for designers, specifiers, and end-users in the interest of transparency

What this proposal does not do:

Weaken the fire safety provisions or test methods of the I-Codes; the ceiling numbers still apply

Change any code requirements; it adds UL 723 in the definition that is already in the body of the code

Relax any Flame Spread or Smoke Developed requirements in the I-Codes

Change foam plastic ignition resistance rating requirements in the IWUIC

Result in any changes to existing listing or code compliance reports, including those that already include reporting of floor values

Change (increase or decrease) any code compliance pathways for foam plastics

For example- consider a product that has UL 723 Ceiling FS/SD 15/165 values and floor values of 125/500. The IBC Section 2603.3 requires 75/450, thus the product currently complies using ceiling values. If floor values are required, product would not comply and this- and virtually ALL thermoplastics- would be completely eliminated from market. This interpretation would cause widespread disruption in the construction industry.

Summary: The XPS industry believes the I-Codes should provide additional clarity for code officials (and other users of the code) in order to help determine code compliance and how XPS materials perform to the fire safety requirements of the I-Codes.

HIRSCHLER:

ASTM E84 and UL 723 are fire tests that assess flame spread index and smoke developed index values for building materials and products. For most aspects of the fire test, both standards are virtually identical.

In the case of some materials, the test specimen will remain in its position on the ceiling of the test equipment (the Steiner tunnel) without melting, dripping, or otherwise interfering with the progression of the flame front over the test specimen both before the flame is applied during the test and throughout the test duration. Those test specimens are considered in the ASTM E84 standard as "self-supporting test specimens". In an ideal world, those are the only test specimens that should be required to be tested to ASTM E84 or UL 723.

However, the code often requires that some materials or products be tested to ASTM E84 or UL 723 to be acceptable for use. One such example are foam plastic insulation materials. Section 2603.3 of the IBC states as shown below and it requires all foam plastic insulation materials (unless used in a roof-covering assembly which has been tested to NFPA 276 or UL 1256) to be tested to ASTM E84. There often are (appropriately) additional fire safety requirements.

2603.3 Surface-burning characteristics. Unless otherwise indicated in this section, foam plastic insulation and foam plastic cores of manufactured assemblies shall have a flame spread index of not more than 75 and a smoke-developed index of not more than 450 where tested in the maximum thickness intended for use in accordance with ASTM E84 or UL 723. Loose fill-type foam plastic insulation shall be tested as board stock for the flame spread and smoke-developed indices.

Exceptions:
1. Smoke-developed index for interior trim as provided for in Section 2604.2.
2. In cold storage buildings, ice plants, food plants, food processing rooms and similar areas, foam plastic insulation where tested in a thickness of 4 inches (102 mm) shall be permitted in a thickness up to 10 inches (254 mm) where the building is equipped throughout with an automatic sprinkler system in accordance with Section 903.3.1.1. The approved automatic sprinkler system shall be provided in both the room and that part of the building in which the room is located.
3. Foam plastic insulation that is a part of a Class A, B or C roof-covering assembly provided that the assembly with the foam plastic insulation satisfactorily passes NFPA 276 or UL 1256. The smoke-developed index shall not be limited for roof applications.
4. Foam plastic insulation greater than 4 inches (102 mm) in thickness shall have a maximum flame spread index of 75 and a smoke-developed index of 450 where tested at a minimum thickness of 4 inches (102 mm), provided that the end use is approved in accordance with Section 2603.9 using the maximum thickness and density intended for use.
5. Flame spread and smoke-developed indices for foam plastic interior signs in covered and open mall buildings provided that the signs comply with Section 402.6.4.

The requirements shown above indicate that foam plastic insulation materials must be tested to ASTM E84 or UL 723 even if the materials do not generate self-supporting test specimens (for example by melting and dripping or otherwise falling to the test equipment floor during the test). The test standard requires that test specimens that are not self-supporting be held in place with metal supports but it cannot address what to do with test results when the materials have been properly supported during the test but they still melt or otherwise fall to the floor during the test. It may be argued that the test is inappropriate for materials that fall to the floor during the test (even if properly supported) but the code does not provide an alternate option.

For every test, UL 723 provides two sets of values: a set of values determined for tests during the period that the test flame progresses while the test specimen stays on the equipment ceiling (ceiling values) and a different set of values determined throughout the test for

tests where the test specimen falls to the tunnel floor at some time (floor values). ASTM E84 provides only a single set of values (ceiling values) but proposals exist to generate also floor values from ASTM E84.

The codes have required ASTM E84 (or UL 723) values for many years and the values used have always been the ceiling values, but that has not been explicitly stated. It is important that a code official who is presented with a test report that contains two sets of values understands which set of values needs to be used for regulation. That is what this proposal does: it continues what has always been done and helps a code official confronting two sets of values.

Note that testing of foam plastic materials that has been conducted with other fire tests has shown that those foam plastic materials that meet the ASTM E84/UL 723 flame spread index of 75 (as required in chapter 26 of the IBC) have better fire performance than those that do not.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Comment (CAH2)# 781

Comment 3:

Proponents: Tony Crimi, A.C. Consulting Solutions Inc., North American Insulation Manufacturers Association (tcrimi@sympatico.ca); Laurie Hill, Rmax, a Business Unit of Sika Corporation (lhill@rmax.com); Edward Lisinski, American Wood Council, American Wood Council (elisinski@awc.org); Marcin Pazera, Polyisocyanurate Insulation Manufacturers Association, Polyisocyanurate Insulation Manufacturers Association (mpazera@pima.org); Jason Smart, American Wood Council (jsmart@awc.org) requests Disapproved

Reason: **CRIMI:** The justification submitted with this proposal is incomplete and can easily be misinterpreted. First, this proposal is in no way editorial in nature and creates a major conflict between products tested to ASTM E84 and those tested to UL 723.

The justification correctly states that:

> "The purpose of the test is to determine the comparative burning characteristics of the material under test by evaluating the spread of flame over its surface and the density of the smoke developed when exposed to a test fire."

In order for these tests to be able to provide comparative information, the tests need to be conducted in the same manner, for the same duration.

The calibration for ASTM E84 and UL 723 is based on a 10 minute fire exposure on a 24 foot long specimen of material. In order for the test to have any comparative ability, the ASTM E84 and UL 723 need to also be based on a 24 ft long specimen over a 10 minute duration. However, when "ceiling values" are reported in UL 723, the flame spread and smoke developed data are ignored beyond the point that the material is "believed" to no longer be burning on the ceiling. That also means that any remaining specimen beyond that point in time and distance is no longer measured, even if it reignites on the ceiling.

The fact that the floor values are reported in UL 723 is to enable the comparative data after the 10 minute test ends. The chart below includes some examples of the significant difference in both flame spread values, but more importantly the hazard from the smoke developed during the full test.

Numbers in RED indicate values above IBC Limits for Class A, B and C[1,2]

UL723			
UL or Intertek Listing	Calculation Method	Flame Spread Index (FSI)	Smoke Development Index (SDI)
BRYX.R5817	Floor and Ceiling XX&YY (same as E84)	175	500+
	Ceiling Only X&Y	25	40
BRYX.R8811	Floor and Ceiling XX&YY (same as E84)	110	500+
	Ceiling Only X&Y	10	175
BRYX.R3573	Floor and Ceiling XX&YY (same as E84)	140	500+
	Ceiling Only X&Y	20	50
SPEC ID: 37392	Floor and Ceiling XX&YY (same as E84)	100	1400
	Ceiling Only X&Y	25	450-
SPEC ID: 42922	Floor and Ceiling XX&YY (same as E84)	105	900
	Ceiling Only X&Y	25	450-
SPEC ID: 37391	Floor and Ceiling XX&YY (same as E84)	100	1400
	Ceiling Only X&Y	25	450-

There is also a statement that “These measurements are made as the test flame advances along the ceiling of the sample.” First, it seems this was intended to mean the surface of the sample mounted on the ceiling. Notwithstanding, this is only true in UL 723. ASTM E84 testing requires the flame spread and smoke developed ratings to be based on the maximum advance of the flame front and total smoke emitted after the 10 minute duration. Until now, the intent of the code requirements for all materials, (except for loose fill cellulose which uses CAN/ULC-S102.2) has been to mount specimens in the ceiling position, consistent with both ASTM E84 and UL723, but to report the flame spread and smoke developed values at the end of the 10 minute test, not somewhere in the middle.

HILL: As stated in the Preface of each code, I-Codes are “intended to establish provisions that adequately protect public health, safety and welfare; that do not unnecessarily increase construction costs; that do not restrict the use of new materials, products or methods of construction; and that do not give preferential treatment to particular types or classes of materials, products or methods of construction.” Approval of this code change gives preferential treatment to thermoplastic materials by allowing an unfair and misleading comparison of flame spread and smoke contribution potential. Disapproval of this code change proposal will not restrict the use of any materials.

The two primary objections to this proposal are lack of technical justification to substantiate the proposed change and the unintended consequences it introduces to code, specifically for plenums.

G7 lacks technical justification for the change:

- The definition that already exists in the IBC, IRC, IFC and IWUIC and is being proposed for the IMC includes that the indices are comparable. Adding language that differentiates materials and to what degree the results are to be used is contradictory to the concept of the indices being comparable. This applies not only to different building materials, but also the calibration standards for which the results were supposed to be based on.
- The first reason statement mentions that code intent has always been to use the ceiling values, yet there is no basis for where this comes from. Additionally, CAN/ULC-S102.2 is acknowledged for loose fill insulation, but there is no mention of CAN/ULC-S102.2 being used for materials that melt and drip. In fact, UL in Canada acknowledges that it is not appropriate to test materials on the ceiling of the tunnel when they require support or melt and drip and continue to burn on the floor of the test chamber during the test, specifically thermoplastic materials. Materials that remain in place are tested in the ceiling position (CAN/ULC-S102.1), while materials that don’t remain in place, i.e., thermoplastic materials, are tested in the floor position (CAN/ULC-S102.2). This doesn’t preclude materials from being used in buildings, it simply acknowledges that the materials are not comparable using the same test method.
- The second reason statement states that there are a few minor differences in how data are captured and reported between ASTM E84 and UL 723. I argue that the difference in how data is captured and reported between the two standards is far from minor when it comes to the materials that this code change proposal is aimed at. UL 723 results in a single Flame Spread Index (FSI) and Smoke-Developed Index (SDI) value for materials that remain in the ceiling position and 2 sets of values for materials that do not but rather melt and drip and continue to burn on the tunnel floor. For the latter group of materials, one set of values represents the ceiling only and is typically established during the first couple of minutes, while the second set, referred to as floor FSI and SDI, represents the entire 10-minute duration of test. Regardless of the material, ASTM E84 results in a single value, which includes burning of the material for the entire 10-minute duration of the test. There is no guidance in ASTM E84 on how to differentiate and calculate ceiling vs floor values, so anything other than a single FSI and SDI representing the entire fire performance is a

modification of the standard.

G7 may have unintended consequences:

- While this code change proposal suggests ignoring the contribution of burning on the tunnel floor is acceptable, one example of where it should certainly be a consideration is in plenums. Insulation requirements for use in plenum construction is an FSI of 25 or less and an SDI of 50 or less, often referred to as 25/50. Movement of flames and smoke through the ventilation system during a fire should be minimized, which leads to the very low FSI and SDI requirements in plenums. 13 of the 66 current UL product listings found for thermoplastic insulations met the low flame spread and smoke-developed index requirements of 25/50 when considering only the ceiling values, even though the total smoke contribution resulted in values well above that, including “over 500” for many of them. These are from 6 of 11 manufacturers' current listings found on UL’s Product IQ on-line directory. Two listings have been included for reference and confirmation of this unintended consequence.
- This code change proposal introduces a new standard in the definition for smoke-developed index. Currently, UL 723 is not defined as an acceptable standard when determining smoke-developed index in any of the I-Codes referenced. ASTM E84 produces a single, total contribution value and is currently the only defined standard for smoke-developed index. I do not believe there has been sufficient consideration of why UL 723, which introduces multiple values (ceiling only and total performance), wasn’t previously in the definition for smoke-developed index.

Thank you for your consideration.

See attached files: FMI EPS R18546.pdf; Dupont XPS R3573.pdf

LISINSKI/SMART: AWC requests reconsideration of the approval of the revision to the definitions of flame spread index (FSI) and smoke-developed index (SDI). ASTM E84 does not report ceiling and floor values, so the revision to the definition is not relevant to the ASTM E84 test and may cause conflicts in interpreting ASTM E84 test reports. The added sentence is already part of the provisions of the UL 723 standard, so it is unnecessary to add this statement in the code. If the requirements of UL 723 are modified in the future, the code could be in conflict with the standard. The added statement to the definition could also be viewed as adding code requirements into a definition.The difference between how test results are analyzed in ASTM E84 versus UL 723 can lead to a significant discrepancy in FSI and SDI values under these two standards. This in turn can lead to drastic differences in classification. Interior finish materials which drip or fall onto the floor during the test could be classified as Class C (or even unclassified) under ASTM E84 but could be classified as high as Class A under UL 723.The proposed revision to the definition of flame spread index could obscure actual FSI measurements, corresponding to maximum flame front travel recorded in accordance with ASTM E84 Section 8.3, by limiting the reported flame spread index to that which occurs only along the ceiling of the test apparatus.

Similarly, the proposed revision to the definition of smoke-developed index could obscure actual SDI measurements, corresponding to the total smoke development throughout the duration of the 10-minute test, by limiting the reported smoke-developed index to the smoke development measurements taken up to the time at which flaming begins on the floor of the test apparatus.

The proposed revision to the definitions of flame spread index and smoke-developed index would add a misleading new sentence to each of these definitions, using terminology that is inconsistent with terminology used in the ASTM E84 test standard. Section 8.3 of ASTM E84 requires that the distance of maximum flame front travel within the tunnel be observed and recorded as a function of time. Note that the word “distance” is singular, not plural. Under ASTM E84, there is only one measurement of the distance of maximum flame front travel recorded for each time at which an observation is to be made. The Commentary in Section X4.6.1.6 of ASTM E84 further clarifies that “the visual observation of flame travel is based on maximum flame extension anywhere within the tunnel volume, not necessarily directly on the specimen surface that may not be clearly visible.” Thus, regardless of whether the maximum flame front travel occurs near the ceiling of the tunnel, near the floor of the tunnel, or anywhere in between, ASTM E84 is clear: the value that is to be recorded is the distance of maximum flame front travel within the tunnel. While there is no prohibition on observing and recording other (lesser) values of flame front travel within the tunnel, ASTM E84 requires that FSI values be calculated using the maximum flame front travel.In addition to the concerns stated above, the scope of ASTM E84 (Section 1.1) states: "The test is conducted with the specimen in the ceiling position with the surface to be evaluated exposed face down to the ignition source. The material, product, or assembly shall be capable of being mounted in the test position during the test." (italics added to emphasize specific key words). If the specimen melts and drops onto the floor ahead of the flame front during the test, it should no longer be considered a valid ASTM E84 test. Furthermore, Section 1.5 of ASTM E84 cautions that "testing of materials that melt, drip, or delaminate to such a degree that the continuity of the flame

front is destroyed, results in low flame spread indices that do not relate directly to indices obtained by testing materials that remain in place." If the specimen melts and drops onto the floor ahead of the flame front, this would likely lead to the exact situation warned against in Section 1.5, wherein the continuity of the flame front on the specimen (which, according to 1.1 is required to be on the ceiling, facing down toward the ignition source) would be destroyed. The proposed revisions would therefore violate the scoping provisions of E84 Section 1 by implying that ASTM E84 makes a distinction between flame spread on the floor versus flame spread on the ceiling, thereby legitimizing flame-spread indices from tests that should be considered invalid under ASTM E84.

PAZERA: Fire safety is paramount to the design and construction of buildings and building systems. Building codes are fundamental to fire safety of buildings/structures and in that respect establish a framework that guides their construction and maintenance during service life. The International Code Council states that the International Building Code “is an essential tool to preserve public health and safety that provides safeguards from hazards associated with the built environment". Fire is one of the most significant hazards in the built environment and the propensity for materials to propagate flames and the associated smoke constitute important considerations when fire behavior of materials is considered and evaluated. The flame spread (FSI) and the smoke developed (SDI) indices are part of the I-Codes, however, the proposed revisions to the definitions in the IBC, IFC, IMC and IWUIC as outlined in the G7-24 are greatly concerning to PIMA for a number of reasons:

1. No technical justification.
2. Ceiling only values are not representative of the material being tested.
3. FSI and SDI are no longer comparable.
4. Unintended consequences in other applications.
5. Eliminates transparency.

No technical justification:

No technical justification has been presented. The only reason provided as indicated in the rationale of the proposed code change is a reference to the intent of the code. According to 2021 IBC Chapter 2603.3 commentary, “The maximum flame spread index value of 75 was chosen on the basis that it is lower than untreated wood (which usually is 100 to 165). The maximum smoke-developed index rating of 450 was selected because, at the time, the code permitted interior finish materials that gave off “smoke no more dense than that given off by untreated wood.”” The commentary makes no mention of using ceiling values only, and doing so would go against the notion of being “comparable” to untreated wood. Basing the FSI and SDI on ceiling values alone in I-codes is a flawed approach and technically unwarranted for materials that melt, drip and continue to propagate flames along the tunnel floor. Furthermore, this code change proposal undermines fire safety and is counterintuitive to fire engineering principles.

Ceiling only values are not representative of the material being tested:

Excluding the burning of material in the floor position of the tunnel, ignores a significant portion of how the material behaves resulting in a false perception of how the material performs. The more sensitive a material is to heat and flame, i.e., the faster the material melts/drips from the ceiling position, the lower the FSI and SDI ceiling values and better perceived fire classification. This approach results in materials shifting from a Class C in most cases to a Class A or even having an FSI as low as 0 (see **attached UL listing, R13184**, from UL's Product IQ on-line directory). UL listings typically show the total SDI as “over 500”, but the **attached Intertek Directory of Building Products listing (SPEC ID: 37392**) shows that SDI values can be as high as 1400.

FSI and SDI are no longer comparable:

ASTM E84 and UL 723 are designed to compare a material’s surface burning characteristics to that of a calibration material, such as fiber-cement board. Ceiling FSI and SDI values alone do not fully characterize fire behavior for materials that melt/drip to the tunnel floor. The ceiling FSI and SDI account for the initial and in many instances short portion of the 10 minutes test. Materials with low melting point tend to melt and drip/fall to the tunnel floor. The material on the tunnel floor continues to propagate flame for the duration of the test. The FSI and SDI criteria based on ceiling alone, ignores a large portion of the material’s fire performance, nullifies the comparison and goes against the intent of the ASTM E84 standard test method.

Unintended consequences in other applications:

Materials are used in applications other than ceilings, and there could be unintended consequences in other applications. Materials can be used in ceilings, floors, walls, roofs, plenums, etc. In certain applications, the contribution from material burning on the floor is indicative of what happens in real fire scenarios. Ignoring the burning on the floor and not acknowledging the connection between

various applications could have unintended consequences.

Eliminates marketplace transparency:

The proposed code change adds to the lack of transparency on the fire performance of certain types of materials. Manufacturers omit and do not report floor tunnel contribution for FSI and SDI. This information is limited to some listings and product labels where material has already been approved. This information is not presented on product data sheets and literature on which product approval decisions are most often based. Thus, products are approved without this critical information. When it comes to fire safety considerations related to behavior of certain types of materials that melt, drip and continue burning at the tunnel floor, we shall not rely on the non-transparent and least technically accurate evaluation approach.

Comment (CAH2)# 372

G8-24 Part I

IBC: SECTION 202; IFC: SECTION 202

Proposed Change as Submitted

Proponents: Jeff Grove, Chair, Building Code Action Committee (BCAC) (bcac@iccsafe.org)

THIS IS A 2 PART CODE CHANGE.

PART I WILL BE HEARD BY THE IBC EGRESS CODE COMMITTEE.

PART II WILL BE HEARD BY THE MECHANICAL CODE COMMITTEE.

SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Building Code

Revise as follows:

[BE] FLOOR AREA, GROSS. The floor area within the inside perimeter of ~~the~~ a *exterior walls* of the *building* ~~under consideration~~, exclusive of ~~vent~~ *shafts* with no openings and *courts*, without deduction for *corridors*, *stairways*, *ramps*, closets, the thickness of interior walls, columns or other features. The floor area of a *building*~~, or portion thereof,~~ not provided with surrounding *exterior walls* shall be the occupiable space ~~usable area~~ under the horizontal projection of ~~the~~ a roof or floor above. ~~The *gross floor area* shall not include *shafts* with no openings or interior *courts*.~~

[BE] FLOOR AREA, NET. The ~~actual occupied area~~ occupiable space of a building, not including unoccupied accessory areas such as *corridors*, *stairways*, *ramps*, toilet rooms, mechanical rooms and closets.

2024 International Fire Code

Revise as follows:

[BE] FLOOR AREA, GROSS. The floor area within the inside perimeter of ~~the~~ a *exterior walls* of the *building* ~~under consideration~~, exclusive of ~~vent~~ *shafts* with no openings and *courts*, without deduction for *corridors*, *stairways*, *ramps*, closets, the thickness of interior walls, columns or other features. The floor area of a *building*~~, or portion thereof,~~ not provided with surrounding *exterior walls* shall be the occupiable space ~~usable area~~ under the horizontal projection of ~~the~~ a roof or floor above. ~~The *gross floor area* shall not include *shafts* with no openings or interior *courts*.~~

[BE] FLOOR AREA, NET. The ~~actual occupied area~~ occupiable space of a building, not including unoccupied accessory areas such as *corridors*, *stairways*, *ramps*, toilet rooms, mechanical rooms and closets.

Reason: The changes clean up both definitions for readability and to remove redundancy. Additionally, it clarifies the use of “floor area” in IBC/IFC Table 1004.5 to point back to definitions.

The IMC includes the definition 'floor area, net', but does not use it in the text. They do include the definition of 'net occupiable floor area' which is used in Section 403.3.1.1.1.1 and footnote a in Table 403.3.1.1. We are proposing to delete this term since it is not used and is inconsistent with the IBC and IFC.

The IZC also includes definitions for 'floor area, net' and 'floor area, gross'. They are different from IBC and IFC and are not used in the text. There will be a code change in Group B to address this.

This proposal is submitted by the ICC Building Code Action Committee (BCAC).

BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 the BCAC has held several virtual meetings open to any interested party. In addition,

there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the BCAC website at BCAC webpage.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is an editorial change to the definitions to provide additional clarity for application in determining occupant loads. This will not result in any changes to construction.

G8-24 Part I

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: This proposal was disapproved. For the definition of gross floor area there were questions if the phrase "with no openings" could exclude central light shaft with windows - now called "interior courts" in the current text. While "shafts with no openings" is current text, it is confusing about what this includes. In the 2nd sentence, 'occupiable space' should not be change to 'useable area' - this could exempt useable areas without walls, such as a pavilion. (Vote: 8-6)

G8-24 Part I

Individual Consideration Agenda

Comment 1:

IBC: SECTION 202; IFC: SECTION 202

Proponents: Jeff Grove, Chair, Building Code Action Committee (BCAC) (bcac@iccsafe.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

[BE] FLOOR AREA, GROSS. The floor area within the inside perimeter of the ~~a~~ *exterior walls* of the *building*~~, exclusive of *shafts* with no openings and *courts*,~~ without deduction for *corridors*, *stairways*, *ramps*, closets, the thickness of interior walls, columns or other features and exclusive of interior courts. Where a space is ~~The floor area of a *building*~~ not provided with surrounding *exterior walls*, the floor area shall include the ~~be the occupiable space~~ useable area under the horizontal projection of a roof or floor above.

[BE] FLOOR AREA, NET. The occupiable space of a building, not including unoccupied accessory areas such as *corridors*, *stairways*, *ramps*, toilet rooms, shafts, mechanical rooms and closets.

2024 International Fire Code

[BE] FLOOR AREA, GROSS. The floor area within the inside perimeter of the ~~a~~ *exterior walls* of the *building*~~, exclusive of *shafts* with no openings and *courts*,~~ without deduction for *corridors*, *stairways*, *ramps*, closets, the thickness of interior walls, columns or other features and exclusive of interior courts. Where a space is ~~The floor area of a *building*~~ not provided with surrounding *exterior walls*, the floor area shall include the ~~be the occupiable space~~ useable area under the horizontal projection of a roof or floor above.

[BE] FLOOR AREA, NET. The occupiable space of a building, not including unoccupied accessory areas such as *corridors*, *stairways*, *ramps*, toilet rooms, shafts, mechanical rooms and closets.

Reason: The intent of the proposal remains to provide clarity with these defined terms. The revisions are to address the committee concerns.

There were questions about if shafts for elements such as mechanical, plumbing or elevators should be included. This is within gross floor area, but has been added as excluded in net floor area. Gross floor areas would not include central courts, such as in an O or U shaped buildings, but would include areas that are under roofs, such as outdoor dining areas at a restaurant. This is important for determination of occupant loads.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is an editorial change to the definitions to provide additional clarity for application in determining occupant loads. This will not result in any changes to construction.

Comment (CAH2)# 129

NOTE: G8-24 PART II DID NOT RECEIVE A COMMENT (CAH2) AND IS REPRODUCED FOR INFORMATIONAL PURPOSES ONLY

G8-24 Part II

IMC®: SECTION 202

Proposed Change as Submitted

Proponents: Jeff Grove, Chair, Building Code Action Committee (BCAC) (bcac@iccsafe.org)

2024 International Mechanical Code

Delete without substitution:

~~**FLOOR AREA, NET.** The actual occupied area, not including unoccupied accessory areas or thicknesses of walls.~~

Reason: The changes clean up both definitions for readability and to remove redundancy. Additionally, it clarifies the use of “floor area” in IBC/IFC Table 1004.5 to point back to definitions.

The IMC includes the definition 'floor area, net', but does not use it in the text. They do include the definition of 'net occupiable floor area' which is used in Section 403.3.1.1.1.1 and footnote a in Table 403.3.1.1. We are proposing to delete this term since it is not used and is inconsistent with the IBC and IFC.

The IZC also includes definitions for 'floor area, net' and 'floor area, gross'. They are different from IBC and IFC and are not used in the text. There will be a code change in Group B to address this.

This proposal is submitted by the ICC Building Code Action Committee (BCAC).

BCAC was established by the ICC Board of Directors in July 2011 to pursue opportunities to improve and enhance assigned International Codes or portions thereof. In 2023 the BCAC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the BCAC website at BCAC webpage.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is an editorial change to the definitions to provide additional clarity for application in determining occupant loads. This will not result in any changes to construction.

Public Hearing Results (CAH1)

Committee Action: **As Submitted**

Committee Reason: The committee voted 14-0 to accept the proposal as submitted. The argument presented made sense in light of the proponent's justification. Although it is not used in the text, the definition of "floor area, net" is included in the IMC.

G9-24

IBC: SECTION 202; IFC: SECTION 202; IPMC: SECTION 202

Proposed Change as Submitted

Proponents: Jennifer Goupil, Structural Engineering Institute of ASCE, American Society of Civil Engineers (jgoupil@asce.org)

THIS CODE CHANGE WILL BE HEARD BY THE IBC EGRESS COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

2024 International Building Code

Revise as follows:

[BE] GUARD. A *building* component or ~~a system of *building*~~ assembly of components located at or near the open sides of an elevated walking surface ~~surfaces~~ that minimizes the possibility of a fall from the elevated walking surface ~~to a lower level~~.

2024 International Fire Code

Revise as follows:

[BE] GUARD. A *building* component or ~~a system of *building*~~ assembly of components located at or near the open sides of an elevated walking surface ~~surfaces~~ that minimizes the possibility of a fall from the elevated walking surface ~~to a lower level~~.

2024 International Property Maintenance Code

Revise as follows:

[BE] GUARD. A *building* component or ~~a system of *building*~~ assembly of components located at or near the open sides of an elevated walking surface ~~surfaces~~ that minimizes the possibility of a fall from the elevated walking surface ~~to a lower level~~.

Reason: This proposal is a coordination proposal to improve the alignment between the provisions in the International Codes with the provisions of the 2022 edition of ASCE/SEI 7 Minimum Design Loads and Associated Criteria for Buildings and Other Structures (ASCE/SEI 7-22). The Dead and Live Load Subcommittee of ASCE 7 has been working for several cycles to align the requirements in these documents related to Dead and Live Loads.

The proposed changes to the definition of the word Guard are intended to remove unnecessary and potentially confusing words, as well as to improve the coordination between the definitions in the International Codes and in ASCE 7.

The word "building" is struck in two places as it is unnecessary and does not appear in the ASCE 7 definition. The definition is clear without it. Additionally, the use of the word “building” could cause confusion as the scope of the IBC includes buildings and structures per Section 101.2, but the word “structures” does not appear alongside the word “building”.

The word "system" is changed to "assembly" to match the ASCE 7 definition. The words in this usage are interchangeable. However, in ASCE 7 the defined term is Guard System, and as such the ASCE 7 definition uses “assembly” to avoid using “system” in both the defined term and in the definition. It is generally considered not good practice to repeat words being defined in the definition itself.

The addition of the word "elevated" and the removal of the phrase "to a lower level" matches ASCE 7 text and uses less words to accomplish the same meaning. There is no need to define where you are falling to once it is established that the guard is on the elevated surface.

Note, this definition appears in the following I-codes and the intent is to have the proposal revise the definition in each code; IBC, IRC, IFC, and IPMC.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal will not increase or decrease costs related to guards as the proposal does not in any way revise the code requirements for guards. The proposal is an editorial code change which aligns specific words in the ICC definition with specific words in the ASCE 7 definition.

G9-24

Public Hearing Results (CAH1)

Committee Action: **As Submitted**

Committee Reason: The change in the wording in was approved. It is appropriate to apply guard requirements to structures as well as buildings. This would also coordinate with ASCE 7 definitions. (Vote: 13-1)

G9-24

Individual Consideration Agenda

Comment 1:

IBC: SECTION 202; IFC: SECTION 202; IPMC: SECTION 202

Proponents: David Cooper, Stair Manufacturing and Design Consultants, Stairbuilders and Manufacturers Association, SMA (coderep@stairways.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

[BE] GUARD. A component or assembly of components located at or near the open sides of an elevated walking surface that minimizes the possibility of a fall from the elevated walking surface to the floor or grade below

.

2024 International Fire Code

[BE] GUARD. A component or assembly of components located at or near the open sides of an elevated walking surface that minimizes the possibility of a fall from the elevated walking surface to the floor or grade below

.

2024 International Property Maintenance Code

[BE] GUARD. A component or assembly of components located at or near the open sides of an elevated walking surface that minimizes the possibility of a fall from the elevated walking surface to the floor or grade below

.

Reason: The current action taken by the committee deletes "to a lower level" from the definition for guard. Deletion of this essential text without substitution renders the definition to be indefinite. Whereas the modification suggested here makes a suitable substitution that actually improves the definition. In the two leading sections of 1015 Guards, the ***floor, grade, finished grade*****,** or ***other surface*** are specifically mentioned to determine the distance of a fall to a level ***below***.

1015.1 General.*Guards* shall comply with the provisions of Sections 1015.2 through 1015.7. Operable windows with sills

located more than 72 inches (1829 mm) above ***finished grade or other surface below*** shall comply with Section 1015.8.

1015.2 Where required.*Guards* shall be located along open-sided walking surfaces, such as *mezzanines*, *equipment platforms*, *aisles*, *stairs*, *ramps* and landings, that are located more than 30 inches (762 mm) measured vertically to the ***floor or grade below*** at any point within 36 inches (914 mm) horizontally to the edge of the open side and at the perimeter of occupiable roofs. *Guards* shall be adequate in strength and attachment in accordance with Section 1607.9. ***<emphasis added>***

This in the same modification submitted by the Structural Engineering Institute of ASCE heard as Graveen MP1 during CAH#1.

The use of "floor or grade below" from **1015.2 Where required** in the definition provides strict correlation with the IBC requirements and clearly identifies that the fall is to a lower elevation in terms clearly understood by users of the code as well as users of ASCE 7. Guards are required "along open-sided walking surfaces" to minimize a fall but not a fall to the walking surface where the guard is located. To delete "to a lower level" and only indicate "fall from" fails to serve as a complete definition and allows a potential misinterpretation that guards can minimize falls from the walking surface, on to the same walking surface, into furniture or even into the guard itself which is a fall that is impossible for the guard to minimize. Guards by design are not handrails or ambulatory aids but rather they establish both physical and visual boundaries with their placement. Guards serve to minimize the possibility of a fall to the opposite side of the guard located at an extreme elevation change. The lack of some indication of where the fall is "to" is indefinite and will inevitably offer a feast to litigators servubg no purpose related to building safety with any concern for cost.

This modification was developed through the collaboration of the ASCE 7 Live and Dead Loads Committee and the SMA, Stairbuilders and Manufacturers Association - Code and Research Committee. This code change effectively correlates the definition in ASCE 7 and IBC as supported by CAH#1 testimony for approval by both ASCE and SMA. In light of this collaborative effort the committees thoughtful reconsideration would seem prudent.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal will not increase or decrease costs related to guards as the proposal does not in any way revise the code requirements for guards. The proposal is an editorial code change which aligns specific words in the ICC definition with specific words in the ASCE 7 definition.

Comment (CAH2)# 218

G11-24

IBC: SECTION 202; IFC: SECTION 202

Proposed Change as Submitted

Proponents: John Poole, Poole Fire Protection, Inc., ASI Southeast (jpoole@poolefire.com); Matthew Stepp, ASI Southeast Inc, ASI Southeast Inc (mstepp@asi-southeast.com); Dale Wheeler, Systech Fire Protection LLC, Scranton Products (sgidw@aol.com)

THIS CODE CHANGE WILL BE HEARD BY THE IBC FIRE SAFETY COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

2024 International Building Code

Revise as follows:

[BF] INTERIOR WALL AND CEILING FINISH. The exposed *interior surfaces* of *buildings*, including but not limited to: fixed or movable walls and partitions~~; toilet room privacy partitions;~~ columns; ceilings; and interior wainscoting, paneling or other finish applied structurally or for decoration, acoustical correction, surface insulation, structural fire resistance or similar purposes, but not including *trim*.

2024 International Fire Code

Revise as follows:

[BF] INTERIOR WALL AND CEILING FINISH. The exposed interior surfaces of buildings, including but not limited to: fixed or movable walls and partitions~~; toilet room privacy partitions;~~ columns; ceilings; and interior wainscoting, paneling or other finish applied structurally or for decoration, acoustical correction, surface insulation, structural *fire resistance* or similar purposes, but not including trim.

Reason: POOLE: Toilet partitions are primarily made from stainless steel, powder coated galvanneal, plastic laminate (particleboard with high pressure laminate facing and edging), phenolic, and high-density polyethylene (HDPE). As a result of changes made to the definition of “Interior Wall and Ceiling Finish” in 2006, toilet room privacy partitions have been defined as an interior wall partition, which subjects it to various flammability test methods to be considered compliant. Based on the extensive history in manufacturing and selling toilet partitions, along with many hours of researching fires from the National Fire Incident Reporting System (NFIRS) data and the National Fire Protection Association (NFPA) One-Stop Data Shop, that occur in a public restroom, we have yet identified a scenario where toilet room privacy partitions, made from any of these materials, was the primary source or contributing fuel for a fire, which was responsible for the loss of life or significant property damage/loss.

The current flammability testing methods are unnecessary and add significant manufacturing and other related costs. Since the changes in the 2009 IBC, Section 803.12, manufacturers of HDPE toilet room privacy partitions have been subjected to a different set of flammability testing standards than all of materials that are commercially used for producing toilet partitions without any supporting historical fire loss data to justify these increased flammability testing measures. For HDPE toilet room privacy partitions to be compliant with IBC regulations and pass the NFPA 286 room corner test, manufacturers have had to consider many reformulations, which in turn increases the cost of this product with no historical fire loss data to justify these increased costs. Each reformulation subjects the manufacturer to increase the overall cost of the product to the consumer. Additional costs come from many different aspects of the product development life cycle including additives to improve the overall performance of the product due to these testing parameters that increases the cost of the product by up to 100%, or selecting a different additive that does not increase the cost but is a known carcinogen. A manufacturer must consider all the additional expenses that will be incurred throughout the entire product process including, but not limited to: an increase in weight of the product by up to 30% which in turn increases freight costs; the repairs and maintenance of the manufacturing equipment in order to produce products due to additives; ensuring employee safety when handling the heavier material; revisions to packaging to manage the additional weight and ensure quality of product; increase in the cost of other raw materials to ensure the quality of the product; revisions to hardware components necessary to install the partitions to ensure product life cycle performance due to the additional weight; the cost of the product outside of the manufacturing facility such as freight to the construction site; additional labor costs required for installation of heavier components to ensure employee safety; reduction of product life expectancy and therefore increased replacement costs due to the introduction of additives that reduces the durability of HDPE and the replacement components. All of these above items increase the cost to the end consumer solely for the benefit of being compliant to

a regulation that is not justified based upon loss of life and property fire loss data.

In addition to the significant costs imposed on toilet room privacy partition manufacturers, none of the fire test standards required by the IBC are specific to the external fuel loading or how toilet room privacy partitions are used and installed. In terms of fire risks in public restrooms, the main ignitable materials in public restrooms are paper products such as toilet paper and/or paper hand towels. Although difficult to ignite, disinfectant and hand soap containers could also be considered ignitable fuels within public restrooms. In terms of these materials, toilet paper dispensers are generally affixed to a toilet room privacy partition to allow easy occupant access. Currently, there is no requirement for the toilet paper dispensers or other devices affixed to a toilet room privacy partition to adhere to interior wall finish requirements. The vast majority of public restrooms contain few, if any, potential ignition sources. Therefore, based on the low propensity for fire ignition, coupled with the low fuel loading within these spaces, the risks of a substantial fire occurring are nearly non-existent. And this is supported by the lack of fire data that reflects the toilet room privacy partitions were the primary source or contributing fuel source of a fire, which was responsible for the loss of life or significant property damage/loss.

HDPE toilet room privacy partitions are exclusively installed in restrooms and HDPE partitions installed in other areas cannot, by definition, be classified as toilet room privacy partitions. As discussed previously, having a fire in a restroom capable of igniting an HDPE toilet room privacy partition is not expected, especially if the restroom is provided with automatic sprinkler protection. When the toilet stall is occupied, it can be expected that the occupant will be in very close proximity to the partitions, providing for very early warning of an incipient stage fire. While it can be expected that a restroom occupant will require more pre-movement time than an occupant of other spaces, this time disparity is offset with the earlier warning. Also, due to general architectural design philosophies, restrooms are separated from most normally occupied spaces to provide their occupants with increased privacy. Therefore, in the case of a restroom fire, once outside of the restroom and in the publicly occupiable disorder, the occupant would be shielded from the restroom fire by the room's walls and door. Therefore, the smoke indices and the peak heat release rates from an HDPE toilet room privacy partition are largely irrelevant in terms of protecting a restroom occupant from a fire, even if one were to be ignited in a public restroom.

For these reasons, it can be expected that the life safety of both restroom occupants, and those within the adjacent publicly occupiable spaces will be at risk from a restroom fire from any toilet partition. Therefore, requiring toilet room privacy partitions, including those constructed of HDPE, to be fire rated to meet interior finish requirements, poses an undue burden on the toilet room privacy partition industry and the consumers, and provides no added benefit, since a restroom fire problem does not exist. For the above-described rationale, "toilet room privacy partitions" should be removed from the "interior wall and ceiling finish" definition in Section 202 of the IBC and IFC.

WHEELER:

Purpose: This code change would remove toilet room privacy partitions from the definition of Interior Wall and Ceiling Finish.

Reasons: Toilet room privacy partitions are not properly characterized as interior finish and should not be subject to interior finish requirements.

Substantiation: In IBC editions 2003 and prior, toilet room privacy partitions were not indicated to be interior wall and ceiling finish. The 2006 edition of the IBC included the current code language. However, no convincing technical substantiation was provided to support that change. Further, toilet room privacy partitions are not similar to typical interior finishes, such as wall coverings, floor coverings, or decorative items. Toilet room privacy partitions are not directly adhered to walls of ceilings as are typical interior finishes. Also, toilet room partitions are installed perpendicular to walls, and therefore are not subject to the same corner-exposure as other wall finishes. Corner configurations of traditional wall coverings are known to produce taller flames due to the reduced air entrainment, compared to a fire in the open or along a single wall, but that is not the case with toilet room partitions. Toilet room privacy partitions also differ from fixed or movable walls with regard to environment and exposure within a building. Typical sources of fire ignition found in areas other than toilet rooms do not exist in proximity to toilet room privacy partitions.

The bulk of ordinary combustibles in a toilet room are not typically near the toilet room privacy partitions. So, for example, a fire starting in a waste can, is not expected to be near to or impact toilet room partitions.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

POOLE: Building owners and those responsible for sourcing toilet room privacy partitions, specifically HDPE partitions, will initially see somewhat reduced costs from $0 and less, which would vary based on the costs identified in the reason statement.

WHEELER: The proposed code change will reduce the cost of construction by removing requirements that are not properly applicable.

Estimated Immediate Cost Impact Justification (methodology and variables):

POOLE: It is anticipated that as additional products from additional manufacturers are able to enter the marked, costs will be reduced. These manufacturers will incur lower initial costs, as they will not be required to pay for materials additives and fire tests that may not represent the real-world conditions in which these materials are installed and utilized.

WHEELER:

Logical Analysis.

G11-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee disapproved the proposal due to safety concerns. The committee did not agree to remove the "toilet room privacy partitions" from the "Interior Wall and Ceiling Finish" definition. The committee indicated that toilet room privacy partitions could increase the fire load in a building that has a lot of people (Vote: 12-0).

G11-24

Individual Consideration Agenda

Comment 1:

Proponents: Marcelo Hirschler, GBH International, GBH International (mmh@gbhint.com) requests Disapproved

Reason: I attach an image of a set of plastic toilet partitions and an image of a set of plastic lockers. They look pretty similar.

Combustible lockers are regulated as interior finish by section 806.8 that reads as shown below. There is no reason to consider treating combustible toilet partitions in a different way than combustible lockers.

806.8 Combustible lockers. Where lockers constructed of combustible materials are used, the lockers shall be considered to be interior finish and shall comply with Section 803.
Exception: Lockers constructed entirely of wood and noncombustible materials shall be permitted to be used wherever interior finish materials are required to meet a Class C classification in accordance with Section 803.1.2.

Cost Impact: No change to code.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Comment (CAH2)# 428

Comment 2:

IBC: SECTION 202, SECTION 202 (New), 803.1.3, 803.14 (New); IFC: SECTION 202, SECTION 202 (New), 803.1.3, 803.16 (New)

Proponents: Dale Wheeler, Systech Fire Protection LLC, Scranton Products (dale.wheeler@systechfire.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

Revise as follows:

[BF] INTERIOR WALL AND CEILING FINISH. The exposed *interior surfaces* of *buildings*, including but not limited to: fixed or movable walls and partitions; toilet room privacy partitions; columns; ceilings; and interior wainscoting, paneling or other finish applied structurally or for decoration, acoustical correction, surface insulation, structural fire resistance or similar purposes, but not including *trim*.

Add new definition as follows:

TOILET ROOM PRIVACY PARTITIONS.. The exposed interior surfaces of partitions used to provide privacy between toilet room stalls.

Revise as follows:

803.1.3 Interior wall and ceiling finish materials with different requirements. The materials indicated in Sections 803.2 through ~~803.13~~ 803.14 shall be tested as indicated in the corresponding sections.

Add new text as follows:

803.14 Toilet room privacy partitions. Toilet room privacy partitions shall be treated as interior finish and regulated under Section 803.1.2 regardless of materials used for the toilet room partition.

2024 International Fire Code

Revise as follows:

[BF] INTERIOR WALL AND CEILING FINISH. The exposed interior surfaces of buildings, including but not limited to: fixed or movable walls and partitions; toilet room privacy partitions; columns; ceilings; and interior wainscoting, paneling or other finish applied structurally or for decoration, acoustical correction, surface insulation, structural *fire resistance* or similar purposes, but not including trim.

Add new definition as follows:

TOILET ROOM PRIVACY PARTITIONS. The exposed interior surfaces of partitions used to provide privacy between toilet room stalls.

Revise as follows:

803.1.3 Interior wall and ceiling finish materials with specific requirements. The materials indicated in Sections 803.4 through ~~803.15~~ 803.16 shall be tested as indicated in the corresponding sections.

Add new text as follows:

803.16 Toilet room privacy partitions. Toilet room privacy partitions shall be treated as interior finish and regulated under Section 803.1.2 regardless of materials used for the toilet room partition.

Reason: During CAH#1, several members voiced their concern that this code change proposal would leave toilet partitions unregulated. To be clear, Scranton Products does not wish to leave toilet partitions unregulated. The current code, however, must be changed for three main reasons: (1) the original code change including toilet partitions in the definition of interior finish was made with no technical substantiation; (2) the original code change, as well as the later code changes subjecting HDPE toilet partitions to NFPA 286, have been driven and influenced by Bobrick, a toilet partition manufacturer that does not manufacture or sell HDPE partitions; and (3) the current code has produced anticompetitive results in favor of Bobrick—who misrepresents the fire rating of their own partitions—and does not increase universal fire safety for the toilet partition industry. For these reasons, this Committee should approve this code change.

1. No Technical Substantiation Prior to 2003, the IBC did not specify toilet room privacy partitions as interior wall and ceiling finish. Starting with the 2006 edition of the IBC, the IBC began classifying toilet partitions as interior finish. Even so, no convincing technical substantiation was provided to support that change. Further, toilet room privacy partitions are not similar to typical interior finishes, such

as wall coverings, floor coverings, or decorative items. Toilet room privacy partitions are not directly adhered to walls of ceilings as are typical interior finishes. Also, toilet room partitions are installed perpendicular to walls, and are thus not subject to the same corner-exposure as other wall finishes. Corner configurations of traditional wall coverings are known to produce taller flames due to the reduced air entrainment, compared to a fire in the open or along a single wall, but that is not the case with toilet room partitions. Toilet room privacy partitions also differ from fixed or movable walls based on their environment and exposure within a building. Typical sources of fire ignition found in areas other than toilet rooms do not exist in proximity to toilet room privacy partitions.The bulk of ordinary combustibles in a toilet room are also not typically near the toilet room privacy partitions. So, for example, one would not expect a fire starting in a waste basket to be near to or impact toilet room partitions because those waste baskets are typically at or near the exit door or embedded in the sink. For these reasons, classifying toilet partitions as interior finish lacks technical support.

2. Bobrick Influenced These Code Changes The lack of technical substantiation to support the original code change including toilet partitions in the definition of interior finish has become more problematic because it has resulted in creating an unfair competitive advantage for non-HDPE partition manufacturers. The current application of NFPA 286 based on the discriminatory definition of interior finish—where particular bathroom partitions are exempt based on material—creates an unfair situation. As this Committee is aware, the change in the 2006 edition of the IBC—which includes toilet partition in the definition of interior finish—was proposed by a representative of Bobrick. Bobrick's involvement in driving these code changes was especially peculiar because Bobrick manufactures phenolic and laminate partitions, neither of which can pass NFPA 286. In other words, Bobrick was pushing fire safety measures on other types of toilet partitions, but not on their own toilet partitions. On top of this, in 2015, Marcelo Hirschler proposed another code change to Chapter 8 of the IBC. In FS-139-15, Mr. Hirschler stated that this code change proposal "reorganizes section 803 to make it follow the testing logic, but it does not change any of the requirements." Mr. Hirschler has testified in litigation involving Bobrick that he is "friends" with two of Bobrick's consultants, has discussed these code changes with at least one of Bobrick's consultants, but denies implementing the changes on behalf of Bobrick. Mr. Hirschler also stated that "any interior wall and ceiling finish material is permitted to be tested to NFPA 286," and he reaffirmed that "[t]extile and expanded vinyl ceiling coverings stay as is, just with the section reference changed. The same is true for HDPE and PP." Despite these statements about the "reason" for this proposed code change, Mr. Hirschler's proposed code change removed the word "permitted" from Section 803.1.2. Said differently, Chapter 8 of the IBC previously permitted HDPE to comply with NFPA 286, but Mr. Hirschler's proposed code change mandated that HDPE comply with NFPA 286. Scranton Products deposed Mr. Hirschler in a litigation involving Bobrick and Scranton Products, and he testified under oath that this code change proposal was not meant to change any requirements in this code, and it was purely an editorial or organizational change. He could not, however, provide a plausible reason for removing the word "permitted" from Section 803.1.2. He also confirmed that he did not make this proposal on behalf of a client or for any other reason other than he decided it was necessary. The ICC ultimately adopted this code change proposal and implemented it into the 2018 version of the IBC. The practical impact of Mr. Hirschler's code change is that HDPE toilet partitions now must comply with NFPA 286, but non-HDPE toilet partitions need only comply with ASTM E84. Said differently, Scranton Products and other HDPE toilet partition manufacturers are expected to meet a more demanding and more expensive fire rating test than their competitors that do not manufacture HDPE toilet partitions, such as Bobrick. Although Mr. Hirschler claims he is independent and does not work as a Bobrick consultant, Mr. Hirschler's continued involvement with these code changes benefiting Bobrick and harming its competitors is particularly troubling, especially given his positions within the NFPA and ICC. Mr. Hirschler's involvement in creating this new requirement is particularly relevant here because he, along with two other Bobrick representatives (Bill Koffel and Jim Lathrop), were the only individuals that publicly opposed this code change proposal at CAH#1.

3. Anticompetitive Results Without Universal Fire Safety Bobrick's misuse of fire safety standards for commercial reasons has resulted in unfair and anti-competitive playing field across the bathroom partition industry. Specifically, Bobrick is holding Scranton Products' NFPA 286 compliant partitions to a standard Bobrick's partitions cannot meet. In ongoing litigation brought by Bobrick, it is arguing Scranton Products should not be allowed to sell their non-NFPA 286-compliant HDPE partitions. At the same time, Bobrick is misrepresenting the fire rating for their own partitions. A universal standard for the toilet partition is necessary to extinguish this uneven playing field established by Bobrick. First, Bobrick is holding Scranton Products' NFPA 286 compliant partitions to a standard Bobrick's partitions cannot meet. Scranton Products commissioned Intertek, an independent fire testing lab, to conduct testing on Bobrick's partitions. Intertek conducted NFPA 286 testing of Bobrick's Duraline Series 1080 Compact Grade Laminate partition ("1080 Partition") and Bobrick's Class Series 1540 High Pressure Laminate partition ("1540 Partition").

Bobrick's 1080 Partition failed the NFPA 286 test, and Bobrick's 1540 Partition notably failed the NFPA 286 test in under 2.5 minutes. Scranton Products manufactures an HDPE partition that passes NFPA 286. If fire safety is the most important concern of this committee, all toilet partitions should comply with NFPA 286. Holding particular toilet partitions to a higher standard (i.e., Scranton

Products) while allowing other toilet partitions to miserably fail the same fire test (i.e., Bobrick) does not support fire safety, but fosters an uneven playing field. Second, Bobrick has made their intentions clear—in litigation, Bobrick is taking the position that Scranton Products cannot sell their non-NFPA 286-compliant HDPE partitions that meet ASTM E84. Bobrick makes this argument even though Scranton Products has explained to Bobrick that pre-2018 versions of the IBC do not mandate that HDPE comply with NFPA 286. In any event, Scranton Products has certified tests from Intertek revealing that these non-NFPA 286 HDPE partitions meet ASTM E84, Class B, which is compliant in jurisdictions that have implemented pre-2018 versions of the IBC .Last, Bobrick argues that Scranton Products should not sell non-NFPA 286 HDPE partitions, but at the same time, Bobrick is misrepresenting the fire rating for their own competing partitions. As noted, Scranton Products commissioned Intertek to conduct fire testing of Bobrick's partitions.

Intertek's independent testing revealed in six tests that Bobrick's 1540 Partitions only achieve a Class C rating, not a Class B rating, as claimed by Bobrick. Even if Bobrick's 1540 Partitions are code compliant because they meet ASTM E84 Class C, Bobrick's misrepresentation of the fire rating for their 1540 Partitions casts doubt on their true motive in pushing fire safety measures on its competitors, while not subjecting their own partitions to the same standards. This Council should either remove bathroom partitions from the definition of interior finish or it should make this standard apply to all bathroom partitions, not just some bathroom partitions. Taking this step would also create clarity and consistency in the industry, including for architects, designers, and builders who are ultimately responsible for interpreting these codes. At CAH #1, the Committee raised an objection with respect to the original code change proposal indicating that acceptance of that code change proposal would have left toilet room partitions unregulated. If this committee is apprehensive to removing toilet partitions from the definition, the undersigned submits the following modified proposal that achieves the goal of creating a universal standard for all toilet partitions. This modified proposal addresses that concern by providing that toilet room partitions would be subject to testing in accordance with ASTM E84 or UL 723. This change would have the added benefit of leveling the field in that all toilet room partitions would then be subject to the same testing criteria.

Cost Impact: No change to code.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Comment (CAH2)# 659

G12-24 Part I

IBC: SECTION 202 (New)

Proposed Change as Submitted

Proponents: Alexander Haldeman, James Hardie Building Products, James Hardie Building Products (alex.haldeman@jameshardie.com)

THIS IS A 5 PART CODE CHANGE.

PART I WILL BE HEARD BY THE IBC-FIRE SAFETY COMMITTEE.

PART II AND V WILL BE HEARD BY THE FIRE CODE COMMITTEE.

PART III AND IV WILL BE HEARD BY THE MECHANICAL CODE COMMITTEE.

SEE THE TENTATIVE HEARING ORDER FOR THESE COMMITTEES.

2024 International Building Code

Add new definition as follows:

NONCOMBUSTIBLE MATERIAL. A material that does not contribute appreciably to an ambient fire. Materials that comply with Section 703.3.1 of the IBC are considered noncombustible materials.

703.3.1 Noncombustible materials. Materials required to be noncombustible shall be tested in accordance with ASTM E136. Alternately, materials required to be noncombustible shall be tested in accordance with ASTM E2652 using the acceptance criteria prescribed by ASTM E136. **Exception:** Materials having a structural base of noncombustible material as determined in accordance with ASTM E136, or with ASTM E2652 using the acceptance criteria prescribed by ASTM E136, with a surfacing of not more than 0.125 inch (3.18 mm) in thickness having a *flame spread index* not greater than 50 when tested in accordance with ASTM E84 or UL 723 shall be acceptable as noncombustible.

Reason: This proposal attempts to serve three purposes, all editorial and clarifying in nature:

1. Harmonize definitions found throughout multiple ICC codes (IBC, IRC, IFC, IWUIC, IMC, IFGC, IEBC)

2. Addresses the recent practice that ICC Codes Definitions should not contain requirements

3. Attempts to offer clarity between often-used, and often-confused terms used throughout ICC Codes: specifically, the difference between "Fire-Resistance Rating" (IFC, IBC, IWUIC) "Ignition-Resistant Building Material" (IWUIC), "Flame-Spread Index" (IBC, IRC, IFC, IWUIC, IMC), "Flammable Material" (IBC, IFC) , and "Noncombustible Material" (IRC, IWUIC, IMC, IFGC, IEBC)

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal focusses on terminology harmonization, and does not add any requirements or change exiting requirements.

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The proposal was disapproved as requested by the proponent to work on the proposal for the CAH2 (Vote: 11-0).

G12-24 Part I

Individual Consideration Agenda

Comment 1:

IBC: SECTION 202; IEBC: SECTION 202

Proponents: Alexander Haldeman, James Hardie Building Products, James Hardie Building Products (alex.haldeman@jameshardie.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

Revise as follows:

NONCOMBUSTIBLE MATERIAL.
See Section 703.3.
~~A material that does not contribute appreciably to an ambient fire. Materials that comply with Section 703.3.1 of the IBC are considered noncombustible materials~~

2024 International Existing Building Code

[BF] NONCOMBUSTIBLE MATERIAL. ~~A material that, under the conditions anticipated, will not ignite or burn when subjected to fire or heat. Materials that pass ASTM E136 are considered noncombustible materials.~~ See Section 703.3 of the International Building Code.

Reason: During CAH1, this proposal was requested to be disapproved to have an opportunity to work with stakeholders to address concerns expressed.
Working with many stakeholders to revise language, we feel this proposal addresses those prior expressions.

The term “noncombustible material” is used in this code in many different chapters, and also throughout the other i-codes. In other codes, this term is inconsistently defined, or not defined at all, leading users of other codes to the IBC for guidance, but this is not defined in IBC resulting in confusion amongst users.

IBC Section 703.3 provides information on what qualifies a material to be noncombustible in context of the i-codes.

This proposal G12-24, in all its parts, guides users of this, and other i-codes which reference the IBC, to where this information can be found.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal is clarifying in nature and will not result in cost impacts. It does not add or remove any requirements. It is clarifying to a user where to find the performance requirements.

Comment (CAH2)# 368

G12-24 Part II

IFC: SECTION 202 (New)

Proposed Change as Submitted

Proponents: Alexander Haldeman, James Hardie Building Products, James Hardie Building Products (alex.haldeman@jameshardie.com)

2024 International Fire Code

Add new definition as follows:

NONCOMBUSTIBLE MATERIAL. A material that does not contribute appreciably to an ambient fire. Materials that comply with Section 703.3.1 of the International Building Code are considered noncombustible materials.

Reason: This proposal attempts to serve three purposes, all editorial and clarifying in nature:

1. Harmonize definitions found throughout multiple ICC codes (IBC, IRC, IFC, IWUIC, IMC, IFGC, IEBC)

2. Addresses the recent practice that ICC Codes Definitions should not contain requirements

3. Attempts to offer clarity between often-used, and often-confused terms used throughout ICC Codes: specifically, the difference between "Fire-Resistance Rating" (IFC, IBC, IWUIC) "Ignition-Resistant Building Material" (IWUIC), "Flame-Spread Index" (IBC, IRC, IFC, IWUIC, IMC), "Flammable Material" (IBC, IFC) , and "Noncombustible Material" (IRC, IWUIC, IMC, IFGC, IEBC)

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal focusses on terminology harmonization, and does not add any requirements or change exiting requirements.

G12-24 Part II

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee stated that the reasons for the disapproval of the proposal were: The definition is not needed. Noncombustible is used throughout the code. There are performance requirements in the IBC. It is going to further confuse the issue about noncombustible material. (Vote: 14-0)

G12-24 Part II

Individual Consideration Agenda

Comment 1:

IFC: SECTION 202

Proponents: Alexander Haldeman, James Hardie Building Products, James Hardie Building Products

(alex.haldeman@jameshardie.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Fire Code

Delete and substitute as follows:

~~**NONCOMBUSTIBLE MATERIAL.** A material that does not contribute appreciably to an ambient fire. Materials that comply with Section 703.3.1 of the International Building Code are considered noncombustible materials.~~
NONCOMBUSTIBLE MATERIAL. See Section 703.3 of the *International Building Code.*

Reason: Prior language suggested in the original proposal raised concerns from stakeholders, leading to a floor modification. During CAH1, additional concerns were expressed and this attempts to address those concerns as well.

The term “noncombustible material” is used many times within this code but does not have a definition, Section 201.3 of this code outlines that definitions not contained within this code shall comply with terms defined in IBC, IFGC, IMC, or IPC.

The *International Building Code* does have criteria outlining what qualifies a material as noncombustible in context of code as was noted during the first hearing. “Noncombustible material” however is not *defined* within IBC or IPC, so performance requirements within IBC section 703.3 cannot be used in this code per IFC 201.3.

IFGC and IMC currently do contain definitions for “noncombustible material”; but both incorrectly mandate requirements within a definition and neither definition matches that of the IBC requirements in 703.3 which includes the additional test method ASTM E2652 using ASTM E136 acceptance criteria, and also makes exception for materials using surfacing not more than 0.125 inch with flame spread index less than 50.

This proposal, and the other parts of G12-24 (which similarly address definitions within IFGC and IMC), seeks to resolve inconsistencies throughout codes while providing guidance to users what is required to qualify as “noncombustible material” within the context of the i-codes.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal is clarifying in nature and will not result in cost impacts. It does not add or remove any requirements. It is clarifying to a user where to find the performance requirements.

Comment (CAH2)# 737

G12-24 Part III

IFGC: SECTION 202

Proposed Change as Submitted

Proponents: Alexander Haldeman, James Hardie Building Products, James Hardie Building Products (alex.haldeman@jameshardie.com)

2024 International Fuel Gas Code

Revise as follows:

[M] NONCOMBUSTIBLE MATERIALS. ~~Materials that, where tested in accordance with ASTM E136, have not fewer than three of four specimens tested meeting all of the following criteria:~~
A material that does not contribute appreciably to an ambient fire. Materials that comply with Section 703.3.1 of the International Building Code are considered noncombustible materials.

1. ~~The recorded temperature of the surface and interior thermocouples shall not at any time during the test rise more than 54°F (30°C) above the furnace temperature at the beginning of the test.~~

2. ~~There shall not be flaming from the specimen after the first 30 seconds.~~

3. ~~If the weight loss of the specimen during testing exceeds 50 percent, the recorded temperature of the surface and interior thermocouples shall not at any time during the test rise above the furnace air temperature at the beginning of the test, and there shall not be flaming of the specimen.~~

Reason: This proposal attempts to serve three purposes, all editorial and clarifying in nature:

1. Harmonize definitions found throughout multiple ICC codes (IBC, IRC, IFC, IWUIC, IMC, IFGC, IEBC)

2. Addresses the recent practice that ICC Codes Definitions should not contain requirements

3. Attempts to offer clarity between often-used, and often-confused terms used throughout ICC Codes: specifically, the difference between "Fire-Resistance Rating" (IFC, IBC, IWUIC) "Ignition-Resistant Building Material" (IWUIC), "Flame-Spread Index" (IBC, IRC, IFC, IWUIC, IMC), "Flammable Material" (IBC, IFC) , and "Noncombustible Material" (IRC, IWUIC, IMC, IFGC, IEBC)

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal focusses on terminology harmonization, and does not add any requirements or change exiting requirements.

G12-24 Part III

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee voted 14-0 to disapprove of the proposal. The proposal's proponent asked for the proposal to be disapproved to have an opportunity to work together with stakeholders to bring back a better proposal to CAH2.

Individual Consideration Agenda

Comment 1:

IFGC: SECTION 202

Proponents: Alexander Haldeman, James Hardie Building Products, James Hardie Building Products (alex.haldeman@jameshardie.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Fuel Gas Code

Delete and substitute as follows:

~~**[M] NONCOMBUSTIBLE MATERIALS.**~~
~~A material that does not contribute appreciably to an ambient fire. Materials that comply with Section 703.3.1 of the International Building Code are considered noncombustible materials.~~

[M] NONCOMBUSTIBLE MATERIALS. See Section 703.3 of the I*nternational Building Code.*

Reason: During CAH1, this proposal was requested to be disapproved to have an opportunity to work with stakeholders to address concerns expressed.
Working with many stakeholders to revise language, we feel this proposal addresses those prior expressions.

The term “noncombustible material” is used many times within this code, is not consistently defined relative to other i-codes, and improperly includes requirements within a definition.

To address this, proposal G12-24 parts I-IV, seeks to address these issues by unifying to those of the requirements of International Building Code Section 703.3.The International Building Code has criteria outlining what qualifies a material as noncombustible within the context of code, “noncombustible material” however is not defined within IBC, so performance requirements within IBC section 703.3 cannot be used in this code per IFGC 201.3.

While IFGC and IMC currently do contain definitions for “noncombustible material”; both incorrectly mandate requirements within a definition and neither definition matches that of each other or of the IBC requirements in 703.3, which includes an additional test method ASTM E2652 and also makes exception for materials using surfacing not more than 0.125 inch with flame spread index less than 50.

This proposal is not defining requirements , it will simply guide users to what qualifies a material as noncombustible in context of the i-codes.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

It does not add or remove any requirements. It is clarifying to a user where to find the performance requirements.

G12-24 Part V

IWUIC: SECTION 202

Proposed Change as Submitted

Proponents: Alexander Haldeman, James Hardie Building Products, James Hardie Building Products (alex.haldeman@jameshardie.com)

2024 International Wildland Urban Interface Code

Revise as follows:

NONCOMBUSTIBLE MATERIAL. ~~As applied to building construction material means a material that, in the form in which it is used, is either one of the following:~~

A material that does not contribute appreciably to an ambient fire. Materials that comply with Section 703.3.1 of the *International Building Code* are considered noncombustible materials.

~~1. Material of which no part will ignite and burn when subjected to fire. Any material conforming to ASTM E136 shall be considered noncombustible within the meaning of this section.~~

~~2. Material having a structural base of noncombustible material as defined in Item 1 above, with a surfacing material not over 1/8 inch (3.2 mm) thick, which has a flame spread index of 50 or less. Flame spread index as used herein refers to a flame spread index obtained according to tests conducted as specified in ASTM E84 or UL 723.~~

~~"Noncombustible" does not apply to surface finish materials. Material required to be noncombustible for reduced clearances to flues, heating appliances or other sources of high temperature shall refer to material conforming to Item 1. No material shall be classified as noncombustible that is subject to increase in combustibility or flame spread index, beyond the limits herein established, through the effects of age, moisture or other atmospheric condition.~~

Reason: This proposal attempts to serve three purposes, all editorial and clarifying in nature:

1. Harmonize definitions found throughout multiple ICC codes (IBC, IRC, IFC, IWUIC, IMC, IFGC, IEBC)

2. Addresses the recent practice that ICC Codes Definitions should not contain requirements

3. Attempts to offer clarity between often-used, and often-confused terms used throughout ICC Codes: specifically, the difference between "Fire-Resistance Rating" (IFC, IBC, IWUIC) "Ignition-Resistant Building Material" (IWUIC), "Flame-Spread Index" (IBC, IRC, IFC, IWUIC, IMC), "Flammable Material" (IBC, IFC) , and "Noncombustible Material" (IRC, IWUIC, IMC, IFGC, IEBC)

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal focusses on terminology harmonization, and does not add any requirements or change exiting requirements.

G12-24 Part V

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee stated that the reasons for the disapproval of the proposal were: The problem with the fact that there

was not information on the part of the definition that says in the form in which it is used and the other language in the definition that is being deleted. The reference to either 703.3 or 703.3.1 does reference an alternate reference standard which was not substantiated as noncombustible materials. (Vote: 13-0)

G12-24 Part V

Individual Consideration Agenda

Comment 1:

IWUIC: SECTION 202

Proponents: Alexander Haldeman, James Hardie Building Products, James Hardie Building Products (alex.haldeman@jameshardie.com) requests As Modified by Committee (AMC2)

Replace as follows:

2024 International Wildland Urban Interface Code

Delete and substitute as follows:

~~**NONCOMBUSTIBLE MATERIAL.**~~
~~A material that does not contribute appreciably to an ambient fire. Materials that comply with Section 703.3.1 of the *International Building Code* are considered noncombustible materials.~~

NONCOMBUSTIBLE MATERIAL.
See Section 503.2.1

Reason: Prior language suggested in the original proposal raised concerns from stakeholders. This proposal attempts to address prior concerns expressed while still making the code more user-friendly by providing guidance to users as to what qualifies a material as noncombustible in context of this code; which is acting as an overlay to other codes as set forth in section 501.1 and 501.2 (which is being updated/corrected per WUIC14 to include the *International Residential Code* and emphasizes that the provisions of this code shall apply).

The performance requirements of noncombustible material within the context of this code, as submitted in WUIC16-24 by FCAC and approved as modified, differ from that of IBC; it cannot be assumed a user of this code would be aware without being highlighted by italics via a definition within this code.

The original definition within WUI had requirements, contained language including the phrase “in the form in which it is used”, and also did not reference the alternate test method ASTM E2652. It is agreed that requirements should not be within definitions.; WUIC16-24, which was approved as modified in CAH1, both removes language from this code such as “in the form in which it is used” as it is implied and not used in other codes; and also adds reference to the alternate test method ASTM E2652, which is commonly accepted as an alternate test method provided the acceptance criteria of ASTM E136 are met.

This proposal is building upon both WUIC14-24 and WUIC16-24. This proposal is not defining requirements, it is a pointer guiding users to what is meant by the term within the context of this code.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal is clarifying in nature and will not result in cost impacts.

Comment 2:

Proponents: Marcelo Hirschler, GBH International, GBH International (mmh@gbhint.com) requests Disapproved

Reason: Continue disapproving this proposal. The committee approved WUIC 16-24 as modified so that there is no definition of noncombustible in the IWUIC and this proposal would partially undo that action.

Cost Impact: No change to code.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

G14-24

IBC: SECTION 202; IFC: SECTION 202

Proposed Change as Submitted

Proponents: David Cooper, Stair Manufacturing and Design Consultants, Stairbuilders and Manufacturers Association, SMA (coderep@stairways.org)

THIS CODE CHANGE WILL BE HEARD BY THE IBC EGRESS COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

2024 International Building Code

Revise as follows:

[BE] SCISSOR STAIRWAY. ~~Two interlocking~~Independent *stairways* located within a common exit enclosure, providing not less than two separate paths of egress located within one *exit* enclosure.

2024 International Fire Code

Revise as follows:

[BE] SCISSOR STAIRWAY. ~~Two interlocking~~ Independent *stairways* located within a common exit enclosure, providing not less than two separate paths of egress located within one *exit* enclosure.

Reason: The term interlocking as defined in most dictionaries implies connection, and is defined as:

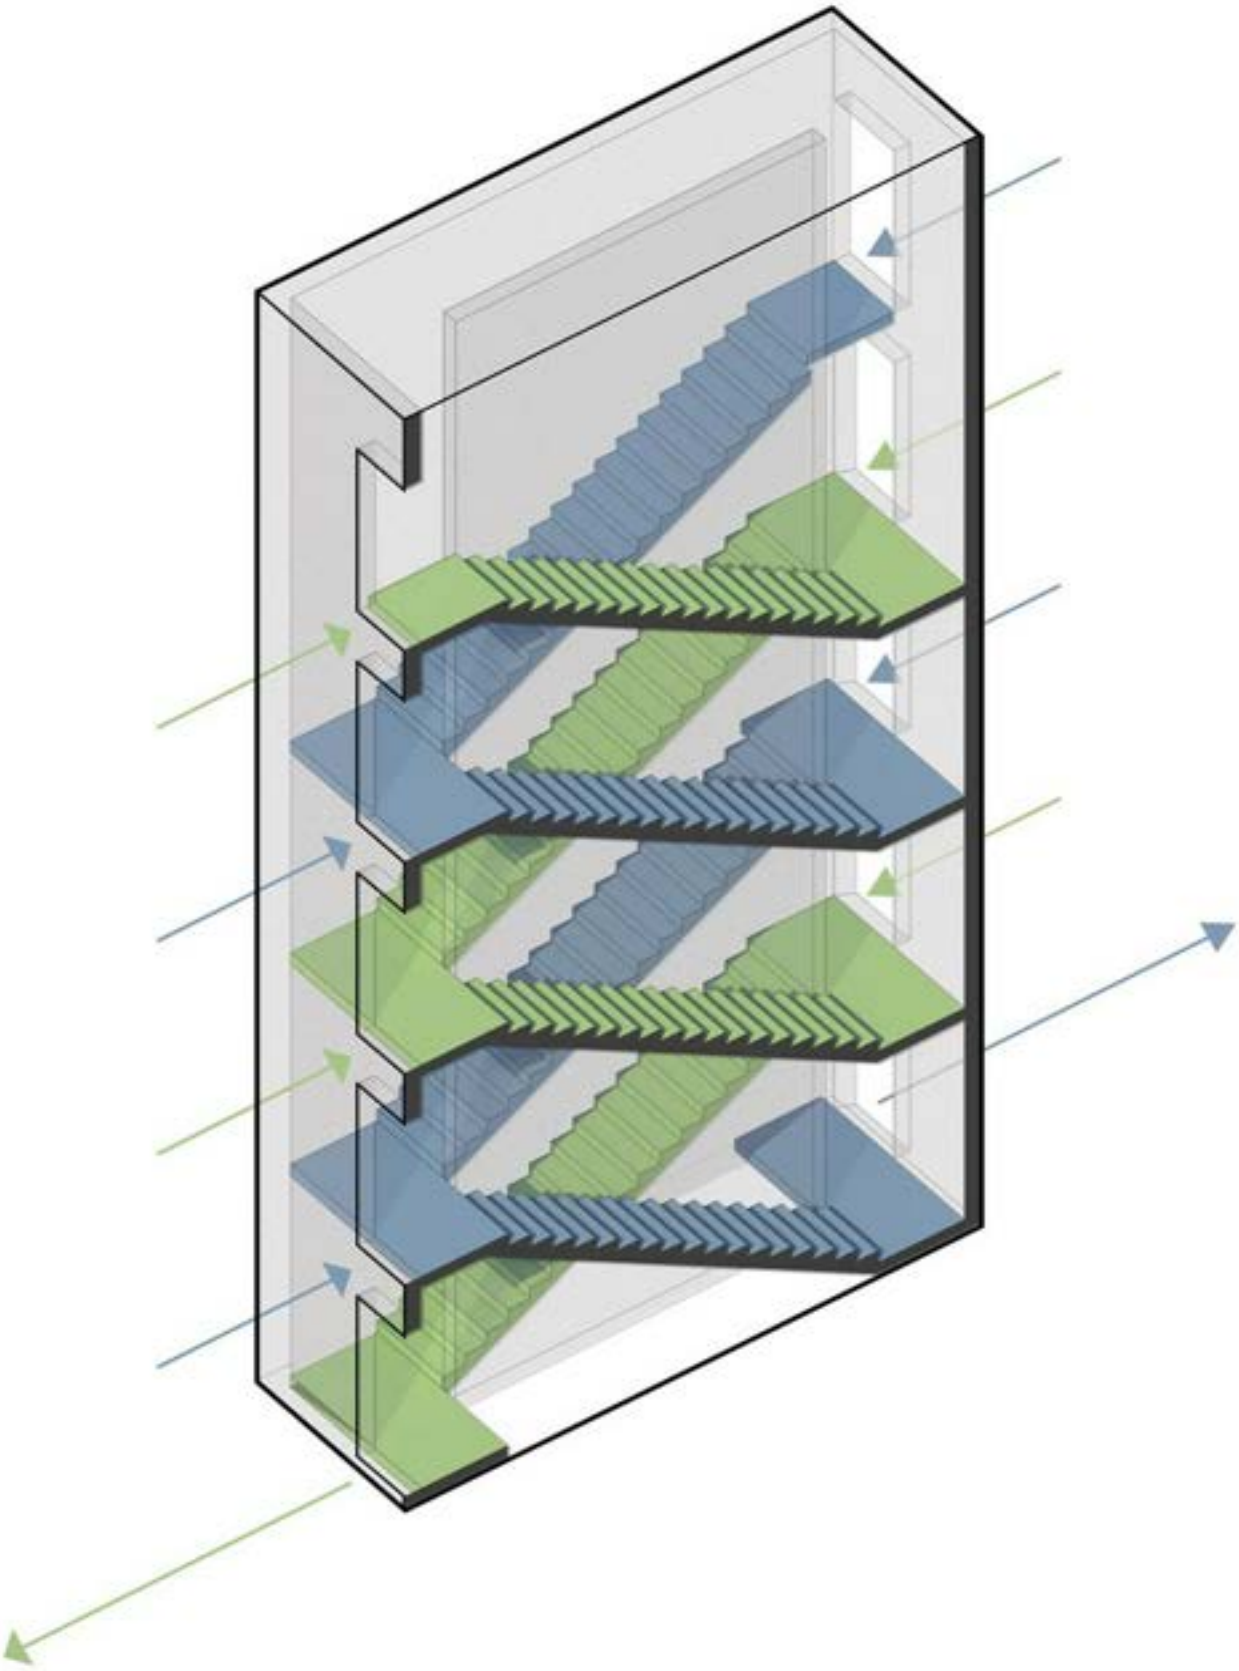
- Webster: 1. to lock together; join with one another. 2. to connect or be connected so that neither part can be operated independently.
- Merriam-Webster: 1. locked together. 2. to connect so that the motion or operation of any part is constrained by another.

A scissor stairway consists of separate stairways that are not connected. Each stairway serves the same function within a common enclosure, but they do so independently without constraining the other. Deleting the term interlocking and inserting independent offers a clearer description. The limit of "two" stairways is incorrect and must be deleted. Figure 1 shows an example of a scissor stairway with 8 stairways as the term stairway is defined in the IBC:

> **Stairway.** One or more flights of stairs, either exterior or interior, with the necessary landings and platforms connecting them, to form a continuous and uninterrupted passage from one level to another.

Please support approval as submitted. This proposal offers clarification and will promote consistent interpretation.

Graphic courtesy of Chris Johns, ThoughtCraft Architects LLC



Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal modifies the descriptive language by providing a more appropriate adjective, adds clarifying language and corrects the numerical error within the definition to align with the ICC defined terms used in the definition. It will have no impact on the cost of construction as it makes no technical changes relative to construction or the cost thereof.

G14-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee felt that the term "independent" would be confused stairways with two separate stairway enclosures. Another word such as "intertwined" might be clearer. Removing 'interlocking' should be coordinated with the text in Section 403.5.1 and 1007.1.1. (Vote: 10-4)

G14-24

Individual Consideration Agenda

Comment 1:

IBC: SECTION 202, 1007.1.1, [BE] 403.5.1; IFC: SECTION 202, [BE] 1007.1.1

Proponents: David Cooper, Stair Manufacturing and Design Consultants, Stairbuilders and Manufacturers Association, SMA (coderep@stairways.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

Delete and substitute as follows:

~~**[BE] SCISSOR STAIRWAY.** Independent *stairways* located within a common exit enclosure, providing not less than two separate paths of egress located within one *exit* enclosure.~~
[BE] SCISSOR STAIRWAY. Multiple *stairways*, located within a common exit enclosure, providing two or more paths of egress without fire separation between them.

1007.1.1 Two exits or exit access doorways. Where two *exits*, *exit access doorways*, *exit access stairways* or *ramps*, or any combination thereof, are required from any portion of the *exit access*, they shall be placed a distance apart equal to not less than one-half of the length of the maximum overall diagonal dimension of the *building* or area to be served measured in a straight line between them. ~~Interlocking or *scissor*~~ *Scissor stairways* shall be counted as one *exit stairway*. **Exceptions:**

1. Where interior *exit stairways* or *ramps* are interconnected by a 1-hour fire-resistance-rated *corridor* conforming to the requirements of Section 1020, the required exit separation shall be measured along the shortest direct line of travel within the *corridor*.
2. Where a *building* is equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or 903.3.1.2, the separation distance shall be not less than one-third of the length of the maximum overall diagonal dimension of the area served.

[BE] 403.5.1 Remoteness of interior exit stairways. Required *interior exit stairways* shall be separated by a distance not less than 30 feet (9144 mm) or not less than one-fourth of the length of the maximum overall diagonal dimension of the *building* or area to be served, whichever is less. The distance shall be measured in a straight line between the nearest points of the enclosure surrounding the *interior exit stairways*. In *buildings* with three or more *interior exit stairways*, not fewer than two of the *interior exit stairways* shall comply with this section. ~~Interlocking or *scissor*~~ *Scissor stairways* shall be counted as one *interior exit stairway*.

2024 International Fire Code

Delete and substitute as follows:

~~**[BE] SCISSOR STAIRWAY.** Independent *stairways* located within a common exit enclosure, providing not less than two separate paths of egress located within one *exit* enclosure.~~
[BE] SCISSOR STAIRWAY. Multiple *stairways*, located within a common exit enclosure, poviding two or more paths of egress without fire separation between them.

[BE] 1007.1.1 Two exits or exit access doorways. Where two *exits*, *exit access doorways*, *exit access stairways* or *ramps*, or any combination thereof, are required from any portion of the *exit access*, they shall be placed a distance apart equal to not less than one-half of the length of the maximum overall diagonal dimension of the *building* or area to be served measured in a straight line between them. ~~Interlocking or *scissor*~~ *Scissor stairways* shall be counted as one *exit stairway*. **Exceptions:**

1. Where *interior exit stairways* or *ramps* are interconnected by a 1-hour *fire-resistance-rated corridor* conforming to the requirements of Section 1020, the required exit separation shall be measured along the shortest direct line of travel within the *corridor*.
2. Where a building is equipped throughout with an *automatic sprinkler system* in accordance with Section 903.3.1.1 or 903.3.1.2, the separation distance shall be not less than one-third of the length of the maximum overall diagonal dimension of the area served.

Reason: The related sections cited by the committee that regulate scissor stairs and include the term "interlocking" have been added to this change for the sole purpose of deleting the misused term "interlocking" which was the intent of the original proposal. Sections 1007.1.1 and 403.5.1 clearly indicate the restrictions or limits for the use of scissor stairways without the term "interlocking".

Other than the deletion of interlocking as originally reasoned, the changes in the definition provide clarity and are editorial in nature when compared to the current definition. The new definition reflects the committee's concern to assure the definition does not imply that the multiple paths of egress are separated but rather are within one enclosure. Scissor stairways as now defined will provide additional egress capacity without conflict with, and subject to, 1007.1.1, 403.5.1, and 403.5.2. The definition now addresses committee testimony and reason for their disapproval. It deletes "independent" and "separate" and provides a clear description.

If it is argued that the use of scissor stairs should or should not be restricted in certain applications then those changes need to be made elsewhere in the code. This definition eliminates confusing language and provides an accurate description as was the intent of the original proposal. Please approve as modified by this comment.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal modifies the descriptive language by providing a more appropriate adjective, adds clarifying language and corrects the numerical error within the definition to align with the ICC defined terms used in the definition. It will have no impact on the cost of construction as it makes no technical changes relative to construction or the cost thereof.

Comment (CAH2)# 85

G26-24

IBC: [F] 427.2, [F] TABLE 427.2 (New)

Proposed Change as Submitted

Proponents: Richard Williams, Washington Association of Building Officials Technical Code Development Committee (richard@cwaconsultants.net); Micah Chappell, Seattle Department of Construction and Inspections, Washington Association of Building Officials Technical Code Development Committee (micah.chappell@seattle.gov); Quyen Thai, City of Tacoma, Washington Association of Building Officials Technical Code Development Committee (qthai@cityoftacoma.org)

THIS CODE CHANGE WILL BE HEARD BY THE FIRE CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

2024 International Building Code

SECTION 427
MEDICAL GAS SYSTEMS

Revise as follows:

[F] 427.2 Interior supply location. Medical gases shall be located in areas dedicated to the storage of such gases without other storage or uses. Where containers of medical gases in quantities greater than the ~~permitted amount~~ amounts specified per Table 427.2 are located inside ~~the~~ buildings, they shall be located in a 1-hour exterior room, 1-hour interior room or a *gas cabinet* in accordance with Section 427.2.1, 427.2.2 or 427.2.3, respectively. Rooms or areas where medical gases are stored or used in quantities exceeding the maximum allowable quantity per control area as set forth in Tables 307.1(1) and 307.1(2) shall be in accordance with Group H occupancies.

Add new text as follows:

[F] TABLE 427.2 PERMIT AMOUNTS FOR COMPRESSED GASES

TYPE OF GAS	AMOUNT (cubic feet at NTP)
Carbon dioxide used in carbon dioxide enrichment systems	875 (100 lb)
Carbon dioxide used in insulated liquid carbon dioxide beverage dispensing applications	875 (100 lb)
Corrosive	200
Flammable (except cryogenic fluids and liquefied petroleum gases)	200
Highly toxic	Any Amount
Inert and simple asphyxiant	6,000
Oxidizing (including oxygen)	504
Pyrophoric	Any Amount
Toxic	Any Amount

Reason: The IBC commentary for Section 427.2 mentions IFC Section 105, which deals with permits for various materials. Without the commentary, it is not clear that IFC Section 105 applies in this case, because there is no mention of it in the body of the code section. Also, the IFC and the IMC both specifically state “**permit** amounts”, not “**permitted** amounts”. The word permitted in this context suggests an allowable amount, not an amount allowed by permit. It is also confusing because maximum allowable quantities are listed later in this section and also deal with allowable (permitted) amounts, but are referring to a completely different set of requirements - maximum allowable quantities for a control area.

The proposed change will bring over Table 105.5.9 from the IFC and will rename it Table 427.2. In our opinion it is cleaner to bring the table over rather than referencing individual sections in the IFC (Sections 105.5.9 and 105.6.3 both reference Table 105.5.9). This change will help to make clear when one-hour rooms (and sprinklers) or gas cabinets are required for medical gas installations.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal does not impact the cost of construction because it does not change existing requirements - it only attempts to clarify them. However, this clarification may in some cases result in situations where it is determined that fire rated construction, sprinklers and gas cabinets that would have previously been provided are no longer required.

G26-24

Public Hearing Results (CAH1)

Committee Action: **As Modified by Committee**

Committee Modification: Revise as follows:[F] TABLE 427.2 ~~PERMIT~~ AMOUNTS FOR COMPRESSED GASES

Committee Reason: This proposal was approved as it provides the necessary correlation in the IBC as to when these requirement apply. The modification simply removes the term "permit" from the title of the table. (Vote 9-4)

G26-24

Individual Consideration Agenda

Comment 1:

IBC: SECTION 427, [F] 427.1, [F] 427.2, [F] TABLE 427.2; IFC: SECTION 5306, 5306.1, 5306.2, TABLE 5306.2 (New)

Proponents: Jeff O'Neil, Chair, Committee on Healthcare (ahc@iccsafe.org) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

SECTION 427
MEDICAL GAS SYSTEMS

[F] 427.1 General. Medical gases at health care-related *facilities* intended for patient or veterinary care shall comply with Sections 427.2 through 427.2.3 in addition to the requirements of Chapter 53 of the International Fire Code.

[F] 427.2 Interior supply location. Medical gases shall be located in areas dedicated to the storage of such gases without other storage or uses. Rooms containing medical gases shall be labeled in accordance with NFPA 99. Where containers of medical gases in quantities greater than the amounts specified per Table 427.2 are located inside buildings, they shall be located in a 1-hour exterior room, 1-hour interior room or a *gas cabinet* in accordance with Section 427.2.1, 427.2.2 or 427.2.3, respectively. Rooms or areas where medical gases are stored or used in quantities exceeding the maximum allowable quantity per control area as set forth in Tables 307.1(1) and 307.1(2) shall be in accordance with Group H occupancies.

[F] TABLE 427.2 AMOUNTS FOR COMPRESSED MEDICAL GASES

TYPE OF GAS	AMOUNT (cubic feet at NTP)

~~Carbon dioxide used in carbon dioxide enrichment systems~~	~~875 (100 lb)~~
~~Carbon dioxide used in insulated liquid carbon dioxide beverage dispensing applications~~	~~875 (100 lb)~~
~~Corrosive~~	~~200~~
~~Flammable (except cryogenic fluids and liquefied petroleum gases)~~	~~200~~
~~Highly toxic~~	~~Any Amount~~
For hospitals, nursing homes and ambulatory care facilities	
Inert and simple asphyxiant	Comply with NFPA99
Oxidizing (including oxygen)	Comply with NFPA99
For health care-related facilities other than hospitals, nursing homes and ambulatory care facilities	
Inert and simple asphyxiant	6,000
Oxidizing (including oxygen)	504
~~Pyrophoric~~	~~Any Amount~~
~~Toxic~~	~~Any Amount~~

2024 International Fire Code

SECTION 5306
MEDICAL GASES

5306.1 General. Medical gases at health care-related facilities intended for patient or veterinary care shall comply with Sections 5306.2 through 5306.5 in addition to other requirements of this chapter ~~and Section 427 of the International Building Code~~.

5306.2 Interior supply location. Medical gases shall be located in areas dedicated to the storage of such gases without other storage or uses. Rooms containing medical gases shall be labeled in accordance with NFPA 99. Where containers of medical gases in quantities greater than the ~~permitted amount~~ amounts specified per Table 5306.2 are located inside buildings, they shall be in a 1-hour exterior room, a 1-hour interior room or a gas cabinet in accordance with Section 5306.2.1, 5306.2.2 or 5306.2.3, respectively. Rooms or areas where medical gases are stored or used in quantities exceeding the *maximum allowable quantity per control area* as set forth in Section 5003.1 shall be in accordance with the *International Building Code* for high-hazard Group H occupancies.

Add new text as follows:

TABLE 5306.2 AMOUNTS FOR COMPRESSED MEDICAL GASES

TYPE OF GAS	AMOUNT (cubic feet at NTP)
For hospitals, nursing homes and ambulatory care facilities	
Inert and simple asphyxiant	Comply with NFPA99
Oxidizing (including oxygen)	Comply with NFPA99
For health care-related facilities other than hospitals, nursing homes and ambulatory care facilities	
Inert and simple asphyxiant	6,000
Oxidizing (including oxygen)	504

Reason: IFC Table 105.5.9 is an operational permit levels for compressed gasses that are applicable to all occupancies.

IBC Section 427 is a copy of the first part of IFC Section 5306. Therefore the reference in IFC Section 5306.1 to IBC Section 427 is redundant.

IBC Section 427 and IFC Section 5306 are applicable to “medical gases in health care related facilities intended for patient or veterinary care.” Medical gasses are only two of the gasses listed in Table 105.5.9, so this complete table should not be listed. Having all the compressed gasses would be confusing. These two types of medical gases are listed in the new proposed table IBC Table 427.2 and IFC Table 5306.2.

For facilities covered under NFPA 99- hospitals, nursing homes and ambulatory care facilities – the table will coordinate with NFPA 99 requirements. Compliance is required for licensure for hospitals, nursing homes and ambulatory care facilities. NFPA 99 has different levels and similar room and cabinet protection requirements. The rest of the table is for other healthcare facilities addressed is this section such as doctor's offices, dentists and veterinarians.We feel that the this modification will address the proponent's concerns for clarifying limits for compressed gases. The reference to NFPA 99 will provide for a comparable level of protection in hospitals, nursing homes and ambulatory care facilities and will reduce conflicts between building code and licensure requirements that are expensive and often difficult for hospitals, nursing homes and ambulatory care facilities to address.

This proposal is submitted by the ICC Committee for Healthcare (CHC).
The Committee on Healthcare (CHC) was established by the ICC Board of Directors in 2011 to pursue opportunities to study and develop effective and efficient provisions for Hospital, Nursing Homes, Assisted Living and Ambulatory Care Facilities. This committee was formed in cooperation with the American Society for Healthcare Engineering (ASHE). In July of 2017, the ICC Board made CHC a standing committee. In 2024 the CHC has held several virtual meetings open to any interested party. In addition, there were numerous virtual Working Group meetings for the current code development cycle, which included members of the committee as well as interested parties. Related documents and reports are posted on the CHC website at CHC webpage.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal does not impact the cost of construction because it does not change existing requirements - it only attempts to clarify them. However, this clarification may in some cases result in situations where it is determined that fire rated construction, sprinklers and gas cabinets that would have previously been provided are no longer required.

IBC: [P] 1210.2.2, [P] 1210.3, [P] 1210.3.1, [P] 1210.3.2, Chapter 35 IAPMO (New)

Proposed Change as Submitted

Proponents: Julius Ballanco, P.E., JB Engineering and Code Consulting, P.C., Bradley Corp. (jbengineer@aol.com)

THIS CODE CHANGE WILL BE HEARD BY THE PLUMBING COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEES.

2024 International Building Code

SECTION 1210
TOILET AND BATHROOM REQUIREMENTS

Revise as follows:

[P] 1210.2.2 Walls and partitions. Walls and partitions within 2 feet (610 mm) of service sinks, urinals and water closets shall have a smooth, hard, nonabsorbent surface, to a height of not less than 4 feet (1219 mm) above the floor, and except for structural elements, the materials used in such walls shall be of a type that is not adversely affected by moisture. Premanufactured partitions for water closets or urinals shall comply with IAPMO Z124.10. **Exception:** This section does not apply to the following *buildings* and spaces:

1. *Dwelling units* and *sleeping units*.
2. Toilet rooms that are not for use by the general public and that have not more than one water closet.

Accessories such as grab bars, towel bars, paper dispensers and soap dishes, provided on or within walls, shall be installed and sealed to protect structural elements from moisture.

[P] 1210.3 Privacy. Public restrooms shall ~~be visually screened from outside entry or exit doorways to ensure user privacy within the restroom. This provision shall also apply where mirrors would compromise personal privacy. Privacy at~~ provide privacy for water closets and urinals ~~shall be provided~~ in accordance with Sections 1210.3.1 and 1210.3.2. ~~**Exception:** Visual screening shall not be required for single-occupant toilet rooms with a lockable door.~~

[P] 1210.3.1 Water closet compartment. Each water closet utilized by the public or employees shall occupy a separate compartment with walls or partitions and a door enclosing the fixtures to ensure privacy. Premanufactured partitions for water closets located in separate gender toilet or bathing rooms shall comply with the Type B privacy requirements of IAPMO Z124.10. Premanufactured partitions for water closets located in all gender toilet rooms shall comply with the Type A privacy requirements of IAPMO Z124.10 or the water closet shall be located in separate room with a lockable door. **Exceptions:**

1. Water closet compartments shall not be required in a single-occupant toilet room with a lockable door.
2. Toilet rooms located in child day care *facilities* and containing two or more water closets shall be permitted to have one water closet without an enclosing compartment.
3. This provision is not applicable to toilet areas located within Group I-3 occupancy housing areas.

[P] 1210.3.2 Urinal partitions. Each urinal utilized by the public or employees shall occupy a separate area with walls or partitions to provide privacy. Premanufactured partitions for urinals located in separate gender toilet or bathing rooms shall comply with the Type C privacy requirements of IAPMO Z124.10. The horizontal dimension between walls or partitions at each urinal shall be not less than 30 inches (762 mm). The walls ~~or partitions~~ shall ~~begin at a height not more than 12 inches (305 mm) from and~~ extend not less than 60 inches (1524 mm) above the finished floor surface. The walls ~~or partitions~~ shall extend from the wall surface at each side of the urinal not less than 18 inches (457 mm) or to a point not less than 6 inches (152 mm) beyond the outermost front lip of the urinal measured from the finished backwall surface, whichever is greater. Urinals located in all gender toilet rooms shall be enclosed by premanufactured

partitions complying with the Type A privacy requirements of IAPMO Z124.10 or the urinals shall be located in a separate room.

Exceptions:

1. Urinal partitions shall not be required in a single-occupant or family or assisted-use toilet room with a lockable door.
2. Toilet rooms located in child day care *facilities* and containing two or more urinals shall be permitted to have one urinal without partitions.

Add new text as follows:

IAPMO ANSI/CAN Z124.10-2022. Water Closets And Urinal Partitions

Reason: IAPMO Z124.10 is a new standard that regulates water closet and urinal partitions. The standard was published in 2022. The standard specified three different privacy ratings. In addition, there are tests for the quality of the partition. The tests include load, coating, surface examination, subsurface, colorfastness, stain resistance, wear and cleanability, chemical resistance, and stress test to name a few.

Type A privacy partitions are intended for all gender toilet rooms and provide the highest level of privacy. The standard states the following privacy requirements, “The bottom edge of the partition including the door shall be located less than or equal to 100 mm (4 in) off the finished floor. The top edge of the partition including the door shall be located greater than or equal to 2.13 m (84 in) above the finished floor. The full height of the door to the partitions on both sides shall prevent any visual observation from the outside of the partition enclosure. Doors shall be lockable from the inside of the partition enclosure. The door locking device shall be readily distinguishable as locked from the outside of the partition enclosure.” Furthermore, the standard requires a visual indication that the compartment is occupied when the partition door lock is activated.

Type B privacy partitions are standard water closet partitions found in separate gender toilet rooms. The standard states the following for privacy, “The bottom edge of the partition including the door shall be located within 406 mm (16 in) of the finished floor. The top edge of the partition including the door shall be located greater than or equal to 1.75 m (69 in) above the finished floor. The door to the partitions shall have a maximum of 13 mm (½ in) gap between the edge of the door and the wall of the partition. Doors shall be lockable from the inside of the partition enclosure.”

Type C privacy partitions are urinal partitions. The standard specifies the following requirements, “The bottom of the urinal partition shall be located a maximum of 406 mm (16 in) above the finished floor. The top of the urinal partition shall be a minimum of 1.5 m (60 in) above the finished floor. The urinal partition shall extend a minimum of 457 mm (18 in) from the wall.”

With the increase in the number of all gender toilet rooms, it is important to have proper privacy requirements to assure both privacy and security. This proposed change will require water closets and urinals in all gender toilet rooms to be enclosed in Type A privacy partitions or be located in a separate room. This will provide the highest level of privacy and security. Because of the added high level of privacy and security, the exception to Section 1210.3 becomes unnecessary. All of the privacy requirements are listed in the following two sections.

Type B privacy partitions are standard water closet partitions found in men’s and ladies’ rooms today. However, the gap between partition sections or between the door and frame have been reduced to ½ inch. Currently, there is no regulation on the gap in partitions nor are there any regulations for the quality of the partitions.

Type C privacy partitions are urinal partitions currently found in men’s rooms. Type C partitions are only intended for separate gender toilet rooms. In all gender toilet rooms, urinals are located similar to water closets to ensure privacy.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Estimated Immediate Cost Impact:

This change could increase the cost of construction $0.12 to $6.04 per partition, dependent on partition production volume. Compliance with the standard will add a cost to manufacturers for the testing and listing of partitions. That cost may or may not be added to the cost of the product.

Estimated Immediate Cost Impact Justification (methodology and variables):

If a design professional intended to select a standard partition for an all gender toilet room, this change will increase the cost of construction by mandating a higher level of privacy and security. It should be noted that manufacturers are prohibited by Federal Law to discuss prices. That being stated, one can review the cost of listing a product on-line. Compliance with the standard will add a cost to manufacturers for the testing and listing of partitions. In an attempt to find out the listing costs, one can check the ICC-ES website. The questions of what a cost of a listing is results in the following answer: Fees may vary. Contact us for a Statement of Work and/or an initial estimate. Similarly, IAPMO R&T does not publish fees. One can only request a quote for a listing. A Google search for the cost of a UL listing identified the cost as ranging between $5,000 and $50,000. Intertek advertises an annual listing fee of $6,040 for a single sanitary product, which is what a partition would likely be classified as. Hence, the exact dollar amount for a listing is unknown. That listing cost may or may not be added to the cost of the product. If it is added to the cost of the product, that additional cost will add to the cost of construction. However, manufacturers do not indicate if listing costs increase the cost of the product (construction). Hence, the impact is unknown. If one assumes the Intertek price for a listing and further assumes that the manufacturer sells 50,000 partitions a year, the increase cost of construction per partition could be assumed to be $0.12. If they only sell 1,000 partitions, the increased cost per partition would be $6.04.

Estimated Life Cycle Cost Impact:

Once installed, privacy partitions do not have any impact on life cycle costs.

Estimated Life Cycle Cost Impact Justification (methodology and variables):

Once installed, privacy partitions do not have any impact on life cycle costs.

G28-24

Public Hearing Results (CAH1)

Committee Action: **As Submitted**

Committee Reason: This proposal adds clarity for privacy of compartments in specific applications. (13-1)

G28-24

Individual Consideration Agenda

Comment 1:

IBC: [P] 1210.2.2

Proponents: Tim Earl, GBH International, Self (tearl@gbhint.com) requests As Modified by Committee (AMC2)

Modify as follows:

2024 International Building Code

[P] 1210.2.2 Walls and partitions. Walls and partitions within 2 feet (610 mm) of service sinks, urinals and water closets shall have a

smooth, hard, nonabsorbent surface, to a height of not less than 4 feet (1219 mm) above the floor, and except for structural elements, the materials used in such walls shall be of a type that is not adversely affected by moisture. Premanufactured partitions for water closets or urinals shall comply with IAPMO Z124.10. High-density polyethylene (HDPE) and polypropylene (PP) partitions shall also comply with Section 803.9 of the *International Building Code*. **Exception:** This section does not apply to the following *buildings* and spaces:

1. *Dwelling units* and *sleeping units*.
2. Toilet rooms that are not for use by the general public and that have not more than one water closet.

Accessories such as grab bars, towel bars, paper dispensers and soap dishes, provided on or within walls, shall be installed and sealed to protect structural elements from moisture.

Reason: The reference to IAPMO Z124.10 will create ambiguity about the fire testing requirements, as the committee noted when disapproving P30, which would have added it to the IPC. This comment addresses that.
Section 803.9 of the IBC contains fire test requirements for HDPE and PP used as interior finish. Toilet room partitions are included in the IBC definition of interior finish. Therefore, they must comply with Section 803.9 of the IBC. The test referenced in 803.9 is necessary to obtain meaningful performance data from these materials, whose melting and dripping behavior can produce misleadingly positive results in other fire tests.
Since IAPMO Z124.10 contains a different fire test, users may erroneously believe that no other fire testing is required of partitions. The addition of this specific reference to 803.9 for HDPE and PP will ensure that the proper testing is not overlooked.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This is simply a pointer to existing requirements.

Comment (CAH2)# 63

G29-24

IBC: [F] 3003.1.4

Proposed Change as Submitted

Proponents: Kevin Brinkman, NEI, NEII (klbrinkman@neii.org)

THIS CODE CHANGE WILL BE HEARD BY THE FIRE CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THIS COMMITTEE.

2024 International Building Code

SECTION 3003
EMERGENCY OPERATIONS

Revise as follows:

[F] 3003.1.4 Temperature Control ~~Venting~~. Where standby power is connected to elevators~~, the machine room *ventilation* or air conditioning~~ and a temperature control means is provided per Section 3005.2, the temperature control means shall be connected to the standby power source.

Reason: To correlate the title and requirements with IBC Section 3005.2. The current titles and language are misleading because the real purpose is to provide standby power for the means to control the temperature for proper operation of the elevator equipment. This public comment to modify the proposal correlates with the public comment and proposal for IFC 604.3.4.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

There is no change in the requirement for standby power, only a clarification to better align with another section in IBC.

G29-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: Disapproved based upon the action on F82-24. (Vote 14-0)

G29-24

Individual Consideration Agenda

Comment 1:

IBC: [F] 3003.1.4

Proponents: Kevin Brinkman, NEI, NEII (klbrinkman@neii.org) requests As Modified by Committee (AMC2)

Replace as follows:

2024 International Building Code

Delete and substitute as follows:

~~**[F] 3003.1.4 Venting.** Where standby power is connected to elevators, the machine room *ventilation* or air conditioning shall be connected to the standby power source.~~

[F] 3003.1.4 Temperature Control. Where standby power is connected to elevators, the system for temperature control of spaces containing elevator equipment provided per Section 3005.2, shall be connected to the standby power source.

Reason: The requested changes are needed to correlate the title and requirements with IBC Section 3005.2 which was updated in the 2024 edition. “Temperature Control” more accurately describes the function and avoids confusion with “venting” which refers to the removal of smoke and gases during a fire. “Temperature Control” is used in other parts of the Code. Standby power is needed not just for cooling of the equipment to prevent overheating, but also to maintain the temperature in the appropriate range to ensure proper operation of the elevator. If the temperature in the equipment rooms and spaces is allowed to drop below acceptable levels, the elevator may not function properly. The alternate language addresses a comment from committee during CAH#1 to clarify that the standby power is any system provided to comply with 3005.2.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

The change is clarifying the requirement not changing it; therefore, there is no cost associated with the proposed change.

Comment (CAH2)# 483

IBC: [BF] 1705.15, [BF] 1705.15.1, [BF] 1705.15.2, [BF] 1705.15.3, [BF] 1705.15.4, [BF] 1705.15.4.1, [BF] 1705.15.4.2, [BF] 1705.15.4.3, [BF] 1705.15.4.4, [BF] 1705.15.4.5, [BF] 1705.15.4.6, [BF] 1705.15.4.7, [BF] 1705.15.4.8, [BF] 1705.15.4.9, [BF] 1705.15.5, [BF] 1705.15.6, [BF] 1705.15.6.1, [BF] 1705.15.6.2, [BF] 1705.15.6.3, ASTM Chapter 35 (New)

Proposed Change as Submitted

Proponents: Bill McHugh, CM Services, National Fireproofing Contractors Association (bill@mc-hugh.us)

THIS CODE CHANGE WILL BE HEARD BY THE IBC - FIRE SAFETY CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THAT COMMITTEE.

2024 International Building Code

Revise as follows:

[BF] 1705.15 Sprayed fire-resistive materials (SFRM). *Special inspections* and tests of *sprayed fire-resistive materials* (*SFRM*) applied to floor, roof and wall assemblies and structural members shall be performed in accordance with Sections 1705.15.1 through 1705.15.6 and ASTM WK70851. *Special inspections* shall be based on the fire-resistance design. as designated in the *approved construction documents* The tests set forth in this section shall be based on samplings from specific floor, roof and wall assemblies and structural members. *Special inspections* and tests shall be performed during construction with an additional visual inspection after the rough installation of electrical, *automatic sprinkler systems* , mechanical and plumbing systems and suspension systems for ceilings, and before concealment where applicable. The required sample size shall not exceed 110 percent of that specified by the referenced standards in Sections 1705.15.4.1 through 1705.15.4.9.

[BF] 1705.15.1 Physical and visual tests. The *special inspections* and tests shall include the following to demonstrate compliance with the listing and the *fire-resistance rating*:

1. Condition of substrates.
2. Thickness of application.
3. Density in pounds per cubic foot (kg/m^3).
4. Bond strength adhesion/cohesion.
5. Condition of finished application.

[BF] 1705.15.2 Structural member surface conditions. The surfaces shall be prepared in accordance with the *approved* fire-resistance design and the written instructions of *approved* manufacturers. The prepared surface of structural members to be sprayed shall be inspected by the *special inspector* before the application of the *SFRM* .

Revise as follows:

[BF] 1705.15.3 ~~Application~~ Substrate temperature verification and ventilation. The substrate shall have a minimum ambient temperature before and after application as specified in the written instructions of *approved* manufacturers. The area for application shall be ventilated during and after application as required by the written instructions of *approved* manufacturers.

[BF] 1705.15.4 Thickness. *SFRM* thickness shall be no less than allowed by ASTM E605. Not more than 10 percent of the thickness measurements of the *SFRM* applied to floor, roof and wall assemblies and structural members shall be less than the thickness required by the *approved* fire-resistance design, and none shall be less than the minimum allowable thickness required by Section 1705.15.4.1.

[BF] 1705.15.4.1 Minimum allowable thickness. For design thicknesses 1 inch (25 mm) or greater, the minimum allowable individual thickness shall be the design thickness minus 1/4 inch (6.4 mm). For design thicknesses less than 1 inch (25 mm), the minimum allowable individual thickness shall be the design thickness minus 25 percent. Thickness shall be determined in accordance with ASTM

E605. Samples of the *SFRM* shall be selected in accordance with Sections 1705.15.4.2 and 1705.15.4.3.

[BF] 1705.15.4.2 Floor, roof and wall assemblies. The thickness of the *SFRM* applied to floor, roof and wall assemblies shall be determined in accordance with ASTM E605, making not less than four measurements for each 1,000 square feet (93 m^2) of the sprayed area, or portion thereof, in each *story*.

Revise as follows:

[BF] ~~1705.15.4.3 Cellular decks.~~ ~~Thickness measurements shall be selected from a square area, 12 inches by 12 inches (305 mm by 305 mm) in size. Not fewer than four measurements shall be made, located symmetrically within the square area.~~

[BF] ~~1705.15.4.4 Fluted decks.~~ ~~Thickness measurements shall be selected from a square area, 12 inches by 12 inches (305 mm by 305 mm) in size. Not fewer than four measurements shall be made, located symmetrically within the square area, including one each of the following: valley, crest and sides. The average of the measurements shall be reported.~~

[BF] 1705.15.4.5 Structural members. The thickness of the *SFRM* applied to structural members shall be determined in accordance with ASTM E605. Thickness testing shall be performed in accordance with acceptance criteria in ASTM E605, or on not less than 25 percent of the structural members on each floor, whichever is greater.

[BF] ~~1705.15.4.6 Beams and girders.~~ ~~At beams and girders thickness measurements shall be made at nine locations around the beam or girder at each end of a 12-inch (305-mm) length.~~

[BF] ~~1705.15.4.7 Joists and trusses.~~ ~~At joists and trusses, thickness measurements shall be made at seven locations around the joist or truss at each end of a 12-inch (305-mm) length.~~

[BF] ~~1705.15.4.8 Wide-flanged columns.~~ ~~At wide-flanged columns, thickness measurements shall be made at 12 locations around the column at each end of a 12-inch (305-mm) length.~~

[BF] 1705.15.4.9 Hollow structural section and pipe columns. At hollow structural section and pipe columns, thickness measurements shall be made at not fewer than four locations around the column at each end of a 12-inch (305 mm) length.

[BF] 1705.15.5 Density. The density of the *SFRM* shall be not less than the density specified in the *approved* fire-resistance design. Density of the *SFRM* shall be determined in accordance with ASTM E605. The test ~~samples~~ sample quantities for determining the density of the *SFRM* shall be selected as follows:

1. From each floor, roof and wall assembly at the rate of not less than one sample for every 2,500 square feet (232 m^2) or portion thereof of the sprayed area in each *story*.
2. From beams, girders, trusses and columns at the rate of not less than one sample for each type of structural member for each 2,500 square feet (232 m^2) of floor area or portion thereof in each *story*.

[BF] 1705.15.6 Bond strength. The cohesive/adhesive bond strength of the cured *SFRM* applied to floor, roof and wall assemblies and structural members shall be not less than 150 pounds per square foot (psf) (7.18 kN/m^2) for buildings with occupied floors up to 75' (22.86 m) above lowest fire department access. For buildings greater with occupied floors equal to or greater than 75' (22.86 m) above lowest fire department access shall be installed in accordance with bond strengths as listed in Table 403.2.3. The cohesive/adhesive bond strength shall be determined in accordance with the field test specified in ASTM E736 by testing in-place samples of the *SFRM* selected in accordance with Sections 1705.15.6.1 through 1705.15.6.3.

[BF] 1705.15.6.1 Floor, roof and wall assemblies. The test samples for determining the cohesive/adhesive bond strength of the *SFRM* shall be selected from each floor, roof and wall assembly at the rate of not less than one sample for every 2,500 square feet (232 m^2) of the sprayed area, or portion thereof, in each *story*.

[BF] 1705.15.6.2 Structural members. The test samples for determining the cohesive/adhesive bond strength of the *SFRM* shall be

selected from beams, girders, trusses, columns and other structural members at the rate of not less than one sample for each type of structural member for each 2,500 square feet (232 m^2) of floor area or portion thereof in each *story* .

[BF] 1705.15.6.3 Primer, paint and encapsulant bond tests. Bond tests to qualify a primer, paint or encapsulant shall be conducted where the *SFRM* is applied to a primed, painted or encapsulated surface for which acceptable bond-strength performance between these coatings and the *SFRM* has not been determined. A bonding agent approved by the *SFRM* manufacturer shall be applied to a primed, painted or encapsulated surface where the bond strengths are found to be less than required values.

Add new standard(s) as follows:

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box C700
West Conshohocken, PA 19428

WK70851 New Practice for Standard Practice for the On-Site Inspection of Installed Spray-Applied Fire Resistive Materials

Reason: This change deals with Spray Fire-Resistive Material installation special inspections. The proposal's purpose is threefold.

1. Introduce a new ASTM document to SFRM Special Inspection, WK70851 Practice for On-Site Inspection of Installed Spray Fire-Resistive Materials.
2. Clean up the language so that it speaks more inspection than application.
3. Eliminate duplications from IBC 1705.15 code sections and ASTM E605 and E736, standards. Where there was duplicate language from ASTM E605 or ASTM E736, the duplications were deleted from the code. Where the code acceptance criteria is more stringent than the inspection practices/standards, the code requirement language is retained.

The ICC Adhoc Committee on Terrorism Resistant Buildings (ICC TRB) added several items to this section to provide performance of installed SFRM fireproofing during the building life cycle. In preparing this proposal, we respected that legacy and left the increased inspection over and above the ASTM E605 and ASTM E736 alone.

In the interest of making this review easier, we kept several sections in the proposal that had no changes for easy reference and comparison of the code change to existing text. We have also highlighted below the changes and a short reason for each change.

- 1705.15 – Inserted new ASTM Work Item, practice for SFRM inspections on jobsites.
- 1705.15.1 – No change. It's important charging language.
- 1705.15.2 – No change.
- 1705.15.3 – Changed title from Application to Substrate temperature verification and ventilation, to reflect that the inspection standard is an inspection standard, not an application standard.
- 1705.15.4 – Thickness, added in the charging language that the inspection thicknesses are not less than what is in ASTM E605, and left the rest of the section alone, which is not in E605.
- 1705.15.4.1 – Minimum allowable thickness. No change, as the code is more restrictive than the E605.
- 1705.15.4.2 – No change, as the code is more restrictive than the E605.
- 1705.15.4.3 – Cellular decks, deleted, the section is duplicated in E605.
- 1705.15.4.4 – Fluted Decks, deleted, the section is duplicated in E605.
- 1705.15.4.5 – Structural Members – Slight change, that the measurement is to be in accordance with E605 or the code, whichever is greater. The code is more restrictive than the E605.
- 1705.15.4.6 – Beams and girders, deleted, duplicated in E605
- 1705.15.4.7 – Joists and trusses, deleted, duplicated in E605
- 1705.15.4.8 – Wide Flanged Columns - deleted, duplicated in E605…a wide flange column is a column, and all thicknesses for columns regardless of size are measured the same.
- 1705.15.4.9 – Hollow Structural section and pipe columns – not in E605, no change.
- 1705.15.5 – Density – slight edit, 'sample quantities', and left sample quantity at the more stringent code mandated amount.
- 1705.15.6 – Bond Strength – Added reference to table 403.2.3 for inspection, highlighting differences of bond strength for buildings between 0-74', 75'-420' and 420'+ in height. The bond strength issue was found by the ICC TRB to be a significant factor in SFRM being able to stay on substrates for the life of the building, hence the 430 PSF and 1,000 PSF that exists in the code today.

- 1705.15.6.1 – Floor, roof and wall assy. - No change, code more stringent than E736 standard.
- 1705.15.6.2 – Structural members - No change, code more stringent than E736 standard.
- 1705.15.6.3 – Primer, paint and encapsulant bond strength - No change, this section is not in E736.

As the ASTM SFRM inspection practice evolves and creates more duplications between the code and the standards, we'll propose more deletions at that time.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal is not a change in requirements to SFRM Special Inspection procedures. The new WK 70851 Practice for the On-Site Inspection of Installed Spray Fire-Resistive Materials actually adds text making the administration of the inspection easier for jurisdictions.

The result of the code change should be that the inspection requirements are easier to handle for all involved, inspection agency, building official and contractors involved with inspections.

S2-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee disapproved as the proposed ASTM standard draft is not complete. The committee was glad to see the process has been started and recommends checking all new language. (Vote 11-1)

S2-24

Individual Consideration Agenda

Comment 1:

Proponents: Bill McHugh, CM Services, National Fireproofing Contractors Association (bill@mc-hugh.us) requests As Submitted

Reason: The Fire Safety Committee Disapproved S2-24 because the ASTM Inspection Standard was not complete at the time of the hearings. We expect that this standard will be completed by the public comment hearing, or before. As soon as the ASTM Standard is complete, we will modify the proposal with the correct ASTM Standard number.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Comment (CAH2)# 463

S4-24

IBC: 1705.17 (New), ASTM Chapter 35 (New)

Proposed Change as Submitted

Proponents: Bill McHugh, CM Services, National Fireproofing Contractors Association (bill@mc-hugh.us)

THIS CODE CHANGE WILL BE HEARD BY THE IBC - FIRE SAFETY CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THAT COMMITTEE.

2024 International Building Code

Add new text as follows:

1705.17 Board and Wrap Fire-Resistive Materials. *Special inspections* and tests for board and wrap fire-resistive materials applied to structural elements and decks shall be performed in accordance with ASTM WK70807. *Special inspections* and tests shall be based on the fire-resistance design as designated in the *approved construction documents* and the manufacturers installation instructions. *Special inspections* and tests shall be performed during construction. Additional visual inspection shall be performed after the rough installation and, where applicable, prior to the concealment of electrical, automatic sprinkler, mechanical and plumbing systems.

Add new standard(s) as follows:

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box C700
West Conshohocken, PA 19428

WK70807	New Practice for the On-Site Inspection of Installed Board and Wrap Type Fireproofing

Reason: For decades, there has been special inspection for Spray Fire-Resistive Materials (SFRM) and Intumescent Fire-Resistive Materials (IFRM). However, board and wrap materials used for fireproofing structural building elements and assemblies have not been specifically named in their own section. The only place to find where special inspection for these materials might be is in section 1705.1 General. In 1705.1, General, it seems to assume that these items would get special inspections.

1705.1.1 Special cases. *Special inspections and tests shall be required for proposed work that is, in the opinion of the building official, unusual in its nature, such as, but not limited to, the following examples:*

1. Construction materials and systems that are alternatives to materials and systems prescribed by this

code.

2. Unusual design applications of materials described in this code.

3. Materials and systems required to be installed in accordance with additional manufacturer's instructions

that prescribe requirements not contained in this code or in standards referenced by this code

In section 1705.1.1(1) the IBC states 'alternatives to materials and systems prescribed in the code' should also get special inspections. Boards and wraps come in various types.

The board materials used can include gypsum panels, calcium silicate, mineral wool, composite metals with ceramic filling, or ceramic fiber type board protection. Wraps include ceramic fiber insulation, endothermic wraps. The common element of these is that they are installed in accordance with a listing and manufacturer's installation instructions to result in a fire-resistance-rated building element or assembly.

This new section is needed to assure fire-resistance and structural integrity is maintained during fire conditions regardless of material type.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This code change is adding a standard practice to the code that regulates how the inspection is conducted - that is already done. Based on section 1705.1.1, Special Cases, the materials are alternatives to materials and systems prescribed in the code.

S4-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee disapproved, although they liked the idea of the proposal, they felt it has unintended consequences, is too broad, and needs to be cleaned up with more specific requirements. (Vote 12-0)

S4-24

Individual Consideration Agenda

Comment 1:

Proponents: Bill McHugh, CM Services, National Fireproofing Contractors Association (bill@mc-hugh.us) requests As Submitted

Reason: The Fire Safety Committee Disapproved S4-24 because the new ASTM Inspection Standard was not complete at the time of the hearings. We expect that this standard will be completed by the public comment hearing, or before. As soon as the ASTM Standard is complete, we will modify the proposal with the correct ASTM Standard number.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

IBC: [BF] 1705.16, ASTM Chapter 35 (New)

Proposed Change as Submitted

Proponents: Bill McHugh, CM Services, National Fireproofing Contractors Association (bill@mc-hugh.us)

THIS CODE CHANGE WILL BE HEARD BY THE IBC - FIRE SAFETY CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THAT COMMITTEE.

2024 International Building Code

Revise as follows:

[BF] 1705.16 Intumescent fire-resistive materials. *Special inspections* and tests for *intumescent fire-resistive materials* applied to structural elements and decks shall be performed in accordance with ASTM WK70852 ~~AWCI 12-B~~. *Special inspections* and tests shall be based on the fire-resistance design as designated in the *approved construction documents*. *Special inspections* and tests shall be performed during construction. Additional visual inspection shall be performed after the rough installation and, where applicable, prior to the concealment of electrical, automatic sprinkler, mechanical and plumbing systems.

Add new standard(s) as follows:

ASTM

ASTM International
100 Barr Harbor Drive, P.O. Box C700
West Conshohocken, PA 19428

WK70852	New Practice for the On-Site Inspection of Installed Intumescent Fire Resistive Materials

Reason: For decades, there has been special inspection required in IBC's Chapter 17 for Intumescent Fire-Resistive Materials (IFRM). A new industry consensus standard is being balloted at E06 Main Committee, on its last few negatives. The consensus standard, ASTM, WK 70852, Practice for On-Site Inspection of Installed Intumescent Fire-Resistive Material, has been collaboratively developed with input from many stakeholders. When the standard is approved, we will submit a floor modification to insert the new standard number.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This code change will have no effect on the cost of construction. The methods used are similar to what is currently written in the code.

S5-24

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee disapproved, and suggested the proposed ASTM standard needs to be complete (Vote 9-3)

THIS CODE CHANGE WILL BE HEARD BY THE IBC - FIRE SAFETY CODE COMMITTEE. SEE THE TENTATIVE HEARING ORDER FOR THAT COMMITTEE.

2024 International Building Code

Add new definition as follows:

STUCCO BOND BREAK. A substantially nonwater-absorbing layer placed directly behind stucco to prevent adhesion of the stucco to the surface of the *water-resistive barrier*, to serve as a protective layer over the *water-resistive barrier*, to provide a capillary break, and to promote drainage; examples include 10-min Grade D paper, No.15 felt, foam plastic insulating sheathing, polymeric building wraps, and other similar materials.

DRAINAGE PLANE. A continuous surface within a building assembly, such as created by a *water-resistive barrier* and flashing, installed in a manner that is capable of draining water by gravity flow downward and to the exterior.

DRAINAGE SPACE. A cavity in an *exterior wall* assembly, located between the *water-resistive barrier* and other exterior materials such as cladding or *stucco bond break*, used to enhance the drainage performance of the *drainage plane*.Examples include cavities formed by a furred gap, channels, a porous material or matrix, or other means to enhance drainage performance.

Revise as follows:

[BF] 2510.6 Water-resistive barriers. *A w*~~*W*~~*ater-resistive barrier*~~*s*~~,a *stucco bond break*, and a means of drainage shall be provided in accordance with one of the methods in Table 2510.6 or an *approved design* complying with Section 1402.2. ~~shall be installed as required in Section 1403.2 and shall comply with Section 2510.6.1 or 2510.6.2.~~ **Exception:** ~~Sections 2510.6.1 and 2510.6.2 shall not apply to c~~Construction where accumulation, condensation or freezing of moisture will not damage the materials.

Delete without substitution:

~~**[BF] 2510.6.1 Dry climates.** One of the following shall apply for dry (B) climate zones:~~

1. ~~The *water resistive barrier* shall be two layers of 10-minute Grade D paper or have a water resistance equal to or greater than two layers of *water resistive barrier* complying with ASTM E2556, Type I. The individual layers shall be installed independently such that each layer provides a separate continuous plane and any flashing, installed in accordance with Section 1404.4 and intended to drain to the *water resistive barrier*, is directed between the layers.~~
2. ~~The *water resistive barrier* shall be 60-minute Grade D paper or have a water resistance equal to or greater than one layer of *water resistive barrier* complying with ASTM E2556, Type II. The *water resistive barrier* shall be separated from the stucco by a layer of foam plastic insulating sheathing or other nonwater absorbing layer, or a drainage space or means of drainage complying with Section 2510.6.2. Flashing installed in accordance with Section 1404.4 and intended to drain to the *water resistive barrier* shall be directed to the exterior side of the *water resistive barrier*.~~

~~**[BF] 2510.6.2 Moist or marine climates.** In moist (A) or marine (C) climate zones, *water resistive barrier* shall comply with one of the following:~~

~~1. In addition to complying with Item 1 or 2 of Section 2510.6.1, a space or drainage material not less than 3/16 inch (4.8 mm) in depth shall be applied to the exterior side of the *water resistive barrier*.~~

~~2. In addition to complying with Item 2 of Section 2510.6.1, drainage on the exterior side of the *water resistive barrier* shall have a minimum drainage efficiency of 90 percent as measured in accordance with ASTM E2273 or Annex A2 of ASTM E2925.~~

Add new text as follows:

2510.6.1 Installation. The *water-resistive barrier* shall be installed in accordance with Section 1403.2. The *water-resistive barrier*, *stucco bond break*, and means of drainage as required by Table 2510.6 shall be installed such that a continuous *drainage plane* is maintained. Water shall be directed to the exterior at the base of the stucco application and at any transition between building stories or other conditions where the *drainage plane* or *drainage space* terminates.

2510.6.2 Combination of materials. Materials or systems that create a continuous plane and combine functions of *water-resistive barrier*, *stucco bond break*, or *drainage space* shall be permitted.

2510.6.3 Flashing. Flashing installed in accordance with Section 1404.4 and intended to drain to the *water-resistive barrier*, shall be directed to the *drainage plane* on the exterior side of the *water-resistive barrier*.

TABLE 2510.6 WATER-RESISTIVE BARRIER, STUCCO BOND BREAK, AND MEANS OF DRAINAGE FOR EXTERIOR PLASTER (STUCCO)

MOISTURE REGIME[a]	METHOD	WATER-RESISTIVE BARRIER (WRB)	STUCCO BOND BREAK (SBB)	MEANS OF DRAINAGE
Dry (B)	D1	10-minute Grade D paper or WRB with water resistance equal to or greater than one layer of ASTM E2556, Type I	10-minute Grade D paper or any material meeting definition of a *stucco bond break*	*Drainage plane* is located between adjacent WRB and SBB layers.
	D2	60-minute Grade D paper or WRB with water resistance equal to or greater than one layer of ASTM E2556, Type II	Foam plastic insulating sheathing or other nonwater-absorbing material meeting definition of a *stucco bond break*	*Drainage space* separating the layers not required
	D3		Not Required	*Drainage space* with means to separate stucco from direct contact with WRB
Moist (A) and Marine (C)[b]	M1	10-minute Grade D paper or WRB with water resistance equal to or greater than one layer of ASTM E2556, Type I	10-minute Grade D paper or any material meeting definition of a *stucco bond break*	*Drainage space* with min 3/16-inch (4.6 mm) depth
	M2	60-minute Grade D paper or WRB with water resistance equal to or greater than one layer of ASTM E2556, Type II	Foam plastic insulating sheathing or other nonwater-absorbing material meeting definition of a *stucco bond break*	
	M3		Not Required	*Drainage space* with min. 3/16-inch (4.6 mm) depth and means to separate stucco from direct contact with WRB
	M4	60-minute Grade D paper or WRB with water resistance equal to or greater than one layer of ASTM E2556, Type II	Foam plastic insulating sheathing or other nonwater-absorbing material meeting definition of a *stucco bond break*	Drainage plane or drainage space with drainage efficiency of at least 90% per ASTM E2273 or Annex A2 of ASTM E2925

a. The appropriate moisture regime shall be selected in accordance with Chapter 3 of the *International Energy Conservation Code*.

b. Requirements for Moist (A) and Marine (C) moisture regimes shall be permitted to be applied in the Dry (B) moisture regime.

Reason: The previous two code cycles resulted in technical improvements to Section 2510.6 to address water management of conventional 3-coat stucco installations in moist (A) and marine (C) climate regimes. However, these changes brought about increased complexity of the provisions that vary based on wall assembly conditions and climate conditions with options and requirements that are cross-referenced between the two subsections (existing 2510.6.1 and 2510.6.2 shown as deleted). This formatting approach made determining a particular solution difficult and confusing. Therefore, this proposal clarifies the existing technical requirements and options by making them more “visual” in a table format without changing the technical intent of the code. The multiple requirements and inter-related options of Sections 2510.6.1 and 2510.6.2 (deleted) are now incorporated in Table 2510.6 in a straightforward manner. Also, new definitions for “STUCCO BOND BREAK”, “DRAINAGE PLANE”, and “DRAINAGE SPACE” are provided to facilitate clarity and accuracy in code reading and understanding of different components (and their functions) currently required for 3-coat stucco

applications but vaguely described within the code text. The drainage plane and drainage space definitions can also be used for other exterior wall covering applications in the code.

Beyond the overall formatting changes and definitions described above, some specific clarifications addressed by this proposal are as follows:

Section 2510.6 Water-resistive barriers.

New Table 2510.6 is referenced for requirements instead of the existing two subsections (proposed for deletion). The ability to use an approved design is also provided as a clarification that other solutions than identified in this section and Table 2510.6 are possible.

Section 2510.6.1 Installation. This new subsection consolidates installation requirements that were not addressed consistently across the existing code subsections 2510.6.1 and 2510.6.2. Also, a sentence is added to require drainage to the exterior at the base of the stucco application and at transitions between stories or other conditions where the drainage plane or drainage space terminates. This was based on stucco performance field research in Florida (see Bibliography).

Section 2510.6.2 Combination of Materials. This new subsection clarifies that materials which combine the required functions into a single product can be used rather than having to provide each of the required functions by separate materials. While this may be implied, the intent is to clarify it for transparency and to avoid different interpretations on this matter.

Section 2510.6.3 Flashing. This new subsection simply captures existing code content related to installation of flashing and its integration with the intended drainage plane.

Table 2510.6. This new table replaces the inter-twined and cross-referenced requirements of existing subsections 2510.6.1 and 2510.6.2 (shown as deleted). The requirements of these subsections are now mapped in Table 2510.6 as distinctly different solutions or methods for combining the various required components and options for those components (one combination of components is shown for each row of the table). Therefore, the user simply determines the correct climate “moisture regime” (see footnote a) and then selects an appropriate (or preferred) method and follows the required combination of components in that row of the table. This eliminates the need for a user to decipher the existing code text and cross-referenced requirements between different subsections of code to determine what is required. Finally, a footnote ‘b’ is added to the table to clarify that the more stringent moist/marine solutions can also be applied to the less stringent dry climate moisture regime (something the code inadvertently did not enable but which was intended to be permitted).

Bibliography: Lstiburek, J.W. (2005). Rainwater Management Performance of Newly Constructed Residential Building Enclosures During August and Septemeber 2004. Prepared for Home Builders Association of Metro Orlando and the Florida Home Builders Association by: Building Science Corporation, Westord, MA. January 11, 2005

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal strives to make no technical changes to the requirements in 2510.6 and focuses on formatting improvements and clarifications to better convey the various inter-related requirements and options in 2510.6 and particularly the cross-referenced requirements in subsections 2510.6.1 and 2510.6.2 for dry and moist/marine climates. The primary change is to reformat the subsections to address topics that apply regardless of the climate moisture regime and to place specific requirements and options (methods) in a table format where they can be easily visualized and selected without having to decipher the logic of the current code language.

Public Hearing Results (CAH1)

Committee Action: **Disapproved**

Committee Reason: The committee disapproved per the request of the proponent, to allow the proponents of S8 & S9 to reach an agreement for a coordinated table. (Vote 12-0)

S9-24

Individual Consideration Agenda

Comment 1:

IBC: SECTION 202 (New), 2510.6 (New), 2510.6.1 (New), 2510.6.2 (New), TABLE 2510.6 (New), [BF] 2510.6, [BF] 2510.6.1, [BF] 2510.6.2

Proponents: Jay Crandell, P.E., ABTG / ARES Consulting, Foam Sheathing Committee of the American Chemistry Council (jcrandell@aresconsulting.biz) requests As Modified by Committee (AMC2)

Replace as follows:

2024 International Building Code

Add new definition as follows:

STUCCO BOND BREAK. A substantially nonwater-absorbing layer placed directly behind stucco to prevent adhesion of the stucco to the surface of the *water-resistive barrier.*

Add new text as follows:

2510.6 Weather protection. A *water-resistive barrier*, *stucco bond break*, means of drainage, and flashing shall be provided in accordance with Section 1402.2 and one of the methods in Table 2510.6. **Exceptions:**

1. The requirements for a means of drainage shall not apply to construction where accumulation, condensation or freezing of moisture will not damage the materials.
2. Masonry or concrete wall construction in accordance with exception 1 of Section 1402.2.
3. An *approved* design complying with exception 2 of Section 1402.2.

2510.6.1 Installation. The continuous *water-resistive barrier* shall be installed in accordance with Section 1403.2. The *water-resistive barrier*, *stucco bond break*, and means of drainage shall be installed in accordance with Table 2510.6. Water shall be directed to the exterior at the base of the stucco application and at any transition between building stories or other conditions where the means of drainage terminates.

2510.6.2 Flashing. Flashing installed in accordance with Section 1404.4 and intended to drain to the *water-resistive barrier* shall be directed to the exterior side of the *water-resistive barrier.*

TABLE 2510.6 WEATHER PROTECTION REQUIREMENTS FOR EXTERIOR PLASTER (STUCCO)

Method	Moisture Regime[a]	Water-Resistive Barrier (WRB)	Stucco Bond Break (SBB)	Means of Drainage
1	Moist (A), Dry (B), or Marine (C) (any moisture	10-minute Grade D paper or WRB with water resistance equal to or greater than one layer of ASTM E2556, Type I	10-minute Grade D paper or WRB with water resistance equal to or greater than one layer of ASTM E2556, Type I	Drainage cavity with min. 3/16-inch (4.6 mm) depth between WRB and SBB layers
2		60-minute Grade D paper or WRB with water resistance equal to or greater than one layer of ASTM E2556, Type II	Foam plastic insulating sheathing or other *stucco bond break*	

3	regime)		Foam plastic insulating sheathing or other *stucco bond break*	Drainage between WRB and SBB layers with drainage efficiency of at least 90% per ASTM E2273 or Annex A2 of ASTM E2925
4	Dry (B)	10-minute Grade D paper or WRB with water resistance equal to or greater than one layer of ASTM E2556, Type I	10-minute Grade D paper or WRB with water resistance equal to or greater than one layer of ASTM E2556, Type I	Drainage is between WRB and SBB layers
5		60-minute Grade D paper or WRB with water resistance equal to or greater than one layer of ASTM E2556, Type II	Foam plastic insulating sheathing or other *stucco bond break*	
6			Not Required	Means of drainage in accordance with Method 1, 2, or 3 with means to separate stucco from direct contact with WRB

a. The appropriate moisture regime shall be selected in accordance with Chapter 3 of the *International Energy Conservation Code* commercial or residential provisions.

Delete without substitution:

~~**[BF] 2510.6 Water-resistive barriers.** *Water-resistive barriers* shall be installed as required in Section 1403.2 and shall comply with Section 2510.6.1 or 2510.6.2. **Exception:** Sections 2510.6.1 and 2510.6.2 shall not apply to construction where accumulation, condensation or freezing of moisture will not damage the materials.~~

~~**[BF] 2510.6.1 Dry climates.** One of the following shall apply for dry (B) climate zones:~~

1. ~~The *water-resistive barrier* shall be two layers of 10-minute Grade D paper or have a water resistance equal to or greater than two layers of *water-resistive barrier* complying with ASTM E2556, Type I. The individual layers shall be installed independently such that each layer provides a separate continuous plane and any flashing, installed in accordance with Section 1404.4 and intended to drain to the *water-resistive barrier*, is directed between the layers.~~
2. ~~The *water-resistive barrier* shall be 60-minute Grade D paper or have a water resistance equal to or greater than one layer of *water-resistive barrier* complying with ASTM E2556, Type II. The *water-resistive barrier* shall be separated from the stucco by a layer of foam plastic insulating sheathing or other nonwater-absorbing layer, or a drainage space or means of drainage complying with Section 2510.6.2. Flashing installed in accordance with Section 1404.4 and intended to drain to the *water-resistive barrier* shall be directed to the exterior side of the *water-resistive barrier*.~~

~~**[BF] 2510.6.2 Moist or marine climates.** In moist (A) or marine (C) climate zones, *water-resistive barrier* shall comply with one of the following:~~

1. ~~In addition to complying with Item 1 or 2 of Section 2510.6.1, a space or drainage material not less than $^{3}/_{16}$ inch (4.8 mm) in depth shall be applied to the exterior side of the *water-resistive barrier*.~~
2. ~~In addition to complying with Item 2 of Section 2510.6.1, drainage on the exterior side of the *water-resistive barrier* shall have a minimum drainage efficiency of 90 percent as measured in accordance with ASTM E2273 or Annex A2 of ASTM E2925.~~

Reason: At CAH1 the proponents of S8-24 and S9-24 requested disapproval to allow time to work with various stakeholders to resolve differences between the two similar proposals. The proponents and stakeholders have met and resolved those differences as represented in this replacement proposal for S9-24. The main goal of the proposal remains the same -- to clarify the current code requirements and clearly identify acceptable methods of installation for stucco applications on exterior walls. The proposal framework places the existing code requirements in a table format with listed methods that are appropriate for the respective climate regimes. The proposal also coordinates with requirements in Chapter 14 related to weather protection of exterior walls, including the exceptions provided in 2510.6.

Cost Impact: The change proposal is editorial in nature or a clarification and has no cost impact on the cost of construction

Justification for no cost impact:

This proposal is a reformat and clarification of existing requirements without impact to cost of construction.
